

The *New* Three *R*_s

- every one will have to learn after a Nuclear War -
or other world-wide catastrophe

(but that most people aren't yet ready to even think about)

1. Reconstruction - of society
2. Recovery - of production
3. Renewal - of religion

And a fourth *R* for the present -

4. Resources - for nuclear war survival

by Bruce M. Beach

Radiological Scientific Officer

The Purpose Of These Pages

Our goal is to put essential information for reorganization, recovery and renewal - after a catastrophe such as nuclear war - onto this web site and onto one or two CDs and to make free distribution of these CDs in such a manner that they will be available to survivors of the catastrophe that we feel is now inevitable. While we do not know what form a catastrophe may take, still with the number of nuclear weapons that there are in the world, there is the very great possibility that it may be nuclear. We also realise that in the immensity and intensity of Divine Retribution the very equilibrium of the planet itself may be disturbed.

In the past we have assisted many hundreds of people in obtaining thousands of pieces of radiation detection equipment and we have given away hundreds of pieces to those who could not afford them. We simply no longer have the time to do that but we have stockpiled, tested and labeled hundreds of radiation detection devices (currently worth tens of thousands of dollars) that we will give away to those people that we have to turn away from the door of the shelter.

At that time - the Resources for Survival information on this site will be of considerably less use because we will be past the time to prepare but we have assembled survival guidance material to handout at the

door of the shelter to people for whom we have insufficient room in the shelter to accommodate. In December 2001 we completed a series of 4 twenty-minute videos, on such subjects as building an expedient shelter, which we hope to be able to show to the same group of people.

The plan is to train Radiological Instructors while in the shelter so that they can go out afterwards and train monitoring teams. Equipment has also been stockpiled for these teams.

For over forty years my wife and I have made an intensive effort to alert people to the threat and to urge them to prepare for it. I could never have done alone all that we have done together. For weeks she stood at my side and helped load two printing presses for imprinting of over one-hundred thousand booklets which we gave away absolutely free. Since the advent of the Internet untold thousands more booklets have been downloaded in a printable format for printing and distribution by many other people.

We used many ways of getting the information out to the public. We sent out tens of thousands of pieces of literature through the mails. We set up booths at numerous fairs, I appeared on many dozens of TV and radio programs, many of national and international scope, and there were so many newspaper and magazine articles written about the Ark Two that we long ago lost count. Literally, multiple millions of people heard about our efforts. And we have never charged anyone a penny for any of the information.

Once the Internet became popular, it surpassed all our other efforts of informing people. The interest in our web pages grew to where we get thousands of hits each day. Sometimes, at a period of particular interest it can be tens of thousands. Once, during one three hour period there were over 85,000 hits which completely swamped the system and the server had to pull the plug. Within hours our webmaster had the url rerouted to a new dedicated server directly on the backbone and we were back up. The site was eventually mirrored at over 30 locations. We have no idea how many hits daily there are on all the sites combined.

All this pales, however, compared to our present goal of making recovery information available for the survivors. It is doubtful that the Internet will be working as it is today but if segments of it can be gotten back up then perhaps some of the information can eventually be distributed over more local areas. For this reason we are going to try to get copies of the CDs out to widely distributed ISPs and ask them to retain them for installation on their servers afterwards. Another thought is if people can find a quantity of blank CDs they can take and duplicate the master CDs and distribute them about their geographical area so that those who can get a computer going with local emergency power - will be able to access the information. Any other strategies or suggestions for distribution would be greatly appreciated. We would like for this information to be shared as broadly as possible.

Recovery Information

Some of our key web pages deal with measuring radiation in food and strategies of dealing with radiation in the soil and food chain. There is information available here that I am not aware of being available anywhere else on the web. It spans from the practical "how to" to the highly theoretical necessary for

professionals to set up laboratories. I am a Radiological Scientific Officer and I can assure you that this is the necessary and correct information.

Many of our web pages deal with the technical aspects of small scale farming such as seed saving, fertilizers, crop management and so forth - and many others deal with alternate energy sources and still other subjects necessary to successful small farming, which will have to be a main focus of recovery.

A great many of our resources deal with old Pioneering skills. We cannot just go back to the old ways. We have lost many of the skills. No one had them all then and you would be hard put today to find a wheelwright, a miller, a tanner, a barrel maker. All those trades, like farming, have advanced into modern technology and the present experts seldom have used the old ways. Many of the old implements are no longer around and we certainly don't have the horses. Modern horses are neither bred nor conditioned to pull the plow. Still, in the skills of the past we may find solutions to the problems of the moment.

Beyond recovery there are many web pages, that are a part of this collection, that deal with the subject of the Reconstruction of Society and the Renewal of Religion. These are issues to which men's thought will have to eventually progress but I shall not belabor the point in this overview.

Our Library

Our personal library is very extensive. At one time I counted 13 encyclopedias. These are mostly specialized - like a 14 volume set on gardening and another 16 volume set on do-it-yourself repairs. There are others on health and medicine and a variety of other subjects.

We have also acquired CDs with hundreds of books and one summer put a crew to work microfilming thousands of documents which we have on microfiche. These, plus many many books, are in just our own home but our Ark Two Community librarian is the real gatherer of information - he has many thousands of books, mostly on technology for recovery.

In the future, when people want it, we hope to be able to disseminate all this information widely. There are many blind spots in our library. We have little information on modern technology and almost no information on leading edge technology. Members of our Ark Two community are of far more than average knowledge about nuclear and computers but there are many, many fields such as in modern metallurgy, petroleum refining, hundreds of specialties in chemistry, medicine, and untold numbers of other areas that the expertise to re-establish them will have to survive with the experts - if they are going to be recovered in the immediate decades following.

One major focus of our library has been maps, in order to determine where that expertise may reside. We have thousands of maps. Local road maps. Topographical maps. More and more maps on an expanding scale. We have every map ever published by the National Geographic. We have CDs with map search programs. North American and World Atlases. The list goes on. One map set which we were very desirous of obtaining cost thousands of dollars (far beyond our budget) from the US government. It

comes with a subscription program for real-time updating and the printed book is reprinted annually. A marvelous tool for demographers tracking changing patterns - but one used copy would serve our purposes. Miraculously, on the Internet we found a library discard copy - at a fraction of the cost.

Other associates of ours are providing us with gigabytes of survival information on CDs. Our problem has not been so much one of obtaining information but determining on which to concentrate our limited resources for storing and cataloging. Tons of information is of no use, if you have no way of finding what you want in it. In early years we were given literally tons of new books by libraries and publishers. Expensive new technical volumes that often cost over a hundred dollars each - but we finally had to abandon that effort simply because of lack of storage space and manpower to handle it. Tons had to be destroyed simply because we could not, even with weeks of searching, find a way to transport them to Third World countries who were desirous of having them.

So the problem of the moment has not been getting information but one of determining which information is going to be most useful to survivors. What we offer in these pages, measuring radiation contamination in food, producing food without the modern technology and its skills, finding alternate sources of energy, recovering and repairing remaining machinery, creating the nucleus of an economic system and restoring the basis of functioning society - information on how to do these things - are what we feel will be most needed at the outset. It is our sincerest hope that we will be able to get it to the people who need it and that they will find it useful.

1. Reconstruction of Society after Nuclear War

Since most people think that all-out nuclear war is not survivable, either individually or for society, and since somehow most intellectuals feel that to make positive plans for its aftermath would seem to somehow advocate or condone it - there is absolutely no scholarly discussion on this subject. In these pages I give some direction for the

World Language Automated Mailing (discussion) List.

Take part in discussing the evolvement of the World Language Process!

The forum is moderated - which means all correspondence goes through the moderators so you won't be plagued with a volume of correspondence. The moderator tries to combine discussions and keep out redundancy so as to keep the correspondence brief.

This list is the place to keep informed of ongoing World Language Processes and to participate as a volunteer. It presently replaces our other discussion lists, volunteer lists, teacher lists, and participant lists until the program becomes further developed and implemented.

Description of the World Language Process

The primary mission statement of the World Language Process is:

*To further world peace through the world understanding
which will be achieved by having One World Language.*

The primary philosophical goal of the World Language Process is a Universal World Language. As a stage towards that goal it seeks to promote the concept of a Universal Auxiliary Language (AIL -Auxiliary International Language, IAL - International Auxiliary Language) that everyone would learn in addition to their mother tongue.

The concept or goal of a IAL has not yet reached a kindling point in the consciousness of humanity or its leaders. Until such a kindling point occurs, the World Language Process, in addition to trying to raise that consciousness, is trying to identify concepts, experiments, and efforts that are directed towards or supportive and compatible with the goal. These it tries to support and learn from. It is hoped that at not some too far off future day there will be broader desire for this information.

The current secondary mission statement of the World Language Process is:

To further world literacy and communication through the ACCESS Project.

To obtain experience in the methodology of developing an IAL, the World Language Process has put extensive effort into the the development of the ACCESS System (Auxiliary Closed Captioned English with Simplified Spelling) and its ANJeL Tun as described below. However, it should be emphasized that the World Language Process is in *NO* way 'solely committed' to the ANJeL Tun and that it will willing, happily and cheerfully support instead any IAL that humanity may select.

However, in the interim, with the ACCESS System we hope to provide economically deprived individuals in developing countries an opportunity to learn to speak English as a second language so that they may improve their economic situation.

Organization of the World Language Process

The World Language Process is a non-profit organization with Chancellors in over 30 countries and hundreds of volunteers throughout the world. Its members are dedicated to furthering world peace through education, literacy and world understanding.

The World Language Process is neither officially or unofficially associated with any religious or political organization of any kind and has no hidden agenda. It is a program of UNKOMMON (UNiversala KOMmunikado por la MONdo-Esperanto for "Universal Communication for the World") Foundation, which is dedicated to supporting attempts towards a universal auxiliary language, and it is a project of the IAEWP (International Association of Educators for World Peace) which is an NGO to the United Nations since 1973 and UNESCO since 1975.

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [Language Main Page](#)

History of the World Language Process and this IAL effort.

- Ten years of computer and language research by the vision holder starting at the
- 1964-** University of Oregon (**1964**) through a NUL Chevron Fellowship (**1966**) a NUL IBM
1974 Fellowship (**1968**) a Canadian Federal grant (**1971**) and an Ontario provincial grant
(**1974**).
- 1975** Designation of the **Universal Language Institute** site as being **Bahji du Canada**.
- 1978** Formation of **UNCOMMAN Association** by 1978 Wintario grant.
- 1984** UNCOMMAN *incorporates federally* as **UNKOMMON Foundation**, a *non-profit organization*.
- 1985** Start of design of the building for the Universal Language Institute at Bahji du Canada.
- 1988** The Universal Language Institute design wins first place award for Canadian Architecture.
- 1989** The **ACCESS Project** begun by the **ACCESS Colloquium** which consisted of the President of The American Literacy Council, The Director of University Systems for Sperry Rand Corporation, The Director of the Modern Languages Department at the Ontario Institute for Studies in Education at the University of Toronto, The President of the Canadian National Captioning Centre for the deaf, and a number of university professors.
- 1990** The Canadian Federal Government gave the ACCESS Colloquium an initial grant. In order to cash the grant check the Colloquium had to incorporate and today operates under the style of **ACCESS Colloquium Incorporated**.
- 1991** Through the government grant and generous community support amounting to several hundred thousand dollars the ACCESS Project shot thirty hours of Betacam SP video tape.
- 1992** The ACCESS Project developed the first software for translating scripts into the FXNeTiK spelling used for captioning in the ACCESS System and analyzed and evaluated video editing equipment. The project was delayed by waiting for manufacturers to develop a promised Nonlinear Online Video Editing Lab (NOVEL) technology that was necessary for the completion of the project.
- 1993** The ACCESS Project obtained use of the first AVID Media Suite Pro sixty-field/thirty-frame per second NOVEL system installed in Canada. This system was installed at the **Canadian National Captioning Centre for the deaf**, for the purpose of working on the ACCESS Project, and this is where the work continued until May 1995. 1993 also saw the development of the **World Language Process** concept by the UNKOMMON Foundation and preparation for its decision to use the ACCESS system for this program.

1994 The World Language Process was accepted as a *project* by the **IAEWP** (International Association of Educators for World Peace). The IAEWP has been an **NGO** of the **United Nations** since 1973 and of **UNESCO** since 1975.

Proposals were sent to twenty-seven provincial governors in Thailand. Each of these governors received a presentation on the World Language Process, under the aegis of the Royal Consulate of Thailand in Canada, while they were in Canada. By the end of 1994 eighteen teaching positions were available in Thailand for WLP teacher volunteers.

In December the first hour of the ACCESS videos, consisting of six lessons, along with a drill tape, was completed and delivered to the University of Kansas for evaluation. Also in December a letter was sent to each of the national chancellors in the ninety-one member countries of the IAEWP, inviting them to participate as chancellor for the World Language Process and by December 31st sixteen countries had World Language Process chancellors appointed.

1995 The editing equipment was moved to a video school location and the World Language Process had assigned to it, by the Toronto Municipal Job Incentives Program, for six months, four full time editors. There was a considerable learning curve in learning to use the editing system, in the training of a half dozen editors, and in the development of the icons, formats and standards to be used in the videos.

By the end of the year, six hours of video had been edited and the project had trained over 60 people in non-linear editing, nine of which proved capable of actually doing the project. At this time the project lost access to the original editing equipment but the video digitizing boards for another system were donated to the WLP by the AVID Corporation.

1996 There were over sixty volunteers for the overseas teaching program and a total of over 100 program volunteers. There were World Language Process Chancellors in 28 countries and over 100 teacher positions available in four countries. It had been demonstrated that both teacher volunteers and teaching positions were readily available.

- a. A 40,000 word simplified dictionary had been scanned in preparation for editing.
- b. Item selection had been made for a 4800 word picture dictionary.
- c. The first five of ten teacher correspondence lessons had been written.
- d. The first four of twenty student workbooks have been written.
- e. A layout mockup has been completed for the student workbooks.
- f. Arrangement had been made with Project Gutenberg to use its machine readable texts and to store the ACCESS dictionary on their system.

1997 The World Language Process went on the World Wide Web.

Because of the Web, The World Language Process, for the first time, achieved a level of over 500 volunteers.

With Sally Ward doing most of the data entry, over 80 editors were able to create sentences for the 40,000 definitions in the dictionary and the dictionary data base was implemented.

Roz Rus edited the 44,000 words on the Angel spelling list.

David Hatch developed and installed the first web on-line Angel Translation program for the web.

In September of 1997, Shawn Beilfuss has taken over guidance of the Comic Book Project.

1998 - In the early part of the year, Alex Nauda directed us to the Carnegie Mellon Institute word list, and by mid year there was completed the major effort of merging it with the Rondthaler/Lias list and converting them both to Angel FXNeTiK spelling.

By August of 1998 the World Language Process had chancellors in over 30 countries and Sally Ward became the Chancellor Administrator and editor of the Chancellor News letter.

In December the editors completed syllabifying 815 merged word list files of fifty words each.

1999 By March of 1999 a number of translators, the world over, helped in translating the 18 languages that appear on the Web Pal pages at:

[Web Pal](#).

Brett Holt wrote an improved Windows 95 program for on-line ANJeL Tun translation which is able to translate to both Angel and NES (New English Spelling). The latter is under the guidance of Ron Footer in London England and is used by the ACCESS project as Bridge English. There were developed a suite of free analyses programs for researchers wishing to do research on the Angel and NES fonetic spelling lists.

We created our

[essays location](#)

on our website and archived (among others) LANGO by Robert Robert Craig & Antony Alexander of the Isle of Man.

Antony Alexander and Dr. Steve Bett, along with Roslyn Rus, Douglas Worthingham, and

some others started reviewing [Regularization](#) for the ACCESS System.

2000 Almost the whole of the year 2000 was spent in a gigantic project of supplementing our definition data base with three more dictionaries, one of them being the unabridged Webster's International Dictionary. All three were digitized and checked for order and spelling.

A significant effort was made to become an independent NGO member of the United Nations. Our president submitted by the stated deadline the required application on our letterhead, but no response was obtained.

We also made a study into using [Arabic Characterization](#) for the ANJeL Tun.

In the fall of the year the Bahji Memorial was extensively landscape. The placing of the natural red stone was accompanied by a Metis Ceremony conducted by the National Chairman of the Southern Metis.

2001 A follow up phone call regarding our United Nations application determined that it had been received but that because of limited resources due to lack of funding they had not been able to process all the applications.

The year 2001 saw a major effort to reorganize our web pages and move them to a new server.

The major task in 2001, was to merge all the dictionary data bases into one and to rationalize them with the word lists.

2002 In 2002 at the future site of the Universal Language Institute we had the first annual World Language Process picnic with a tree planting activity to plant 88 new trees. There was attendance from 3 States in the US and 2 Provinces in Canada.

We once again did a major reorganization on the web pages and moved them to a still faster server.

The major task in 2002, continued to be to merge all the dictionary data bases into one and to rationalize them with the word lists. Two volunteer programmers worked on the project.

There was appointed a Chancellor for Japan and a professional paper was presented at the JALT Conference by Professor Jonathan Britten.

A major arrangement was made for the placing of volunteers into China and information about that program was incorporated into the web pages.

Video editing technology made a considerable advance during the year. Reasonably priced non-linear editing programs with much greater capability became much more available and new video cameras with direct DVD storage capabilities appeared to be on the verge of integration with them.

During the year we also began the study of animation capabilities.

2003 In 2003, at the suggestion of Professor Britten, the name World Language Program was changed to the name World Language Process, as being actually more reflective of the process of investigation, research, development - and promotion - of the concept that there should be a universal language and what it should involve - and how it should evolve.

Application was made to the 2003 JALT conference for a second presentation about the World Language Process.

The ongoing study of animation processes, synthetic generation of voices, TTS (Text To Speech) technology, talking heads and so forth received the assistance of several notable experts.

The possibility of cooperation with AT&T in developing videos with VTTS (Visual Text to Speech) technology, for training Chinese personnel for the Olympics in China, was undertaken with the appropriate director at the AT&T Research Laboratories.

The World Language Process presence on the web was further extended with its being mirrored at two other North American locations. Both the present web site and one of the new sites has a T1 available and the second North American mirror site has dual T3s. The need for this massive amount of bandwidth was necessitated by the primary site being overwhelmed on two occasions because of demand in connection with catastrophic threats for which it also provides support and response materials. The one occasion saw over 85 thousand hits in less than 3 hours.

At the time of this writing, arrangements are being made for the distribution of the web site by CD to other parts of the world so that at a future time it may be implemented on websites there.

The major tasks being performed at this time are the further development of the elemental lists, the investigation of script theory, and the study of animation and voice synthesis technology.

With Thoughts and Efforts for Peace

From late 1998 through 2001 the many projects of the World Language Process have had to share time resources with other priorities of the World Language Process coordinator. Because of millennialist concerns and the worsening world geopolitical situation, particularly in the Middle East, a considerable portion of his time and effort has had to go into the Ark Two Project.

The world's inhabitants and their leaders have so far shown little (more truthfully - practically no interest so far) in the development of an IAL (International Auxiliary Language). Nevertheless, the World Language Process continues to devote what resources it can obtain - to the following projects.

Projects of the World Language Process

<p>Web Pal (explained)</p> <p>Example</p>	<p>ACCESS System</p> <p>Videos</p> <p>Student Workbooks</p> <p>Teaching Manuals</p> <p>Teaching Kits</p>	<p>ANJeL Tun</p> <p>Tutorial</p> <p>Online Translator</p> <p>example</p>

Web Pal

Web Pal was a working system, but it is not currently. Someday, it will hopefully again be operative. Below is its history:

The definition of the Web Pal project has come full circle. Initially the concept was to match teachers and pupils for an IAL. Because no IAL officially exists, as yet, we thought to match teachers and students of English. This idea struck many as being too colonialistic or linguistically imperialistic so we enlarged upon it to match teachers and students in any language that they desired. The Web Pal idea is sort of a pen pal idea, but over the web. People would correspond with people in the language of interest and thereby learn the language.

While many hundreds of hours were put into this project, it proved too cumbersome to handle. There was lots of expressed interest, whole highschool classes from Japan for instance, and many North Americans who liked the idea of having web friends elsewhere in the world. However, the coordination of the project just became too cumbersome. We tried having sub-coordinators for various language groups and geographic areas. And we went through four overall coordinators - but it proved to be just too great a burden and we couldn't make it work.

We also tried to automate the process, with machine readable forms and a database program. Hundreds of hours went into that effort also. With our limited resources we had to just finally give up on it and chalk it up to a learning process. In the future, with just people interested in teaching or learning the ANJeL Tun,

or some universally accepted IAL, we hope to be able to use the experience that we have gained in again implementing an automated system.

You can look here at what

[Web Pal](#)

looked like. The forms do not presently work but this will give you an idea of what we did in the past - and of what we hope to do in the future.

- Numbers of translators, the world over, have helped in translating the 18 languages that appear on the Web Pal pages but we would still like to translate the following languages:

Hindi, Hebrew, Bengali, Panjabi, Javanese, Bhari, Telugi, Marathi, Malay, Urdu, Turkish. They would then cover all the worlds most populous language groups.

ACCESS System

The ACCESS (Auxiliary Closed Caption English with Simplified Spelling) System is described in more detail on [another page](#).

Videos

18 one hour long videos are being made to teach the ANJeL Tun

Student Workbooks

18 student workbooks are being prepared one for each of the 18 hours of video

Teaching Manuals

18 teacher manuals are being prepared one for each of the 18 hours of video

Teaching Kits

18 teaching kits are being prepared - one for each of the 18 hours of video. These are part of the ACCESS pedagogical method, that emphasizes a word/action relationship.

ANJeL Tun

The ANJeL Tun is currently a part of the ACCESS Project and is described in some detail [there](#). There is also a [Tutorial](#) for anyone who like to actually be able to read the ANJeL Tun.

Online Translator

There is also an Translator Program that we have had on line twice in the past, but which needs to re-installed. This program is actually capable of translating into any phonetic representation of English. Here is an [example](#) of a translation from one of the earlier versions of the translator program.

Dictionary Project

The longest ongoing project of the World Language Process has been the that of developing the tools to create dictionaries. A number of different dictionaries are envisioned. A BASIC 8,000 word phonetic/pictorial dictionary and a more extended one of 40,000 words. The key concept behind both these dictionaries is that they use a very limited set of words in the definitions. Beyond these limited dictionaries, it is hoped then to make specialized dictionaries, still using phonetic spelling and the basic vocabulary, for specialties in science and the arts.

Database

Developing the dictionary and spelling data bases has been the

most consuming activity. Four dictionaries and two phonetic spelling lists have been acquired and formatted and the final task of merging them into a single data base is under way.

Search Programs

There are a variety of search programs that allow one to do a comparison of word lists, find out how often words are used in definitions, and to find words containing particular character string (and in particular positions such as prefixes and postfixes).

Spelling Converter

The spelling converter works differently from the translator, in that it allows one to establish the rules by which phonetic conversion is to take place. Its output is actually the spelling database for the translator program. Where there are homographs of the word then it provides alternative targets.

Regularization Project

The Regularization Project has been under the direction of Antony Alexander on the Isle of Man. It is an ongoing dialog which welcomes any knowledgeable participants. For a part of the discussion - look at:

[Regularization](#)

Keyboard Project

The Keyboard Project has been studied in depth and resolved in principle. Computer programs have been found that permit the assignment of any character to any key. The ANJEL Tug uses only 39 phonemic characters (compared to English which uses 52) and this permits a "shiftless" keyboard. Furthermore, using the Dvorak ergonomic principles we have done letter frequency and

adjacency studies to develop optimized layouts. Until there is a universal language and script selection such information and methodology, however, remains academic.

Script Project

Even more academic than keyboard layout designs, has been the study of character representations themselves. One such effort has been an attempt to study the feasibility of English sounds with Arabic characters having the same phonetic target. If this interests you, You can view this attempt at:

[Arabic/ANJeL representation](#)

Volunteer Program

The World Language Process has had a strong volunteer program with hundreds of volunteers. They have worked on many projects from making the videos to editing the dictionary database. All the World Language Projects are done by volunteers. To become more informed about our volunteer program and changes in it, as they take place, [please join our mailing list!](#)

Teacher Program

The World Language Teacher program has already received hundreds of volunteers, along with requests for hundreds of teachers from many countries. Our goal is to make the ACCESS System available world wide but it has to first be further developed. In the interim we are doing a cooperative teacher placement program with CNteach in China. For more information about that look at [China Teach](#). To stay aware about the status of the program [please join our mailing list!](#)

Project Gutenberg

Michael Hart at the University of Illinois has made one of the great contributions to the age with his Project Gutenberg. Through his complete dedication and the

monumental effort of a great many volunteers, much of the worlds classical English writings have been digitized and made available in the public domain. Michael has been a superb supporter of The World Language Process for many years and has said that he will arrange for translations from the World Language Process translator to be stored in the Project Gutenberg database.

Comic Book Project

The comic book program has been under the direction of Shawn Beilfuss since September of 1997. Shawn has had extensive experience in the field and has traveled to Japan in his studies of comic books as an art, communications and education form. We have developed a number of scripts for a character called "Shoe Boy" and the intention is to reinforce the ANJeL Tun or an accepted IAL using this medium.

Universal Language Institute

The Universal Language Institute of the UNKOMMON Foundation won the first prize for Canadian Architecture in 1988. Here you can see a [picture](#) of the model and the [Memorial](#) associated with it.

Essays

The World Language Process has accumulated a few [essays](#) on the subject of IAL, but would like to store at this site any other contributions anyone would like to make along with any proposals for an IAL.

English

Web Pal
is a free service that matches email
pen pals throughout the world so
people can learn each others
languages

Sponsored by

[World Language Process](#)

After you complete this form to become a Web Pal ...
if you speak English like a native then **PLEASE** go to: [World Language Process](#)
which **GREATLY** needs VOLUNTEERS!

If you speak English we will try to match you up as a Web Pal with someone who wishes to learn English.

If you do not speak English well and would like to learn English (or some other language) then why not ...

exchange email with a **Web Pal**?

We will try to match YOU with someone who does speak the language you want to learn. Just fill out this form:

What is your Native Language?

If you have selected "other" please enter your native language in the comment box at the bottom of the form.

Your title (Prof., Dr., Rev., Mr., Mrs., Ms., Miss, etc.)

Your last name

Your first name

Your middle name or initial

Your email address

=====

A Tutorial for Traditional Orthography Readers

Who Wish to Learn ANJeL

This is a tutorial for TO (Traditional Orthography) users on how to read ANJeL.

The Angel alphabet consists of 39 symbols, each of which represents a unique sound. Unlike the traditional English alphabet, there is no duplication whereby different letter combinations can sound alike. For example, in English "threw" and "through", "bough" and "bow", "blue" and "blew", "write" and "right" have identical sounds but varied spellings. In Angel, all identical sounds have identical spellings.

The Angel alphabet assigns a unique symbol to each unique vowel and consonant sound. The symbols used are similar to those of the traditional English alphabet, with one big difference: Upper case letters have one unique sound, and lower case letters have another. In addition, sounds composed of multiple letter groupings (such as "oo", "ow" and "oy") are represented by single symbols in the Angel alphabet.

Unlike traditional English, Angel has no "silent" letters that can change the pronunciation of other letters in the word. (In traditional English, silent letters often change "short" vowels to "long" vowels: "cut" becomes "cute" even though we never hear that "e" on the end). In Angel, every letter in a word is essential and is pronounced.

In short, Angel is CONSISTENT. Its purpose is to permit new English learners to "See what we Say" on captioned TV, using the closed captioning decoder standards imposed by the U.S. Congress. The assignment of symbols to sounds was dictated by the need to avoid letters with descenders because such letters are poorly represented by the pixel arrangement on the television screen. Angel will be used in the ACCESS (Auxiliary Closed Captioned English with Simplified Spelling) System of the World Language Process for teaching English in Third World Countries.

Lesson 1

The Letters of the Angel Alphabet

The ANJeL 39 letter alphabet is as follows:

A a d

E e r
I i b
X x k
U m n

c s t
w z h

B D F
G H J
K L M
N P R
S T V
W Y Z

The following explains how the ANJeL Alphabet is organized.

The traditional English alphabet may be written as follows:

A B C D
E F G H
I J K L M N
O P Q R S T
U V W X Y Z

or

A -- B C D
E -- F G H
I -- J K L M N
O -- P Q R S T
U -- V W X Y Z

showing how we arrive at the order of the long vowels, AEIOU, when we recite them by giving them the letter's name.

In the ANJeL alphabet we use X for O, so that the letter will not be confused with a zero. Also we give the U the name and sound of the u in up. Therefore we get:

- A -- the sound like in bay
- E -- the sound like in bee
- I -- the sound like in pie
- X -- the sound like in go
- U -- the sound like in up

In the ANJeL alphabet we use the lower case letter for the short vowels and write them adjacent to the long vowel arriving at the start of our 39 character alphabet written in the following format.

Note the sound assignment to "m". In ANJeL, some letters are assigned completely different names and sounds than in TO.

- A a** ____ a- the sound of a in cat
- E e** ____ e- the sound of e in bed
- I i** ____ i- the sound of i in sit
- X x** ____ x- the sound of o in dog
- U m** ____ m- the sound of oo in foot

As you see, this schema is composed of three blocks of letters. The upper block is vowels and the lower blocks are the consonants, the lower of which we shall fill in now.

- A a** ____
- E e** ____
- I i** ____
- X x** ____
- U m** ____

B D F
G H J
K L M
N P R
S T V
W Y Z

The order of the consonants is the same as in the TO alphabet with simply the TO vowels and the X (and capital letters C, O and Q that ANJeL does not use at all) left out. As you will notice, all the letters in this block are capitals, which is why we call them the large consonant letters.

In the case of the vowels, which we covered a moment ago, the name of the vowel letter and the sound of the vowel letter are identical. A consonant, in the TO alphabet, is accompanied by a vowel (in front or behind) in order to be pronounced. The most commonly used vowel in traditional English is E. Thus in the alphabet of Traditional Orthography we have BE, DE, PE, TE, VE, and ZE ie. **B, D, P, T, V** and **Z** (forget the crazy Canadian zed). The names of these letters are the same in the ANJeL alphabet.

However, in ANJeL the other large consonant letter names are pronounced a little differently than in traditional English orthography. One of the main features of the ANJeL TUn is simplification through consistency. The ANJeL TUn large consonants have no exceptions. Therefore the letter **F** instead of having its vowel placed in front and being pronounced eF is named with the consistent long **E** afterwards (like FEE). **G** therefore becomes the mule skinnners GEE, ach (**H**) becomes HE, and jay (**J**) becomes JE (like in my wife's name Jean).

B (bee)
D (dee)
F (fee)
G (gee)
H (hee)
J (jee)
K (key)
L (lee)
M (me)
N (knee)
P (pea)
R (re)

S (see)
T (tea)
V (vee)
W (we)
Y (ye)
Z (ze)

While all of this is very simple, it still much more simply demonstrated with a video and of course its audio. But to continue, we will now fill in the rest of the vowel sounds.

A a ___
E e ___
I i ___
X x ___
U u ___

There are certain symbols on the traditional alphabetic typewriter keyboard that we have not used. We now use these for the sounds in the English language that have no letter.

For example ow, ou, ough which are all pronounced the same as in: owl, out, plough, are written in ANJeL using the **d** symbol which we have not previously used. Thus cow is written Kd, now Nd, out dT and plough PLd.

The **r** is somewhat of a special case. It is called a schwa. It is the sound heard very often at the end of words (and elsewhere) as in "mother", MUhr, "baker", BAKr, and at the beginning of "urgent", rJeNT.

The **b** is used for the oi, or oy sound. Like in oil and boy, which we would spell bL and Bb.

The **k** is used for the oo sound in tool.

The **n** is a particularly curious letter. It is NOT a vowel, but we put it at the end of the vowel block because it is the only consonant that cannot be pronounced with an **E** after it. We use **n** to represent the ng sound which is the sound we find at the end of the words like ring, rang and rung.

To remain as consistent as possible we pronounce the letter name **n** with the usual E as the preceding vowel. The sound is ng and therefore the vowel name is Eng (sort of like the ing in going but with a stronger E sound). **n** can be preceded by any vowel. That is why in ANJeL

"tongue" is TUn. It is a curiosity that English has this exceptional sound as its name.

These five letters now fill into our matrix in the following locations:

A a d d- the sound of ou in out and therefore dT

E e r r- the sound of r in sir and therefore Sr

I i b b- the sound of oy in boy and therefore Bb

X x k k- the sound of oo in tool and therefore TkL

U m n n- the sound of ng in ring and therefore Rin

The remaining set of letters are referred to as small consonants (as distinguished from the block of large consonants which were described earlier). They are called small consonants simply because they use what are lower case letters in traditional English orthography. The set is in the small consonant block.

c s

w z

These are named as:

chee she thee

whee zhe thee

Notice that each of these letters has the appearance of being associated with an h in TO. Like:

ch sh th

wh zh th

The zhe sound is rare in English but is found in words like garage (GaRxz in ANJeL) but I will dispense of the long orthological discussion of its defense.

Each of these small consonants can be followed by any of the vowels. It is more difficult to put a vowel in front of wh.

You will notice that there are two "thee" sounds in TO English. The first th is like in th in theology or thousand and the second th is like th in the or thou.

th is indiscriminate in traditional English orthography. How is "thou" pronounced?

Wilt thou loan me a thou (like in thousand)?

But ANJeL discriminates:

WiLT hd LXN ME A td?

So, now, we have the complete ANJeL alphabet which is read, memorized, recited (and yes sung as a memory device) in rows from left to right.

A a d

E e r

I i b

X x k

U m n

c s t

w z h

B D F

G H J

K L M

N P R

S T V

W Y Z

The full reasons for the selection of the letters involves considerable more detail about how descenders are represented in captioning on the video screen but this suffices to show the names of the letters in the Angel alphabet. In the next lesson we will deal further with the sounds of the letters.

Lesson 2

The Sound of the Angel Letters

We will now examine each of the Angel letters in the order that they are recited and examine the sound associated with each letter. The first examples will show the letter under discussion as a leading letter and the second three examples will show it as a trailing letter. The first row is the TO example, and the second row the Angel example.

A	- Abe,	able,	aid	- bay,	day,	may
	AB,	ABUL,	AD	- BA,	DA,	MA
a	- act,	apple,	approach	-		
	aKT,	aPUL,	aPRXc	-		

There appear to be no words that end in the "a" sound.
They all seem to get converted to U.

d	- ouch,	out,	owl	- bough,	cow,	plough
	dc,	dT,	dL,	- Bd,	Kd,	PLd
E	- each,	eat,	eek	- any,	bee,	collie
	Ec,	ET,	EK	- eNE,	BE,	KxLE
e	- echo,	edit,	etch	- bed,	feminine,	get
	eKX	eDiT,	eTc	- BeD,	FeMiNiN,	GeT

(**e** often follows consonants but there do not appear to be any words which it ends)

r	- early,	earth,	urban	- acre,	copper,	mother
	rLE	rt,	rBan	- Akr,	KxPr,	MUhr
I	- eye,	I,	idol	- buy,	tie,	why
	I,	I,	IDxL	- BI,	TI,	wI
i	- idiot,	ill,	itch	- dish,	bill,	with
	iDiUT,	iL,	iTc	- Dis,	BiL,	Wit

(**i** often follows consonants but there do not appear to be many words which it ends)

b	- oil,	ointment,	oyster	- boy,	joy,	toy
	bL,	bNTMeNT,	bSTr	- Bb,	Jb,	Tb
X	- obey,	oh,	old	- ago,	blow,	yellow
	XBA,	X,	XLD	- aGX,	BLX,	YeLX
x	- odd,	off,	on	- bra,	pa,	saw
	xD,	xF,	xN	- BRx,	Px,	Sx
k	- oodles,	oof,	oops	- blue,	shoe,	two
	kDLZ,	kF,	kPS	- BLk,	Sk,	Tk
U	- udder,	under,	up	- the,	bust,	butter

	UDr,	UNDr,	UP	- hU,	BUST,	BUTr
m	- _____	_____	_____	- book,	foot,	soot
	_____	_____	_____	- BmK,	FmT,	SmT

I have thought of no examples where the **m** begins or ends a word, but I know of no technical reason why it could not.

n	- _____	_____	_____	- bang,	bing,	bong
	_____	_____	_____	- Ban,	Bin,	Bxn

n is something of an anomaly in Angel (and TO) in that it never starts a word or syllable. One can't even say it that way. One of the few words in English that even has it near the start of the word is ingot (inGxT), except for the word English (EnLis) itself.

c	- chair,	check,	church	- beach,	ouch,	rich
	cAR,	ceK,	crc	- BEc,	dc,	Ric
s	- she,	ship,	show	- ash,	fish,	mush
	sE,	siP,	sX	- as,	Fis,	MUs
t	- thank,	theory,	thin	- bath,	oath,	teeth
	tanK,	tEXRE,	tiN	- Bat,	Xt,	TEt
w	- what,	where,	which	- _____,	_____,	_____
	wxT,	weR,	wic	- _____,	_____,	_____

w is something of an anomaly in Angel (and TO) in that it never ends a word or syllable.

z	- genre,	genres,	jabot	- beige,	garage,	rouge
	zxNRU,	zxNRUZ,	zaBX	- BAz,	GaRxz	Rkz
h	- that,	the,	then	- bathe,	lathe,	loath
	haT,	hu,	heN	- BAh,	LAh,	LXh
B	- babe,	ball,	bat	- Abe,	rob,	tube
	BAB,	BxL,	BaT	- AB,	RxB,	TkB
D	- dinner,	doubt,	dumb	- bed,	blood,	dude
	DiNr,	DdT,	DUM	- BeD,	BLUD,	DkD

The **D** on the end of words is something of a strange letter. Sometimes in TO it is sounded as a T. (See discussion under T). However, other times, TO words that end in ed do have a D sound

such as in "We polled the voters or we pulled the wagon". In Angel these become PXL D and PULD).

F	- fine,	fix,	funny	- chef,	chief,	half
	FIN,	FIKS,	FUNE	- seF,	cEF,	HaF
G	- go,	going,	gone	- bag,	dog,	pig
	GX,	GXin,	GxN	- BaG,	DxG,	PiG
H	- heavy,	how,	hump	- _____,	_____,	_____
	HeVE,	Hd,	HUMP	- _____,	_____,	_____

The **H**, **W**, and **Y** do not appear to end any words in Angel. This may be because that in TO they are in those positions what we call silent letters.

J	- jade,	jive,	jump	- badge,	edge,	ridge
	JAD,	JIV,	JUMP	- BaJ,	eJ,	RiJ
K	- cane,	key,	cap	- ache,	cook,	desk
	KAN,	KE,	KaP	- AK,	KmK,	DeSK
L	- lame,	last,	long	- ball,	pal,	tell
	LAM,	LaST,	Lxn	- BxL,	PaL,	TeL
M	- me,	more,	my	- bomb,	come,	name
	ME,	MXR,	MI	- BxM,	KUM,	NAM
N	- know,	never,	no	- on,	one,	sun
	NX,	NeVr,	NX	- xN,	WUN,	SUN
P	- pea,	pod,	please	- nap,	step,	up
	PE,	PxD,	PLEZ	- NaP,	STeP,	UP
R	- read,	read,	red	- bar,	bear,	boar
	RED,	ReD,	ReD	- BxR,	BeR,	BXR
S	- same,	seed,	some	- guess,	weakness,	horse
	SAM,	SED,	SUM	- GeS,	WEKNeS,	HXRS

The **S** is sometimes used as the sound of a TO plural but most often TO plurals actually end in a Z sound (see **Z**). Sh combinations, such as shout (sdT), of course have their own representation in ANJeL (see **s**).

T	- tag,	top,	two	- at,	cot,	worked
----------	--------	------	-----	-------	------	--------

TaG,

TxP,

Tk

- aT,

KxT,

WrKT

Curiously, the ed sound at the end of words in TO often has the T sound in Angel. In old English the e in worked would have been sounded as work-ed. But not now.

V	- van,	vicious,	victory	- cave,	grieve,	love
	VaN,	VisUS,	ViKTXRE	- KAV,	GREV,	LUV
W	- wag,	we,	went	- _____,	_____,	_____
	WaG,	WE,	WeNT	- _____,	_____,	_____
Y	- yam,	year,	yes	- _____,	_____,	_____
	YaM,	YER,	YeS	- _____,	_____,	_____
Z	- zebra,	zip,	zoo	- buzz,	fez,	fizz
	ZEBRU,	ZiP,	Zk	- BUZ,	FeZ,	FiZ

Z gets extensive other use in Angel as the plural at the end of TO words - WrDZ.

In the next lesson we will get into actual practice in reading Angel words.

Lesson 3

Reading Angel Words

It has been said that anyone who can read TO can learn to read any English phonetic system in about two hours. Angel is a little more difficult than some phonetic systems that are specifically designed for ease of reading by TO readers. It is less difficult than some others like Deseret that are specifically designed as a code to discourage those who do not know the code. Angel is specifically designed to make the learning of English easy for those who do not know English at all. Still, the rule of thumb for most phonetic systems, about two hours, to become a fairly proficient reader in Angel, holds. Speed reading requires sight recognition of thousands of words, and combinations of words, and long periods of practice.

Because 40% of most English text is made up of about 50 words, a very big help in learning to read Angel is to be able to sight recognize 35 of those words, of that list of 50, that are less apparent in their translation to the TO reader. Here are those 35 words in the order of their approximate frequency of use.

1. the - hU
2. of - UV

3. to - Tk
4. that - haT
5. this - tiS
6. was - WxZ
7. as - aZ
8. with - Wit
9. his - HiZ
10. by - BI
11. are - xr
12. they - hA
13. one - WUN
14. were - Wr
15. all - xL
16. her - Hr
17. she - sE
18. would - WmD
19. there - hr
20. has - HaZ
21. been - BiN
22. their - hr
23. when - weN
24. what - wxT
25. which - wic
26. where - weR
27. why - wl
28. who - Hk
29. you - Yk
30. them - heM
31. about - aBdT
32. than - haN
33. how - Hd
34. now - Nd
35. going - GXin

Simply memorizing the above list and being able to easily recognize the above words will greatly facilitate the reading of Angel. However, it is probably best to go through the rest of this lesson for a better understanding of how come those words are translated into English in the manner in which they are. After finishing the lesson, it is well to then come back here and learn to sight recognize the above list. The fastest way, at that time, would be to write them out on a set of 35 flip cards and to repeatedly go through the cards until you can do so very quickly.

Now, let us do a little drill of the ANJeL large vowels.

Cover up the TO line and try to recognize the word in ANJeL before reading the TO line.

First **A**

BA, DA, SA, RA, MA, GA, HA, JA, LA, PA, WA

bay, day, say, ray, may, gay, hay, jay, lay, pay, way

Now for **E**

BE, FE, SE, HE, ME, GE, TE, LE, PE, WE

bee, fee, see, me, gee, tea, lea, pea, we

And **I**

BI, DI, SI, RI, MI, GI, HI, JIV, LI, PI

buy, die, sigh, rye, my, guy, high, jive, lie, pie

The TO is getting stranger and stranger, and more unpredictable isn't it? But still you can read the Angel just fine.

On to **X**

BX, DX, SX, RX, MX, GX, HX, JX, LX, PX, WX

bow, dough, sew, row, mow, go, hoe, joe, low, poe, woe

TO gets stranger and stranger. NX? BUT xN WE GX!

U

UP, UNDr, SUN, BUT, KUT

up, under, sun, but, cut

And now onward for a little practice with the first column of small vowels.

a

aD, DaD, FaT, SaT, KaT, RaT, MaT, SaT

add, dad, fat, sat, cat, rat, mat, sat

Vowels at the beginning, vowels in the middle, vowels at the end. You can handle them all. Much harder to teach to someone who does not speak English. If sometimes a word like aD surprises you because you do not know whether in TO it is going to be ad or add, that is because of the nature of TO. You can tell by the context that it is used in. In TO you do not know by itself whether read is RED or ReD. In Angel you likewise have to know the context, to know whether NO is no or know, but at least you will be able to read it correctly.

e

eKO, eDiBUL, MeDiKUL, FeD, HeD, ReD, DeD

echo, edible, medical, fed, head, red, dead

i

iD, iF, iL, iN, iT, iZ, DiP, DiM, TiP

id, if, ill, in, it, is, dip, dim, tip

x

DxG, HxG, FxG, DxN, LxN, FxN, KxT, SxD, xF

dog, hog, fog, dawn, lawn, fawn, cot, sod, off

m

KmKEZ, FmT, FmL, GmD, HmK, LmK, SmT

cookies, foot, full, good, hook, look, soot

Now, that you know the second column of small vowels, we will look at the last column of vowels, which to a TO reader are some of the strangest looking letters in words. First, there is:

d

dc, d, dR, TdL, Hd, Nd, BRdN, Kd

ouch, ow, hour, towel, how, now, brown, cow

You probably can't get any of the words in the vowels in the last column without looking at the prompt. But once you know the secret of each of the five letters you will be able to decipher future words. This is the same problem any new reader in any language has. It is almost like learning how to read again, but you already know the principles of reading. That is, the fact of the relationship of sounds to words, and the figuring out about words because of the context. So, you will catch on very quickly, while for someone who cannot read at all, or who cannot speak the language, it will take a little longer.

r aTrNE, aVreJ, BeTr, SrTeN, crc, LATr, NUMBr, Uhr, Wr, WrKr

attorney, average, better, certain, church, later, number, other, were, worker WrKr 33.....

b

bL, bNK, Bb, Bb, Tb, TbL, BbL, SbL

oil, oink, bouy, boy, toy, toil, boil, soil

Some people would pronounce bouy as BkE, but it is the nature of ANJeL that we select some one pronunciation, and then that becomes the ANJeL pronunciation. This applies particularly to words that are foreign to English and come into ANJeL. Often ANJeL does not have the accurate French sound, the trilled Spanish R, or some tonal expression of Chinese. The list goes on and on, but we simply Angelize the word. This also applies to some marginal U, ai, and aw sounds in English, and particularly to many schwa sounds. They simply become Angelized. The word angel itself is an example in its becoming ANJeL.

k

kZ, kPS, FkL, TkL, Tk, Tk, Tk, BLk, Yk

ooze, oops, fool, tool, to, two, too, blew, you

WE HaV Nd LmKT aT xL UV ANJeL VdLZ. NeKST WE WiL LmK aT hU SMxL KxNSXNaNTS.

n

Rin, Rxn, RUn, Ran, Ban, Sin

ring, wrong, rung, rang, bang, sing

n needs a preceeding vowel in order to be pronounced. You can't pronounce it with a vowel after it.

Yk KaN Nd RED MXST WrDZ aND SeNTeNSeZ RiTeN iN ANJeL SX I WiL BeGiN RiTin iN ANJeL.

c

cAR, cAN, cEP, cIM, ciN, cd, cb, ck

chair, chain, cheep, chime, chin, chow, choy, chew

s

sE, sk, siP, sxT, siN, sUN, skT

she, shoe, ship, shot, shine, shun, shoot

t

tExLXJE, tiN, tiSuL, tinK

theology, thin, thistle, think

w

weR, weN, wI, wxT

where, when, why, what

z

azkR, GaRxz, KXRsz, BAz, BeZk, DeSizUN, iNVAsUN, PLezr

azure, garage, corsage, beige, bijou, decision, invasion, pleasure

z iZ hU LEST YkZD UV eNE LeTr iN ANJeL.

[Status and Completion Requirements of the ACCESS System](#)

Description of the ACCESS System

To obtain experience in the methodology of developing an IAL, the World Language Process has put extensive effort into the the development of the ACCESS System (Auxiliary Closed Captioned English with Simplified Spelling) and its ANJeL Tun as described below. However, it should be emphasized that the UNKOMMON Foundation and the World Language Process is in *NO way* 'solely committed' to the ANJeL Tun and that they will willingly, happily and cheerfully support instead any IAL that humanity may select. In that regards it **MUST BE EMPHASIZED** that *wherever* in the outstanding projects for the ACCESS System or the World Language Process that we make mention of an English related project, that will *then instead* **AUTOMATICALLY** become an IAL project, of whatever the IAL language may be.

Theoretical Basis of the ANJeL Tun

The ANJeL Tun is the most distinguishing feature of the ACCESS System. ANJeL Tun is sufficiently different to be classified as a separate language from English and while its present purpose is as an Intermediate Teaching Language it may properly be called a pidgin. The name Angel Tongue comes from the story reported in the Webster's International Dictionary that when St. Gregory first heard it being spoken he said that this is surely the lash (the tongue has often been referred to as a whip or lash) of the Angles or Anglash, which evolved into the word English.

ANJeL Tun is based upon three theoretical principles, phonetization, elementalization, and regularization. These technical names are the designation of the author and came from the analysis and study of the theories of a number of experts.

Phonetization

Phonetization is the Simplified Spelling portion of the ACCESS System. There have been many attempts to develop an acceptable phonetical orthography for English. Historically, English was phonetic but because of the use of dictionaries as the authority for spelling the spelling did not change as the pronunciation did. Two of the best known present phonetic systems for English are WES (World English Spelling) and ITA (Intermediate Teaching Alphabet). In its development phase the ACCESS system has used the character set encoded in new television sets under the law of the U.S. Congress. This has the advantage of permitting materials to be developed anywhere there is type generating equipment that uses the standard English alphabet.

In future development, the ACCESS system would like to become more universal in its access. There may be difficulties to be overcome with the PAL and SECAM television systems used in other parts of the world. In reality, an even more foresighted solution may be necessary. What may actually be needed is an entirely new script because the Roman script is actually limited to 26 characters and it may be that 40 plus characters will be necessary to represent what will be finally accepted as a universal auxiliary language. Developments such as this, in the World Language Process, will probably have to wait upon social developments such as the formation of a world authorized committee with the authority to make such decisions.

The ANJeL Tun FXNeTiK builds upon the research of Dr. Rondthaler and Dr. Lias and a host of scholars that preceded them. Technically, it is possibly more correct to say that the ANJeL Tun is phonemic rather than phonetic. Rather than trying to represent existing speech it phonemically designates the sounds to be associated with its character set.

Elementalization

Ogden and Richards discovered in their process of writing *The Meaning of Meaning* that there is much redundancy in English both as to words and syntax. Moreover, there are certain core words that are necessary to every English speaker but there are many others that are simply subject oriented. This concept was further developed by Noam Chomsky and found its implementation in what are called Basil texts for teaching English. Extensive use of computer generated word frequency lists have been made to select the actual words used.

Elementary or basic ANJeL Tun uses the Chomsky concept of the distinction between 'form' and 'function' words (the latter including what some people call 'glue' words) to determine those words which should be taught and learned first. The English language has hundreds of thousands of form words which designate both concrete (words like boat, house, hammer, nail) and abstract concepts (like boating, housing, hammering, nailing and more particularly love, truth, beauty and other 'spiritual' ideas).

English, however, has at most only a few hundred 'function' words. These are the words that glue and relate the form words together. They are words like (of, to, if, and, for) and include relational words like (above, below, next, after). The function words are necessary to any form or discussion or writing that arises above pointing and naming. If one were to examine two entirely different essays - one dealing with the activity in a classroom and the other on a farm they would find entirely different form words. In the one essay they would find words like teacher, desks, chairs, blackboards, students, books and so forth and in the other they would find words like barn, cows, chickens, farmer, fields, tractors and so forth. It is easy to distinguish here which would probably be in which essay. However, both essays could share equally well the function words.

The most Elementary or most basic level of ANJeL Tun therefore seeks to teach only the function words. When one knows all the function words (just the few hundred involved) then one can say that they know the language. Of course they could not talk about anything, because they would not have any form words about 'things'. But still, we could not say that they did not know the language. If a Ph.D. in literature or language were to have opened before them a modern computer, and if they knew nothing about computers they could only say that there are colored wires and objects and things of this shape or that but they would not be able to talk intelligibly about the computer any more than they could stand at the elbow of a brain surgeon during an operation and describe the parts of the brain with which the surgeon was dealing. This is not to say, the Ph.D. does not understand the language, they just do not know the words or concepts for those subjects.

Once one has learned the several hundred function words of the ANJeL Tun - then they know the language. But of course they still cannot talk about anything since they do not have the form words. But it is now simple to teach a person the form words for say their employment. A maid might learn the form words for a hotel room (towels, sheets, closet, mattress, bed, and another hundred words) and be able to communicate quite well about her work. Likewise a cook in the kitchen with a different set of words, or any trade such as carpenter, plumber, bricklayer, or electrician. There may be a culturally shared experience involving a set of form words that are understood by most 12 year olds of average brightness. To learn these words - would be a second level of accomplishment. Beyond that, the vocabulary for college admission or some particular profession may be still higher standards.

The size of one's vocabulary is reflective of their education and intellect. Intellectual growth is measured in the concepts and terms that one comprehends. Likewise spiritual growth may well be measured by the abstract terms, reflected in words, that one comprehends in that sphere, and for some this would be the mark of success in life. The concept here is that there can be ranks of elemental terms for any trade or profession - and indeed perhaps for general levels within various cultures themselves. One would build a vocabulary suited to their purpose upon a tree arrangement of the many available elemental lists.

Regularization

English is a language of exceptions but the ANJeL Tun reduces the language as much as possible to a logical system of rules. Some of these concepts, but not nearly so extensively, were applied by Ogden

and Richards. In regards to using the ANJeL Tun as an Intermediate Teaching Method (ITM) the idea is that it is easier to first understand and learn a system of rules and then later to comprehend the exceptions. This conformity to rules is what makes the ANJeL Tun a pidgin.

Description of the System Development

The ACCESS (Auxiliary Closed Captioned English with Simplified Spelling) system started from the foundation of research on the BASIC English system of C.K. Ogden of London England and Dr. I.A. Richards of Harvard University. The latter received a grant from the Carnegie Foundation to produce movies at Walt Disney Studio to teach the BASIC English system but the cell animation technique of the time proved prohibitively expensive. The BASIC English system initially received considerable personal support from Winston Churchill and Franklin Roosevelt but they both became preoccupied with the concerns of World War II and consequently the BASIC English movement lost its momentum with the death of Ogden.

George Bernard Shaw offered to leave Ogden his fortune if he would combine BASIC English with some form of phonetic spelling but Ogden was adamant in his refusal because of the historic opposition to such phonetic spelling. Ogden's system was used in twenty-two countries and proved extremely beneficial. The claim for the system was that it could teach a person to speak English in just thirty days. The Ogden/Richards system of BASIC English was based on a list of 850 words plus that they felt to be universally accepted. It also had some rules for simplified syntax. The ACCESS System uses the function versus form words insights of Noam Chomsky to further reduce this basic list.

The ACCESS system also adds further rules of syntax simplification, to such a degree that there are no exceptions, the language becomes a pidgin for the purpose of using it as an Intermediate Teaching Media (ITM) on the path to learning traditional English. The teaching language is combined with FXNeTiK spelling so there are no extra or silent letters and the learner can see on the video screen exactly what it is that they are supposed to be hearing.

At least *eleven* major technological advances have occurred in the fifty years since Ogden's and Richards' time that make the development, use and distribution of such a system as this much more feasible than it was in their time. Further specific beneficial developments are anticipated in the near future.

1. There has been the widespread implementation of television into people's homes.
2. There has been the development of home VCRs.
3. There has been the development of captioning technology.

4. There has been the development of large main frame computers for analysing word lists, which were used by the early spelling researchers.
5. There has been the development of the microprocessor and desk"TOP" computers for assisting individual communication and word processing.
6. There has been the key development of non-linear on-line video editing labs (NOVEL) for inexpensively developing and modifying the teaching programs.
7. There have been developed cable distribution systems to provide sufficient channels and efficient distribution of the material.
8. There is being implemented a world wide satellite system with sufficient channels for the efficient distribution of the material world wide.
9. Project Gutenberg has made available hundreds of volumes of classical literature in machine readable form.
10. The Internet has become available for world wide control of distribution of the project.

Most importantly, an *eleventh* reason makes the distribution of the ACCESS system much more feasible today, and that is the defacto acceptance of English as the world wide auxiliary language of business, air traffic control, sea communication, science, and tourism, and perhaps we could also say the world wide web. Over ninety-five percent of all scientific literature is originally written in or later translated into English. There are more movies, videos and other entertainment media originally published in English than in all other languages put together. English has become the Second Language of choice world wide.

While English has become, in the eyes of some, by default, the universal auxiliary language and with the spread of the Internet, and Hollywood videos and movies by satellite, is becoming more entrenched daily, the ACCESS system being used by the World Language Process gives English a number of additional advantages such as permitting traditional English to be machine translated into it untouched by human hands, while the spoken word remains understandable to any traditional English speaker.

While the ACCESS system requires high technology for its development, it has a low technology inexpensive delivery system, working out to a capital cost of less than \$20 per student as compared to the thousands of dollars it often costs to learn a language in North America. Moreover, the other attraction is its great efficiency, requiring only thirty days

to teach a person to speak English.

Teaching Principles

The ACCESS presentation method of the language is also based upon certain specific pedagogical principles using the formula of listen, look, say, write and do which are tied to a particular theory regarding certain physiological processes of the brain as to learning a language.

The first basic teaching principle behind the ACCESS system is that it is easier for an Adult learner of a new language to see the language (captioning) than it is for them to hear it. With English the problem of using captioning to learn the language has been that since the orthography was not phonetic the learner still could not see what it was they were supposed to have heard.

The second basic teaching principle behind the ACCESS system is that a new English speaker needs only a few hundred words in order to be understood by someone who speaks English. The reciprocal, however, is not true because most native English speakers use a considerably larger vocabulary. Consequently, when the learner knows only a few hundred words they must use a sort of twenty questions game type of communication in order to comprehend what is being said to them.

The third basic teaching principle behind the ACCESS system is that while the learner initially learns a limited rationalized and logical syntactical system that sounds odd to the native speaker it still gives the learner very rapid access to communication and the incentive and confidence to go further.

The theory of the actual pedagogical method, such as "total physical response" will be explained in the teacher correspondence training course and the step by step procedures for applying the method will be outlined in the teacher guide that accompanies each lesson.

There is associated with the ACCESS system a bridge orthography that permits the learner to learn traditional orthography, if they so desire. The main thrust, however, because it is the most difficult learning problem, is to teach the individual to hear the language. This is done through the incentive of entertainment video which is phonetically captioned so that they can see what they are hearing and therefore painlessly practise their hearing skills while watching entertainment video.

However strange the ANJeL Tun may appear to the traditional English speaker and however unlikely it may seem to them that it could ever become a universal language the real issue here is its effectiveness as an ITM for teaching ESL. If the ANJeL Tun is widely accepted then a future committee of scholars may find within it a prototype upon which to build even more rigorously the reforms necessary to make it a universal auxiliary language.

It takes the average literate English speaking person only about two days to become proficient in learning to read and write the ANJeL Tun.

[Return to top](#)

Status and Completion Requirements of the ACCESS System

- a. The completion of what appears now to be about 18 hours of edited video tape, six hours of which have been edited and for which all the remaining unedited material has already been shot on 30 hours of Betacam SP.
- b. The writing of a student workbook to go along with each of the estimated 18 hour long video tapes, of which four workbooks have been written.
- c. 4,800 illustrations (for which subjects have already been selected) need to be drawn to go into the workbooks and dictionary.
- d. The workbook pages need to be made up, typeset and laid out for printing.
- e. There needs to be a teacher's manual written to accompany each of the hour long videos.
- f. All the above material needs to be packaged.
- g. The system is to be tested among the Spanish speaking population in the prison system of Florida under an arrangement that has been made with the State of Florida.

Additional projects include:

- h. The publishing of a 8,000 definition simplified phonetic and pictorial dictionary.
- i. The machine translation to simplified phonetic English of all the material on the Project Gutenberg files.
- j. The making available of automatic translation on the Internet of all English files to the simplified phonetic English.
- k. The making of a captioned simplified phonetic English animation series.
- l. The printing of comic books based on the same series.
- m. The publishing of a series of large type simplified phonetic English books of literature.
- n. The publishing of a comprehensive series of a simplified phonetic English books that are an introduction to the sciences.

Future but more immediate to the World Language Process will be:

- q. The training and sending out of the first 1,000 teachers.
- r. The establishing of Internet procedures to coordinate the teachers' activities.
- s. The establishing of schools and classes throughout the world.

And as real far out future dreams:

- o. The publishing of an international newspaper or magazine in simplified phonetic English
- p. A world wide television network captioned in the simplified phonetic English.

And longer term to the World Language Process:

- t. The establishing of satellite World Language Institutes throughout the world for the training of teachers.
- u. The establishment of the institutions for further research and development and the establishing and maintaining of standards.

Compendium of Ideas of the World Language Process Colloquium for the Regularization of English Syntax as of July 15, 1999 Latest Changes in Red

Introduction:

The way this compendium works is that forum members submit ideas and discussion to the moderator.

- On the first following update the ideas and comments are added in RED.
- On the second subsequent update, the material is edited, and changed to BLUE.
- That material being considered for deletion will be marked in GREEN.
- On the third subsequent update the material is changed to BLACK.

To join the Colloquium so as to receive the inter-discussion of other members and to submit suggestions and comments for addition to this Compendium, email:

language@webpal.org

Because I am not as conversant, as the rest of you, with the technical terms for describing English grammar I hope that everyone will provide a simple example of what they are saying. Also, anyone who is willing to take over the **editing** of the Compendium, will be most welcomed.

The stage that we are at, at the moment, is to try to list all the possible syntactical reforms that we can suggest for English.

- Those suggestions, that we are considering to try to implement in the ITL (Intermediate Teaching Language) Angel are preceded by the word (ANJeL) in red.
- Those suggestions that have strong recommendation or consensus for inclusion in a reformed English syntax are preceded by the word (REFORM) in blue.
- The remaining ideas are simply present to indicate that they have been presented and have been or are being considered.

Three subjects have been added to this compendium:

- The ranking of the order in which syntactical forms should be taught. (Category 17)

- Discussion regarding the selection of words to be taught in an ITL. (Category 18)
- A list of Links that are beneficial to developing and understanding our cause. Contributions to this category will be appreciated. (Category # to be designated)

Category 1. Plurals.

Category 1a. Definition of the Problem with Plurals.

The use of plurals provides additional information, ie. that there is more than one. A few languages are much more specific in that they use specific nouns and verbs to indicate specific numbers up to four. However, there are numbers of languages that do not indicate plurality at all. In this, English is inconsistent, and therein lies the

problem, since the goal of regularization is to make English consistent, therefore regular.

In English we oftentimes add an "s" to a word to make it plural. Therefore cat and cats. However, very often, the "s" is given a "z" sound. Thus, dog becomes dogs, but in a phonetic system this would be written dogz. This means that plurals would sometimes be presented with an "s" and sometimes with a "z". Nor is even this the extent of the problem because the plural is sometimes represented by es, such as in beach and beaches, or more correctly, phonetically, beach and beachez.

Nor does the above conclude the problem. For a number of words, there is a special word for the plural form. As an example, for man and mouse, we have men and mice. On the other hand there are words that have no plural. Such as sheep, elk, moose, and others. While these examples involve animals, there is no rule limiting it to animals, and no consistency about applying it to animals.

To summarize the five examples:

- cat - cats
- dog - dogz
- beach - beachez
- mouse - mice
- sheep - sheep

Perhaps we can answer this question by considering some English nouns that are invariant whether singular or plural: "deer, moose, elk, sheep, grouse, woodcock, salmon, cod". It is notable that these animals are all normally regarded as game or food.

[] Consistent with lack of a plural in othr nouns tht ar comnly referd to in terms of quantity rathr than number, e.g. grain, butter, wool, tar -- their plurals usually refer to 'varieties of...'

[Antony] Exactly so: "a bundle of wool" vs "a bundle of wools"; but if we abolish the plural affix we obviously cannot say "a bundle of varieties of wool" - and "a bundle of variety of wool" is not quite the same thing, is it?

[Doug]I've scant knowledge of (other) Eastern languages -- I suspect the normal practice is to let context indicate number / plurality, as in English "six deer"....

[Antony] You've probably more knowledge than I have. The most I've picked up is that many languages - including Chinese, Japanese and pidgins / creoles - do not normally employ plurals.

I can see how people cope quite well without a noun plural in traditional cultures: "I have five cow" - the meaning is normally clear enough: a cow is usually just a cow.

But in modern society, with its diversification, standardisation and mass production, the statement is more likely to require elaboration. I might well have a mixture of breeds.

Well, how about "I have five computer"? This statement definitely need qualification. Are the computers the same, or different?

I suggest we regularize the plural on the basis of current usage. For example, if a storeman orders "ten oil" we know he means "ten (identical units of) oil", but we understand an aromatherapist with "ten oils" to have "ten (different) oils".

The numeral is a quantifier; the plural is a diversifier. I think it might be an advance if we could say "I have five cow" or "I have five cows" - the difference between the statements being understood.

[Doug, May 3] The question arises then: What is a regular plural? The suffix '-(i)z' has points favoring it abuv '-(e)s':

1. Iz comnly so writn in advertizing matr, e.g. 'Beanz meanz Heinz', my neihrhood handiman servis 'Fixzit', as in other wordz with 's' as writn standard, e.g. a lubricant 'Ezy-Glide'.

2. Reflects actual sound after all wordz except folowing th soundz ov € , €h (unvoist, tho some speakerz turn it to 'dh' before sufixt -s, analogous to change ov 'f' to 'v' sound in pluralz ov calf, hoof, leaf &s.), €k , €p .

2. Cd b replaced by 's' where so sounded, just as we replace the word 'a' by 'an' where adjoining sounds require it; but even if -(i)z were made constant fr the plural sufix morfeme it wd automaticaly b red az 's' az it iz in 'Ritz, Fritz'.

3. It wil hasten th redundancy and so the removal of a second 's' in wurfdz tht uze it only t dstinguish them from wurdz with 's' sufix sounded 'z' e.g. 'needles(s).

It's noteworthy tht most French pluralz sound exzactly th same as their singulars, perhaps a major reason fr the wider use ov th definit articl (which indicates plurality) in French

[Robert] Oriental (and otder) languages kan individualise, e.g. "horse, a horse; man, a man". "A group of horse, a group of dog" etc. is not so strange.

Now let us contrast some concrete nouns which take either the singular or the plural form in the plural number: "lion\lions, tiger\tigers, elephant\elephants, partridge\partridges, horse\horses, grass\grasses, ivy\ivies, mistletoe\mistletoes". In each case the first is game, cannon-fodder, food or a parasite, and the second is a collection of individuals, whether in appearance, temperament or species.

[] -- i.e. they are countable (how meny) rather than quantifiable (how much).

It occurs to me that Eastern culture derogates plurals for the same reason it tends to believe that "the protruding nail should be hammered down". Western culture may tend towards excessive anthropomorphism and sentimentality but it would nevertheless probably resist referring to a group of dogs, cats or horses as "dog", "cat" or "horse".

[] Judging only by Melanesian Pidgin English (Pisin) -- I've scant knowledge of (other) eastern languages -- I suspect the normal practice is to let context indicate number/ plurality, as in English "six deer". There are Pisin plural pronouns but (as with English 'you') these are not all obligatory if context suffices. The occasionally

needed plural particle corresponds to the plural third person pronoun (ol). English resorts to an equivalent at times with 'you all' (dialectal 'y'all'), 'you lot/ mob' etc. I favorf 'lot' in general. Some ('subcultural'0 Australians use 'youse' as a plural.

Category 1b. Suggestions for Regularization of Plurals.

Category 1b1. Consistently use an "s".

Then sheep becomes sheeps.

However in a phonemic system it is difficult, if not impossible, to pronounce fish as fishs. We seem to wish to say fishez.

Category 1b2. Consistently use a "z".

Then sheep becomes sheepz.

However, this too seems strained, in a phonemic system, when we try to pronounce cats as catz.

Category 1b3. Create a new word for each plural (possibly) from some other language.

This would greatly expand the language and make it more complicated for anyone to learn. Every new noun would have to be created in two forms, sigular and plural.

Category 1b4. Consistently use an additional particle "ZEE".

1. cat - catZEE
2. dog - dogZEE
3. beach - beachZEE
4. mouse - mouseZEE
5. sheep - sheepZEE

This appears to be a very workable solution. It means that the ITL learner has to learn only one additional rule. The format may be slightly grating (it will certainly be distinctive) to Traditional English listeners.

>[Robert] ...better (I think) would be "-ze": "cat-ze, dog-ze, beach-ze, >mouse-ze, sheep-ze". Native speakers could pronounce "catz, dogz, beach'z, >mouse'z, sheeps".

[] There ar 3 spoken regular pluralz in English: s, 'z, z (using ' for schwa):

[] 1. -s only suffixt to final voiceless consonant sound of ɸ (tho singular -fs is often replaced by 'irregular' plural -vz az in calves, hooves),

ɸk, ɸp, ɸt or

ɸh (tho -ths is sometimes replaced by 'irregular' -dhz sound e.g. in oaths, sheaths, and some 'substandard' speakers revert to -'z e.g. for paths)

[] 2. -'z suffixt to other voiceless sibilant (s,sh e.g. asses,ashes) and z, zh sounds (e.g. phases, edges).

[] 3. -z elsewhere (sofas, rays, ploughs, ebbs, abodes, ears, crows &s.)

[] This suggests that 'z or ez wd be mor lojicl than ze. If we recomend abreviatd formz fr comn wurdz (to unstrest = t , do = d, be = b , for = fr) this particle/sufix cd bcum just z t suit mor peopl. It wd create new homofonez, not just th posesiv sufix mentiond blow (Ted's hat) bt unstrest as/ az (good z gold) and voiced 's v cloqial speech (Ted's here -- Tedz here or Ted z here)).

Category 1b5. Consistently use "-en" or "-(schwa symbol)n".

Possibly worth discussing - a reversion to the original Teutonic form still found in German and in "oxen, men, child(r)en". That would allow the genitive/possessive to have the monopoly on "-z".

[] I prefer use ov -n as comn in coloqial English fr 'individual' e.g. young'n, good'n. It cn regularize - ((er)m)an, -ian, -eon, -ent, -(e)ant, -ar/er/or/ress/rix, -one fr 'agent' suffixz ov e.g. fisher(man), musician, surgeon, correspondent, sergeant, appellant, pedlar, cobbler, actor, actress, aviatrix, everyone.

Category 1c. Suggestion for the Elimination of Plurals.

Plurals might also be eliminated, and since one consideration is that of simplification of the syntax in a way that permits one in an ITL to more easily learn the language this could be the easiest solution.

It would be one less rule for the learner to learn and it might be less grating to hear, for those used to Traditional English. As an example:

- a. There is a sheep in the road.
- b. There are sheep in the road.
- c. Sheep in road.
- d. Look out for the sheep.
- e. Look out for sheep.
- f. Look out for car.

[Robert] Tde Chinese du not regularli indikate plural: haw du tdei deal with tdi problem illustrated "Look out for cars"? (Tdere is much tu bi learned from China de grammar.)

In cases a and b there is the additional complication of making the verb agree with the singularity or plurality of the noun. If a passenger were issuing a warning to a driver, case c would be equally effective.

In cases d and e, does it really make any difference whether there is more than one sheep or not? As in case f wouldn't make any difference to warn a child about to cross the street to look out for one or more than one car.

In cases where number IS important one could say:

- "Look out for both car."
- "Look out for two car."
- "Look out for many car."

"Look out for some car."

"Look out for all car."

What interplay there might be between an ITL and an IAL in this regards, is a different matter. If an ITL were widely used, it might effect current practice in the IAL. On the other hand, if the IAL maintains a strong historical relationship to Traditional English, then all the rules and exceptions listed at the outset of this category, would remain, and would remain to be assimilated by anyone making the transition to Traditional English.

Category 2. Articles.

Category 2a. Definition of the Problem with Articles.

Articles (a, an, the, this, that, etc) are part of the glue words of the English language. There are definite and indefinite articles. There is little distinction between

"Bring me any dog" and "Bring me a dog"

and these may even be understood as being the same as "Bring me one dog",

but "Bring me the dog" means a specific dog.

"This dog" can also be distinguished from "That dog",

as well as can "These" from "Those", (a subject of plurals)

so the article provides a very useful purpose.

Category 2b. Regularization of Articles

One of the inconsistencies of articles in English is that between the use of "a" and "an". "A dog" and "an apple" still mean one of each. The rule simply being to precede those words which begin with a vowel by the use of "an" rather than "a" so that two vowels will not be adjacent. This may have some phonemic merit but it does make one more rule for the new learner, and this may be unnecessary at the outset.

[Robert] "Since artikles are kynds of adjektives riplace "a/an" bi (i) and "the" bi (thi) (sii proposal in Categori 8b)".

[] Indef. art. in most languages is (for French, German &s.) an extant or (for English) eroded form of the numeral one . This alreedy gainz a sufixt -i sound in 'any' & if chanjed to i wd lose its conexion w th articl (no weeping fr that, since most users probaly learn it as a separat entity), bt I se som valu in keeping a link btween th abuv -n, -'n, -one suffixz wth th articl pronounst normally one ov 4 way: like a(n) in sofa, ape, organ or began. Mor t th point, I think most v us 'feel' an identity of th articl with the alternativ expression 'one' so ofn rzortd to by newcommerz t our languaj. "may I by wun apl?" &such.

[] 'The' iz a diferent proposition. It haz 2 standard pronunciationz, th/ thee, larjli (like thozv v a(n)) dependent on hwethr th next sound aftr it iz a vowel. I think th lojicl (and in th long term, i.e. hwen current/ sE spelingz no longr inhibit rform, the eziest) option iz t hav 2 spelingz (th('), thi/the) az in sE fr a(n) .

Category 2c. Elimination of Articles

Articles are eliminated in many Pidgins as well as in a number of languages like Russian and Latin. "Bring me dog", would possibly be more meaningful in context of the moment, than in some literary sense. Indeed, since Pidgins are generally spoken, rather than written, this may be a consideration for the formation of an ITL.

Since articles are not present in many languages, it is perhaps best to leave them out of the ITL as it involves teaching an unfamiliar concept. Indeed this may be a principle for Pidginizing a number of matters of syntax in the ITL.

[Robert] "Major languages such as Chinese, Hindi, Japanese, Malay and Russian do not employ articles (a fact which might apply to the majority of languages)."

[Antony] Against this might be set the possibility that the predominance of English as a world language is connected with the fact that it employs articles. There is no question but that English-speakers love to use articles. Frequency Analysis of top words in English (Johansson & Hofland 1989): "the 68315, of 35716, and 27856, to 26760, a 22744, in 21108, that 11188, is 10978, etc. etc." - "the" is by far the most popular word in English, and "a" is fifth on the list.

[] The label 'definite' applied to this article 'indicates' that it is an 'indicative'/ definitiv adjectiv like that/ this, ov wich it is historikli n eroded form, az in most European languajz and I think Arabic. It's populr bcauz it indicates tht th next wurd/ fraze is nounal, &/or th preseding wurd/ fraze is not part v it; tht th foloing noun is identifiable az distinct from such entitiz in jenral and iz a unique individual/ item, distinct from th same expression with indef. art. -- a mor clearly indicativ adjectiv function, beyond a mere partitioning or 'particle article'..

[Robert] The correct use of articles is difficult for non-native speakers of English.

[Antony] I suggest that "1" and the indefinite article be merged. "A, two, three"?

Click here to return to the [Table of Contents](#)

Category 4. Possessives

Category 4a. Definition of the Problem of Possessives.

Possession in Traditional English is indicated in writing by use of an apostrophe. Audibly, however, the word sounds just like a plural. For example, when we speak of "cars" (plural) or a "car's window" in both instances, "cars" sounds the same. The distinction is based upon context.

Category 4b. Alternate Proposals for Possessive

In some languages and pidgins, possession is shown simply by juxtaposition of words. Therefore "John's book" is simply "John Book".

Another alternate proposal is to use some sort of verbal marker. For example, "Book John de" where de sort of stands for "of" and the meaning would be "The book of John". The "de" would, however, always follow the possessor. This technique of the following modifier would parallel its use in some other examples.

[Robert] "Empti" word "de" is taken from Chinese, where tdi word order bi "John de book"; ratder tdan "John book de".

[] This z a postposition az distinct from a preposition. Som prepositions cn b postpositions in sE e.g. 'Clues to the contrary NOTWITHSTANDING, this z hwat I bcame aware OF'.

Category 4c. Elimination of the Apostrophe

Because the apostrophe is not pronounced it does not belong in a phonemic system. One could continue to use the "s" sound for possession, without conflict with plurals, if one were to use some other marker for plurals such as the ZEE sound which has been mentioned above. However, there would still remain an inconsistency in the use of s or z such as in "The cat's box" and "In the dog'z box".

[me] If "-en" were used for plurals, and "-z" exclusively for the genitive/possessive, then the apostrophe might be dropped. As a long-term aim, words ending "-en" in the singular and "-s" or "-z" in the nominative might be replaced by alternatives from other languages. This would not be unprecedented: for instance, tens if not hundreds of verbs denoting repetitive action "handle, swivel, ladle, feel, amble, mangle etc." end in /l/.

[] I'm al fr adopting (hav recmended in IngLingo) -l but rathr as an abbreviation of TOOL (/ INSTRUMENT) than as a sign of repetitiveness, e.g. handl pedal swivel swizzle toggle ladle label bottle kettle shovel mangle gavel level chisel medal model castle needle throttle cradle saddle/settle table trestle wistle axle &s. (possibly fable, riddle?). Admittedly it also functions as an indicator of repetitiveness but perhaps less frequently e.g. amble, waddle, wiggle, waggle, wriggle, battle, dabble, gabble, gobble, double/treble/triple &s., dribble, dapple, quibble, rubble, tipple, (possibly addle grovel cuddle fuddle huddle muddle settle?); fiddle, rattle and grapple seem to have both senses or either; riddle, runnel, fabl, offal, maple, apple, petal, sepal, nettle and others seem to fit neither. I don't see great strength in the case for a possessive form. French (except for some pronouns) and others dispensed with it long ago. Pidgins use a particle e.g. Pisin: hat blong mi = my hat. Several substandard English speakers make no spoken distinction between the objective case pronoun and possessive pronoun in some cases (me hat) and sE in some cases (her hat). If there ar eny examplz v importing a foreign wurd to improv regularity I can't think v one, and I'm inclined to think it unlikely to catch on for several generations.

[Robert] Use of the Chinese "empti" word "de" would eliminate the apostrophe: "The man I saw yesterday's daughter" = "The man I saw yesterday de daughter".

Category 6. Adverbs

Category 6a. Definition of the Problem of Adverbs.

Adverbs are sometimes called the dustbin of the parts of speech. Many times we think of creating an adverb by adding "ly" to an adjective, such as "likely", "darkly" and so forth. However, in Traditional English grammar the words "tomorrow, very, no, however, when, not, just, the" have all been classified as adverbs. "The" in "The more the merrier."

The words in the latter example have not become an adverb by adding ly to an adjective. Moreover, there is an additional problem of inconsistency. Adjectives ending in "y" have the "y" changed to "i" before the adding of "ly" to make them an adverb (happy - happily).

While it may not be important for a language learner to know the names of the various parts of grammar, still the more rules that there are for them to learn or patterns for them to assimilate, the harder it will be to learn the language, and this difficulty reduces their confidence and retards their progress. Therefore it is our desire to make the rules as few and as consistent as possible.

Category 6b. Alternate Proposals for Adverbs

One suggestion has been that the "de" proposed earlier for the possessive would work equally well in creating what are now "ly" adverbs.

e.g. "rapidly rising tide" ~
"rapidly rising tide" ~ ("rapid rise de tide")
although it might be almost as clear and certainly more simple just to say
"It is rapid rise tide".

It appears to be largely a function of word order.
"It appears to be large function of word order",
would seem to mean something different in that this sentence would seem to imply that one of the main functions of word order is create the effect of adverbs.

This whole subject is something that I do not have a grasp of, as yet.

Click here to return to the
[Table of Contents](#)

Category 7. Superlatives.

Category 7a. Definition of the problem of Superlatives.

This being a relative world, much that we try to communicate has to do with the matter of degree. (no, not, non, none, one, couple, few, some, many, much, more, most, full, all). The greater difficulty still, comes when we try to apply many of these, which are often abstract terms in themselves, to concepts that are abstract (such as truth, love, and beauty).

In order to modify words in terms of degree we often use prefixes and suffixes. However, the problem is that

there is no consistent form for doing this. This subject may really need to be more generalized under the heading of morphology which is said to be the study of how words are structured.

Category 7b. The use of er to indicate degree and est to indicate maximum

We can see, by looking at the prefixes and suffixes, how they have developed from other words. No, not, non, none, are all related. None, and non, appear as contractions of "not one" or "no one". Words that are used as prefixes often start out in a hyphenated form. (Non-sense thus becomes nonsense and non-liquid can become nonliquid). Since, in a phonetic representation of speech, the hyphen is not pronounced, it is not necessary.

In similar manner the words more and most may have become postfixes.

More as "er" and most as "est".
More great is therefore greater.
Most great is therefore greatest.
More small is therefore smaller.
Most small is therefore smallest.

While this presents some difficulty with some words
More little becoming littler is grating to some ears,
but it is correct and applies to size,
whereas more less becomes lesser
and applies to quantity.

How far one may want or be willing to go with establishing a fixed rule may get into philosophical issues. Some terms may be considered superlatives within themselves. Therefore some persons would not accept the expressions gooder, goodest, or badder, baddest, or virginer, virginest. While philosophically one may have difficulty with such terms there is no gramatical reason why they should not be acceptable.

Category 7c. The use of more to indicate degree and most to indicate maximum

Whatever one's philosophical concerns about the application of superlatives to certain abstract concepts it may be that the simplest solution in a pidgin is to simply eliminate the use of prefixes and suffixes and to use the full word itself. This approach also eliminates a conflict with another use of "er". We add the "er" sound to words to indicate someone or something that performs an action. (Baker, Waterer, Carrier).

Within an ITL pidgin, we could perhaps take further this principle of eliminating suffixes. In Traditional English the postfix "ness" is add to words to denote the presence of a "quality" (Highness, Goodness, Darkness). In idealist philosophy this can apply not only to abstract qualities but to concrete objects itself. Socrates would have argued for "chairness", that quality which distinguishes a chair from a stool, seat, sofa, table, or other object.

There may be still others. Full for example. Beautiful is that which is full of beauty and awful was something that originally meant that it was full of awe or caused awe. There are still others, (-ous, -ose, -oid, ish, -y, (or ie), -ize, -like, -shaped, -ly, -fashion). Just how far we might want to go with this principle in an ITL pidgin, in either formalizing their use, or eliminating them, is a subject that should be examined. Many, many words have an etymological history as being the combination of concepts. Some-thing, any-thing, no-thing, and many others

could possibly be reduced back to their original meanings.

That we might try to simplify an ITL by selecting a single syntactical method from among many in an extended language does not mean that an extended IAL could not have for variety a greater number of acceptable syntactical structures. These might be used for variety as well as might be numbers of synonyms.

Click here to return to the
[Table of Contents](#)

Category 8. Adjectives

Category 8a. The problems with Adjectives

One of the curiosities of English is that many words can be used in different grammatical forms. The same word may be used as a noun, verb or adjective. For example. One may sit in a chair when they chair a meeting. And we may refer to a particular type of seat as a chair seat.

This free form of construction is very different from those languages which require that nouns, verbs and adjectives all agree, in tense and other syntactical endings including perhaps even gender. One wonders then, if proposals specify adjectival endings is not a step back from this advantage of English.

On the other hand there has been the suggestion that all adjectives should end in some one form (-i -ic -ig -al -ive -ing) instead of the listed variety since all sometimes have the sense of 'involved in the action/state of' whatever the word stem refers to.

Category 8b. Alternate Proposals for Adjectives

There are also opposite proposals for adjective endings to indicate different meanings:

o'pi (=open), o'po (=public, frankovert, obvious, 'transparent';
chairopi seat - an open chair like seat. A park chair or bench could be a chairopi seat.

shuti = enclosing (shutting);
chairshuti seat - an enclosed chair like seat. A chair in a steam cabinet could be a chairshuti seat.

shuto = private, secret(ive), seclusive, exclusive, covert (closed);
chairshuto seat - a hidden chair like seat. A chair in a confessional could be a chairshuto seat.

waido = general, widespred, non-specific (wide);
chairwaido seat - an indefinite chair like situation. A long divided bench like sometimes found in an airport could be a chairwaido seat.

narro(id) = special, restricted;
chairnarro seat - a special seat. The chair in a court witness box could be a chairnarro seat. Also that

occupied by the judge.

airni = ferri-, ferric -- trivalent iron compound prefix or adjective;
chairairni seat - an iron seat. The unpadded seat in a fighter plane, or some ornamental iron lawn furniture could be a chairairni seat.

raoni = circular, spherical, globoid;
chairaoni seat - a spherical seat - A hanging basket type of seat could be a chairaoni seat.

raono = roundish, surrounding, (a)round, encompassing, re, spheroidal,
chairaono seat - a round seat. The circular seat sometimes found in a hotel lobby or surrounding a fountain might be a charaono seat.

These few examples are but part of what could be a very long list. It is said that the Eskimos have over a hundred words for snow, but we are talking about something more generalized than specific words. We are talking about specific endings that can be added to any adjective (that is to any word being used as an adjective) in order to add to that adjective some generalized concept.

While an approach of this sort could be developed, possibly better over time, in a very advanced language, even if, or especially if, that language were an IAL, it seems questionable that a very elaborate approach of this sort should be used in an ITL.

There may also be a need to distinguish adjectives referring to completed, and potential/projected action, as distinct from -i, -o which in general relate to continuing/occasional action. These could be standardized as follows:

'tense-/aspect-/mood-related' adjectival endings for the completed as
-t (burnt, lurnt, spelt, ment etc.)

'tense-/aspect-/mood-related' adjectival endings for continuing
-bl (i'tbl = edible, du'bl = doable/agendum, hapbl = possible, solbl = soluble, etc.)

[Robert] "<-i> commonly indicates adjectives in Slavic languages" (Ruby Olive Foulk might have been on to something [me])

Ameri(can), Australi(an), Engli(sh), (H)indi(an), Irani(an), Iraqi, Iri(sh), Israeli, Maori, Russi(an), Turki(sh) {turki-fowl}. Since articles are a kind of adjective: the ~ thi, a/an ~ i.

[] Wun coment on my use v -i az th main adj. ending (usuali = -y, -ic(al), -ive) in IngLingo wz: It is too short - how about -ic or -ish? Az I propose an alternativ -o (usuali = -ous, -ose, -oid, -some, -like, -shaped) with a slightly diferent emfasis (aftr wurd stem ending -e/i; or tu emfasize adverbial rathr than adj. function; or especially t diferentiate somthing a bit mor abstract/ metaphorical, e.g. fiti = fitting/ suitable; fito = fit, sound, helthy; ferri = ferric, fero = ferrous; ringi = ringing, surrounding; ringo = ring-like, ring-shaped, cycloid.) I'm inclined to opt fr options, e.g. -i(c), -o(id).

[Antony] I'm presently inclined to think that Doug is on the right lines here. There are a limited number of suffixes that can be used universally without wrecking the concept of orthographic regularity, and "-i"

and "-o" are among them (cf. the "-ed" and "-s" inflections in English - as in "talked, banned, landed, cats, dogs, foxes").

Where a word is used exclusively as an adjective, e.g. "hot, bold", it shouldn't take an affix because there is no need to differentiate its use in different word classes (cf. "hand, to hand, handy, handily")

It's right that adjectives and adverbs should take the suffixes because, where a word falls into different classes or parts of speech, it is the adjectives and adverbs that qualify the nouns and verbs (respectively) and not vice-versa.

It's always possible to distinguish the noun from the verb, whether by context, word order, noun or pronoun number or case, or the use of verb auxiliary/inflection.

I think Esperanto went astray here. The word class or part of speech should serve the word, not vice-versa.

[Doug May 3] I agree

Half-baked, definitely, and the claim that "hot" and bold" are used exclusively as adjectives is absurd: "hotly, boldly, boldness" etc..

However, I'm not yet convinced that it's all nonsense. It doesn't seem to be necessary to differentiate the noun from the verb by means of a suffix. Nouns derived through adjectives don't seem to be used as verbs; verbs derived through adverbs don't appear to be used as nouns. I mean the same word + suffix. Could someone put me right on this?

Esperanto puts a suffix on all the main word classes, but what is the problem with using bare word-roots, where one can get away with them? Perhaps descriptive suffixes might develop on or in word-roots in the absence of grammatical suffixes - as in many words ending in //.

All this might be of marginal relevance to an ITM strategy, but is central to an IAL strategy. Response(s) welcomed - however negative!

I understand that some languages don't bother with nouns and adjectives: they use pronouns, verbs and adverbs, e.g. "it houses whitely" ("a white house"). How about that?

Not greatly different from English and Chinese because 1. all things are also events or processes. An atom is a dance of electrons and liable to change if electromagnetic waves or subatomic particles collide or combine chemically with it.

2. We use the same word as noun, verb, adjective, adverb and preposition without ambiguity if context is clear, e.g. round balls are used in a round of golf, round a course and a winner may treat his opponent or a round dozen of the players to a round of drinks when they finish going round.

3. Many languages use adjectives as adverbs, including English at times: the VERY day I saw you I took very ill (from French adjective vrai=true, not vraiment=truly). He runs FAST. Less standard expression: I

felt proper/ real proud.

Category 9. Personal pronouns

Category 9a. The Problems with Personal Pronouns

Traditional English has a number of irregularities in regards to personal pronouns and their relationship to verbs. One of the marks of English education is how well one has mastered the exceptions to what would otherwise appear logical. Children, foreigners, and the poorly educated often make the mistake of using logic in their constructs of syntax. This sometimes is seen as humorous in the speech of children, but in the case of foreigners it often subjects them to ridicule and an inclination to classify them with the ignorant.

An example would have been the southern black mammy of some decades past who would have said, "He is going to town, she is going to town, and I is going to town". Syntactically, such a construct follows completely logically, and it is not only symptomatic of the problem but a model for one of the recommended types of solutions.

Another obvious shortcoming of English pronouns is that they do not include a neutral or inclusive word for he/she. One must use a cumbersome circumlocution such as "he or she" or "the person".

In the following subcategories we will present some of the suggested remedies one by one.

Category 9b. Use of "sheet" for indiscriminate sexual definition

The word "sheet" is a combination of she, he, it and in Angel it would be written sET. The words he, she, and it would continue to be used. sET would be used in only in those cases which are indiscriminate. If the Angel ITL were to contain no plurals then sET would also replace the present indiscriminate they. (Only by context in present Traditional English can one know whether "they" is men, women, a combination thereof, or some combination of more than one it). On the other hand, if Angel were to adopt the ZEE form for plurals then they would be replaced by SETZE.

[Robert] "She - he - it" is ingenious but I don't like it. Too long to start with (Zipf's Law).

Category 9c. Elimination of the repeated pronoun

A second problem with Traditional English is that it inconsistently uses a repeated pronoun. The pidgin, "I go town" is expanded to "I am going to town", by adding "am", modifying "go" to a gerund and supplementing it with "to". 'Am' is an irregular form of 'be' which has its own gerund form of "being" and in the past tense becomes been.

The elimination of the "be" verb could reduce more indefinite syntactical expressions in the following manner:

I will be walking. (I will walk)
 I may be walking. (I may walk)
 I have been walking. (I did walk)
 I should be walking. (I should walk)
 I could be walking. (I could walk)

Further verb reduction would come by the removal of the further supplementary "to":

I will be walking to town. (I will walk town)
 I may be walking to town. (I may walk town)
 I have been walking to town. (I did walk town)
 I should be walking to town. (I should walk town)
 I could be to walking. (I could walk town)

As in Traditional English, additional verbage can be added to sentences for clarification or emphasis. Where needed or desired one could add to, from, in, about, and other terms.

[Robert] Regularisation of personal pronouns: "myself ~ me self ~ self" etc. has been lost. Could it be restored?

[Antony] Shouldn't the current contents of 9c be in 10?

Category 9d. Examples of some other suggested remedies

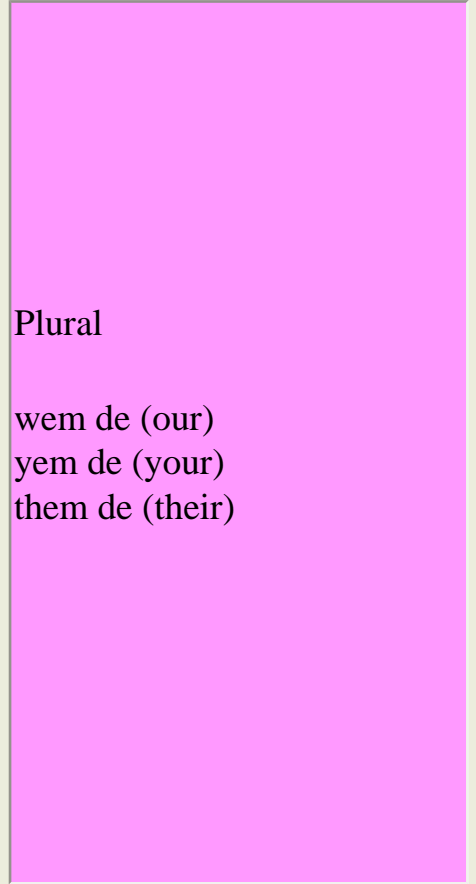

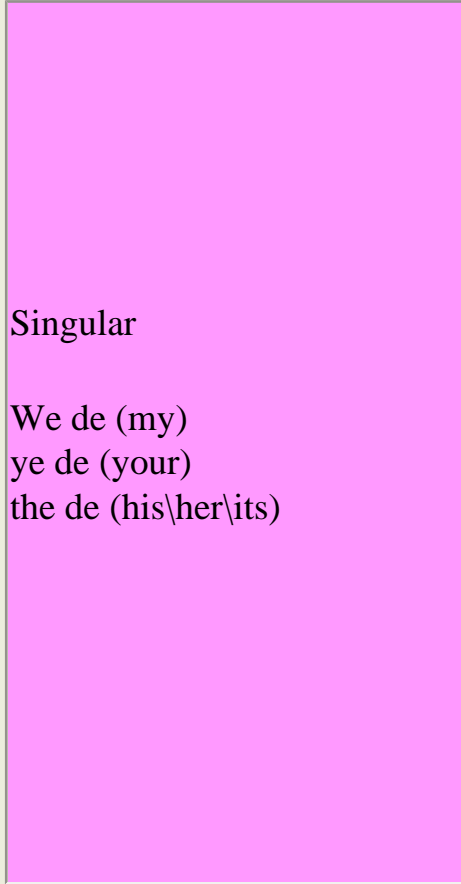

There follow examples of some alternate suggested remedies. If they have not been fairly presented here, or the presentation can be improved, please inform me.

Active (Robert)

<p>1st person 2nd person 3rd person</p>	<p>Singular</p> <p>We (I) ye (you) the (he\she\it)</p>	<p>Plural</p> <p>wem (we) yem (you) them (they)</p>
---	--	---

Possessive (Robert)

* "the" rather than "they" *

Doug

1st person
2nd person
3rd person

Singular

I/me we/us
you
he/him she/her they/them
(s)he/h-er/-im/it/the-y/-m

Plural

mi
'u, yu'mi, 'u lot
herm, em
em, it

[Robert] cf. Chinese (Putonghua)

wo de (my) women de (our)
ni de (your) nimen de (your)
ta de (his/her/its) tamen de (their)

Category 9e. Current Angel Inclinations

Traditional English:

(I, We, You (Sing./Plural) want to walk.
(He, She, It) wants to walk

Proposed Angel:

(Me, We, You, You all, He, She, Sheet) want walk.

Or possibly even (Me, MeZee, You, YouZee, Sheet, SheetZee)

The thing that I notice here is that the proposed modications
are two syllables whereas the traditional was one.

SheetZee would replace 'they', 'them' and 'those'

Traditional English:

I walk or I (will, do, should, can, may) walk

Proposed Angel:

Me (will, do, did, should, can, may) walk (time - place)

(time - now, everyday, always, seldom, sometime, before, at night, in morning, yesterday, etc)

(place- to work, in park, on street)

Traditional English:

(My, Our, Your (Sing./Plural) apple.

(His, Hers, Its, Their) apple

Proposed Angel:

(Me, We, You, You all, Sheet, SheetZee) apple.

If the ZEE convention for plurals were to be adopted then the plural "you all" would be "youzee".

Category 10. Verb Variations

Category 10a. Past Tense Problems

In Traditional English, past tense is dealt with in several ways. Oftentimes by adding "ed" which, however, is often pronounced as a 't' such as in "I walked". Sometimes, the past tense is actually spelled with a "t" such as "I sleep", "I slept". Some verbs have an entirely different form for the past tenses such as "I eat", "I ate", "I have eaten", and one could also use the extended phrase, "I did eat".

This variety and inconsistency of rules is of course confusing to the learner.

Category 10b. A separate word to denote the past tense:

Ogden suggested "he did cut". This is an emphatic tense.

"He has cut" is closer to the aorist.

However, the names don't really matter:

"he cut" ~

"he has cut" or

"he did cut", if the latter is closer to the meaning.

There may be some historical or etymological justification for this approach. One can see how the 'did' could be looked upon as having been simply transferred to the end of the phrase. "I sleep did", "I walk did", and then shortened to "I walkdid or walkid or walked".

Thus, there could also be a logical pidginic approach to the past tense by simply adding the full past tense

expression to the phrase. Therefore, "I walk did", "I sleep did", and so forth.

Indeed this appears to be the approach of some other languages. Some languages, such as Chinese, place the tense at the end of the action.

He dived\dove in the water. ~ He dive in the water, la.

It snuck\sneaked by. ~ It sneak by, la. (a Chinese type)

One of the great advantages of the Chinese "empty" words "ma, la, de": would be a reduced dictionary, because this would eliminate the additional forms of verbs. It is also pointed out that this eliminates the homonyms "ate/eight" and "one/won".

"He ate lunch"=

"He eat did lunch"

"He won the race"=

He win did race

Again it should be noted that oftentimes the solutions suggested for regularizing syntax actually makes it longer. There may be at work here some inverse variant of Zipf's Law, as applied to syntax that says since custom and hence rules, worked in the past to simplify expressions, that to regularize them we must often lengthen them. There is probably no real advantage in changing the word order, so we would then be back to Ogden's suggestion.

In Traditional English, for some verbs, we can only separate the present tense from the past tense by the context.

"What do you do in the factory?"

"I cut the wood."

"Who cut the wood?"

"I cut the wood."

While one can say, "I did cut the wood", there is no "I cutted the wood".

Category 10c. Elimination of the verb alteration for third person singular.

Some of the verb variation could be reduced by just eliminating the alteration for the third person singular.

In Traditional English, "I eat" becomes "He, She, It eats"
but could be reduced to:

"I, He, She, It eat".

Category 10d. Elimination of the past tense

One recommend solution is the elimination of the past tense altogether but this seems to too drastically reduce meaning.

Category 10e. Other advantages to verb regularization

By removing or regularizing verb variants we will also regularize some adverbs, nouns and adjectives.

For example where eat, ate, eaten presently has associated with it "edible" this could become "eat, did eat, eatable".

Traditional English changes the sound (and sometimes the spelling) of nouns

sheath, bre(a)th, cloth

to verbs sheathe, breathe, clothe

These could be regularized by simply using the noun pronunciation, but in actuality there are probably many verbs with etymological roots in nouns for which we no longer see a clear association. The use of phonetic spellings further distorts these apparant relationships, so how far one might wish to go down a path of regularization in this regard, is problematical, as this latter word itself demonstrates.

Verb variants also affect the spelling of grammatical variants ending in "-ly" and "-y"

The substitution of tenses by variable auxiliary\auxiliaries + an invariant verb-stem might render their traditional names more or less irrelevant. As the number of actual and potential auxiliaries is large, so is the number of tenses.

Chapter 13 of LANGO - also refers to the creole usage of serial verbs, e.g. "she go try find it, he start run escape", rather than the infinitive - and to the negation of verbs using "no", e.g. "He no work today."

the participle\gerund "-ing" suffix is already eliminated in sentences such as "The man was at work (working) in the garden".

"As wel as saying "at", Irish uses "in". This, i.e. "in", is invariable in Welsh. From English: in flower (flowering); in song (singing); in flight (fleeing or flying); in doubt (doubting). The 'nakk wil bi tu kriate more noun-verbs, e.g. "He was in entry thru the door." ~ "He was entering thru the door."

As a result of parallel usage the phrase and the participle are very often not quite equivalent, but it does show that the auxiliary\auxiliaries + invariant verb-stem model might become universal.

the kind of expression used by non-native speakers, e.g. "If it will be that...."

"talking" ~ "at talk" (cf. the Irish preposition "ag") also the English "on" = "about" ~ the Dutch "om", which is used in the same way as the German "um" and the Welsh "am"

"He will be talking on China."

"He will be ag talk om China."

"He was talking on China."

"He ag talk om China, la."

[Robert] Doug misses the point of "I am walk". "Am" is intended as an indicator of the continuous tense, i.e. "am" is equivalent to "ag, at, in". "I am/ag/at/in walk" = "I am walking". It is just a matter of which turns out to be the most euphonic. Also, Somerset dialect is not "he be" but "er be", where "er" = "he" or "she".

[Antony] "Er" sounds like a better alternative to "sheet". (see 9b)

[Robert] I prefer "I sing" to "I be sing" for the simple present and "I be sing" to "I will sing" for the future (i.e. as in B.E.V.), Doug's preferences being "I be sing" and "I will sing".

[Doug May 3]. I would omit the 'be' or 'wil' or 'did' (or 'am') when the tense (and/or aspect/ continuity) iz clear from context: I (usually) sing here yesterday/ today/ tomorrow/ often

Category 11. Courtesies

The use of courtesies, while not essential, change the tone and to some extent the meaning of communication. Some languages involve courtesies to a much greater extent than does English. All verb expressions in some languages are determined by courtesies. The way the verb is used can change between male and female, young and old, blood relationship, age, and other denominations of cultural rank.

The main courtesies in English are 'please' and 'thank you' with some usage in respect to titles. While it may not be absolutely necessary to teach courtesies in the first level of an ITL they should have some priority.

Click here to return to the [Table of Contents](#)

Category 14. Regularisation of Grammar

Category 14a. According to the word-order principle

In Traditional English, meaning is affected by word order.

Traditional English generally uses a SVO (subject - verb - object) word order. HOWEVER it can use any order:

SVO - the boy saw the man

OVS - Jones I invited - not Smith
VSO - govern thou my song (Milton)
SOV - pensive poets painful vigils keep (Pope)
OSV - strange fits of passion have I known (Woodsworth)
(and also the Jedi Master Yoda)

It is probably best in an ITL to restrict the syntax to SVO.

Category 14b. Elimination of the Accusative

Madhukar notes: "English is free of liaison and many odd features. That does not mean English is quite logical. (cat kills rat) changes meaning if word sequence is altered to (rat kills cat). But Marathi inflection- postposition is helpful there. laa = accusative. Using English words, cat kills ratlaa.

Now interchange words. ratlaa kills cat, kills cat ratlaa, etc. The meaning is not altered.

Everingham responds: "I prefer word order to accusative suffixes which correspond in English only to accusative forms me, us, her, him which are irregular and abandoned in most natural interlanguages, e.g. Melanesian pidgin has mi = I/me, mipela/yumi = we/us, em = he/him/she/her/it, ol = they/them."

[Robert] English moved on from such inflections 1000 years ago - word order preferred.

Category 14c. Simplification of end phrase interrogative

Antony says, " We know that the interrogative end-phrases, used in English to turn statements into questions, are unnecessarily complex - not to mention the difficulty for learners. Other languages have proven that a single invariant phrase, or word, is sufficient.

For example, where English has "won't I? can't you? don't we? aren't they? etc. etc.", French makes do with "n'est-ce pas?" and Esperanto has the interrogative marker "Cu" at the beginning of the sentence

Robert proposes the use of the Chinese interrogative marker "ma", e.g.

"You're Robert, ma?"
Cf. Canadian "You Robert, éh?"
Nice one, eh?
Or, how about "eh", eh?

Click here to return to the
[Table of Contents](#)

Category 18. Reduction of word meanings in the elemental list.

While meaning is affected by word order it is also affected by word usage itself. In their important book on the subject,

The Meaning of Meaning (1923)

C.K. Ogden and I.A. Richards

listed 16 different meanings of the word 'mean/meaning'
some of which were:

- John means to write. (intends)
- A green light means go. (indicates)
- Health means everything. (has importance)
- His look was full of meaning. (special import)
- What is the meaning of life. (point, purpose)
- What does 'capitalist' mean to you. (convey)
- What does 'cornea' mean. (refer to in the world)

To this we could add many other meanings of mean

- What is the mean temperature. (A measurement of average)
- He is a mean boss. (unpleasant)
- What does the boss mean? (want to communicate)

The purpose of language is to communicate meaning.
But there are various levels of meaning.
Perhaps because of what Noam Chomsky refers to as
"surface" and "deep" levels of grammatical structure.

The mark of intelligence,
particularly in reading poetry, imaginative literature, scripture and so forth,
is to be able to see deep meaning.
In fact, we can almost say that
this is the way that language marks progression in life.

Still, in the development of an ITL our thrust needs to be in the other direction. That of limiting the possibilities of meaning. This same standard has other applications also. In contract language and in scientific technological explanation. At the other end of the scale, in pure scientific research, there may need to be freer coinage of meaning in order to develop new ideas. But, as these are brought back down to technological application, then the words need to be more closely defined.

One interesting concept would be that of the development of Speed Words. The idea is to reduce the basic ITL word to the least number of phonemes. The purpose for doing this is many fold:

- That it makes less for the learner to learn.
- That it makes less for the learner to write.
- That shorter words add to rapidity of thought.
- That shorter words add to rapidity of speech.
- That it is more economical for printed materials.

The above does not begin to exhaust the list of Speed Word benefits, but it gives one the general idea. Such an

idea might be more suited to a new IAL, and an associated ITL, than to an ITL that has as its target Traditional English because the speakers of Traditional English would not know the ITL vocabulary when they heard it, although the change could be minimized by judicious use of existing Traditional English root words. Although presently impractical this is still an interesting idea and we might say that it takes Zipf's law to the extreme.

Some proposals for speed words have advocated increasing the number of phonemes to 100, thus allowing for more 1 and 2 phoneme words. However, the trend in Traditional English (at least in North America) has been towards phoneme reduction, which is itself further language simplification. With the 39 phonemes of Angel it is possible to present 684 one and two phoneme words. This should be sufficient for an ITL.

A close relation to speed words is speed writing. Historically, lower case letters were themselves developed for cursive writing. Today, with the disappearance of penmanship, the predominance of keyboards, and the trend towards word processor speech recognition, and the presence of minaturized voice recorders, how critical this may continue to be, is as yet undetermined.

Further discussion on Elementalization

(Madhukar) For instance, changing chairman to chairperson; changing term "Christian" name to "first" name or "personal" name, when thousands of non-Christians accepted English language.

These ar trendz also in Australia but old usajz hav not disapeard here and there may b lots ov uthr cultural quirks slower t chanje, e.g. humankind for mankind where it is not contrsted with womankind.

[Robert] British English uses "first name" and "family name" ratder tdan "Christian name" and "surname", also "chair", "chairperson", "madam chairman".

[Antony] Madhukar raised the important question of ambiguous words in his email of 26 April. The mass of exact synonyms is probably an even greater problem. Which word to choose? It's not always obvious.

[Doug May 3] Hogben tackled this problem -- I did a précis:

[ESSENTIAL WORLD ENGLISH \[ewE\]](#)

Category 19. A regularized number system

0 zero

1 one

2 duo

3 three

4 quatro

5 five

6 six
7 seven
8 octo
9 nine
10 ten
11 ten one
12 ten duo
13 ten three
14 ten quatro
15 ten five
16 ten six
17 ten seven
18 ten octo
19 ten nine
20 duo ten
21 duo ten one
22 duo ten duo

29 duo ten nine
30 three ten

40 quatro ten -----
50 five ten

100 one hundred
111 one hundred ten one
121 one hundred duo ten duo

The logic behind this is:

a. it eliminates the words with competition for double meaning such as to, for, and ate

It is a more logical organization of numbers

ten and one instead of eleven
ten and two instead of twelve

The teens are probably a transposition of this system anyway

fourteen is four and and ten
but still illogical
compared to the expression
in the twenties, thirties and so forth.

There has been one suggestion that
"seven" ~ "sem"

(because it is so often so pronounced in the U.S. and Britain - and because of Slavic forms)."

Also it has been suggested that Spanish numbers could be adopted in their entirety.

[DE: IngLing compromises for now with 'wun tu thri for faiv siks sevn e't nain ten/te hunrt ki'lo mion/meg mu maikro'. 'te' = -teen/-ty thus ten = wun te, 11 = (wun) te wun, 13= (wun) te thri, 20= tu te. I'm concerned here to preserve terms compatible with the International Communications Alphabet (alfa braavo charli delta eko fokstrot golf ho'tel indya ju'lyet ki'lo li'ma maik nvembr oskr ppa qbek ro'myo syera tango 'un'form viktr wiski xre yangki zu'lu) and numbers used in traffic control radio using the international language prescribed, English. I have tried with no success so far to track down on the internet a publication outlining Seaspeak, which I understand was an attempt to compile a simplified core vocabulary/ phrase book etc. for such purposes. Can eny ov 'u direct me to such a source please? -- DE]

[Robert] Tde niw Welsh numbering system:

un, dau, tri, pedwar, pump, chwech, saith, wyth, naw, deg undegun, undegdau, undegtri, undegpedwar, undegpump, undegchwech, undegsaith, undegwyth, undegnau, dauddeg, dauddegun, dauddegdau etc.

earlier, 11 = un-ar-ddeg, 12 = deuddeg, 13 = tri-ar-ddeg, 14 = pedwar-ar-ddeg, 15 = pymtheg, 16 = chwech-ar-ddeg, 17 = saith-ar-ddeg, 18 = dau-naw, 19 = naw-ar-ddeg, 20 = ugain, 21 = un-ar-hugain etc.

If Welsh cn do it, English can. One ov my teacherz deliberately pronounst th 'ty' suffix for 20,30,40,50,60,70,80,90 as in 'tying' t avoid cnfuzion with '-teen'. Foloing th Welsh exampl we'd rplase th -teen with 'wunten-' prefix, but both -teen and -ty are derivativz ov 'ten' and on Zipf's principle we ouht t uze th shortest unambiguous form which may be 'ti' [(wun)tiwun = 11, tuwtiwun = 21, forti= 40, &s.]

Research in the U.S. shows tdat tde proposed new arangement (based on oriental systems) has advantageous inplikations for improving standards of numeraci. (Sugestion about Spanish numbers - at bottom of p.16 - was not intended as a serious proposal.)

Click here to return to the [Table of Contents](#)

Category 20. Philosophical Discussion

For years, I have referred to this subject as Rationalization, but Antony has now chosen what is undoubtedly the better term of Regularization. (Roz now informs me that I picked up the term "rationalization" from Ogden, but that she agrees that Antony's term is better.)

Everingham says that it is his hope, "that among us some consensus may arise, as in the drafting of international treaties/conventions in multinational forums. They often start with a small drafting group, then add inside square brackets the amendments moved by individual nations but not supported by all. The next stage tries to change the form of words till brackets are removed or included in optional protocols that some signatories will endorse. Language change is by nature piecemeal and erratic, often with several new coinages vying for general acceptance for a new concept or categorization till one or a few dominate.

(Bruce replies) I would be happy for Doug or anyone else, to take over the effort of maintaining this compendium and I feel sure that there are others who can do it much better than I.

However, my format at the moment, is to revise, and re-revise, each of categories both as to title and content as each of you give me suggestions that I can assimilate.

I feel that it would be too awkward, cumbersome and bulky, to try to retain each of the comments and counter comments. Consequently, the Compendium is a dynamic work.

If some comment, or concept, falls out of the compendium you simply need to restate it and PLEASE tell me WHICH category to put it under and I will try to re-insert it.

I will PARTICULARLY appreciate any help in refinement of the categories.

So, what is it that we are trying to do?

We are trying to simplify English as to its syntax.

Robert requests a call for papers on the optimum phonemic inventory

Bruce replies:

In the development of Angel, we have now passed beyond the subject of phonemic inventory. I recognize the philosophy of those who would like to see a system that permitted the representation of up to fifty some + sounds, and it may well be that some future IAL committee will wish to consider and implement such a philosophy, but for Angel we have passed beyond that point and have created a phonemic word list of over 40,000 words based upon 39 sounds.

However, as regards the matter of symbols, we have also provided the tools to any researchers to represent that word list in any ASCII compatible system that they wish, along with a Translation program that will translate present English Text files into their symbolism.

This particular Compendium is mainly limited to the discussion of Regularization. Another time and another place will need to be more fully devoted to Elementalization. While Phonetics/Phonemics are a subject near and dear to the hearts of many who are participating in this forum, however, there are other times and places for that subject and it should not be a central part of this discussion.

[DE: I wonder have you seen Rondthaler & Lias "Dictionary of simplified American spelling - An ALTERNATIVE spelling for English"

(Bruce replies) Drs. Rondthaler and Lias have been most generous in their assistance in the development of Angel. In the early years I fear that I bothered Dr. Rondthaler, by phone, rather incessantly. Dr. Lias has more than once provided me with copies of the sound speller. I do not know that I ever had the source code but perhaps someday we can embody the principles in a real time translator of Angel. Drs. Rondthaler and Lias did provide me with machine readable copies of their "Dictionary of simplified American spelling - An ALTERNATIVE spelling for English" and extensive usage was made of it, as well as of the Carnegie Mellon Institute Phonetic Spelling Word List, in Developing the Angel Phonetic Word list.

What is our reason for considering Regularization?

- a. To make English easier to learn by adults
- b. To create a more logical and comprehensible Pidgin

How would it be used?

In two ways:

a. As an ITL (Intermediate Teaching Language) for teaching English.

This is controversial in that some pedagogs would say that one should teach the "correct" formulations from the beginning.

They would say that, while the learner may simplify syntax in logical ways they should only hear the correct formulations. And that learning the "wrong" way is simply learning formulations that must then be unlearned.

Still, there must be some intellectual effort in trying to comprehend in what ways the "correct" formulations differ from logical formulations.

Beyond the ITP one would then teach the exceptions to the logical formulations and the learner could then learn all the present "correct" formulations.

If the ITP is sufficiently logical and consistent, and designed for the pedagogical purpose of being a path towards the exceptions of Traditional English then it could be easier to understand and learn the exceptions.

b. As a proposal for an IAL (International Auxiliary Language).

In this regards ALL ideas for Regularization should be listed and considered but we may implement MOSTLY those ideas which are compatible with category A immediately above. The question remaining, how useful a Pidgin would be as an ITL.

Still we may decide to implement some radical items. If the IAL was accepted then its forms might come to be accepted as "correct" forms, even in Traditional English and could be further supplemented by other new "correct" formulations by whatever body authorizes the IAL.

The relationship that might exist between any English based IAL (if some English based IAL were accepted as such) and the present full Traditional English language is another subject. There would then be, as there are now, more or less formal styles and levels of writing. So nothing that radical is being proposed in that regard.

FURTHER DISCUSSION on the usefulness of a Pidgin.

(Antony) "this woman child" is ambiguous. The Internet is about as far as one can get from the normal pidgin\creole environment whose visual\tactile\sensual immediacy practically dispenses with the need for grammar. There is an inverse relationship between grammar and context (which is why, as it seems to me, there needs to be a continuum between simple and complex grammar).

(Bruce) This matter of continuity between the simple and the complex will certainly be a major issue when we go to make any selections for the ITL.

(Bruce) It may also be a matter of what I understand Noam Chomsky to mean by surface meanings versus deep meanings of language

(Antony) we should concentrate on those aspects of grammar that directly affect the operation of a rationalised orthography - or, in other words, where the principles of grammatical and orthographical regularity are in conflict. Prominent among these are verb inflections (particularly "-ed", "-t" and "-s" suffixes on the verb-stem).

(Bruce) this is a point well taken, and one of the prime motivators behind the present activity.

(Antony) Actually I am more doubtful than ever about the universal applicability of pidgin/creole usages. They certainly work in real-time situations where the context itself provides the meaning, but reduced grammar tends to be ambiguous at second-hand - hence the circumlocution characteristic of reports in pidgins/creoles.

A particular source of potential ambiguity in pidgins/creoles is the lack of differentiation between word classes (parts of speech). Esperanto goes to the other extreme - universally defining a word as noun, pronoun or correlative, verb, adjective, adverb or preposition/conjunction/interjection according to the affix.

English takes a half-way house: many words are invariant whether used as noun, adjective or verb (and sometimes adverb and/or preposition too), but most are exclusive to a particular word class. Examples of the former are "head, arm, dog, right". So far as I know there are hundreds if not thousands of invariants covering three or four word classes, and a few e.g. "under" in at least five (someone might like to correct me here). Examples of the latter (the "exclusives") are "gratitude, bold, survive".

(Doug Everingham). A pidgin-like simplification of sE which would provide ? a 'core' vocabulary of under 2000 word, based on English but following Zipf's principles of least effort, i.e. pursuing the natural trend of language development by broadening the senses of simple words, simplifying forms of frequently recurring concepts, and finding simple compound terms to increase precision when necessary to offset a broadening range of meanings

of a simple term.

- a restricted range of affixes and grammar rules,
- flexible transfer of core terms from one part of speech to another
- logical and simple substitutes for abstruse idioms peculiar to English
- an indication of gradations to the above two sE simplification projects suggesting an order of preference and possible evolution for each listed word.

This is the sort of thing I've been pursuing under the current term 'IngLingo' with invaluable suggestions from some other reform planners.

(Bruce) Rather than using the expression sE in this Compendium, the convention here will be to change it to Traditional English. The reason is that we are working towards the goal of an IAL that would become the STANDARD, while present sE would then become the historical, traditional, or classical English. It is too early and presumptuous to use the phrase 'historical' and the term 'classical' is already used in other contexts, hence the selection of 'Traditional'.

[Robert] Learning vocabulary is a major task for those trying to acquire a new language. We should seek to develop an international lexicon of most widely acceptable words, e.g. soldier ~ soldat, editor ~ redactor, sailor ~ matrose; also place names, Macedonia ~ Makedonia, Russia ~ Rossia, (as per UNGEGN - "UN Group of Experts on Geographical Names"). Words like "soldat, redactor, matrose" may not have much resonance for speakers of non-European languages, but the numbers of people speaking European languages is vast, and many of these words have been adopted into non-European languages where countries were either colonies, e.g. Indonesia, or influenced, e.g. Japan. Also, European languages have taken root in the Third World, e.g. Latin America.

[Doug May 3] I like the UNGEGN suggestion -- new to me -- but not sure that e.g. 'matrose' is more widely understood than 'sailor' or some more basic term like perhaps 'ship worker'.

[Robert] I suggest "interlingua" rather than "pidgin". Learner's language ~ interlingua ~ Traditional English. (There will obviously be things to be learned from pidgins which can be applied to the interlingua.

[Doug May3] Interlingua is a generic term for pidgins, creoles and other bridging tongues perhaps including patois, but 'Interlingua' is already in use for the constructed interlinguajz, earlier (originally called 'Latino sine flexione') by Peano of Turin, 1903, later (and perhaps still currently) the system adopted in 1951 after 26 years of research to compile the most common European word roots by New York's International Auxiliary Language Association, compiled by Dr Alexander Gode and co-workers. [See Dr M. Monnedrot-Dumaine's 'Précis d'Interlinguistique Générale et Spéciale, published 1960 by Librairie Maloine, Société anonyme d'Éditions Médicales et Scientifiques, 27, Rue de l'École-de-Médecine, Paris] IALA published through Storm Publishers, New York an Interlingua-English dictionary, 1951, (480 pp.) and Grammar (1951, 2nd edition copyrighted by Science Service, Inc., 1955, 128 pp.). Several international journals on spectroscopy were published in Interlingua, and a handful of medical journals included précis of each article in Interlingua. Alfandari's 'Neo' (1965) is one of the best improved systems based on Esperanto, Ido Interlingua-IALA and de Wahl's Interlingue.

Angel / Arabic Font

The following are what we call the vowel set in Angel
(but it also contains "ing" and "er")

آي ^s	آه [~]	او
A as in bay	a as in cat	d (ou) as in out
اي ^s	اه ^s	ار
E as in bee	e as in bed	r as in sir or baker
آي ^o	ايه ^s	اوي ^s
I as in pie	i as in sit	b (oy or oi) as boy or oil
اوه ^s	اه [~]	اوه
X (0) as in go	x(o) as in dog	k (oo) as in tool
اه ^s	اوه ^s	نج
U as in up	m (oo) as in foot	n (ng) as in ring

The following are what we call the small Consonants
(because they are lowercase - small letters in the Angel/English Font)

The following are what we call the Large Consonants
(because they are uppercase - capital letters in the Angel/English Font)

This is an attempt to analyze the use of Arabic as an

Angel Script.

A. The idea to use Arabic was prompted by the fact that the current Angel characters have the following deficiencies.

1. unaesthetic
2. difficult to scan
3. disturbing to people acquainted with Traditional Orthography
4. too similar to English for those who have an anti-English cultural bias
5. impossible to write cursively
6. detracts from Angel as being a separate language.

B. It was felt that Arabic would be a possible choice because

1. It is the language of Revelation
2. It is recognized and admired in Moslem cultures throughout the world.
3. It has a long calligraphic history and many established styles.
4. It is used phonetically.
5. It can be written rapidly - (cursively?)
6. It has a deep linguistic tradition, like Arabic numerals.

C. Further investigation of Arabic has disclosed that it too has the following deficiencies.

1. While it is said to be phonetic, it really does not have a much stronger claim to that than T.O. English.
2. There is no single Arabic letter representation for each phoneme.
3. Some of the Arabic letters are use in combination to create a variety of phonemes. The Aleph alone appears in 13 Angel phonemes.
4. There are only 29 letters in Arabic whereas Angel has 39 phonemes.
5. There are about one third of the Arabic phonemes (as represented by Arabic letters) that do not have an equivalent phoneme in Angel.
6. While English uses two cases (Upper and lower).
 - a. The upper case being used to start sentences and proper nouns

and sometimes for emphasis.

b. The lower case being used for body text.

Arabic has four cases.

a. A stand alone character.

b. A beginning of word character

c. A middle of the word character

d. An end of the word character

D. Given all these deficiencies I am continuing an examination of Arabic for the following reasons.

1. It remains the language of Revelation and for this reason its used should be encouraged so that the world's population will more easily make the transition to studying the texts of Revelation in their original form.

2. It might attract support for Angel (as an IAL) from the world's geographically distributed Moslem population.

3. It might serve as some sort of Bridge annotation for those from a Moslem background who would be learning Angel.

E. The obvious problems at the moment are:

1. The problem of display and printing of the characters.

While I have not yet seen them I have however seen intimations that there are word processors for this purpose and that some web browsers such IE 4.0 have versions that can display the existing text.

2. Whether even the above browsers and word processors could display what I will call the Angel/Arabic font is questionable.

3. Keyboard entry of the Angel/Arabic font would be another problem although this might be overcome in two manners that I know of.

a. The re-assignment of the keys as we do for a Dvorak keyboard or

b. A translation program that would take Roman Character entry and convert it for display in an Angel/Arabic TrueType format.

The beauty of the present system is that one can write in traditional English and the Angel Translator Program will put the text into the present Angel Font.

A second translator program could then put into Angel/Arabic with right to left printing. Except for the character representation itself, this would not be an arduous task to program.

The difficulty comes in developing a word processor that would display in Angel/Arabic font and format.

4. As per C (2,3 and 4) if we are to represent the Angel phonemes we must use an Arabic technique similar to what we would call a diphthong in English.

AND

if we are going to have a single letter to represent a single sound (which is an INVIOABLE Angel Principle) then we must create new Angel/Arabic letters.

5. The new letters in 4 above will be used in a typesetting rather than a calligraphic fashion.

6. The new Angel letters need to be created in an aesthetic fashion that still retains the Arabic identity so that they can be used in transition to Arabic.

Preface

The Biblical story of the Tower of Babel reminds us that the notion of a universal language has existed for a very long time. There have been numerous candidates including Sumerian, Akkadian, Hittite, Babylonian, Persian, Aramaic, Greek and Latin in the West; and Sanskrit, Pali and Chinese in the East.

The motto of the U.S.A. is reproduced on the first page to signify the goal of global language unification - which no doubt will be ultimately realised through an international auxiliary language. The authors of the Constitution of the United States would have been mindful of Latin as the most successful universal language when they chose this aphorism - linking what would become the foremost English-speaking country with the Roman civilisation of antiquity.

For almost two thousand years Latin had played the role of common language to the known world, but the founders of the American Republic would have known it as a long-unchanged predominately written language used by scholars. At that time, French was still the accepted universal language of culture and diplomacy, but subsequent events, influenced by the failure of the 1745 Jacobite rebellion in Scotland, conspired to pass the mantle of the international auxiliary language on to English - which still retains it, though with less than wholehearted support from other language groups.

Indeed, the unwillingness of the great powers to agree upon one of their own languages for use as a common tongue led to the concept of a politically neutral and orthographically consistent artificial language. The past 150 years have seen numerous attempts to construct such a language from familiar elements like common word-roots. Esperanto has remained pre-eminent among these constructed languages but has failed to correct serious defects of grammar and vocabulary.

As we have seen in Northern Ireland and former Yugoslavia, a shared language is no guarantor of peace; but it does allow a wider understanding of the issues, so that the cause of problems may be identified and rooted out. With the world facing an unprecedented range of potential disasters, from terrorism to ecological breakdown, the need for a universal language to facilitate co-operation has never been greater.

Moreover, unmistakable signs of progress towards a lasting peace and harmonious civilisation are evident throughout the world, inseparable from the remarkable 20th Century advances in standardisation, in all branches of arts and sciences, in religious understanding, and in education. This outpouring of knowledge, though pictured by a global media, can really only be shared through the use of language. A common tongue may not be the whole answer, but is certainly part of it.

Introduction

The present account attempts to promote our belief that a reformed version of the English language, prepared according to democratic procedures, would now be the best starting-point for a planned international auxiliary language.

In theory there are two strands of thought here: the concept of an international auxiliary language, and the idea of English spelling reform. Hitherto, these causes have usually been treated separately - an artificial auxiliary language on one hand, and proposals to improve English for use within the English-speaking world on the other - but in practice they are already inseparably combined in the form of the pre-eminent multinational status of the English language.

The following 20 chapters build upon this realisation by advocating the orthographic reform of an offspring of English to an international standard, the substitution of words from other languages, and the possible incorporation of certain rationalised grammatical forms pioneered by the creoles. The intention is to initiate an empirical process of reform towards a revised version of English, not only for everyday usage, but also for the attention of the globally representative committee of linguists that will eventually be appointed to choose the international auxiliary language.

The cost of translation between increasingly interdependent language groups might well force the convention of this body of experts sooner rather than later. Currently it would have to choose between a traditional, organic, "natural" language such as English, Spanish, Russian, Arabic or Farsi, and one of the rationalised but limited constructed languages such as Esperanto or Glosa. We are offering proposals towards a third alternative which would incorporate and harmonise the essential qualities of both national and artificial tongues.

The suggestions in Chapters 18 & 19 are offered as concrete examples in the hope of stimulating discussion. The result of such schemes would be perfectly comprehensible to English speakers, at least for a considerable period of time, though the spelling would be different from the start. Moreover, a language so revised would always be an auxiliary - at least in name - so traditional varieties of English could remain in their present roles as long as demand for them continued.

It is all very well to set out the linguistic requirements of a world language, and project a path from an existing tongue towards it, but the exercise is merely academic unless various cultural phenomena expressed through language are taken into consideration. One of these is the now well-established democratic point of view which would challenge the primacy, though not at all the validity, of "autocratic" and "objective scientific" approaches to language reform.

Chapter_One: "The_Origins_and_Spread_of_English"

Original English was a Germanic language closely related to Friese. The Germanic group of languages came into being as a result of trade between speakers of the expanding Indo-European languages and the native peoples of the Baltic. Slightly more than 2,000 years ago Germanic-speaking tribes began to expand from their homeland, moving southwards towards the Rhine. As a result, the Celtic speech of these areas was replaced by Germanic dialects. Germanic was already a mixed language containing elements which were not Indo-European.

By the 4th Century, the Roman Army in the West was largely recruited from these German tribes, so Britain was full of various German soldiers: Bavarians, Allemanns, Franks, Swabians, Frisians, and, most commonly, Saxons. As these soldiers were pensioned off they settled down in Roman colonies, and married local British women. Lowland Britain was, therefore, trilingual, with a Latin-speaking administration, a Germanic-speaking army, and a Brittonic-speaking populace.

After the withdrawal of the Roman administration in the 5th Century, Britain was left with a considerable population which was Celtic in race but Germanic in language. Brittonic-speaking Picts from what is now called Scotland were starting to raid south along the east coast and Goidelic-speaking Scots from Ireland (Scotia) were invading and occupying Argyll and also Dyfed, Gwynedd and Cornwall.

It was not long before an even wilder tribe was settling uninvited along the north-east coast. These were the Angles ("Engle" in Old English) from the area of Schleswig near Flensburg still known as Angeln. Whether or not the Angles dominated a larger area than the nominally Saxon bands which had established sovereignty further south, their dialect "englisc" ([sc] = /sh/ in O.E.) which was closely related to the Germanic lingua franca of the old Roman army of occupation, became the name of the popular language which was emerging from the coalescence of all these influences. The Angles also gave their name to the country which came to be identified with this common tongue.

By the Middle Ages, English had displaced Brittonic from most of England - apart from Yorkshire (Elmet), Hereford and Shropshire, the Chilterns, Kent, Gloucestershire, Dorset and Somerset, Lancashire and Cumberland. Pockets of Brittonic speech persisted here for shorter or longer periods, while English incorporated Scandinavian dialects, and a large amount of Norman and Central French from 1066 A.D. onwards.

As a result of these influences English emerged in the 12th Century as a new hybrid language bridging northern and southern Europe. Later, neologists referring directly back to Latin further modified English,

so that it has ended up closer to Italian than to French. Moreover, English might now be better identified as a Romance rather than as a Germanic language, although the adjective precedes the noun - as in four out of the world's five leading languages: Chinese (Putonghua), Hindi, English and Russian. The exception is Spanish - which is a Romance language.

Meanwhile Ireland had been annexed by Henry II - since when Irish idioms have played a part in shaping the increasingly heterogenous English language. Brittonic continued to be spoken for a long time in Cumbria, and until the 18th Century in Cornwall, but was long ago replaced by Irish in Pictland (most of modern Scotland) and the Isle of Man.

By reason of long association, the senior or intrinsic tongue intimately linked with Great Britain might be said to be Brittonic rather than English. The descendant of this original language of the Britons (including the "English") is, of course, still found in Wales - with a Gaulish-influenced variant in Brittany. The remarkable endurance of these two Brittonic-derived tongues can largely be ascribed to the diverse and mainly alien origins of both English and French which, although formed within the British Isles and France, have never really been national tongues, in the sense of being identified with the whole or a part of a country, or with any single country.

Thus English and French have both been, to some extent, international languages from the start: a role which they have continued to perform in different areas, though English has obviously replaced French as the leading world language. As English has spread throughout the world it has drawn in elements from numerous languages, including Latin, Greek, Hindi, Malay, the Amerindian tongues, Maori, Chinese, Zulu etc.. The map of "World English" embraces varieties in Africa, North America, the Caribbean, Australasia, India, Malaysia, the Philippines, Polynesia and Melanesia.

Most estimates put the number of idiomatic English-speakers, mostly from mother-tongue countries, at around 370 million. Second or auxiliary language speakers, i.e. those for whom English is not the primary language or mother-tongue, may be divided between fluent speakers, reckoned at about 100 million, and less than fluent speakers - but with some knowledge of the language - who are counted between 300 and 700 million, depending upon where the line is drawn between what is "English" and what is not. Another commonly quoted statistic is that a quarter of the world's population (of nearly 6 billion) speaks some English. It is also reported that about 80% of the world's electronically-stored verbal information is in English. Such estimates are necessarily rough and somewhat speculative, but they indicate the approximate size of the numbers involved.

Chapter_Two: "English_as_an_Auxiliary_Language"

The great common languages of humankind arose, not by planning, but rather by accompanying civilisations of historic significance. Thus Greek became the language of learning for centuries as a direct result of the outstanding pre-Roman civilisation of Greece which produced scientists and philosophers like Pythagoras, Hippocrates, Socrates and Plato; and writers like Homer and Euripides. Following the conversion of the Roman emperor Constantine, Latin became the lingua franca of the Christian church in Europe; and then, after Muhammad, Arabic was the common tongue of the Islamic civilisation which stretched at its height from Spain to China - and gave the rest of the world so many branches of knowledge. French was later the language of the international culture which, coeval with and in reaction to the turbulence of the Reformation, identified itself with French style and humanist philosophy.

Similarly, the rise of the English language mirrored the fortune of the English-speaking world as it diversified through a variety of commercial enterprises, military campaigns, cultural activities and missionary endeavours into the largest political combination the world has ever seen. Moreover, an overall reputation for administrative justice, and for upholding the right to life and faith, held English in good stead, long after the end of Empire, a tradition maintained to a great extent through various international agencies with close links to the best aspects of Anglophone civilisation. However, there are now signs that the relative influence of the English-speaking peoples is waning, whether in the commercial or cultural spheres. The inexorable lesson of history is that the decline of the English language should follow.

But a world awakening to consciousness of itself need not be determined by historical precedent. Even supposing two centuries of Anglo-American hegemony were bought out by Chinese economic success, English might still surpass Chinese as a basis for the international auxiliary language: not only due to its spread and status, but also by virtue of its inherent qualities. Hence one point of view that merits consideration is that an internationally determined, but orthographically unreformed, version of the English language would adequately fill this role. Could a modern version of English be formally adopted by the U.N., taught to children in schools all over the world, and used for all international purposes?

This certainly remains a possibility: for English retains a high profile as an international auxiliary. The large number of schools and institutes continuing to teach English to foreign students; its use in information technology, air and maritime telecommunications, publishing, international scientific and medical terminology, global conferences and, of course, popular music; the co-status of English and French as the two "working languages" among the six used at the United Nations - all these things attest to the continued health and vibrancy of English as an international auxiliary language.

The relative neutrality of English, compared with other ethnic and national tongues, also allows it a greater role as an international auxiliary. For example, books by Palestinians are currently being translated into English, and then from English into Hebrew (i.e. not directly from Arabic to Hebrew). Likewise, in Belgium many nationals choose to address one another in English rather than use the language of the other community; and there are even calls for a Flemish capital city because of the dominance of French in Brussels. A similar situation exists in South Africa, where languages such as Afrikaans and Xhosa are identified with national groups, but English is seen as neutral. This feeling about English is also a factor in its success in India and many African countries.

However, in spite of these recommendations, we find not only chauvinism from within other language communities, and historical resentment from within ex-colonies, but also thoughtful lines of argument which question the fundamental suitability of any national or otherwise partial language for the demanding role of international auxiliary. One criticism is that such languages always have features which are linguistically difficult for people from different speech areas: for example, the common English phonemes /dh/ and /th/ would be included in this category; another would remind us that native speakers have an advantage when using their mother-tongue with those for whom it is an imperfectly absorbed second or auxiliary language: since the latter have to struggle with the language as well as with the ideas under discussion. It is thus claimed with no little justification that diplomatic, commercial and ideological advantages would accrue to those countries where the chosen international language was spoken as a mother-tongue.

Only a minority of people are perfectly bilingual, so this is a real problem, and one for which translation is an inadequate solution. Proper translation is inconvenient and expensive because it requires an excellent knowledge of two or more languages. (Fluent speakers of second languages may appear to be competent, but can cause misunderstandings by missing idiomatic meanings or misusing words, e.g. "demand" for "ask for".) Most of us have a far from perfect command of even one language. Some idioms can be difficult for the average translator to understand, much less correctly translate, and many words, e.g. "fun, pet, get; demi-tasse, éclat (Fr.); Gemütlichkeit, Weltanschauung (Ger.)", often have no exact equivalents in other languages. Numerous are the gaffes and misunderstandings, with occasional disasters, which have resulted from mistranslation.

A common source of amusement has been trade names which have unintended meanings in other languages: such as the "Nova" car that "doesn't go" in Spanish. Diplomatic gaffes like President Kennedy's "Ich bin ein Berliner!" are from the same vein of humour. (The two expressions are now equivalent in German - perhaps too many foreigners were calling themselves frankfurters and hamburgers - but in the early 1960s inclusion of the little word "ein" - in direct translation from the English - changed the meaning from "I am a Berliner!" to "I am a jam doughnut!")

The absence of an international language can also have tragic consequences. It is widely reported that the atomic bomb was dropped on Hiroshima at least partly because of a mistranslated reply from the Japanese. At another time many died in Spain when bread was made from imported grain. Nobody could read the labels which identified it as mercury-treated seed-corn. More recently a World Health

Organisation report warned about the dangers of countries donating drugs and medicines. For example, some pregnant women in Latvia were given cattle worming medicine which caused them to go temporarily blind. Doctors had guessed at what the medicine was by comparing labels. Mediators in international crises regard lack of a common language as a major complication. For instance, this view was expressed on BBC Radio 4 after the recent (August 1996) hijacking of a plane containing 199 passengers from Khartoum to Stansted (London) via Cyprus.

The failure, in 1919, of the Conference of Paris and Treaty of Versailles has been partly attributed to the inherent deficiencies of translation. It has been suggested that the fact that Clemenceau spoke both French and English, but that Lloyd George and Woodrow Wilson spoke only English, gave an undue advantage to the French on their home ground. Thus, whereas Anglo-American intentions were transparent to the French, the heads of the British and American delegations had to understand the French position through the medium of translators and Francophone (almost certainly Francophile) officials. This tended to ensure that the French and Belgian demands for excessive reparations against Germany prevailed.

Such objections to translation and the international use of national tongues were the motivation behind the idea of an international auxiliary language: which every child would learn at school in addition to the mother tongue. Esperanto has been the most successful attempt to create such a "neutral" language. It continues to set the standard in various ways, even while remaining an essentially European concept with certain unrevised defects which now limit its international viability.

Moreover, the same objections continue to militate against English: which cannot but be classed as a national language to some extent, in spite of its present international roles. Indeed, such is the level of feeling about the issue, that not only is English unlikely to be adopted as the international auxiliary language in its present form, but a reformed version would have to consciously move from the English-speaking world to the whole world: whether in orthography, phonology, vocabulary or grammatical structure.

A name change would also be necessary, as pointed out by Hans Lunder of Oslo, Norway, in letters to the "European" (30/5 & 4/7/96): "...Seventy per cent of those Europeans earning double or more the average income are able to read English newspapers or watch TV news in English.

I propose that we make English the main European language for communication, conferences and international events. The world is getting smaller but has too many languages. These mean unnecessary expense and time in translation, wasted time learning other languages, poor communication, cultural polarisation and conflict.

Nationalism is the main problem. The French, for example, fiercely guard all aspects of their language. "English" is both the name of a country and a language. This problem can be solved by calling the international English "Globish" the global or world language. Then everybody could talk and write Globish without thinking about nationalism..."

"...I propose Globish - "the global language based on English" - because it is simple to grasp and express. I do not propose that Globish should take the place of national languages but that everyone could use it as a supplementary or auxiliary language."

We would endorse Mr Lunder's concept of "the global language based on English" with a new name (which might be "Globish" or something else - the name doesn't really matter) because the present status of English as an auxiliary language is equivocal: businessmen, politicians, scientists and even language researchers from the English-speaking countries have evidently greatly overestimated its penetration as a second language. In 1989 a study conducted in Belgium, France, Germany, Italy, the Netherlands and Spain concluded: "The real correct understanding of English in all the countries studied is notably inferior to the most pessimistic existing evaluations and our own guesstimates" Van de Sandt, Report in "Initiative Media News Bulletin" (London: Lintas Worldwide, January 1989).

In 1990 Sir (now Lord) Randolph Quirk, Professor of English at University College in London, put it thus: "Despite the persistent and glib assumptions in Britain and America, we are witnessing a significant relative decline (perhaps even an absolute decline) in the currency of English worldwide. This may come as a surprise to those who think of English as the medium of high-tech skills, international conferences, and professional journals: here indeed continued growth is doubtless the order of the day. But these are relatively slim and specialized lines of communication."

In 1991 Richard Bailey, Professor of English Language and Literature at the University of Michigan and Associate Editor of the "Oxford Companion to the English Language", was even more specific: "The proportion of the world's population who regularly use English is 15% - and falling." It appears that, although mass travel, media and communications within the English-speaking world have continued to iron out extremes of accent and dialect, preventing mutual unintelligibility between indigenised varieties, the burgeoning of these very connections has also exposed the comparative economic decline and moral uncertainty at the heart of the English-speaking world. Thus the appurtenances of modern civilisation may well have had the reverse effect of lowering the prestige of English and turning the masses in various ex-colonies towards other cultures and languages.

Moreover, English can be difficult; many who are not natural linguists have failed to master it, in spite of intensive study. Stress and intonation present particular problems. Idiomatic expressions can be confusing or misleading. Uncertain syllabification, irregular and phrasal verbs, the vast range of tenses and compound nouns are among the features of English that cause headaches for its students. Even the so-called simple grammar itself, based on prepositions and word order rather than inflections, is very vulnerable to the bad writing which stems from muddled or disordered thinking. In such a case the efficient but rather fragile syntax breaks down and the meaning becomes ambiguous or impenetrable even to native speakers. Worst of all is the notorious dissonance between spelling and pronunciation.

The official use of English in aircraft telecommunications, to which most countries and airlines have signed up, is contentious for the same reason. A number of horrific air crashes have been directly related to the difficulties of English when used for this purpose. For example, in 1977 two 747s collided at Tenerife, with a death toll of 582. The Dutch pilot had apparently misunderstood the English of the

Spanish air traffic controller. Similarly, the Russian pilot's poor understanding of English (far from untypical according to Indian officials) was blamed as a significant factor in the very recent (12/11/96) mid-air plane crash over Northern India, which killed 351. Moreover, the British Airline Pilots' Association reports that, contrary to the official agreement, French and Spanish aircrews use their own languages in the air. Also, local languages are used to gain advantages over English-speaking crews, e.g. precedence in landing. A rational, consciously internationalist language, that crews would take pride in speaking correctly, would go a long way towards eliminating these infringements.

Finally, since language is an organic phenomenon, English has sometimes been characterised as reaching that proverbial "middle-aged" condition where, in contrast to the lean and questioning period of youth, the mind tends to narrow whilst the body enlarges. During a century and a half from the beginning of the 16th Century, between 10,000 and 12,000 words were introduced into English, of which half still exist. Shakespeare coined about 1,700. Also, a measure of orthographic and grammatical reform accompanied the new words. But since that time, although the English language has been distended by the addition of thousands of new words, they have been mainly in narrow or specialised areas, especially those concerned with science, technology and commerce. The fact that English has developed in this narrow-minded way (as has every other "national" tongue to a greater or lesser extent after its own fashion) seriously limits its capability as an international auxiliary.

In particular, the historical connection between the English language and Judaeo-Christian civilisation has allowed a cultural gap to develop between English and Eastern tongues with very different political and religious traditions. As a result, English is not the ideal medium for use as an international language in these societies, and holds the status largely for lack of an alternative. One problem is that English has few words for many concepts that exist in Eastern tongues. For example, the words "knowledge" and "love" are used in English to cover different categories of meaning that are separately defined even in Ancient Greek; much more so in Arabic, Farsi and other modern languages. Such deficiencies make English an inadequate vehicle for both speech and translation in the eyes of some cultures.

Chapter_Three: "English_as_a_Primary_Language"

National languages tend towards exclusivity. The purist movement in Iceland, supreme for about 200 years, has kept Icelandic notably free of foreign vocabulary and grammar. When Norway achieved independence it began to develop a Norwegian language purged of "Danishisms"; and similarly when Romania became a nation it set about replacing Slavic elements. Purifying the national language is something that nations try to do. International languages on the other hand tend to be inclusive. Spanish has been very influenced by Arabic, and by the languages of South America; and Persian also absorbed huge quantities of Arabic when it became an international language. Russian has likewise been ready to admit foreign elements, receiving words from all quarters, in contrast to the majority of Slavic languages (e.g. Czech and Slovak which are rooting out words of German origin).

It would be almost impossible to "purify" English in this way. Most of the vocabulary is from other languages and the grammar has drawn in elements from around world for centuries. The attempts in Scotland to establish Scottish English suffer from the same problem since Scottish English is shot through with foreign influences from the same sources. Whereas languages obviously limited to a national role, like Welsh and Irish, are amenable to "purification", it would make no sense for varieties of English, all of which have departed from the "national" type. English has apparently been abandoned to internationalism: no language, including Latin, has been so separated from its roots. This means that an offspring from English might be consciously developed as a basis for an orthographically-regular international auxiliary language, while the rest of the English language continued in its present national and international roles.

Although English has gone well beyond the boundaries of national exclusivity, it is far from culturally neutral. Its pre-eminence as an auxiliary is very much a result of the former political and commercial dominance of the English speaking peoples. But it is also seen to be the best, or the least bad, existing language for international purposes from the linguistic point of view: a state which it has achieved by incorporating a greater variety of words from diverse languages, by disposing of genders and other superfluous or non-essential parts of speech, and by avoiding the kind of "national" linguistic reform which would have made English less appealing at the international level - the consequent incongruity of T.O. with any known speech has given English the benefit of a measure of cultural neutrality.

These relative advantages, compared with other languages, have allowed English to function as a second language for necessary communications, but the heart of the language is still fixed in the English-speaking world, which limits its creative usefulness for speakers and writers from other cultures. Such

internationally-acclaimed authors as Professors Chinua Achebe and Wole Solinka still value English as an auxiliary language, but for essentially this reason do not write in it as much as before. They now have serious reservations about English as a literary medium for African expression. Other writers resent the pervasive implication in Anglo-American culture, often explicit in the mass-media, that the typical African lifestyle is inferior. Consequently they refuse to use English, and propose Hausa or kiSwahili as the pan-African language. A similar attitude is widespread in various ex-colonies of the U.K. and U.S.A.

The difficult question is how English might become a distinctly idiomatic language without, as Achebe put it, losing its "value as a medium of international exchange". Unfortunately, what tends to happen at present is the worst of both worlds, for whatever the historical assimilative capacity of English, the sclerotising combination of businesspeak culture and spellchecker orthography is now stifling its capacity to adapt to, or represent, varieties of ethnicity. Moreover, much if not most of the English in many of these countries is more or less suffused with the characteristic stress-patterns, rhythms and intonations of indigenous languages, and is infused with elements of their grammars and vocabularies. For example, in India, the West Indies and West Africa, the English spoken tends to be timed by individual syllables rather than by stressed syllables, as in British and American English. The result is that, although these indigenised varieties of English may function efficiently as lingua francas between or within these countries, they may be sometimes difficult to comprehend when used in international circumstances.

The tendency of the English-speaking world to overestimate the global use of the language is largely due to colonial legacies, such as the third-world élites at American and British universities and military colleges who subsequently maintain the profile of English through commercial contacts and domination of the local media. This English-speaking leadership may have come into existence partly because the colonial administration was ambivalent about native peoples learning English since, as a common tongue, opposition to Empire spread through it; but, for whatever reason, such prominent figures are wholly unrepresentative of the penetration of English into the general population of these countries. The international usage of English is actually quite precarious; but by the same token it is well positioned for a thorough revision.

English is the sole or joint official language in about forty-five nations; but in most of these countries, and especially in Africa and Asia, it is the native tongue of no more than a small minority. Moreover, the desire to affirm national cultural identities is beginning to promote indigenous languages in the education system and elsewhere at the expense of English, not least through television. Thus English is gradually losing even more of its limited influence on the masses; and is becoming almost exclusively the auxiliary language for international communication.

But that is not necessarily a great honour either, for an exclusively auxiliary status might threaten the long-term survival of English in these countries, since it would no longer be used as a primary language. Moreover, the international focus in these parts is moving away from the English-speaking world, and more towards regional economic communities which favour other languages.

On the other hand it must be admitted that, although the English-speakers in these nations are numerically small, some of them exert an influence far beyond their numbers by reason of international relationships or links - whether in administration, commerce, literature, the arts, science or religion. This is the point of view from which the prospect for English looks hopeful. For were its orthography to be entirely reformed and its name changed, so that it became politically and linguistically acceptable to many more progressive thinkers within these nations, primary status as the living world language - the growing conduit for global culture - might well be realised.

Chapter_Four: "English_and_Other_Languages"

Languages are continually in a process of transformation. A primary language or mother-tongue might become extinct, or turn into an auxiliary elsewhere. Equally, a second language might become a primary tongue through relexification. Thus Cornish borrowed so much vocabulary from English that it became thoroughly "Englished". This continued until the majority of speakers decided that they might as well be speaking English: so they abandoned Cornish.

In America the first wave of immigrant tongues, e.g. German, Italian and Japanese, disappeared in this way. The same is already happening to mostly second-wave languages such as Russian, Korean and Vietnamese, though the process may take longer given the greater dissimilarity between most of these languages and English. Even indigenous Amerindian tongues, before which English is an immigrant language, are gradually fading for the same reason. Decreolisation has occurred in a similar manner, as in Hawai'i, where the original indentured labourers from Japan, the Philippines, China etc. used Pidgin English, their children developed Hawaiian Creole, the next generation used Hawaiian English, and many of their descendants are now speaking General American English.

Most minority tongues, having found themselves isolated in the midst of a major language area, have eventually vanished likewise. The process has appeared to be impervious to both herculean effort and generous funding. The classic example within the British Isles is the Irish language. In spite of, or perhaps partly because of, seventy-five years of Irish Government endorsement, the primary language community of mother-tongue users of Irish has continued a long historical shrinkage to its present level of about 10,000 speakers. The obvious reason for this process has not changed over time: a knowledge of English gives access to an incomparably greater range of literature, television, radio programmes, domestic employment opportunities in an increasingly international market, foreign travel, and so on. Conversely, Irish is a difficult language for those outside of a mother-tongue family to learn to speak properly: largely due to a marked discrepancy between the spoken tongue with its 60 phonemes and the historic Irish spelling system.

Those who are concerned with the future of Irish recognise that the size of the primary language community is crucial because any tongue will only develop organically, or in a genuine rather than a prescribed manner, when it is used creatively as a primary language. From this point of view the large number of people who speak Irish even quite fluently, but as a second language, do not really count because the predominance of their thought, and hence of their linguistic innovation, tends to take place in English. Similarly, the fact that the number of native Welsh speakers may currently be increasing should

not necessarily be seen as significant, so far as the future of this language is concerned. For Welsh is much easier to learn than Irish, and is also more important symbolically, in the absence of other tokens of statehood. The salient fact from the linguistic or long-term political viewpoint is that the increase is of those who continue to value and speak English for the access it gives to a wider international culture.

But English-speakers should not be complacent. The status of their language largely rests upon a past greatness, and currently favourable political conditions; whilst these minority tongues are being revived (or resurrected in the case of Manx and Cornish) more thoroughly and systematically than in the past, with Government assistance, and particular concentration upon pre-school children. The tide of opinion could turn, to leave English high and dry, if it was felt that these tongues were easier to learn than English, and offered more in the form of creative expression.

The use of English as a media language, including in recorded items such as audio and video tapes and discs, has been a central part of its success during this century. So much so that some promoters of minority tongues see media saturation, even to the extent of suppressing all other languages on local radio and T.V., as the only route to survival. The plethora of broadcasts in English across the expanses of the U.S.A. earlier this century was indubitably one of the main factors in the decline of other languages. More generally, the electronic media have provided an incentive to learn one of the major languages - in order to be able to follow the maximum number of broadcasts. This is at least part of the reason why over half the world speaks just five major languages: Putonghua (the official language of China), Spanish, Hindi, English and/or Russian. Nine tenths of the rest of humanity use no more than 95 languages, and only 77 of the thousands of remaining tongues have more than 1 million speakers. It is notably countries still largely unpenetrated by the electronic media, or mountainous and with consequent poor reception for land-based signals (e.g. in the Caucasus), that have the largest number of languages (which are often phonetically precise and hence "media unfriendly").

In America, and much of the rest of the world, the dominant media language is of course English. But one language which English will not necessarily be able to displace from the U.S.A. by this means is Spanish: which is very widely used as a media language in its own right. In the U.S.A. as a whole there are over 200 radio and 300 television stations broadcasting in Spanish, as well as 200 Spanish-language newspapers. Moreover, English might lose an audiovisual war with Spanish because the orthographic relationship between the spoken and written language is much closer in Spanish. Consequently, since the acquisition of literacy in Spanish does not depend so much upon the visual impression of the written word, the electronic media are more profitably used for educational purposes in Spanish than in English.

Another modern development of linguistic significance is the growing power of the Spanish-speaking bloc beyond the U.S. southern border. The North American Free Trade Agreement, inexorably leading to the formation of a political union throughout the Americas, will not necessarily operate to the immediate economic advantage of the North. Not only has a great deal of U.S. industry been copied or transferred to low-wage parts of Central or South America (or elsewhere in the world) but a lot of once exclusive knowledge and expertise has gone with it.

At present, linguistic integration is following the standard pattern: most second-generation Spanish-speaking immigrants speak English, and about half speak only English. However, the situation could change: in Los Angeles, Miami, and many towns near the Mexican border more than half the population speaks Spanish and there are large areas where community facilities and essential services operate in that language. Moreover, illegal immigration continues apace, and there seems to be a new mood of militancy: commentators have observed that, compared with a generation ago, immigrant New York taxi-drivers are often reluctant to speak English. English is still the nominal language of American education, but practice very often dictates otherwise. (The fact that English is now the "official language" in a number of states is hardly significant, considering the number of countries where English is the official language but relatively few people actually speak it.)

In a similar way, Quebec has been buttressed by considerable moral support from France over the centuries, but for which French would have disappeared from this part of Canada in the same manner as other minority tongues in North America. Moreover, the relatively high birthrate both here and in the Spanish-speaking countries has helped to move the linguistic balance away from English. This is a worldwide phenomenon. Not so many years ago the global native English-speaking community was second only to that of Putonghua in size; but now, by some estimates, it is overtaken by native populations speaking Spanish and Hindi. These demographic changes obviously concern mother-tongue speakers only, so they affect the primary rather than the auxiliary status of English. However, since creative renewal mostly proceeds through first rather than second languages, an actual or potential reduction in the strength of English as a primary tongue eventually weakens its role as an auxiliary language too. A predominantly second language role is eventually fatal to a language, because the incorporation of "ethnic" words and expressions effectively ceases; rather is the second language plundered to strengthen the "mother tongue".

This process is the norm because the latter remains the primary vehicle of thought and feeling: the language most people hear within their own heads. Conversely the second language tends to be used for second-hand thoughts, the stuff of business transactions and formal conversation, rather than for the creative imagination that gives the impetus to transliteration and neologism. Any second language gives more to the primary tongue than it receives back. Here is an obvious danger to a second language which is not being recreated as a primary tongue elsewhere. Hence, the continuing pre-eminence of English as a second language should be regarded as a temporary reform opportunity towards the international auxiliary language, rather than as a reason for optimism.

The relationship between first and second languages is crucially dependent upon the relative prestige of the associated communities as cultural or economic entities. Often it is difficult to tell whether a language is first or second, and even speakers themselves may be unsure, until they have decided which language is going to bring most practical benefit. Statistics showing the worldwide distribution of English reflect this confusion with widely varying estimates of mother-tongue speakers - e.g. two 1997 reference books, the Cambridge Encyclopaedia of Language (2nd edition) and the 1997 Encyclopaedia Britannica Yearbook, give very different figures, 70,600 and 8,000 respectively, for the number of mother-tongue English speakers in Malta out of a total population of about 373,000.

Ultimately there is only one solution to the dilemma of first and second languages: a single universal auxiliary language which can act as both. It might be asserted that this language already exists embryonically: a still rather nebulous and obscure entity which is growing and forming through the internationalisation of vocabulary, phonology and script. One tremendous impetus in this direction is the transliteration of supranational scientific and religious neologisms into different languages - mainly through the pervasive media culture which is replicating famous names and replaying slogans and soundbites around the planet.

Chapter_Five: "The_Constructed_Languages"

Over the centuries at least 200 attempts have been made to construct a language which consciously reflected this universalising tendency: endeavours which have successively marked the expansion of linguistic theory and political understanding. The movement reached its zenith before the First World War, but has since declined due to certain inherent limitations. Nevertheless, it has greatly advanced the cause by empirically demonstrating the theoretical possibility of consistent grammar, regular orthography and cultural neutrality within a single language - though the combination has not yet been fully realised in practice.

The languages which have been devised for this purpose may be divided into two types: "a priori" and "a posteriori". The former attempted to classify ideas and were unrelated to actual languages. These were pioneered by Wilkins in his "Universal Character" (1668), and by Leibnitz with his projected "characteristica universalis". A later example was Ro: which had some success at the beginning of this century. However it is now generally accepted that any practical solution must be "a posteriori" i.e. drawing on existing tongues. Proponents of the latter prefer the adjective "constructed", since they argue that these languages are made from "organic" elements such as common word-roots.

The first truly successful "a posteriori" language was Volapük ("World Speech"), published by Schleyer, a polyglot German priest. Although 40% based on English, it was complicated by an array of grammatical rules, and an expanded range of vowels. A few years later, in 1887, Dr Ludwik Zamenhof, alias "Dr Esperanto", introduced a language which used fewer vowels and had a much simpler grammar than Volapük. (On the other hand it employed a greater number of consonants identified by diacritics.)

Zamenhof was born and brought up in Poland near the Russian border: a place of diverse ethnic groups divided by language. At home he spoke Russian and studied Latin, Greek, German and French. Hebrew was spoken at the synagogue. Somewhat later he encountered English at school. This may be significant because his "attempt towards an international language" contained several grammatical structures which English manages without: e.g. distinct transitive and intransitive verb forms, separate reflexive pronouns, plural adjectives and the accusative case.

Despite these, and other especial difficulties for certain nationalities, Esperanto entirely supplanted Volapük and went on to a far greater influence. In particular the humanitarian ("homaranismo") movement which Zamenhof explicitly associated with the language exactly caught the spirit of the times. Realising that a consciously internationalist language required an ethic to sustain its ideal, Zamenhof

created a humanitarian morality, or set of principles, subsequently put it into practice in various ways, including through a culture of hospitable exchange. Although such schemes have probably benefited international relations, an unintended side-effect may have been to reinforce the cult of Zamenhof as linguistic genius - which has hindered a rational approach to the reform of Esperanto.

It wasn't long before Zamenhof began to receive extensive correspondence about his language. Amid the general praise he was also offered a number of suggestions as to how the language might be improved. He reacted to the latter by including a questionnaire listing six proposed reforms, with a detachable ballot, in the back of a later edition of his booklet. Of the low percentage of ballots remitted the great majority rejected all six suggested revisions.

However, in spite of this apparent endorsement of his original scheme, certain prominent supporters continued to be dissatisfied: so at the first Esperanto conference, at Boulogne-sur-Mer in 1905, Zamenhof announced a plan to restore unanimity. Citing the paramount need to preserve the unity of the language, he decreed that nobody, himself included, henceforth had the right to alter the basic grammar ("fundamento") of Esperanto until after it had been officially adopted as the international auxiliary language.

Since the near realisation of the latter was expected by many in those idealistic times, before the world was sundered by national, racial, class and religious conflict, Zamenhof had raised a hope ("Esperanto" = "one who hopes") which allowed the movement to progress rapidly for two or three decades. By the late 1920s Esperanto was a household name, 44 radio stations were putting out broadcasts in the language, and it was being taught in the commercial schools of London and Paris. It also had the support of the League of Nations.

The perception that the influence of Esperanto has declined since those days is not confined to the English-speaking world - where Esperanto never really took hold for obvious reasons. Esperanto was very much a product of its time: it displays a 19th Century belief in an objective "mechanistic" approach which runs counter to modern convictions about the organic process of language development. This is epitomised by the exclusive "auxiliary" role Zamenhof ascribed to his language. Although such a status may have made Esperanto more politically acceptable heretofore, it now prevents it from developing organically as a primary language.

Moreover, a letter from a member of "...the "Akademio de Esperanto" the organisation which indeed is responsible for the language itself" explains why the particular linguistic difficulties for some language groups remain unrevised: "...no one, repeat no one, now can possibly propose changes in Esperanto which would have the slightest effect on the use of the language all over the world." "We are constantly receiving proposals from old and new Esperantists for "improvements" to the language, any of which would have as much chance of success as trying to improve the English language - of which there have been many projects, all of which have been, and will always be, ineffective."

Thus the Esperanto Academy, while claiming responsibility for the language, declares itself unable to

exert any influence - as though it could not use its authority to initiate steps towards fundamental revision. Orwell, who grimly satirised the centrally-controlled artificial languages Esperanto, Interglossa and Basic English as "Newspeak" in his famous novel "1984", would have identified this as "doublethink". It is perhaps fitting that Esperanto has latterly found its greatest support in totalitarian states - last refuge of the personality cult.

By mortgaging the future of Esperanto in this way, though with the best of intentions, Zamenhof created a double-bind which prevented the fundamental revisions that might have brought the popular success that would have ensured official endorsement - and subsequent adoption as the world auxiliary language. Another unfortunate effect was to provoke the formation of rivals, the first of which was the openly-derivative Ido ("Birthling"), published in 1907.

Other new constructed languages sought to build on Latin or Greek rather than the European tongues used by Esperanto. For example, Interlingua was based on Latin, and Interglossa on both Latin and Greek. It is noteworthy that some such artificial languages have an even simpler grammar than English - with no verb inflections and very few tenses.

That Esperanto remains pre-eminent among constructed languages, in spite of the many imitators that have set themselves up as rivals, is a tribute to Zamenhof's genius. There is no doubt that the best features of Esperanto, including the concepts of cultural neutrality, rationalised orthography, regularised grammar and global organisation, will live on - though not necessarily under that banner.

The aims of the Esperanto movement were recently endorsed by 183 British MPs in the "Esperanto Parliamentary Group". However, very few of the listed MPs actually speak much Esperanto, and neither do their constituents. Many have made an attempt but have found it too difficult (considering the relatively insignificant size of the world speech-community after a century). It is rather the idea of Esperanto which accounts for its appeal to these MPs: the notion of a "politically correct" international auxiliary language with a simplified and easy-to-learn grammar and orthography. Such is the importance of these populist political aspects that no international language which fails to heed them is likely to succeed.

Chapter_Six: "The_International_Auxiliary_Language"

The constructed languages have provided a paradigm, if not a realisation, as the strengthening bonds and links between the whole of humanity - whether forged through religion, science, commerce, tourism, sport, the media or in any other way - have increasingly exposed the expense and inefficiency of speaking about common purposes with a multitude of tongues.

But strong opposition to the concept of an international auxiliary language remains, in spite of this powerful testimony. Militant nationalists naturally anathematises the idea - and would proscribe any viable language in the same way that the Nazis banned the teaching of Esperanto in 1935. Such may well have had their day, but opposition is still likely from moderate nationalists who may well be concerned that the international auxiliary will imperceptibly suppress and eventually extinguish their treasured national tongues.

However, unless the constructors of the international auxiliary choose to learn nothing from history, they will refrain from repeating the mistakes of the past. For every tongue forced into silence later shouts out twice as loudly. Basque is but one prominent example. Every minority language has reacted in the same way to the extent that attempts have been made to extirpate it. But within other minority ethnic groups, which have not been linguistically oppressed, there is an even stronger appreciation of the educational, economic or political advantages of belonging to a wider speech-community. This is the dynamic, two-way but unequal, which is allowing many of the minority ethnic tongues to be absorbed by creoles; or by the great "national" languages.

But although most of the speakers of these tongues are persuaded that they are willingly abandoning old-fashioned and limited languages, with which the desire to remain is essentially retrogressive and nostalgic, the alternative viewpoint, which insists that neither the creoles nor the national languages can adequately represent the phonology or vocabulary of the speech that is lost, is still a force to be reckoned with. Emboldened by the long-term political trend towards global subsidiarity, which is encouraging former regions to express an historic "national" identity, this ideological position argues that, since minority languages were formerly obscured by foreign rulers who were hostile to any tongues which might rival their own, the original tongues should therefore be reinstated and restored as symbols and vehicles of cultural independence.

This interpretation appears to be becoming the fashionable orthodoxy. For example, a report in the "Times" (1/5/96) which mentioned the revival of the Manx language and culture in passing, began with

the apocryphal sentence: "A hundred years ago, any child who dared to speak Manx Gaelic in the school playgrounds of the Isle of Man would have a noose tied round their neck." No attempt was made to disabuse the uninformed reader of the implication that it was through political and linguistic oppression, rather than with parental approval, that the Manx language was killed off.

The phenomenon of minority ethnic languages is extremely complex because two separate issues are involved. One is the essentially political view that a major national language such as English, French or Russian, cannot express sentimental attachment to a distinct geographical area with a unique history; or, at least, it cannot when compared with a minority ethnic tongue which has evolved in the place for centuries and supports a personal sense of identity.

The other is a subtler argument, which is essentially linguistic, but also cultural in the patriotic sense of diversity within the body of nations. This asserts that, since any national language, however large the area it may represent, is by definition less than universal in scope, it cannot do full justice to the speech and thought of an area with a different outlook, sense of history, and cultural and religious experience, as expressed through language.

The minority language phenomenon has become one of those issues, like atmospheric pollution or disputed borders, which require a solution beyond the national level: for since the decline of religion as a metacultural bond, the connection between language and politics has been emphasised to the extent that it has become very difficult to hold together a modern nation formed out of old language groups - as Belgium, Canada, and many recent ex-colonies have found. These countries have also demonstrated that bilingualism (or multilingualism), however necessary in practice, is highly unsatisfactory and expensive - and is not a proper solution anyway since everyone always prefers one tongue to another.

The concept of an international auxiliary language addresses the minority language (or multilingual) problem from both the political and the linguistic standpoints. Those nations choosing to be an integral part of the civilised world could retain their mother-tongues for domestic purposes while employing the designated "neutral" international language for all communications outside of the indigenous culture. Every child would learn this specified auxiliary language at school as well as the mother-tongue. Thus it would no longer be necessary for everyone dealing with the wider world to waste time and resources learning several languages; nobody would need to learn more than two.

But this is not the end of the story: such an arrangement would have inexorable linguistic repercussions. The nations of the world are becoming more and more interdependent every day; the notion of self-sufficient or autonomous entities communicating indefinitely on a second-hand basis is no longer credible. Although everyone might learn two languages at school for decades or centuries to come, it is inconceivable that the auxiliary would not take on a life of its own - as a result of authors, advertisers, film-makers etc. writing in it directly to access the global market.

Assuming this came to pass, the relationship between the international auxiliary language and every national tongue would be comparable to that which presently exists, or has existed, between the minority

ethnic tongues and the great national languages which entirely surround them. Thus, even as islands of minority ethnic tongues have been surrounded by a sea of English, every language would eventually find itself within the matrix of the international auxiliary language. And correspondingly, even as English has diluted and absorbed minority ethnic tongues in its midst, it would itself be absorbed, along with all other languages, into one universal tongue of enormous capacity and subtlety.

The history of the dogged survival of certain minority ethnic tongues clearly shows that such a process would never be achieved by force, rather would it happen for cultural and economic reasons. Thus, if speakers and writers were to deliberately use the international auxiliary language to reach the widest possible audience or readership, and listeners were to learn it - and tune into it - to keep up with the latest news and newest thought from anywhere in the world, there is little doubt that this common language would develop its own character as a truly global tongue, even as primary creative impetus went into it. If this did indeed happen - whether through neologism, transliteration, or other aspects of linguistic development - the national languages of the world could be expected to successively abandon their separate identities, over a period of centuries, in order to become part of it: in the same way that some minority ethnic tongues have hitherto become submerged in national languages.

Thus there is no reason to suppose that an international auxiliary consciously developed for creative usage would not gradually obtain the linguistic and euphonic capacity to incorporate all useful features, whether structural or decorative, from both "national" and constructed languages. Indeed, it might well display these assets more precisely and harmoniously than their own more or less irregular grammars, partial phonologies and ramshackle orthographies. In such a scenario the mother-tongues would continue to be preserved in written and recorded form, but ultimately for sentimental value rather than linguistic information.

Chapter_Seven: "The International Language Committee"

If language were a purely scientific phenomenon, it would be judged according to strictly dispassionate criteria, and endorsement by social groups would be irrelevant. But language is partly subjective and a matter of opinion: it is notable for not always behaving in an objectively rational manner. It is qualitative as much as quantitative: the fact that the majority of languages, or most speakers, use a certain construction is no guarantee that linguistic development is moving in that direction. It is an art as much as a science: which is why a democratic mandate would not be enough in itself, and why it would be ultimately futile to proceed with a scheme, however popular, however apparently coherent and complete, which did not accord with the fundamental views and meet with the basic approval of society as a whole.

This is why the final choice of international auxiliary language is much too important a subject to be determined except through the widest possible consultation. In practice this means that all interested parties must have the chance to be represented or involved, and that any exclusively private or public enterprise, no matter how popular, far-reaching or well-funded, would ultimately fail to thrive without universal endorsement and confirmation. For the international auxiliary language will have to satisfy a variety of political imperatives, financial targets, cultural requirements and philosophical and religious ends.

However, all these interests will need to find a common active focus, lest they be dissipated, and the best instrument would appear to be an international language committee with close links to government, to the scientific realm, and to all parts of society. By the same token, it would be the common responsibility to ensure that this committee were not co-opted by any national or ideological group, which might wish to swing the development of the international auxiliary language in its direction.

Although the responsible international committee would be eminently qualified, the inherently subjective aspect of language would always introduce an element of fallibility into its decision-making. It would therefore be wise to consult widely with concerned groups and knowledgeable individuals, lest expensive mistakes be made. Conferences are proliferating between a growing number of language groups - as in the European Union - so exorbitant commercial translation costs, currently estimated at a minimum of 25p (38¢) per word, will eventually force the adoption of a common language. A hasty or putative choice, driven by political expediency, would inevitably do more harm than good: merely inflaming those national, racial or religious suspicions that act as figleaves to sectional interests.

The responsible international committee convened to form the language would no doubt be aware of

these dangers. No longer might an autodidact, or body of linguists, pluck a language out of the air, or develop one from scratch, when so much has happened already to indicate the limitations of the theoretical approach. So many prescribed rule systems and defined lexicons have failed already that the committee would be flying in the face of all experience were they to create yet another artificial vocabulary and grammar.

Esperanto itself has served to demonstrate that even an excellent linguistic phenomenon is not a language. Zamenhof failed to recognise that a language springs from the people using it. New linguistic modes are constantly coming into being, but in a very disparate fashion, due to the enormous diversity of national and regional speech communities worldwide. This produces the never-ending state of flux which distinguishes a living language from a constructed language, the rules and character of which are fixed.

In any case, there is now such a vast process of interactive research that it would be hard for the said committee to impose a language without due consultation - through which means alone the considerable fund of linguistic knowledge accumulated over the centuries in every culture would become available, to guide and inform their deliberations, and ensure that the chosen tongue be as free as possible from cultural bias - whether in script, vocabulary, grammar, or phonology. The same criterion of practical experience also demands that the selected language be already spoken by a large community: in order to prove that all its various aspects work in everyday speech.

Thus the international committee is most likely to form a new language out of an existing language which already possesses the necessary attributes of speech-community, cultural neutrality, rationalised orthography and transformability to a requisite degree. From these various diverse premises proceeds the logic of a language proposal that would meet the eventual arbiters of the international auxiliary language halfway - or even three quarters or nine tenths of the way. Zamenhof had much the same in mind when he made the revision of Esperanto's "Fundamento" conditional upon official endorsement, although he went only a quarter or a third of the distance before putting a freeze on further development. Had Zamenhof known about 20th Century linguistic insights like Zipf's Law he might have hesitated to take this decision, but he was primarily concerned about preserving the unity of the Esperanto movement, in view of the parlous situation prevailing at the time. Nowadays the better understanding of consultation and the democratic process will make it possible for the heirs of Zamenhof's valued linguistic endeavours to unitedly take the difficult and potentially divisive decisions involved in language formation - towards a successful and unified conclusion.

Chapter_Eight: "Constructed_and_Organic_Languages"

At first sight these two practical qualifications of the coming international auxiliary language, that it be politically neutral as well as spoken by a large community, appear to be mutually exclusive. For although the constructed languages, and Esperanto in particular, have been spoken by idealistic internationalists from all over the world, nothing like a genuine, organic, linguistically-developing speech community has yet emerged within the constructed language movement - in spite of every advantage from a regularised orthography and grammar.

An explanation of why the constructed language movement has failed to produce a serious rival to the national or ethnic tongues was presciently and cogently given by Edward Sapir in 1933: "Any consciously constructed international language has to deal with the great difficulty of not being felt to represent a distinct people or culture. Hence the learning of it is of very little symbolic significance for the average person, who remains blind to the fact that such a language, easy and regular as it inevitably must be, would solve many of his educational and practical difficulties at a single blow. The future alone will tell whether the logical advantages and theoretical necessity of an international language can overcome the largely symbolic opposition which it has to meet. In any event it is at least conceivable that one of the great languages of modern times, such as English, or Spanish, or Russian, may in due course find itself in the position of the de facto international language without any conscious effort having been made to put it there."

Sapir's prediction has come to pass for the very reason he gave. All languages, whether constructed or organic, rise and fall according to the popularity of the culture they represent. For instance, a constructed language would need the backing of a thriving global speech community in order to prevail. Moreover, when Sapir mentioned Russian as a possible international language it was associated not only with a huge transnational state, but also with a successful political system with ambitions to take over the world.

After the Second World War Soviet influence spread even further, but the realities of communism were reaching a climacteric, and in the 1980s the whole system collapsed. All of a sudden Russian ceased to be the common language of the Soviet Union and its satellites. To some extent English entered the resultant auxiliary language vacuum; but across Central Asia Turkish and other languages reasserted themselves; in Europe, Hungarian and various Slavic tongues re-emerged to reclaim their areas of influence; and in the West of the former U.S.S.R. Ukrainian, Belorussian, Lithuanian, Latvian and Estonian were re-established.

Now that Russia has lost its former superpower status, the notorious linguistic difficulties in the Russian language, such as the numerous irregular verbs, are no longer overlooked for political and economic reasons, but correspondingly are open to further reform. It may happen that revision of a second or auxiliary language is only considered when the dominance of the associated culture begins to falter. For example, part of the resistance to the orthographic reform of English has been a complacent assumption within the English-speaking world that the language will triumph anyway due to the innate excellence, or even superiority, of the associated pattern of civilisation enjoyed by the English-speaking peoples.

Anyway it looks most unlikely, at this juncture in world history, that an international language will prevail through the extension of national sovereignty across the planet. However enlightened certain empires of the past, or even imperialist powers of the 19th Century, might have been; the unfettered state, whether communist, racist, nationalist or nominally theocratic, has evidently turned malignant during this 20th Century, causing so much grief that nations have been effectively forced into confederation for the sake of collective security. Regional economic communities and various political associations under the aegis of the U.N., though not yet formalised on a global scale, have already begun to impede or frustrate the languages through which these national or otherwise partial aspirations or ambitions are inherently expressed. For example, the European Union has rejected English as its official working language; legitimate orthographic reasons are given, but additional factors such as that the political capitals of the E.U. - Brussels, Strasbourg and Luxembourg - are predominately Francophone, should not be considered irrelevant.

Briefly, a world order may have already arrived in which no language will be accepted for international auxiliary purposes simply because its associated nation, class or ideology happens to be more powerful or influential than others at the time. Moreover, the same scrutiny must be given to the constructed languages, which are not without political or ideological baggage - even if it is wholly unconscious and inherent. But nevertheless, in the more equitable cultural and linguistic ethos which is fast approaching, the valuable work put into the constructed languages promises to be realised, not least in view of certain practical considerations; one being that, although great multinational tongues - with millions of native speakers - have revised their spelling, none have approached anywhere near the standard of orthographic regularity set by Esperanto and the constructed languages. Orthographic consistency is also of increasing importance due to the rapidly expanding role of I.T. machinery including voice-recognition software.

However, for equally pragmatic reasons the logistics of the situation will continue to favour a language which has developed organically in preference to an artificial language, even one which is much better from a theoretical linguistic standpoint. The former will have hundreds of millions of speakers and millions of teachers; but the latter, perhaps Esperanto or a similar language, will have, at the most, millions or hundreds of thousands of speakers and thousands of teachers. It is obvious which language would be simpler to graft on to the world for mass usage even in a substantially revised form.

It follows that the optimum language which might now be prepared, in anticipation of the future formation of the international language committee, would probably be an organic tongue combined with the ideal qualities of the constructed languages. All the indications are that language is gradually moving in this direction anyway: for instance, the major organic tongues are being greatly influenced by

universalism and regularity, those signal features of the constructed languages. One facet of this universalism is that vocabularies are converging; many modern expressions including personal, place and brand names, scientific and religious terms and "buzz-words" are the same or similar in different tongues. An international language is thus forming obliquely through global neologism.

The regularising and print-saving tendency associated with the constructed languages also seems to be occurring spontaneously, particularly in commercial areas of English-speaking culture which the sharp eye of the literary-educational vulture has disdained to regard, e.g. spellings such as "Kall-Kwik, Def Leppard, Sun-Lite, Lo Kost, All-Nite, U Haul, Spud U Like, Toys R Us" - and the abbreviated headlines characteristic of tabloid newspapers. Moreover, as we show in the next chapter, infants naturally use rational forms until they are "corrected". We also investigate why older students, increasingly living in the aural world of the electronic media, have more difficulty than ever with an irregular spelling which requires the constant impression of the written word. Can orthography resist the trend towards global standardisation which has informed more and more aspects of life, including the electronic media themselves?

All organic languages, having developed in a more or less haphazard manner, contain shibboleths and irregularities despite the operation of this tendency towards rationalisation. The constructed languages on the other hand, while limited by the restricted size and virtual nature of their speech communities, have been able to keep sight of the fact that language and script should be rational phenomena. The international committee which forms the revised language will be well aware of this dual imperative for it to be theoretically consistent while being accepted, nay welcomed, by the wider speech-community.

Chapter_Nine:

"Language_in_Education_and_the_Media"

Great power accrued, in preliterate societies, to those who could read and write. Everyone else may have been spared reading nonsense in books, and lies in newspapers, but the consequent limited opportunity for objective investigation, and reporting of events, gave succour to the plots and shady dealings of princes and kings, to extraordinary theological claims, and to numerous wild exaggerations and inaccuracies - which all too often led to strife and armed conflict.

The introduction of the printing press to London, by Caxton in 1476, opened the book on the new scientific age in the English-speaking world. Whereas previously the interest of both rulers and scribes had ensured that the connection between language and script remained mysterious and obscure, the market for printed books demanded a more rational orthographic link. In particular there was a pent-up demand for an accessible translation of the Bible. Consequently Caxton and other London-based printers, using the "East Midlands" dialect typified by Court circles and educated speakers in London, Oxford, Cambridge and central England, rationalised both language and script to some extent.

In retrospect it might be asked why the process did not continue until a common orthographic standard was reached. One answer is that there was simply a lack of demand. The classroom situation of children learning to read provides a useful analogy. Those children who benefit from an intensive education, and/or parental diligence, become literate largely through the habituation of constant exposure to the written word: an osmotic process of memorisation which effectively offsets the partial operation of the orthographic principle in English. Likewise, centuries ago, a tiny educated class, mainly selected from wealthy families which could provide books, and generally having the additional advantage of a knowledge of Greek, Latin and French, had little problem with English spelling.

In fact it is notable that the first concerted attempts at spelling reform did not start until after the middle of the 19th Century - when universal primary education was beginning to become a reality in both the U.S.A. and the British Isles. For the first time, schools were being attended by a significant proportion of pupils for whom the osmotic methods of acquiring literacy were inappropriate, since they had little or no opportunity to read at home. Thus, for want of an alternative, these children had to rely on the phonic or orthoepic method, which incidentally served to highlight the inconsistency of traditional orthography. Spelling reformers, invariably promoters of education for all, were reluctant to see a large section of the population cowed into functional illiteracy by this incongruity.

These facts have taken a long time to permeate the political consciousness for various reasons essentially connected with the particular experiences and prejudices of those who have been setting the educational agenda. However, the evidence is conclusive that whole-word methods are inappropriate for those pupils

not encouraged to read at home. An orthographic reform of English would enormously facilitate literacy by building upon the inherent advantages of the phonic method.

The greatly superior reading skills of Italian compared with English children prove the point. With the benefit of a mostly predictable orthography, young Italians can normally read words whose English translations would often leave equivalent English children guessing. In languages which are even more orthographically regular than Italian, such as Hungarian or Finnish, a small child might read out a page of difficult text, hardly comprehending a word, while being understood by an adult audience.

Children respond to a logical orthography because of an inborn sense that language has laws. Both experience and experiment have long shown that the concept of regular and rational language is innate in young minds. For instance, deaf children may spontaneously develop sign language between themselves, even when they have not been taught it; and many English-speaking children naturally use rule-based words. For example, they tend to regularise plurals into words like "mouses, deers, dices", and turn strong verbs into weak forms, such as "rised, teached, bringed, swimmmed, eated". Scientific studies have confirmed that children prefer to use regular and consistent grammatical forms, even at the expense of brevity and simplicity: a consistent conclusion if the primary purpose of language is to communicate knowledge accurately. A full realisation of its many other powers, mainly associated with brevity, exclusion or wit (including metaphor, metonymy, ellipsis, synecdoche, jargon, in-words and code-words, acronyms, puns, euphemisms, argot and foreign expressions) normally comes later.

The main problem with regard to children is not illiteracy so much as sub-literacy: a condition which can be associated with some aspects of late 20th Century civilisation. The difficulty of English spelling should not take more than part of the blame: another share should go to motivational and social factors. The success of high-profile intensive reading courses, using the phonic method, attests to this. For example "The Independent" on 16/9/96 included a report about a government-funded reading scheme in Bradford, West Yorkshire, which had brought childrens' reading-age on by 6 months in 10 weeks. According to researchers, the childrens' school-work had improved, they were much less likely to play truant, the burglary rate had dropped to less than half of its 1992 level on the housing estates where the scheme was held, and those who had taken part were still well ahead of their classmates three months later.

Such results are impressive enough, but allowance must be made for extraneous factors before conclusions are drawn, not least the quality and motivation of both teachers and students in a showcase scheme. Moreover, some families are very amenable to education as a means of social mobility, particularly immigrants, middle-class incomers and/or those who by reason of religious belief are not bound into local class-systems and attitudes; the corollary being that a similar success would not necessarily be achieved elsewhere.

Indeed, experience has shown that significant sections of the population are resistant to both education and literacy. Successive governments are partly responsible for this. By orienting the state education system towards "white-collar" employment, they have alienated those whose vocation is manual rather

than cerebral, and for whom an academic curriculum is mostly irrelevant. (The over-mechanisation of work which has led to the decline of craftsmanship, mass unemployment, global warming, soil erosion, the marginalising of the animal kingdom and various other ills is part of the same mindset.) All these things will take time to change, but meanwhile a reformed orthography would make literacy more accessible.

Another important factor is that modern media devices, such as the telephone, gramophone, radio, television, and tape and video recorder, have compounded the difficulties of current English spelling by seducing many people, whether literate or not, into an audio-visual environment where they barely read. Since proficiency in English spelling is hard to maintain without the constant visual impression of the written word, especially since the irreversible abandonment of Latin and Greek in the majority of schools, it isn't surprising that the standard of literacy has deteriorated during the latter part of this century, even as these new media have contrived to replace print with images. A British survey in 1996 showed that 65% of 16-24 year olds misspelled "occasionally" and over half of all graduates misspelled "accommodation".

A vicious circle has developed, with children spending more and more time watching television, partly because they find reading difficult. It isn't coincidental that the English-speaking countries lag behind others, both in literacy and educational achievement generally. Moreover, inability to read and write appears to be a factor in a range of social problems which particularly affect the English-speaking countries. For example, it was estimated in 1996 that about half the relatively high U.K. prison population of 54,000 was functionally illiterate.

Recorded programmes, whether sent out through radio, tape, T.V. or video, are an excellent source of learning; but the relative absence of script creates a particular problem in English, since education must depend to a large extent upon written examination. The solution is not to restrict the use of these appliances, but rather to establish congruence between language and script, so that learning aids work with rather than against the examination system.

Computer technology poses a challenge to the English language from the other direction - by providing script without language. There is no sound to give a guide to the meaning of unfamiliar words and idioms - and "netiquette" forbids the correction of spelling mistakes! Users of the Internet in various countries must normally use English because it is the established lingua franca of the medium - to the irritation of many speakers of other languages. Nana Mouskouri, the European Union Commissioner for Culture, has been charged with combating the spread of English through the Internet. This is one of many circumstances crying out for the establishment of a simple and orthographically-rational official international auxiliary language; another is international drivers' documents - which Spain has turned into an issue by insisting upon Spanish translation.

The Internet is certain to become an important phenomenon in the future, although less than 5% of the world's population presently has access. English predominates in the medium for reasons connected with its pre- eminent international status; but the outdated and biased orthography of English is wholly

inadequate for the Internet's exacting demands. The right linguistic vehicle has yet to be found: meanwhile English is the least bad language in terms of global comprehensibility.

The demand for an Internet language with a predictable orthography will grow because, in a silent medium, those with limited command of English can only discern the sound of words orthoepically from the script. But if they cannot do this to the extent of reading words with confidence, due to English orthographic irregularity, they will start looking for a language which is written as it is spoken and spoken as it is written. Moreover, as increasing numbers of people get "wired", there will be more and more who can read and write some English, but cannot speak it well enough to hold an extempore conversation. But the desire to do just this is demonstrated by the growing demand for "netphones": simply computers with an integral telephone, which is used ordinarily as a telephone, or as an adjunct to script on the Internet (the addition of a video camera permits video conferencing). If English does not rise to the challenge of these modern inventions, with reforms leading to orthoepic predictability, another language is likely to replace it.

The Internet has encouraged abbreviations like "imo" = "in my opinion" and "re-hi" = "hullo again" (it may not be long before such words creep into speech.) Orthographic reform would likewise tend to reduce the size of words by omitting silent letters and replacing common digraphs. For example replacing "th" (/dh/) in English by a single letter would mean an approximate 3% print saving. Thus orthographic reform would reduce the space required by words, whether on the page or the screen - which would consequently reduce the relative cost of literature, and hence encourage literacy.

Chapter_Ten: "Orthography_and_Orthoepy"

Only within the last 1% of recorded history has the majority of people become literate. Most people, for most of the time, have used language without script. Moreover, when languages with scripts are compared to those without, there is no essential difference as regards structure, pronunciation and complexity of vocabulary. Languages with scripts naturally have a more extensive vocabulary; but not necessarily a more useful and subtle one. No wonder it is called "language" rather than "script".

Likewise, in the life of the individual, language always precedes script - and has greater influence. Language encompasses the euphony of speech, the levels of meaning within words, and the power and mystery of names; whereas script, however attractive on the page, has no function except to represent language. This dominance of language over script means that the primacy of the orthographic ("correct writing") principle over the recessive, but still operational, orthoepic ("correct speaking") principle is the consequence of the natural order of priorities.

Obviously there are advantages in having a script to accompany language; but a script, by itself, does nothing to mitigate, and may even multiply, the "Chinese whisper" effect inherent in speech. The legend of the dragon's teeth which, when buried in the soil spring up later into soldiers, was reputedly a comment on the invention of script - with its ability to rend apart languages, and hence cultures and nations, when interred in books - separate from the continuous development of language. Likewise, the story of the Tower of Babel (Genesis 11) tells of a disintegration into a multiplicity of tongues. One might speculate whether a disinclination among the hierarchy for face-to-face meetings concerning the building of the tower led to the introduction of a chain of command through hieroglyphics on papyri or clay tablets - which worked well until there was a breakdown in the correspondence between speech and script.

In less colourful terminology it might be said that problems are created when someone who recognises a script attempts to read it without fully understanding the significance of the symbol-system to the person who wrote it. This is because (alphabetic) script has an innate orthoepic ("correct speaking") function which evokes speech-sounds corresponding to the ascribed symbolism of individual letters. A doubling of confusion tends to occur because a spoken word takes different forms when written down on the page according to different orthographic ("correct writing") systems (whether they use the same alphabet or not), while a single word on the page is read in different ways when different education systems ascribe different orthoepic values to the letters.

In this way the orthographies or spelling systems based on local dialects which were devised in Scotland and the Isle of Man had the effect of breaking up the Common Irish language. Religious differences were also undoubtedly a provoking factor in this area. The Roman Catholic Church had seen Ireland as a springboard for the conversion of England, but considered the native language of Ireland an irrelevance, or even a hindrance. However the Protestant churches historically associated the Irish language with Catholicism and, when evangelising in Scotland, modified Common Irish according to the Protestant translation of the Bible published in 1801. (The Latinate neologism "Gaelic", often pronounced "Gahlic", is proper to a Scottish form of the language which in earlier times would have been known in Scotland as "Erse" i.e. Irish.)

This attitude was most radically displayed in the Isle of Man where a peculiar spelling system, using mainly English conventions, originates from Bishop Philips' translation, completed in around 1610, of the 1604 edition of the Book of Common Prayer. The first printed book in Manx, dated 1707, was a tract on Christian duties; and the entire Bible, published 1771-3 and since taken as the literary standard, confirmed the separation between Manx spelling and the Common Irish spelling employed at that time in Scotland and Ireland. Essentially the Common Irish orthography is still used in Ireland, apart from a few reforms introduced by the Oireachtas in 1948, and the substitution of modern script for the old half-uncials.

In Scandinavia, Norwegians, Swedes and Danes still speak much the same language; but less so than before, partly due to the introduction of differing orthographies. Norway had been ruled by Denmark for centuries, and then by Sweden for decades, when in 1853 Ivar Aasen constructed a Norwegian language, with its own orthography, from the rural western dialects of the country. After Norwegian independence in 1905 this language "Nynorsk" became the focus of cultural self-determination; but was resisted by the urban majority in Norway who regarded Nynorsk as rustic and preferred a dialect closer to the Danish of the old ruling élite. Although Norwegian is west Scandinavian, and Danish and Swedish are east Scandinavian, the resulting compromise between Nynorsk and Dano-Norwegian has produced a language which slots in between Danish and Swedish, which themselves have drifted apart over time.

Orthoepic divergence tends to be even greater where a single language is orthographically written down in two scripts. Before the recent conflict in former Yugoslavia, Serbo-Croat was much the same language everywhere it was spoken, despite being transcribed into Cyrillic and Roman script in Serbia and Croatia respectively. However the religious and national polarisation accompanying the war has separated the spoken language to a greater extent by introducing partisan religious terminology, and also by fracturing the integrity of the former Serbo-Croat speech community, thus giving more scope to foreign orthoepic interpretations of the language. Reportedly, the Croats are bringing in words from other languages and coining neologisms, in a deliberate attempt to create a distinct Croat language.

A similar division has taken place between Urdu and Hindi. These two literary languages were derived from colloquial Hindustani and published by the British in Calcutta at the beginning of the 19th Century. Devised for predominately Moslem and Hindu readerships respectively, they were written in Arabic/Persian script with a Persianised vocabulary and Devanagari script with Sanskrit/Prakrit loan words. Hindustani continued as the lingua franca of India, and was promoted as a simplified Hindi-Urdu

by Mahatma Gandhi. However, since partition in 1947, the termination of the common national culture has allowed this common spoken tongue to be defined ever more by Moslem and Hindu terminology in Pakistan and India respectively. The situation of an integral speech area being gradually sundered apart as a consequence of the introduction of the same script with different orthographies, or different scripts with the same orthography (or a combination of the two), is one that has occurred many times. The divided parts normally merge themselves into other language groups, unless they themselves become dominant. The ideal compromise of a new shared standard orthography does not seem to have happened much - if at all. However, valuable though such regional affiliations would undoubtedly be, the wider question of integration of all the world's languages is incomparably more important, since the advantage of the part is best served through the advantage of the whole.

Chapter_Eleven: "The_Language_of_Empire"

An alternative situation also exists where, instead of a single speech community being divided by two scripts, a single script area contains a number of speech communities. The former pertains to smaller countries and nations; whereas the latter is found in empires, or former empires, where the necessity of keeping together peoples with wholly different patterns of speech has been paramount.

For example, an entirely ideogrammatic script has enabled China to remain a united country despite the difference in language between provinces: the Chinese script does not relate at all closely to any of the language varieties in China, so it serves them all. This means in practice that, when people from different parts of China meet, their speech is often mutually unintelligible - though they can of course understand one another's ideograms. The Chinese Government has been attempting to remedy this state of affairs by promoting Putonghua: the "national language" based on the Beijing pronunciation of the northern dialect. This official language was first introduced in 1955 along with the Pinyin system of transliteration into Roman script - which is now used for proper nouns. Putonghua has since been given a simplified script and is taught in every school in China.

This promotion through the national education system has ensured that the Chinese are already well on the way towards creating a unified language and script. Other factors are conducive to the same end: the large number of workers on the move since economic liberalisation, the compulsory use of Putonghua at international conferences within China, and centralised radio and television broadcasts - to which the geography of China is well adapted. However, the problem is entirely different for English and French, the only "empire" languages which, by geographical spread, are seriously regarded as international languages; they are now the property of so many diverse nations and interests that reform in the Chinese manner is practically impossible.

Under the circumstances it may be considered surprising that English and French have survived at all as reasonably homogenous international entities. The former recognisably "international" pronunciation of both tongues has lost the respect of the political establishment within both homelands, to the extent of being deliberately subverted by the domestic broadcasting services, and the opposition in ex-colonies continues. However, the nationalism motivating these trends is not necessarily a bad thing, provided it is kept with reasonable limits. Protest that local phonologies do not relate to the orthographies of former imperial languages is by no means illegitimate. The worldwide spread of the great national languages has always had as much to do with political sovereignty as with any intrinsic linguistic merit, though the two are of course intimately connected.

In spite of all these drawbacks; the one advantage these two languages enjoy - an international status - is

at least equal to all the benefits accruing to Putonghua as a great national tongue. Whether as the two "working languages" of the United Nations, or as the literary recipients of some of the world's brightest talents, they are the palpable beneficiaries of the need for an international auxiliary language. The honour accruing to a principal focus of this need, the B.B.C. World Service, explains the extraordinary dedication of its staff, including many "stringers" or foreign correspondents who are prepared to work for it for nothing or next to nothing, and why its English is still of a high broadcast quality (though not nearly as high as it was), in contrast to much of the B.B.C. domestic output.

Nevertheless, it is evident that the U.K. alone is no longer prepared to bear the cost of such an institution, and that the World Service will have to come under the aegis, or at least share facilities, with the national service: with all the potential for a parochial British attitude that entails. Many commentators have expressed misgivings at the prospect. This is yet another evidence that the writing may be on the wall for present-day English as an international language. American world service broadcasts are likewise excellent; but the limited output suggests a similar lack of funding.

The experience of these major colonial tongues is directly relevant to the coming international auxiliary language. It too will be the lingua franca of a kind of empire: the coming world federal system, even now being constructed behind the scenes, largely in response to new kinds of economic inequity produced by the instant operation of market forces among peoples at such different stages of social and political development that more than half the world's population has never even used a telephone; while small sections elsewhere, who often but not always lack the moral counterpart to their material civilisation, live in a state of affluence which is largely dependent upon access to the latest technology. This is an old problem, but the simplistic solution of redistribution by force has arguably made the situation worse. A change of attitude by all parties is the fundamental requirement: a vast educative process in which the international language will be central.

Computerisation has given wings to Marx's dictum that "capital breaks down all Chinese walls". The multinationals now largely exist within a global cyberspace that transcends every nation state: rapidly moving resources to where they can obtain the best financial return. The global superstate is coming into being on the same level in order to counter the social and ecological disruption produced by this economic activity. It will also have the task of maintaining peace and establishing global equity through an agreed and enforced code of laws: inevitably placing some limitations on national sovereignty in favour of world unity. However, although the necessity for such a planetary federation has often been advanced, nobody would be so bold as to assert that it would always operate perfectly - even though it might be an improvement on some the empires of old.

Similarly, the international auxiliary language is unlikely to be used in the right way, and in due measure, everywhere it is introduced. In such circumstances, all the tendencies that bedevil present tongues, such as towards orthographic irregularity and fossilisation, will no doubt threaten its integrity. However, moderation in matters of vocabulary, phonology and script will minimise these dangers. Another safeguard would be the creation of an international speech standard upon which to base a unified orthography.

Chapter_Twelve: "Pidgins_and_Creoles"

Anyone who has found themselves off the tourist trail in a foreign country, with whose inhabitants they share no common tongue, may have witnessed the first stage of a contact language in action. Although basic requirements in such a situation may be communicated via sign language, a few words representing relatively complex ideas, not quite so easily gestured, are already so ubiquitous that those who have the means to travel abroad may gain a helpful response by uttering them even in provincial areas of almost any nation: these magic words include: "otel, taksi, telefon, banko".

This contact language is the beginnings of an international auxiliary language, which is emerging unofficially through the commercial world ahead of official endorsement, such is the demand for it. Such contact languages appear through necessity. Grammar is superfluous, given the immediacy of the context, and so is linguistic purity. Moreover, whether or not the affix pertains to a particular language is irrelevant, so long as the word-root conveys meaning: e.g. "bank, banque, banco, banko" - any such word will suffice.

Today the contact language phenomenon, like everything else, takes place on a world stage - such is the power of the mass media. But these most rudimentary of tongues are not a new invention; they have appeared throughout history wherever international communication has been essential: thus war zones, e.g. Vietnam, have provided a number of examples. Likewise "Russonorsk", a primitive Russian/Norwegian hybrid tongue, developed between whalers from these countries based on the inhospitable Svalbard archipelago and Kola peninsula in pre-Soviet times.

Such auxiliary languages have naturally come to an end with the circumstances which produced them. However, another kind of situation exists where contact is long-term, but neither party wishes to learn the other language. Typically this has been because both sides are more interested in trade than fraternisation. Thus the contact language has remained an auxiliary, but used and elaborated so much over time that it has developed structure and grammatical rules.

This type of auxiliary language is called a pidgin for a reason which is no longer obvious. The most popular explanation points to Chinese Pidgin English where "pidgin" means "business"; but about six other possible derivations for the word have been advanced. One theory suggests encounters with the Pidian Indians in Venezuela as the source; another harks back to the merchant adventurers who set sail from Southern European ports such as Genoa and Lisbon in the 14th and 15th Centuries, initially in an attempt to secure the spice trade by sea routes, since the land route had been cut by the westward thrust

of the Turks.

A prominent member of the crew in these sailing ships was the translator. Who would such a figure have been? As often as not, he came from that race of scholars - the Jews. He would have spoken Ladino - the Mediterranean Yiddish. Thus it might be supposed that the word pidgin comes, via Ladino, from the Hebrew word for barter - "pidjom".

Some details concerning the origins of pidgins are still disputed, but the central facts correspond in broad outline with the general development of language in communities and individuals. This topic might be approached by considering the following example in the development of an international vocabulary: although underground railways began in London, the word "underground" has not travelled in this connection, nor has the New York word "subway" - which in Britain rather means an underground tunnel for pedestrians. The word for "underground railway" which has prevailed internationally, even within the English-speaking world, is "metro", and it is not difficult to see why: the word is short (Zipf's Law), its phonemes are both common and easy, and it has the right associations in various ways - e.g. with "metropolis".

Briefly, the word "metro" has the right resonance in many cultures. Similarly it seems that indigenous peoples, approached by seafarers bearing goods which they wished to barter, but speaking a language quite unlike their own, seized upon certain of the words being enunciated in connection with these goods, and signified affirmation of a proposed exchange by repeating these words, perhaps in a modified form, with appropriate expressions and gestures.

Had the merchantmen been linguists they would have found that the words thus emerging with cross-cultural resonance were nearly all short and simple, with perhaps only four or five vowels, and no phonemic difficulties like consonant clusters. In any case, when they discovered which words were acceptable and could be readily understood, they proceeded to teach and use them as a business or barter contact language wherever they went. After a number of such trading encounters, this contact language of appropriate words began to arrange itself according to the bare minimum of syntax and grammar required by a strictly commercial language, i.e. it became what would now be defined as a pidgin.

Once a pidgin was successfully formed in one place, it was apparently considered expedient to try it elsewhere; there is evidence that the Portuguese-based pidgin spoken in West Africa around 1500 AD was actually taught by the Portuguese. Moreover, the fact that many pidgins around the world contain words of Portuguese origin such as "savvy, save" etc. from Portuguese "saber" ("know") and "pikin, pikinini, pickaninny, piccanin" etc. ("child") from "pequenino", the diminutive of Portuguese "pequeno" ("little"), is a further indication that pidgins were taught by these pioneers of global exploration and trade.

The many pidgins based upon reductions of French, Spanish, English and other languages, e.g. Sango - an African tongue, seem to have appeared in a similar way. The first pidginised English arose between American Indians and settlers at the beginning of the 17th Century. The activities of British seafarers

gave rise later the same century to Pidgin English on the Chinese coast and also to the West African English-based pidgins. By the end of the 19th Century, English-based pidgins had come into existence in various parts of the world, but principally in West Africa, the Caribbean area, S.E. Asia and the South Seas.

Some pidgins share some words or word-roots, but the lexical differences between these tongues are still great, mostly as a result of originating from different base languages. However, the pidgins also share a universal characteristic called "transparency", which is simply a receptiveness to linguistic innovation. This can be difficult to see, due to the obtrusion of base languages, but the same concern for the mundane efficiencies of life which has mostly eliminated from the pidgins grammatical categories such as number, gender, case, person, tense, mood and voice, is always on the lookout for new economies of expression.

The signal result of this transparency is that, even if a useful linguistic feature is rare in the world's literary languages, it is likely to appear sooner rather than later in the pidgins. For example, subject-verb-object syntax along with the associated jettisoning of inflections, first appeared in the Indo-European language group around 1000 AD. This innovation has been slow or unsuccessful in penetrating literary languages, but entered the pidgins immediately. The coming international auxiliary language has a lot to learn from the pidgins: for to begin with it too will be mostly concerned with the groundwork of international communication - rights, laws, rules and agreements. Much of the linguistic superstructure will probably have to come later.

A creole is a pidgin which children have learned as a mother-tongue, while elaborating it according to inherent linguistic rules, and adding words from different sources. In practice the distinction between creoles and pidgins is not clear-cut; a pidgin may become a mother-tongue for some and yet remain an auxiliary for others. Hence "pidgins" may be partially or almost wholly creolised. Another factor which should be mentioned is that some pidgins and creoles are closer to the base language than are others. For example some West Indian creoles are, depending on the speaker and the circumstances, more or less accessible to English speakers from elsewhere; whereas other English-based creoles will always be completely incomprehensible to outsiders.

In many countries of the world creoles are growing at the expense of indigenous tongues and borrowing freely from the major languages; in this way, English and French are being effectively marginalised in former colonies where they are still the official languages. A not atypical example is Mauritius, where English is the official language, but hardly anyone speaks it, and very few speak French. Nearly everyone speaks creole. Like an egg sucked dry by a weasel, English may appear to be unaffected by the burgeoning of these creoles; but the very fact that primary creative activity is going into other languages is depriving English of vitality and impetus: starving it of development except in narrow and specialised areas such as are found within commerce and science. That languages like Tagalog, Malay and even Korean are becoming anglicised is not necessarily indicative of the triumph of English; it could rather be a sign of it being devoured.

The simple grammar and phonology of the creoles, and the transcultural resonance of their vocabulary,

allows them to become common languages for the speakers of diverse minority ethnic tongues: a feat which linguistic remoteness prevents great European languages from fully achieving. For example, although Cameroon was divided (in an approximate 4:1 ratio) between French and British colonial administrations in 1919, under 20% of the population speaks French or English (the two official languages) in contrast to the 50% who now speak creole - which has become a vital lingua franca between Cameroon's 24 major African languages and more than 220 minority tongues. Likewise the exclusive or auxiliary use of creole is expanding in both Nigeria and Papua New Guinea which have over 400 and 860 minority tongues respectively.

However, the role of pidgins and creoles should not be over emphasised. Popular they might be; but they are still phonetically restricted, lexically utilitarian and grammatically reduced languages which have to struggle to express complicated or abstract concepts by using unwieldy circumlocutions or inelegant grammatical bolt-ons. Whether in words, speech or grammar, the pidgins and creoles dominate the mass-market - as it were; but the major languages are ahead of them in range and flexibility.

The quality of creoles is as tongues which have developed entirely orally, and specifically as trading languages, primarily concerned with sounding good, and being as comprehensible as possible to a wide variety of peoples. Thus any "threat" which the pidgins and creoles present to the great national languages is only because the dead hand of literary orthodoxy has stopped the orthographic revision which would allow the popular sounds, words, speech-patterns and grammatical short-cuts developed by the creoles to be incorporated or transliterated. Such beneficial linguistic innovations will no doubt figure strongly in the forefront of the minds of those who construct the international auxiliary language, whether or not they are heeded by the guardians of the great national languages.

Chapter_Thirteen: "LANGO_Grammar"

In theory the international auxiliary might begin from any language: its appearance centuries hence after incorporating the best features from every tongue, living or dead, would be much the same whatever the starting-point. However, the right inaugural language would greatly speed and facilitate the process; and we are proposing that a reformed version of English would be ideal for the role. For example, those who learned it would be using their time profitably, even should the projected purpose fail to be realised; the mastery of one of the world's major spoken languages would guarantee a return on their investment. They would be able to go to any English-speaking country and be perfectly well understood, since the reforms would affect the script rather than the language - at least for a considerable time to come.

There would also be a distinct advantage in beginning with a language whose particular irregularity lies in the script rather than in speech, for language is normally more spoken than written. The spoken word always precedes and usually outweighs the written, whether in the life of the individual or of society, and consequently is more ingrained and less amenable to change. Script revision is not easy, but changing a spoken tongue is so hard that it is probably best accomplished through the orthoepic effect of script reform.

The relatively simple grammar of English came into existence precisely because popular speech threw off superfluous grammatical constructions while aristocratic and learned circles were using French and Latin. Moreover, English is part of the Indo-European family of languages, which is twice as large as any other, and where the dominant trend for 1000 years has been towards subject-verb-object rather than subject-object-verb syntax, and the use of word order rather than inflections.

Languages tend to fall into three grammatical types: synthetic - case endings and inflections - as in Russian; agglutinative - compound words with prefixes, suffixes and infixes - as in Turkish; and isolating - bare word roots without inflections or affixes - as in Chinese. English grammar developed into a form that does not fit exclusively into any of these camps but, partaking of all three, allows at the one extreme for elementary prosaic communication, using just the present tense and simple nouns with short sentences and, at the other, for complex expressions employing the full range of a grammar which contains these three characteristics: a wealth of inflected pronouns, verb tenses and moods; a variety of compounds - such as constitute many nouns, verbs, participles, adjectives and even adverbs; and isolates - typically the prepositions and conjunctions which hold English together with the aid of pronouns, punctuation and word order. This gear-changing capacity of the language may be seen by comparing typical tabloid journalism with the finest philosophical exegesis.

A measure of flexibility in grammatical style is necessary if linguistic unity is to be maintained in the face of a wide variety of cultures. The previous chapter showed how pidgins happened upon the minimal grammatical, lexical and phonological requirements of speech. However, although these tongues are relatively accessible by virtue of their simple grammar and basic phonology, they are severely limited, for the same reason, when it comes to prosaic discussion of complex and abstract subjects. Conversely, the great literary languages have preserved an advanced grammatical and lexical capacity, though at the expense of penetration throughout society and across cultural boundaries.

The essential feature of pidgins is their mundane genesis as contact languages: hence minimal grammar, with juxtaposed one-clause sentences, suffices for straightforward subject-matter: e.g. "Man plough. He my brother." English typically embeds the second clause into a complex sentence: "The man [who is] ploughing is my brother." The strength of the English construction, with its relative pronoun, is that it contains an element of transcendence or ambiguity (ploughing what?); but this is also its weakness. Comparing a religious saying in these two styles might show this: "All men are equal before God. He is no respecter of persons." "All men are equal before God, Who is no respecter of persons." The former is the original or authentic version.

Potentially, there is a gulf between these two kinds of language. The pidgin or tabloid type needs less grammar, because the meaning lies less in the sentence than in the word, whether it describes an entity or a situation. This kind of speech, which is essentially focused upon a material object, runs through picture story-books and propaganda posters into its modern home: the television set. Among the constructed languages it is exemplified by Glosa - which has only four tenses (as in "mi sedi [I sit], mi nu sedi [I am sitting], mi pa sedi [I sat], mi fu sedi [I will sit]") and no inflections, i.e. practically all its words can be used interchangeably as noun, adjective or verb. Glosa is a slightly modified update of Interglossa, the international language invented by Lancelot Hogben, humanist and polymath.

The basic unit of pidgin-grammar is the clause, but complex language also derives meaning to a great extent from the tension between clauses embedded in a sentence, and from the dynamic between adjacent sentences, and the contrast between paragraphs; its grammar, whether expressed through pronoun, inflection or tense, is the fulcrum for the shaft of understanding thus formed. This kind of language is still found in newspapers, but more usually in journals and books.

The constructed language Volapük exemplified this literary type of grammar. By the time of the third congress, in Paris in 1889, Volapük had 200,000 adherents in 300 societies and about two dozen publications; but the attempt to conduct the congress entirely in Volapük proved that a language which worked on the page could nevertheless be unsuited to general conversation. Volapük subsequently faded away after author Schleyer, priest and polyglot, refused to simplify it.

Any discussion of this subject would be incomplete without mention of the Canadian media philosopher Marshall McLuhan (1911-80 - he appears in Woody Allen's multi-media comedy film "Annie Hall"). By his aphorism "the medium is the message" McLuhan was essentially describing the qualitative difference between a human conversation, in which there is the possibility of dialogue (in spite of the prevalence of

boring monologues!), and interaction between human and machine, where dialogue is once-removed, if it exists at all. By their very nature, the voices of the media talk at us rather than to us, and do not particularly want a reply: a tendency that has become ever more so as these organs have consolidated into centralised ownership, and have moved from print into more expensive and elaborate electronic imagery.

McLuhan thus perceived a relationship between the providers and consumers of electronic media analogous to that between the oligarchy - tribal chief, witch-doctor etc. - and the mass of the people in indigenous cultures; that whereas traditional tribal societies are enthralled by magical artefacts and ceremonies, the tribes of the late 20th Century are spellbound by totems from lifestyle features and advertisements in tabloid newspapers, magazines, cinema, radio, television etc.: new packaging for old products and ideas sold by advertising shamans and political spin-doctors - the revenant Portuguese adventurers bearing glittering wares. And we are the natives who must weigh the values, for they also bring valuable stuff amid the dross (McLuhan would have been the first to admit this), and their globalising pidgin carries new scientific and religious concepts amidst the slogans and brand names.

The language of course is very often the predominant world auxiliary, namely English - or is it? Typical mediaspeak is not noted for its similarity to the language of Shakespeare, Emerson and Tennyson, and closely matches the voice of no writer from the pre-electronic age. Moreover, the new speech has accompanied a profound cultural shift from imagination to imagery: it is hardly surprising that sheltered modern children adjusted to the televisual realisation of fantasy should prefer Roald Dahl to the literary classics. A great part of the population generally is in thrall to television, when as much topical information can be gained from a decent daily newspaper in a fraction of the time. How many now read the great poets, philosophers and novelists, or the world's seminal religious works - such as the Bhagavad-gita, the Bible, the Qur'an or the Bahá'í Writings? McLuhan, in a letter to a fellow Catholic (20/2/70), put it thus: "I have spent a good many years in studying the cultural effects of print and in proclaiming the alphabet in its printed form as the sole basis of civilisation. The electro-technical forms do not foster civilisation but tribal culture."

From a linguistic viewpoint, at least, these questions are very relevant because an equilibrium between different grammatical styles is impossible to retain in the long run; every partial language - not excepting English - follows the trend of one cultural tendency or another. For instance, many traditional languages have preserved a "correct" literary usage, whereas the creoles cater for a mass market which requires no more than a minimal grammar. The standing of English as an international language has largely been due to its capacity to contain these two grammatical styles.

But this potential may have weakened as the pidginised style has gained the ascendant. It might be asked whether this represents a degeneration of the language, or why a meagre fare should be preferred when the linguistic heritage is so rich. The answer to such questions again derives from the pre-eminent international role of English. The advertising and propaganda industries which cohabit the mass-media and its offshoots, with their remit to maximise the market at all costs, have encouraged a certain style in imagery and language which, by aiming for the universally familiar, effectively crosses many cultural and linguistic barriers. Moreover, the pictures of war, poverty and environmental degradation, and expositions of ecology and macroeconomics, emanating from the same media, have encouraged the formation of a

number of international charities, causes and movements, much of whose discussion has perforce taken place through a simplified or pidginised version of English - both because English is the leading international language, and because proper simultaneous translation is extremely expensive.

In such ways, through the dynamics of the mass-market and of global accessibility, the focus of English use has gradually shifted from a literary to a pidginised form. The frontier of this kind of language is found above all where access to less-educated or second-language speakers is the priority, whether the products on offer be jejune ephemera or matters of great import. In some respects, the English so produced approaches the distinctive qualities required by the coming world auxiliary language. Will it now take the next step?

In all these ruminations it is essential to maintain a proper perspective. Although the common international tongue will be instrumental in promoting understanding and fellow feeling between all the nations presently separated by their languages, its influence will be severely limited without collective action to confront and resolve those spiritual exclusions, moral prejudices, legal inequities and practical difficulties, too numerous to mention, which tend to keep the peoples of the world apart, and hinder the free and voluntary association which is a precondition of dialogue.

Since the international auxiliary language will be taught to children in every school of the world, the difficulties of grammatical redundancy and irregularity will have to be addressed. This is because, as researchers have discovered (and experience shows), children prefer a certain level of grammar to a minimal grammar; and they tend to spontaneously regularise grammar where it is irregular. Thus creoles are essentially created by children who, learning pidgins as mother-tongues, gradually elaborate them by the addition of grammar and vocabulary.

The reason for this tendency is evident. Pidgins developed to facilitate transactions exclusively between adults. In a context where the ground rules of social interaction are mostly understood, and the purpose is mundane rather than transcendent, no more than a minimal grammar is necessary. But children are primarily concerned to orient themselves in an unfamiliar world, and to establish the precise meaning of a situation - as indicated by the syntax, tense, mood, voice and inflections of speech.

The corollary of this finding is that children are deterred less by complex grammar than by redundancy and irregularity. For example, the Turkish inflectional system is fairly intricate, but Turkish children normally master it well before the age of two because it is completely regular and straightforward. An oft-quoted illustration combines the noun "el" ("hand") with the inflections "-im" (first person possessive), "-ler" (plural) and "-de" (locative):

elim "my hand"
 elde "in hand"
 eller "hands"
 elimde "in my hand"
 ellerim "my hands"
 ellerimde "in my hands"

Similarly, relative clauses (i.e. those beginning "who, which or that" in English) are so straightforward in SerboCroat that most Serbian and Croatian children have likewise mastered them by the age of two. Other languages also have grammatical features of exemplary regularity which children learn to use without difficulty. The international language committee will no doubt look at all such instances in order to assemble the best grammar from all sources.

An interesting fact about the above two examples is that their converse shows some of the worst grammatical practice. Both Turkish relative clauses and Serbo-Croat inflections are incoherent and excessively complicated. The children of these nations struggle to make sense of them, and do not normally use them competently until about the age of five. This conjunction between the regular and straightforward and the confusing and opaque is typical of national languages. For instance, in English we see a relatively simple grammar conjoined with a relatively difficult orthography, and in Finnish and Hungarian the reverse. There appears to be an inherent shibboleth function in national tongues, seemingly designed to identify foreigners and/or those who have not mastered the language properly.

The same psychological constraints will inevitably apply within the international auxiliary language, so any reforms will have to take cognizance of conflicting considerations: firstly, that the international pre-eminence of English is related to its current level of grammar, and secondly that English-speakers who use a rather different grammar should be represented or catered for as far as possible (according to the wisdom of Webster's dictum "Grammar should derive from language, rather than language from grammar").

The present controversy about black American English or "Ebonics" illustrates this tension. Defining Ebonics as a separate language solves nothing, but neither does the non accommodating status quo. Sensible grammatical reform would align itself with such dialects as far as mainstream opinion and historical continuity allowed. Moreover, grammatical irregularities which presently cause children problems might be rationalised by adopting the best practice elsewhere.

The English-based creoles provide some ideas in these simplifying and rationalising directions. The operation of the word-order principle in English has rendered superfluous all noun cases except the genitive, as well as adjectival agreement etc.. However, the creoles have pushed the principle harder in order to achieve further economies, including the abolition of the genitive. Some of the more promising creole constructions, with reference to their possible use in the revision of English, include the following (in order to illustrate the grammatical point they are artificially written in Standard English - in practice an orthographic rendering of creole speech should be spelt very differently [e.g. "the" would normally be "de" etc.]):

(1) The third person singular does not alter verb declension in the present tense: e.g. "he run, she sing". (It is difficult to find grounds for objecting to this one.)

(2) Possession may be denoted by juxtaposing nouns rather than using the genitive with the apostrophe: e.g. "this woman child, that man field". (The context normally distinguishes the genitive from the

adjective; the more rigorous use of hyphens and compound words would help to distinguish them on the page. Other languages dispense with the genitive, e.g. Welsh: "llyfr John, llyfr coch" "John's book, red book".)

(3) A plural is often not marked by an [s]: e.g. "two house, them rabbit". (Determining whether "sheep, deer, fish, cod, grouse, Portuguese, Swiss, Maori" etc. are single or plural is hardly a problem in English. Chinese usually does without plurals. Eliminating the plural would abolish irregular forms like man/men, child/children, mouse/mice etc.. Plurals can often be identified by numerals or pronouns; a plural definite article like the French "les" [the plural "the"], or the Chinese plural marker "xie" ["some"], might help.

(4) Verbs are negated by the word "no": e.g. "he no work today". (Old English used the same construction with the prefix "ne-" for "no", exactly as in Scottish English, Russian, and other languages. Also "ne-" might replace "un-"/"in-". English already uses "never" in a similar way.)

(5) Adjectives are used as adverbs: e.g. "he walk silent, she sing soft". (Word order allows this. Words are entities which may often be used interchangeably as noun, verb, adjective or even adverb: e.g. arm, foot, back, up, right, top, shine, love, dog, plant, air, etc., etc.)

(6) Auxiliary verbs like "be" or "do" are often omitted: e.g. "the sun hot, he old man, them hungry, why you bring this?". (There seems to be little problem with this one if the omitted auxiliary or copula is understood to be in the present tense. Russian also does without the copula in the present tense e.g. "he engineer".)

(7) Serial verbs are commonly used in creoles: e.g. "she go try find it, he start run escape". (This would be a most useful reform if it could be done without introducing ambiguity between the infinitive ("to" escape) and the noun. In English the "to" is sometimes omitted from the infinitive as being understood. The infinitive is essentially a self-directed imperative.)

As previously emphasised, no more than an offspring or copy of English would be reformed: a refraction which might then proceed to change the main body of the language - though perhaps in conservative directions. Moreover, it is likely that the pidginising influence of the global media would be transferred on to this grammatically-simplified and orthographically regular language. For the dynamics of the market economy, and the high capital cost of launching any new media product, whether an advertisement, film, TV show, pop record, computer game or other fashion item, are such that the multinationals are concerned above all to maximise global access. A pidginised international language might well be irresistible for this very reason. Thus English, and the other mother tongues, might be freed from the trivialising influence of these things.

It is probable, then, that the international auxiliary language, towards which LANGO is proposed as an initial stage, will have a grammar of the utmost simplicity so that it might permeate everywhere with the aid of the mass-media. But what will happen to the mother-tongues meantime? It is certain that they will continue, for a very long time, as custodians of speech and grammar. For instance, the English-speaking

peoples, with their tradition of individual purposefulness, have a grammar replete with tenses, moods and voices (though poor in inflected nouns and adjectives). Conversely the Finns, that poised and musical race, have a language which is very emotionally expressive in its wealth of noun cases denoting different states of being. (Finnish also possesses a useful personal pronoun which denotes either sex.) Briefly, the grammar and vocabulary of every tongue reflect the characteristics of its native speakers.

A complex grammar has as many advantages, for philosophical or literary purposes, as has a simple and straightforward grammar for universal access. An increased grammatical range would give every national tongue greater logical capacity, and better receptiveness to translation and transliteration. For example, a third-person reflexive pronoun for English, as in Esperanto and many other languages, would prevent the ambiguity in sentences like "Eric told Mark about his wife". However, it is unlikely that there will be any more direct transfer of grammar between developed national tongues than there has been in the past. Creoles and languages at early stages of development can do this, but every partial tongue reaches a point at which it resists change.

However, it is certain that the grammatical level of the international pidgin would be gradually raised, once it had an established status world-wide. This would have to be done with the greatest care: the timing of any change closely related to the general level of literacy, and nothing that had not been exhaustively tested in one language or another. Thus, in the distant future, having developed an unsurpassed grammatical, lexical and phonological capacity, there is no reason why the international auxiliary language should not absorb all other languages.

The advantage of a complex grammar for elucidating abstruse subjects on the intellectual level is essentially that of economy: not the simplicity of the pidgins, but the brief representation of a phrase or a clause in the same way that the right word might encapsulate a circumlocution. For example, the use of the gerund in English often obviates a pronoun and predicate, or noun and preposition. In view of the proliferation of knowledge currently taking place in the world, brevity and concision are vital.

However it can be argued that a still more advanced grammar is that of poetry, where understanding exists "between the lines" in the ratiocination of images and thoughts, as well as from words themselves and the tension between grammatical structures. Moreover, the alienation between simple and complex grammar is inherent to prose: at the level of poetry it disappears along with the innate distinction between words and their groupings. For this reason poetry will expand greatly in influence, reciprocally with the global tongue. This is yet another matter which, although of great import to the international language, is mostly dependent upon factors outside its sphere of influence.

Chapter_Fourteen: "LANGO_Vocabulary"

The constructed languages have proved the futility of attempting to mint vocabulary on the grand scale from familiar word-roots, not only because of the failure of these languages as independent entities, but also because the ethnic tongues have rejected the new words. The demise of many English neologisms of perfectly rational provenance confirms the point. Euphonic considerations must prevail alongside the rational: the neologism must sound right as well as look right. Just because a word is constructed from an impeccable Latin or Greek root, or from the most common root extant in European languages, does not mean that the ear will accept it. Inspired word-coiners like Shakespeare always paid as much attention to euphony as to etymology, but even then their neologisms did not always stick.

But although a group of experts, however well-qualified for the task, may not necessarily succeed in creating a popularly-acceptable lexicon; it is incontrovertible that words with the right pedigree are more likely to prevail. Thus the English language like the great common tongues of history has addressed the vocabulary problem by incorporating those words which have stood the test of time in former and current languages. In this way inspired wordsmiths, whether great authors or academics, successfully introduced many thousands of words into English from Greek, Latin and the Romance languages. Neologists following this method helped English to emerge from the shadow of Latin and French during the 16th and 17th Centuries when the printing presses were busy churning out translations of the Ancients.

This might be confirmed by choosing one word at random from every page of a standard dictionary. The percentages of words from different origins might be: Romance languages 54%, Teutonic languages (mostly pre-1066 AD) 31%, Greek 11%. English has acquired these words whole, or by direct transliteration, or through careful modification when necessary; but never after the manner of the constructed languages with their instant vocabularies. The apparent failure of the artificial tongues as vital, rather than theoretical or philosophical, entities would seem to indicate that language, like any other organic process, can only assimilate the new in measured proportion.

Moreover, a defined lexicon may not give an adequate choice of synonyms. A single word might be sufficient to convey meaning, and quite adequate for many; but language is more than logic for those who wish it to be so. Any speaker or writer who seeks to create poetic speech may require stress, rhyme, alliteration, metre, cadence, resonance, contrast, variety or emphasis within a single word. This is why synonyms may be preferred - even though they all mean practically the same thing. In addition, English is full of near-synonyms from different languages e.g. "rear/raise, weak/frail/fragile", which not only give it subtlety, but lower the "vocabulary barrier" for many nationalities. No other tongue, least of all among the constructed languages, displays this degree of flexibility. It is difficult to imagine that any constructed

language could be designed with such a feature - which means that, when people from diverse linguistic backgrounds use English, they can employ the synonym nearest to the word in their first language. It might not be quite right; but they will be understood.

A degree of freedom in grammar and choice in vocabulary is as essential as standardisation in script elements and spelling. As we have seen, English has drawn heavily from both Germanic and Romance sources in its choice of vocabulary. Hence a greater proportion of its words are readily accessible to Europeans, North and South, than are those of more specifically national languages such as French and German. English also compares favourably with other tongues in the absorption of words from the widest international sources. Since the learning of vocabulary is the most demanding part of acquiring proficiency in any language, English begins with a great advantage in terms of the international acceptability of its vocabulary.

However, it is also true that some nations and peoples find many English words difficult due to unfamiliar phonology, consonant clusters and the like. At this point the pidgins and creoles might be as great an assistance to lexical reform as to grammatical revision. For instance, they have largely eliminated the consonant clusters that many language groups find difficult: e.g. "want, must" are "wan', mus'". Any vocabulary problem caused to an English-based international auxiliary language by these omissions would soon be rectified. It is not as though there is a shortage of alternative words in other languages!

Selecting words from different languages will also solve the question of homonyms. Traditional English orthography contains a vast number of homophones and homographs; and a consistent orthographic reform, based on the international standard pronunciation described in Chapter 19, would produce very many more. An idea of the current situation in English might be had by glancing at a standard dictionary. A few common English words, taken at random, are defined in the following approximate numbers of different ways, whether as substantives, verbs, or adjectives, on about the following number of pages of the Oxford English Dictionary:

Word	free	keep	line	make	mark	point	post	run	set	take	turn
Defs.	34	48	46	87	43	41	46	91	172	63	88
Pages	3	5	8	9	6	6	5	10	15	8	8

Not all of these separate definitions are distinct homonyms, but a large number of them are. Hence an orthographic reform would not only produce more definitions in the O.E.D., but more homonyms too. For example, "plain" has approximately 40 definitions on 4 pages of the O.E.D., and "plane" about 16 on 2 pages. Thus a reformed spelling might produce "plän" with 56 definitions. The sensible policy of replacing most of these homonyms with words from other languages would not only greatly increase the scope and precision of the language, but would also make it incomparably more acceptable as an international auxiliary language.

An additional factor, relating to the international currency of word-roots, might make it desirable to substitute some English words by those from other languages - even where there are no homonyms. For

example, the English words "soldier, editor" are not typical; the French equivalents "soldat, rédacteur" have a wider international currency. Zamenhof recognised the essential importance of this principle. Here he used the words "soldato, redaktisto", and likewise tended to base his vocabulary upon predominant word-roots, (though he sometimes flouted the principle as in "lernejo" for "school").

The question of vocabulary is one of the most challenging that the constructors of the international auxiliary language will have to face. They will have to be concerned, not only to reflect popular usage, but also to refrain from bias towards any part of the world. However, although it will be necessary to make compromises, there are mitigating factors. Firstly, it will often be possible to list several words from different languages as near-synonyms, since they are not exact equivalents. And secondly, there is the advantage that different cultures and their languages have tended to specialise in diverse areas of experience. For this reason, a lot of metaphysical words might be introduced from Arabic and Farsi, philosophical words from Indian languages, political ones from Chinese and Russian, and so on. The trend of these things is already extant in English.

Moreover, mathematical words might be introduced from East Asian languages. Irene Miura and Yukari Okamoto have established that number values in Chinese, Japanese and Korean are better understood, because the counting system relates directly to the meaning of numbers: hence, eleven in Japanese is "ten-one", twenty is "two-ten", thirty-one is "three-ten-one". The language is also better at explaining fractions: e.g. in Japanese one third is "san bun no iti" meaning "of three parts one". It is well known that East Asian students consistently surpass their British and American counterparts at maths. The difference is so great that it cannot solely be the result of superior discipline, motivation or teaching; it must also reflect the nature of their languages. The vocabulary of the international language will no doubt be influenced by such findings.

Chapter_Fifteen: "LANGO_Phonology"

A revised version of English would capitalise on both the global dominance of the left to right horizontal Roman script, and also on the present position of English as the leading international language: for whereas English has fewer speakers than Putonghua, and perhaps two or three other tongues, both its primary and secondary users are more widely distributed around the world - and with fewer political and cultural ties than other more strictly "national" tongues. Moreover, English has a relatively simple and flexible grammar, an extremely mixed vocabulary, and allows for a wide range of accent and intonation to shade meaning. It is also, of course, the leading language of commerce and diplomacy, and the lingua franca of information technology and international telecommunications.

But, in the case of the latter, we have seen how the poor orthography and extensive phonology of English can combine disadvantageously. Every nationality tends to experience phoneme difficulties - perhaps with consonants like /dh, th, z/, or /dzh, tsh, zh/, or /p, f/, or /r, l/, or with certain vowels, depending upon whether they occur in their own language: the Japanese substitute /r/ for /l/, whereas the Irish have ten variants of these liquids in their tongue, but struggle to pronounce the /dh, th, z/ sounds of English.

In the same way, English-speakers are likely to have difficulty with many of the sounds in Russian. And nonstandard dialect speakers in Great Britain and the U.S.A. may employ only a proportion of the vowel sounds in Standard English, which itself uses just two of them - the schwa as in "the" and the short [i] as in "it" - nearly half the time but most of the others infrequently or rarely: e.g. the four vowel sounds as in "bird, care, deer, boy", added together, only about 3% of the time. Hence a reasonable objection to an international auxiliary language based on English might be that the standard phonology is dauntingly extensive.

One response might be that, since the international auxiliary language would presumably be introduced into schools around the world more or less simultaneously, it would be entirely feasible to start with an orthographically reformed English - together with its present vocabulary and phonological range, and that this approach is possible because children have a natural capacity for language learning; whereas adults generally find it very difficult if not impossible to master a new range of speech sounds.

Moreover, it might be asserted that, since the international auxiliary would be the only language children anywhere in the world would need to learn in addition to their mother-tongue, enough time might be devoted to it to master difficulties like unfamiliar phonemes, which should not present too much of a problem if introduced to children at a young enough age. An extended range of phonemes might thus be

inducted into every population by means of child education. Another argument which might well be advanced is that, if the auxiliary is to be truly international with words from different languages, there is ultimately no alternative to a comprehensive range of phonemes.

However, present social conditions would present a fatal drawback to this idea. For although most children may well develop an inherent capacity to differentiate and articulate phonemes, so that by a certain age they have the theoretical ability to speak any language with an extensive range of difficult speech sounds, the capability is gradually lost through childhood as the process of ethnic acculturation reinforces some phonemes but entirely neglects others. New speech sounds are not normally heard, i.e. distinguished from familiar phonemes, except by those who have learned to say them; but when the speech sounds corresponding to the "missing" phonemes are seldom if ever heard, the child's confidence and ability to say them tends to atrophy, as eventually does the capacity to even hear them.

This shows that using education alone to transform the phonology of a society would be as useless as similarly attempting to promote morality or religious revival. The willingness of children to learn, and to actually use, unfamiliar phonemes in everyday speech must also depend upon the confirmation of a global society that still does not exist for the great majority. It is for this reason that confident expansion of the global auxiliary language requires the reinforcement of a world civilisation: final consummation of the same process whereby an increasing majority have chosen to live and express themselves in "national" rather than "minority ethnic" cultures.

This global civilisation, prophesied by the great religions of the world and projected by communists and materialists, should not be regarded as chimerical. However it is clearly not here yet, unless in an embryonic stage, so the communal endorsement necessary for the introduction of an extended range of phonemes is still more or less absent.

Consequently an international auxiliary language based on reformed English might have to change its core vocabulary by replacing some common words, which have relatively difficult phonemes, with easier words from other languages. Many tongues have fewer phonemes than English. Spanish has only five vowels; some languages have only three (one is said to have only two). Likewise there are tongues with nine consonants or less. Some have /l, m, n, r/ and then /b, d, v, g, z/ or /p, t, f, k, s/; depending on the cultural preference for voiced or voiceless speech sounds.

Modern research in the University of California Phonological Segment Database shows that the most commonly used consonant segments are:

p, b	t, d	ty	k, g	'
f	s	sh		(glottal stop)
m	n	ny	ng	
w	l, r	y		h

As well as having fewer consonants, many languages also use them more sparingly than English, usually one per syllable. Consonant clusters, especially those like "twelfths, strengths", are another feature of English which is not typical of other languages; though there are notable exceptions, including among minority ethnic tongues (mostly in the Caucasus), some of which have strong and complex consonant sounds with few vowels. However, on balance, a number of common and essential words in a reformed version of English for international usage, such as prepositions and conjunctions, might have to be replaced by alternative words from other languages - so as to avoid those phonemes and consonant clusters that are particularly difficult for the majority of nationalities. By making its phonology as palatable and digestible as possible for the greatest number of language groups the international auxiliary language might be enabled to get off to a flying start.

Present-day English forms would continue for those who wished to carry on using them. Moreover, as the phonological capacity of the culture associated with the international auxiliary increased, it would be possible for it to gradually "take back" from English and other mother tongues the full range of former phonemes and other desirable linguistic features.

Chapter_Sixteen: "LANGO_Orthography"

Orthographic reform is especially difficult because it deals with letters, the building blocks of words, as well as with words themselves. Neologisms and grammatical innovations are continually introduced, sometimes successfully, by writers and editors; but a change to the orthography of a language is much too important and fundamental to take place informally. Moreover, an organised orthographic reform of the English language, for the direct benefit of the whole English-speaking world, is unlikely to happen, for reasons which are explored in the next chapter. The most that could now be expected, realistically, is the revision of an offspring of English towards a rational foundation for the coming international auxiliary language.

Although this common tongue might start from a point close to contemporary English, at least in sound, it would necessarily lose all but traces of this origin as it evolved into a medium with the capacity to express or reflect a global culture. Its linguistic and euphonic centre of gravity would likewise move from the English-speaking world to the whole world, even as it has already shifted from the British Isles. The task of entirely constructing a new language would be beyond any individual or group - however well qualified. It would have to be carried out, via a comprehensive process of consultation, by an internationally representative panel of expert linguists. A democratically determined global standard accent, as explained in Chapter 19, would act both as reinforcement and failsafe mechanism.

Such a reform would bring into focus linguistic problems which T.O. deals with in an essentially negative way; the conventionalised spelling of T.O. avoids giving precedence to any of the accents in the English-speaking world and distinguishes homophones like "peak, peek, pique" on the page by the same means. As an alternative to T.O. we propose an international standard pronunciation and the introduction of many words from other languages. But a third negative argument for T.O. is more difficult to answer. This claims that fundamental spelling reform is practically impossible in English due to the limitations of an alphabet with only 26 letters - which must be retained for practical reasons.

It is a relevant point because the letters of the English alphabet must represent over 40 speech sounds or phonemes. In particular, the 5 vowels and 4 semi-vowels signify 18 or more sounds between them. These are, at a minimum, the 12 monophthongs in "sat bet bit fog the car bee low soon saw fir put", and the 6 diphthongs in "care deer lie day boy how". (It might be claimed that English needs at least 20 vowels: that the [u]s in "sun" and "put" are both categorically different from the schwa in "the": that the vowel in "poor" is a diphthong distinct from the monophthong in "paw", and that the vowel in "low, go" is a diphthong.) The 21 consonants must likewise signify a greater number of sounds; 24 consonant phonemes are normally listed as "English", approximately /b, tsh "chin, church", d, dh "the, that", f, g "go, get", dzh

"gem, jar", h, k, l, m, n, ng "young, singer", p, r, s, sh "she", t, th "theatre, thin", v, w, y, z, zh "measure, beige"/. Others like /ts "mezzo, pizza, pretzel", kh "loch, Bach" and ny "Enya, manana, union, canyon"/ are endemic through transliteration.

The result of this imbalance is that three quarters of the vowel sounds must be represented by digraphs like "ie, ea, ou" etc., rather than by single letters, and the consonants are likewise too few for a useful one-to-one correspondence. However, changing the English alphabet (e.g. to introduce extra diacritics and/or characters from the Russian, Greek or Hebrew alphabets) is not such a straightforward step as might be supposed: billions of pounds worth of hardware - not just manual typewriters but also a great deal of computerised equipment - would become redundant overnight; moreover, millions of touch-typists are psychologically imprinted on the QWERTY layout and would find it hard to readjust. More advanced I.T. machinery can easily switch to another alphabet, or to a layout such as Dvorak: which permits over a third less finger travel when typing English. However, the difficulty of mental adjustment probably explains why the ergonomic Dvorak keyboard has not prevailed even after 60 years. New letters and diacritics would no doubt be resisted for the same reason.

Every would-be reformer agrees that the present alphabet contains duplicated and redundant letters: [c] represents different phonemes, as in "cut cell once ocean luscious scene", only one of which, /ts/, as in some pronunciations of "once, dance, wince", is not duplicated by another letter; [g] and [j] are also duplicated, as in "judge", [q] and [x] are more or less redundant, and other letters are often used inappropriately, e.g. [f] for [v], and [s] for [z]. Consonant digraphs in English are even more irregular than individual letters. /Sh/, for instance, is spelt no less than 15 different ways, including [ce] "ocean", [ci] "facial", [ti] "nation", [si] "mansion", [s] "sure" and [sci] "conscience". Moreover, the following table of the (approximate) relative frequency of letters in the Cambridge Encyclopaedia, computer-counted, and based on q = 1, shows that several consonants are used so rarely in English as to be practically redundant:

e = 89	a = 67	t = 61	i = 61	n = 58	o = 54	r = 51	s = 50		
l = 33	h = 33	d = 30	c = 29	m = 21	u = 21	f = 18	p = 17		
g = 15	b = 12	y = 12	w = 11	v = 8	k = 4	x = 2	j = 1	z = 1	q = 1

However, there would be enormous difficulties in recasting the alphabet on a rational basis for an orthographic reform of English even within the English-speaking world, much more so towards a basis for the international language. The next chapters touch on some of the issues connected with an attempt to promote the latter.

The principle of orthographic regularity is important, but should not be taken to excess. In any case it will have to be approached gradually and carefully. The letters of the English alphabet represent phonemes, or narrow ranges of speech sounds, which are often different from those which are most common in other parts of the world. Moreover, users of ideogrammatic and syllabic scripts have coped for aeons without an alphabetic orthography: there is no reason why they should adopt one unless it were clearly beneficial.

Chapter_Seventeen:

"A_History_of_English_Spelling_Revision"

Idiosyncratic English spellings arose in the 12th Century from the difficulty of trying to reconcile the very different orthographic conventions of England and France. The introduction of printing from the Netherlands in the 15th Century promoted new orthographic practices; but spelling became even more according to the fancy of authors, influenced by the phenomenon of "line justification", which encouraged compositors to vary the length of words, or adopt alternative spellings, so as to fill out the text to the right-hand margin. Another theory is that printers often preferred to use longer words, e.g. "delight" for "delite", because they were paid for linage. During the "English Civil War" from 1642-9 the propaganda machines on both sides turned out broadsheets at an enormous rate. There was no time for line justification; but this mass-production effectively standardised many irrational spellings which had been perpetuated by its requirements, or for other arbitrary reasons, just at a time when English pronunciation underwent considerable changes, especially in its vowels (the "Great Vowel Shift"). Dictionaries from Dr Johnson's onwards have perpetuated or even compounded these errors.

Most other major languages have undergone official revisions to remedy this problem of irrational spellings becoming immortalised in print. Thus, spellings like "ch" in "chasm", "ph" in "phantom" and "ps" as in "psalm" are notorious in English, but were replaced by "c", "f" and "s" in Spanish and Italian centuries ago. However, from the international point of view, the absence of a thoroughgoing reform during the history of the English language should not necessarily be seen as a bad thing because, although such rationalisations tend to iron out extreme discrepancies, the employment of national norms can militate against international acceptability.

Spanish and Italian are also among that group of languages, headed by Finnish and including Hungarian and Malay, which are relatively straightforward to spell from speech, or vice versa. This is because a simple phonology, especially in the case of vowel sounds, allows phonemic spelling i.e. close correspondence between phonemes and letters of the alphabet. English, on the other hand, has the problem of attempting to cram over 40 phonemes into 26 letters - a few of which, like [q], [x] and [j], are greatly underused. This undercapacity has partly arisen because, unlike most other tongues using Roman script, English does not employ diacritics to increase phonemic representation. English has also suffered from the tendency of neologists to incorporate etymology into words, influenced by a French Academy which has vacillated between etymology - laying claim to the glories of Rome - and logic. For example, a [b] was restored in "debt" and "doubt" to show the derivation from the Latin "debitum" and "dubitare".

In the absence of effective official action to remove such redundant features, there have been numerous private attempts since the 16th Century to set in motion a process of English reform. A representative early figure was James Elphinston (1721-1809), who drew attention to the link between the international dominance of French and reforms previously instituted by the French Academy. To the scorn of critics,

and amused tolerance of friends like Dr Johnson, he sought to advance English by the same means: publishing a number of books in his phonetic spelling system including eight volumes of correspondence "between Geniuses ov boath Sexes and James Elphinston".

Noah Webster (1758-1843), the patriotic publisher of the "American Dictionary", is widely regarded as the most effective of the early reformers; but most of the spellings associated with him were current in Britain at the time. However, because of Webster's success in establishing them as "American", many logical spellings ceased to be extant in Britain. In this way, Webster's dictionary established the original Latin "-or" ending in words like "colour, labour, authour and mirroure"; the reversal of the last two letters in words like "centre" and "metre" (as in "enter"); the elimination of the final [k] from words like "musick and logick"; and the substitution of [k] in "risque" and all but one kind of "cheque". Dr Johnson expressed his "horror" at such barbarities as "author and music".

Organisations for the improvement of English spelling have existed for at least four hundred years. In the 16th Century the Royal Society investigated the need for orthographic reform, and eventually formed a committee which included the poet John Dryden. In 1869 the Philological Society endorsed the cause; and the British Spelling Reform Association, which included famous writers like Tennyson and Darwin as well as philologists, was founded in 1879. The Simplified Spelling Society, which had links with an American counterpart, was inaugurated in 1908. In its earlier days the S.S.S. attempted to unite behind a single scheme of reform, but in recent years it has turned more to providing an educative forum for various viewpoints. These range from corrections of only the most extreme inconsistencies in English orthography to radical reforms which attempt to phonemically rationalise the alphabet.

In 1984 the S.S.S. published a moderate list of suggested reform proposals which had some qualified support within the society. (1) short [e] as in: "eny, meny, frend, hed, etc." (2) replace [ph] with [f] as in: "foto, telefone" (3) delete [gh] as in: "caut, dauter, bou, drou, plou" (4) replace [ugh] with [f] as in: "laff, draft, cof, troff" (5) drop redundant final [e] as in: "hav, giv, relativ, opposit".

However, as anyone concerned with the problem may discover for themselves, at least four fundamental difficulties arise with any reform of English. The first is that almost any disturbance of traditional orthography immediately throws other discrepancies into relief. For example, however reasonable they might appear at first glance, four of the five proposed revisions listed above raise as many questions as they answer:

(1) "eny, meny" or "enny, menny" and, if "eny", why not "peny"?

(2) "saffire, saffire or safire"; "fotografy or fotograffy"?

(3) Why not "cawt, dawter, bow, drowt, plow" or something else?

(4) Why not "laff, cawf, troff"?

Likewise, substituting other short vowels where appropriate may seem like a positive step; but if "plait, women" becomes "plat, wimmin", then "plaited" must become "platted", and we are immediately up against not only homographs but also the modernising tendency to use single rather than double consonants as in "enrol, skilful, fulfil" (British) and "traveled, marvelous, woolen, worshiper, carbureted" (U.S.). Similarly, the question arises whether short [u] should signify the vowel as in "put, foot", or that as in "putt, flood, bud, run". (Standard English differentiates these from the schwa as in "random, element, infant": a tripartite distinction which is not recognised by Welsh and other languages.) Numerous other examples might be given; all demonstrating that English has developed into a precarious edifice which it would now be practically impossible to repair without destabilising the entire structure.

A second difficulty concerns homonyms. Most reformers would see the eventual deletion of extra or silent letters to be desirable; but although the initial letter might simply be dropped from "knife", "knock" or "gnat", omitting it from "know", "knit" or "write" would produce homographs: and to delete the one but not the other would be widely regarded as inconsistent. Any thorough programme of orthographic reform would turn numerous homophones e.g. "ate, eight" or "rain, reign, rein" into homographs. It would be difficult to solve this problem of homonyms without introducing a large number of substitute words from other languages: in which case it would cease to be a recognisably "English" reform.

A third major problem with English reform has simply been a shortage of symbols to represent all the phonemes. For eminently sensible reasons the S.S.S. has mostly been against extending the alphabet or using diacritics; but the result has been a lot of words that are longer or less elegant than the originals. Thus, in "New Spelling 90", "almost, paper, motion, accumulation" become "aulmoest, paeper, moeshen, akuemuelaeshen". Moreover, none of the S.S.S. schemes are entirely orthographic: "New Spelling" (1948) often refrained from distinguishing the schwa, and "New Spelling 90" usually employs [e]: both use several words like "the, to, so, be, he" and the affixes "re-, -ful" conventionally, i.e. without regular orthographic spellings.

Attempts have been made to reduce the length of these regularised spellings by employing under-used letters, e.g. [x] for /sh/, /th/ or /kh/ as in other languages; but there are not really enough spare letters to go round. Another response has been "Cut Spelling": which is presented by the S.S.S. as an alternative to "New Spelling 90". Cut Spelling is more regularised than T.O., but is still conventional rather than orthographically consistent, as the following sentence shows: "As yet, th question of english spelng reform, tho ocasionly atractng public atention, has not convinced th relevnt authoritis that it requires serius, informd considration." Cut Spelling represents a 10% print saving, but its conventionalised forms necessarily appeal more to the present than to the future users who are, by definition, the greater constituency of any major language. For instance, one problem with Cut Spelling is that children learning to read must place the missing schwas correctly.

However, the fundamental problem for spelling reformers has never been wholly dependent upon QWERTY keyboard limitations which might be entirely removed by extensive computerisation anyway; public attitude has always been equally fundamental. There is probably just as much chance of the present arbiters of the English language adopting Kingsley Read's radical new alphabet (which won G B Shaw's competition in 1958) as any modest reforms. Even piecemeal alterations are always going to be

impossible so long as there is an unwritten contract by the already-literate to maintain traditional orthography at the expense of future generations and foreign learners. In such a climate the most unambiguously useful revisions, e.g. of = ov, off = of, are pounced on as "spelling mistakes", and the most arcane usages, which have long ceased to relate to any known orthography, are perversely valued since they reinforce the cultural shibboleth. It would be difficult to change this attitude except in a new internationalist context.

A fourth difficulty is that the principles of orthographic and grammatical regularity are often in conflict. For example, "talked, edited, banned, landed" are grammatically regular on the page, but in speech they tend to be "torkt, editid, band, landed"; likewise "banks, cats, dogs, foxes" usually become "banks, kats, dogz, foksiz". Inevitably, the sound of an inflection is changed by the nature of the adjacent phoneme: a tendency which even the recorder of the international standard accent might not be able to resist, without making the word sound artificial and unreal.

One response to this problem would be to reduce grammatical inflections to a minimum. As we have seen, the creoles have shown the way here, by greater use of the word-order principle; but beyond a certain point there is an inevitable loss of semantic capacity. An artificial language like Glosa may be potentially 100% orthographically regular, which is an advantage, but one which must be traded against the value of inflections. Another possible solution would be to change either the vocabulary or the nature of the inflections. For example, inflections like short [a] or [i], or long [o], tend to sound the same, whichever word they are attached to. No doubt they are found in many languages for this reason.

A fifth reason why English reform has not proceeded since Webster is the variety of pronunciations worldwide. There are numerous words, like "vase, clerk, potato, tomato, harass, genuine, fertile, schedule, simultaneous", which are normally pronounced differently across the Atlantic. Millions of English speakers do not differentiate between /w/ and /wh/ in words like "which, when, what"; but many others use the aspirated pronunciation /wh/. Likewise, the English-speaking world divides between those who pronounce the /r/ in words like "word, bird" (generally the U.S.A., Canada, Ireland and the Philippines), and those who do not (usually the rest of the English-speaking world). For every word the question might be asked: upon which variety of pronunciation should an orthographic spelling be based?

Merely substituting words from other languages would not solve this problem because accent differences affect vowel sounds, and to a lesser degree consonant sounds, in so many words that "culturally impervious" alternatives would not readily be found. This is the very situation which the notional pronunciation and standard accent described in Chapter 19 are designed to address. The creation of a single international standard accent, unified but not uniform, is absolutely vital because English orthographic reform depends upon the close definition of vowel sounds. This would allow the reallocation of symbols or redefinition of the semivowels (l, r, w, y), the substitution of single for double consonants, and the removal of many superfluous letters.

It becomes apparent that a proper reform of English could not take place without a comprehensive overhaul of the alphabet, which would in turn necessitate an international standard pronunciation, as an

orthographic benchmark, and also the incorporation of numerous words from other languages to replace all the consequent homonyms. The language undergoing such a process would soon pass a point at which it was no longer "English" according to any objective standard, so it might as well change its name to one signifying "international auxiliary language".

Endeavours to reform English on less than a global scale failed earlier this century when a "national" outlook was still the norm, and would be even less likely to succeed now. In 1949, and again in 1953, an attempt to get a scheme for English reform through the House of Commons was defeated: extraordinary luck having twice permitted a Member of Parliament to present a Private Member's Bill on the subject. The second bill actually passed its second reading; but further progress was halted by the implacable opposition of the Ministry of Education.

This was a historic missed opportunity because, at the time, British Received Pronunciation was still more or less the accepted standard accent throughout the English-speaking world. It was the front-of-house accent favoured by large corporations in America, diplomatic circles in various countries, and educational institutions everywhere. Such a bill would not even pass its first reading today. The notion of reforming British English apart from the other "national" varieties of the language would now be totally unacceptable.

An enormous amount of money has been thrown at the cause of English reform, but with very little result. Andrew Carnegie donated nearly \$300,000, and there have been other substantial legacies. Another sign of enthusiasm early this century was the petition to set up a Royal Commission, which attracted around 15,000 signatures, including those of many prominent academics. Why has it all come to nothing apart from a few minor revisions in America?

Firstly, English reform is unlikely as long as the language still largely centres upon a country whose social order is greatly influenced by class, as well as wealth, religion etc.. Thus the divergence between spelling and pronunciation functions as an educational and cultural shibboleth, to the despair of students from societies where such a device is irrelevant, and the difficulty of children learning to read. This observation is equally valid if the upper-middle class accent is deprecated and proletarian ones are fashionable.

Secondly, the social forces which have been transforming the English-speaking world since the 1960s, shaking many ancient institutions, customs, mores and beliefs to the foundations, dispossessing much of the old aristocracy and middle-class, and raising up previously disadvantaged sections of society along with new media interests and extensions to state sovereignty, have not operated primarily through the traditional rational arguments of literary culture. Rather have they fashioned their emotional appeals into images, focused via the new electronic media directly into the heart, using the spoken form of language about which rational orthography has very little to say.

Thirdly, the majority of people are simply not interested in spelling reform, because there is nothing in it for them. Since the advent of mass electronic entertainment most people seldom read anything much

other than magazines and tabloid newspapers anyway. They had difficulty learning to read at school; but it never did them any harm - so their children might as well experience the same! In fact, within the English-speaking world, the idea of language reform is inconvenient or irrelevant to nearly everyone except primary schoolteachers and the organised English Language Teaching (E L T) industry, with its T E F L (Teaching of English as a Foreign Language) and T E S O L (Teaching English to Speakers of Other Languages) qualifications.

However, the same people who are totally unmoved by the idea of the reform of English for use within the English-speaking world, may be enthused by the prospect of an international auxiliary language - because it stands to benefit them personally. Their children would only have to learn one "foreign" language at school: and it is one they would be likely to actually use afterwards! All free peoples would have access to a world-wide literature and media. When "abroad", a concept that would cease to have much meaning, since the world would become as one country through the common language, everyone would be able to talk to the locals, read the press, and listen to the news.

And last, but not least, we would all spend less in taxes through an international language. In a world which is becoming more and more united every day, whether by desire or necessity, the consequently increasing number and scale of international conferences, simultaneously translated into several languages, is not taking place without exorbitantly rising costs. The European Parliament and other agencies now spend most of their budgets on translation. For example, in 1994 (even before Austria, Sweden and Finland joined), the European Union spent £1,200,000,000 on 72 translations.

Chapter_Eighteen:

"A_Suggestion_Towards_Orthographic_Reform"

Spelling reformers, including the S.S.S., have hitherto been constrained by the premise that the current English alphabet should be retained. It may be that computerisation will advance at such a rate, throughout the English-speaking world, that such a limitation becomes irrelevant: but that stage is still a long way off. The manual typewriter is far from extinct; and demand for cheap word-processors and other kinds of low-level I.T. equipment with no choice of typefaces etc. may well continue into the distant future. This point has been repeatedly emphasised because it is the very crux of English spelling reform. Its relaxation to the extent of using even one diacritic, like the circumflex (as on ê), would remove the phonemic barrier to a rational orthography at a stroke.

For example, although the Esperanto alphabet has only 22 letters, lacking the symbols [q, w, x & y] (the English /w/ and /y/ are represented by other letters), the optional accentuation of [c, g, h, j, s & u] effectively increases its alphabet to 28 letters. Using diacritics likewise in the English alphabet would certainly solve all the problems of representing its range of phonemes, though it would make a great deal of QWERTY hardware redundant in the process.

We have examined the consequences of this limitation in some detail, showing that phonetic spellings using the existing alphabet are prolix, but that there are not enough underused letters such as [q] and [x] to represent even consonant digraphs economically - much less vowels. The fundamentals of the problem are twofold: firstly an alphabet which could exist within the existing QWERTY machinery, and secondly an alphabet which could orthographically represent at least 27 consonant phonemes and 18 vowel phonemes.

In order to accommodate these constraints, we suggest that the capacity of the alphabet might be doubled by severing the phonemic identity between lower case letters and their upper case equivalents. Operation of the shift-key would thus allow no less than 52 phonemes to be independently symbolised. But then initial capitals on names and sentences would have to be denoted differently: we suggest the use of an initial stop instead, e.g. "David Lovel in yon abbey." = "..david .lovel in yon abbey."

One variation on this idea would use the upper-case letters exclusively to represent vowels - an arrangement of possible long-term potential for a type of usage which might be best understood by considering Hebrew, the ancient language of Israel, revised for modern use. As an entirely consonantal script, Hebrew had always relied on memory to provide sound and context to distinguish homographs, but the Nikud system essentially uses two scripts: one with diacritics - which are used to signify vowels; and one without - for those who are so familiar with the appearance of words that the diacritics may be

omitted. A somewhat similar system is used to a lesser extent in other Middle-Eastern languages.

The first script is printed in school primers, textbooks for language students, and where an exact orthographic rendition is required - as in certain religious passages. This script is normally handwritten, since it is predominately used by children and students. The second script, which consists of consonants only, is printed in books and newspapers - where the mass of the population, which has mastered the first script to the extent of being able to recognise words without diacritics, can read it with little difficulty.

The objection will soon be raised that such a dual system is wholly unsuitable for English words, which are often short and full of vowels, including diphthongs and triphthongs. (There is an approximate 2:1 ratio between consonant and vowel sounds in English.) The objection is valid. If used in present-day English, or practically any of the world's languages for that matter, there would be an immoderate number of consonantal homographs in the second script. For example: "rat, writ, rot, rut, rate, rete, rote, root, rite, rout and wrought" would all become "rt"! Moreover, words like "a, I, eye, owe, ewe" would disappear entirely.

However, this second abbreviated script might be introduced decades or centuries hence, when a very different vocabulary from a wide range of international sources allowed it to work. (The phonemes would perhaps need to be redefined at the same time as they moved from an "English" towards a more international currency.) When this happened every child would learn the first script: meanwhile consciously learning to recognise words by their appearance - as is done in the case of East Asian ideograms - to the extent of being able to miss off the vowel representations (i.e. the capitals) at some stage. That would leave the second script - which could be none other than the present alphabet as found on the QWERTY keyboard. This follows the normal pattern of development wherein children and students use handwriting, and typing is a skill which may be acquired later.

However, such considerations are for the future; the present concern would be to choose symbols to facilitate a rational spelling. We could start with the consonants, which are more straightforward: seventeen of them might as well be the same as in English. Some rationale might be given for the ten alterations: [c] = /ts/ in German and many other languages, also some pronunciations of words like "once, mince, city" give this sound; [c] = /tsh/ would also make sense, given imports like "cello, ciao", but morphically the stroke on [e] might signify the /ts/ modification; [g] = /dzh/ in many English words already, e.g. "gel, gender, gesture, giant, gist"; [i] = /ng/ might be appropriate in view of the very common suffix "-ing"; [j] = /zh/ as in French, this phoneme is heard increasingly in English through imports, e.g. "beige, bijou, azure, Zhivago, Siobhan"; [o] = /th/ as in Greek "theta"; [q] = [g] (plosive or "hard"), unprecedented but fits morphologically, [q] is easily substituted by [kw] or [k] ("queen, queue"); [x] = /sh/ as in Portuguese, Basque, Maltese and Catalan, [x] is also readily replaced, by [gz], [ks] or [gzh/ksh] ("examine, exit, luxury").

Moreover, the apostrophe might be used to represent a 27th consonant: the glottal stop or alif, which is found in Hebrew, other Middle-Eastern languages, Amerindian tongues, and elsewhere. As the world contracts, the glottal stop is being increasingly required for accurate transliteration into English. De facto, it is the 27th letter of the English alphabet already - used for transcribing names, and also dialect or argot

expressions, e.g. "bu'er" or "go'a lo'a bo'le". In addition, the apostrophe is now used to denote missing letters, e.g. "fo'c'sle, haven't, Scarboro'", and also the genitive case, e.g. "Susan's". Orthographic reform would make the former unnecessary - since words would be spelt as they sounded - and the genitive could be abolished if the simple creole usage became current. Alternatively, a convention could be established that all plurals ended in [z], and all genitives in [s], e.g. "Londons taksiz, artists artistz" - which is more or less the standard orthographic spelling anyway.

These consonants may be tabulated thus:

a = /dh/	j = /zh/	s
b	k	t
c = /ts/	l	u = /ny/
d	m	v
e = /tsh/	n	w
f	o = /th/	x = /sh/
g = /dzh/	p	y
h	q = /g/	z
i = /ng/	r	'

The number and specification of the vowels varies between languages, and also between dialects within languages, much more than in the case of consonants. With that proviso, Table 1 lists 18 vowels previously shown to have a wide currency in English, and also the irregularity of traditional orthography when it comes to representing them. According to this system, vowel digraphs ending in [e] and [u] are considered to be monophthongs, and those ending in [a], [i] and [o] are diphthongs.

Table 2 matches 18 capital letters to these vowels: an allocation which is even more arbitrary than in the case of consonants. Six capitals [C, O, S, V, W & Z] are not used because the upper-case and lower-case symbols are normally similar. This could cause confusion when using computerised equipment with the ability to reduce the font size when touching the shift-key. [Q] and [P], the top-corner letters on the keyboard, might be added if 20 vowels were employed. The vowels and their symbols are also tabulated below:

a	A	e	E	i	I
o	D	u	U	ea	R
ia	H	ae	M	ie	N
oe	G	ue	X	ai	Y
ei	K	oi	T	ao	B
au	L	eu	F	ou	J

The Lord's Prayer, transcribed from a non-rhotic speech into this orthography, demonstrates both regularity and print saving. Improvements to this spelling system might include the conventionalising of some common words and inflections.

"Our Father, which art in heaven, hallowed be Thy Name. Thy Kingdom come, Thy Will be done, in earth as it is in heaven. Give us this day our daily bread, and forgive us our trespasses, as we forgive them that trespass against us. And lead us not into temptation, but deliver us from evil. Amen.

Another variation on the same idea (using a mixture of upper and lower case letters) would be statistically based. According to this system, sounds which occur most frequently in current English, i.e. in more than 1.5% of text, would be allocated to lower case letters and the remaining sounds, i.e. those occurring in less than 1.5% of current English text, would be signified by upper case letters, irrespective of whether they were vowels or consonants.

Although this system does not have the long-term possibility of the previously described scheme, i.e. that of dispensing with the vowels (and thus of the upper case letters representing them) in text used by the already literate, it has a significant advantage in the short and medium

term - which is that, since the upper case letters symbolise the less frequent sounds, the use of the shift-key on the usual QWERTY keyboard would be minimised. A suggested system is as follows (the proposed use of letters is illustrated where appropriate by the word before the slash):

Sounds occurring in over 1.5% of current English text (all the consonants except those signified would retain their present usage):

a = opan / open	j = fjl / feel	s
b	k	t
c = c / the	l	u = up / up
d	m	v
e = pen / pen	n	w
f	o = hop / hope	x = hxt / hat
g = get / get	p	y = ply / ply
h	q = mqk / make	z
i = pin / pin	r	

Sounds occurring in less than 1.5% of current English text (a rhotic pronunciation would be represented by this scheme in order to maintain a visual link with T.O.):

A = Art / art	I = let / yet	Q = nQ / now
B = bBk / book	J = viJan / vision	R = fRr / for
D = hDt / hot	K = Kin / chin	T = Tin / thin
E = bErd / bird	L = uLan / onion	U = Uz / use
F = Fen / when	M = Mip / ship	Y = rYl / rule
G = Gel / gel	N = siN / sing	! = glottal stop
H = HAn / khan	P = bP / boy	

Below is the Lord's Prayer translated into this orthography:

".Qr .fAcar, FiK Art in hevan, hxlod bj .cy nqm. .cy kiNdam kum, .cy .wil bj dun, in ErT xz it iz in hevan. .giv us cis dq Qr dqli bred, xnd fRrgiv us Qr trespAsiz, xz wj fRrgiv cem cxt trespAs agenst us. .xnd ljd us nDt intY temptqMan, but dilivar us frDm jvil. .Amen."

Chapter_Nineteen:

"International_Pronunciation_and_Accent"

The disintegration of empires, the movement of nation-states towards confederation, the rise of transnational corporations and global institutions, and the proliferation of electronic media, have also brought the unifying process to bear upon language. Firstly, half a millennium of printing has harmonised different dialects within primary language areas until there are now few verbal expressions, apart from regional or national token-words or phrases, which are not the common currency of all. Moreover, in this age of the electronic media the speech coming from all parts of the world is challenging the value of former standard pronunciations and accents. For example, the images of wealth and status crowding the T.V. screen from America and Australia have undoubtedly had an effect on British English, if only by diluting its affective value.

Indeed, the very accessibility of radio and T.V. as passive entertainment is altering the perception of modern peoples to language itself, compared to earlier print-oriented generations. Thus, even as the printing-press, through the circulation of books of international interest, such as the Bible, scientific works, great novels etc., embraced most dialect variations within the English-speaking world, the electronic media have contributed to the harmonisation or internationalisation of pronunciation: in other words, to an utterance that is globally acceptable as a result of its clarity, euphony and general comprehensibility. One evidence of this trend may be heard by comparing old films with modern ones of an equivalent quality. The clipped British accents of yesteryear have obviously absorbed international tonal elements. It has also been observed that young people in Britain are now more inclined to end sentences with the interrogative intonation characteristic of Australians.

But demonstrating that the best "national" pronunciation is clearly internationally comprehensible is quite different from claiming that it also represents a suitable standard pronunciation upon which to base a unified global spelling. Distinct national variations in pronunciation obviously remain, even within speech of the highest broadcast quality. It is evident that another means for determining a standard pronunciation for the orthography will have to be found.

The traditional method employed by nations which have decided to reform the orthography of their language has been to appoint a panel of experts, who have used statistics to obtain a closer match between spelling and an established national norm. This is the way in which language planning has progressed in Ireland, Norway, Russia, China, and other countries during the past hundred years. Even in the case of national languages, where publishers and lexicographers are closely associated with media/literary/educational establishments, the method is difficult enough; any attempt to repeat it on the

global scale would of course be considerably more so.

Within a national language area it is usually fairly evident what the normalised or "notional" pronunciation should be; but a more scientific, statistically-based procedure would have to be used internationally for the same purpose. Thus the representative panel of linguists officially selected to construct the language, having access to all the statistics concerning the global distribution of preferred diaphones for the standard phonemes, would be able to derive and ascribe a "notional pronunciation" for the international standard, based upon a precise allocation of phonemes to letters of the alphabet. This phonemic representation would be abstract, rather than exemplified by a given speaker, though a voice actor might be found to portray it.

Attempts have already been made to define this standard speech. The late Professor A C Gimson suggested a decreolised but rhotic Caribbean speech for the role within the English-speaking world. South African speech, in which the [r] has a rolled or trilled pronunciation, has also been advocated. To mention a few verbal examples, a suitable pronunciation according to international norms might have "vee-uh" rather than "vie-uh" for "via"; likewise "fin-ance" rather than "fie-nance"; "dee-alect" rather than "die-alect"; "anti-bee-otic" rather than "anti-bie-otic"; "Iran-ian" rather than "Eye-rayn-ian" etc.. Words with "long vowels" might have two pronunciations - current English, and a normalised "continental type" associated with the international dialect e.g. "make" might be pronounced as "maak": closer to the spelling (and an older pronunciation). Consonants [c, g, j] might be "hard", i.e. "okean, gem (not /dzhem/), yoint". These sounds might be brought about by the orthoepic effect of the written form.

Suitably qualified linguistic experts for the international language committee would really need an actual mastery of the entire global phonology, an equal regard for different national vocabularies, an understanding of the logic behind every grammar, and an aesthetic appreciation of the various kinds of script. No single individual could be expected to possess this degree of knowledge, or to be entirely free of linguistic presuppositions, but a properly-constituted and well-chosen committee, acting in consultation with all interested parties, would command the necessary expertise.

Many linguists around the world are already studying and codifying morphemes and phonemes, the building-blocks of language, with the idea of an international auxiliary very much in mind. Computer-linked, and with huge databases of information, they are more or less abreast of language development - and are keenly aware of the linguistic imperative of a global tongue: the need to harmonise vast differences in both phonology and script. The inauguration of the international language committee would inevitably catalyse a vigorous interaction between ideas for orthographic reform and a mass of research data.

But there is a drawback inherent in the essentially reactive nature of the scientific method. This could easily be seen in the past when the manual collection and collation of data could scarcely keep up with linguistic change. However, although modern recording and I.T. equipment may reduce the time-lag, e.g. by using phoneme-recognition programs on a population pro rata basis, the result will always be a step behind events. The safety-first objective approach avoids being bound by the dubious prognostications of

experts, but also loses the inspired predictions. A related problem is that of data selectivity: in this case concerning the types of "national" speech chosen to go into the computer.

Another problem with theoretical speech, formed by computer modelling, is that it might resemble no known pronunciation. In view of this, one suggested programme of English reform would be both orthoepic and minimalist, with spellings kept much the same as T.O. while international pronunciations according to this spelling became established. Listening to radio or television interviews from around the world, it is obvious that interviewees often pronounce words as they are written according to international norms, rather than like Britons or Americans: e.g. "the house in Austria" might well be said as "tea hoce in Owstria". Likewise, it is evident that Russians, Germans and Japanese speak Russian, German and Japanese English, respectively. These Englishes have their own national characteristics, but they also share features of syntax, pronunciation and vocabulary which do not derive from the English of Britain and America. Such varieties of linguistic preference would have to be accommodated in the fabric of the coming common language.

One advantage of the latter approach is that it would allow the notional pronunciation to gradually take concrete shape. But the world would wait a long time for a consensus to establish itself through this process. The accents in the media might well be converging, as might be discovered by comparing sound recordings from different decades and places, but it is happening so slowly that the demand for a common orthographic standard might not wait for it. Hence an alternative would be to anticipate the convergence of accent in some way. For instance, most people are quite capable of differentiating a "national" accent from a "regional" one; indeed, this is generally regarded as much easier than distinguishing a regional accent from a local one within that region. But this capability has only arisen due to the emergence and partial realisation of the national or racial idea, expressed through national politics and broadcasting institutions, and consolidated in reaction to other states.

In the same way, significant developments in international co-operation during the latter part of this century (such as the publication of "Agenda 21" in 1992), by demonstrating the possibility of global initiatives supported by the great majority of nations, have testified to the dawning awareness of humanity as a single society which is accountable for the interests of all its peoples. As with the development of the national idea, there is every reason to suppose that this global consciousness will be expressed by a corresponding fusion of speech elements, if such is not happening already. Thus, an attempt to determine the most internationally acceptable accent, as embodied by an individual on hand to record it, might become increasingly feasible. Such an enterprise might well reinforce the notional pronunciation which itself could never be more than an approximation due to the inherent limitations of the scientific method.

The standard accent might be determined by the official auxiliary language committee drawing up a sizeable shortlist of internationally-known public personalities and media figures from different parts of the world - any one of whom would be a suitable exponent of it - Sir Peter Ustinov is a contemporary example. The standard speaker would then be elected from this shortlist, perhaps by a world-wide telephone poll, or an extra ballot at elections.

By personalising the issue, this kind of election would be excellent publicity for the international auxiliary language, and would also be a realistic prospect since media broadcasts are beginning to span the globe. International satellite T.V. is well-established and trans-continental optical-fibre connections are gradually being laid, which also mean that the vagaries of short-wave radio reception can theoretically be replaced by crystal-clear sound coming from the other side of the world by satellite or cable. The practical facilities are thus being set in place for what could become a periodic election of the best, clearest, and most internationally- comprehensible English-speaker.

Briefly, the chosen speaker would read a list of words or a text containing the full range of phonemes, and would be carefully recorded doing so. The script would then exactly describe the accent portrayed by the selected speaker. This would be the global standard accent upon which, when beneficially combined with the international notional pronunciation, the comprehensive orthography/orthoepy would be based: a standard that would be referred to for a designated number of years - until change in the linguistic centre of gravity demanded a new election.

This exercise should produce a result very close if not identical to the notional pronunciation formulated by the language committee; and if not, the enquiry into the discrepancy might well perform the service of revealing a procedural inadequacy on either side, if not both. Taken together, these two approaches should powerfully reinforce and complement one another. In fact they should permit a speech/script relationship for orthographic purposes to be established with such exactitude that almost any kind of speech, e.g. authentic dialogue in plays or novels, might be precisely signified on the page. It is conceivable that this phonemic alphabet would replace the International Phonetic Alphabet (unusual consonants and vowels might be represented by standard digraphs) apart from the diacritics (only used in special circumstances) indicating nasalisation, stress, pitch, tone etc.. An author writing dialogue would simply need to check an aural copy of the global standard accent against its transcript, and vary his own script accordingly.

Such a thing would be impossible in Chinese, and hardly less so in English, as G B Shaw and other playwrights and writers of dialogue have testified; an orthographic link scarcely exists between the script and even one of the variations of Standard English like British Received Pronunciation. Ironically, it couldn't even happen in Esperanto because, as a consciously international auxiliary language, there are no non-standard accents and dialects by definition - since they would betray a sub-international mentality!

It must be firmly emphasised that the international standard would exist solely for the purpose of allowing various accents, dialects, and even foreign languages, to be represented orthographically on the page; in other words, to permit the operation of both the orthographic and orthoepic principles on a unified global scale around a single script. It should not be regarded as an "elocution standard", or as any indication as to how people should speak.

Chapter_Twenty: "Names_and_Organisation"

The approach of an international language committee towards questions of orthography and script should be modified where names are concerned because words and names are two different things. Words are inclusive but names are exclusive - as in the distinction between common and proper nouns. Names always contain an element of privacy - including the subjective definition of correct pronunciation. This is especially true of personal names; it is up to the owners of personal names to give them up for orthographic revision if and when they are ready; anything else is a kind of violation.

However, place names have a wider currency than personal names, and might be standardised via proper consultation with all interested parties. Lancelot Hogben in his book "Essential World English" suggested that local forms of place names should replace "English" versions. This is already happening - e.g. Ceylon, Leghorn, Moldavia, Andalusia have become Sri Lanka, Livorno, Moldova, Andalucia - but the process is not always straightforward. The ownership or validity of a name can be disputed: e.g. most of the citizens of a great Indian city call it Mumbai, but a substantial and influential minority prefers the "English" name Bombay. Homonymous villages, towns and regions are normally harmless enough, but not so in ethnic hot-spots such as Macedonia. Variant names for famous places become established by long and frequent usage. Thus the city the Italians call "Roma" has been "Rome" in English for hundreds of years and "(An) Róimh" in Irish for over a thousand; "Beijing" is now largely accepted, but "Peking" - which derived from the 17th Century French Romanisation system in which [k] was used for the "j" sound /dzh/ - is still preferred by some publishers. Sometimes a name cannot be universally adopted due to the script, or the presence of diacritics, yet an old transliteration is inexact: e.g. "Cologne, Copenhagen" for "Köln, København". Many place names have a traditional spelling which hardly corresponds to the spoken version, and many others have distinct local and national pronunciations - raising the question of which should be used as the basis of an orthographic change.

The 1967 decision by the United Nations Organisation to standardise geographical names worldwide in Roman script may be seen as yet another indicator that the coming international auxiliary language is likely to be English-based. The United Nations Group of Experts on Geographical Names (UNGEGN), which meets biennially, is concerned not only to promote particular names but also to discourage the production of additional variant names. This disapproval of so-called "exonyms" challenges the desires of nations whose people are strongly conscious of the value of language as an aid to independent political existence.

The question of a name for an initially English-based international auxiliary language would have to be

determined democratically: a provisional suggestion we have come up with, until or unless something better emerges, is LANGO - which would have far-flung linguistic resonance, yet without a current meaning as in the case of LINGO or LINGUA. Moreover, LANGO is a handy acronym in English, French and Spanish, among other languages, (as shown on the first page - also, "LANGuage Organisation", as on the front cover). LANGO also happens to be the name of an important African tribe divided linguistically by two dialects and politically by the Sudan/Uganda border. Other names for the language that have occurred to us include:

LIBRE "Language Initially Based on Reformed English"

REFIC ("Refits") "Reformed English For International Communication"

ALIEB "Auxiliary Language Initially English Based"

GABIEL "Global Auxiliary Based Initially on the English Language"

KABARE "Kommon Auxiliary Beginning As Reformed English"

LUA "Langue Universelle Auxiliaire"

UNAL "Universal Neutral Auxiliary Language"

IDEAL "Initially Derived from English Auxiliary Language"

KIT(EB) "Kommon International Tongue (English-Based)"

KIBAT "Kommon International Brito-American Tongue"

KEBARO "Kommon English-Based Auxiliary Reformed Orthographically"

KOINE "KOMmon INternational English" orig. "lingua franca"

MON "Modern Orthographic Norms"

BUSA "Britain/USA language" or "BUSiness Auxiliary"

SHENGIL "Shared English International Language"

MUNDISH "Mundo" - "world" (Romance); "Mund" - "mouth" (Ger.)

GENLISH "General English" or "Genesis in English"

WoLa "World Language"

Most of us are trained throughout our formative years to regard the slightest variation to T.O. as a "mistake" rather than as a simplification or useful innovation: and the valid reason for this constraint - that unity must take precedence over regularity in matters of orthography - has tended to develop into a fetishistic or shibbolethic attachment to T.O. which scorns attempts to construct a universal and rational alternative. Thus the psychological aftermath of early conditioning has figured largely in the failure of attempts, whether gradualist or revolutionary, to influence the English language directly.

Ingrained attitudes of this kind can be difficult to change, but have yet been shown to respond to determined campaigns of public education, which brings us to the thought that we haven't yet considered the role of publishers and propagandists in the orthographic reform of English. Could influential newspaper and media magnates extend their worthy contributions in the fields of grammar and neologism to the realm of English spelling reform? They would seem to be ideal agents of change - conscious as they must be of the benefits of print-saving, of the needs of second-language speakers, and of the value to the bottom line of reaching the widest possible readership for their products.

Indeed, it might be supposed that the transnational character of major English-language publishers was an advantage in this respect. So it might be, but the maintenance of orthographic unity within the peculiarly decentralised English-speaking world depends upon an agreement which is all the more powerful for being informal, with no obvious centre to define itself against; and although publishing and media interests may be merging and consolidating, there is still sufficient diversity of ownership that no publisher or lexicographer is likely to independently introduce substantial reforms for fear of being left out on a limb.

The experience of the "Chicago Tribune" provides a telling illustration. Towards the end of the last century Joseph Medill, owner and editor of this leading American newspaper and member of the Council of the Spelling Reform Association introduced a number of orthographic spellings, most of which were gradually abandoned. However, the enterprise was revived in 1934 by Medill's grandson, with the support of readers who voted 3 to 1 in favour of "short spelling". Thus the "Tribune" once again started using words such as "bazar, burocrat, catalog, crum, glamor, harth, herse, iland, jaz, rime, sherif, staf, subpena, tarif and trafic".

Other spellings, including "tho, altho, thru, thoro, frate, fotograf, filosofy" were subsequently added, though some of the 1934 originals were already being discontinued. During the 50s and 60s no new words appeared, and most of the remaining orthographic spellings were dropped, including "tarif" and "frate". By the 70s only "thru", "tho" and "catalog" etc. survived, and even these were soon to disappear from the "Tribune's" columns.

Likewise "The Times" abandoned more orthographic spellings such as "Jugoslavia, baptize, colonize" etc. after a fairly recent change of ownership. All the evidence goes to show that an orthographic reform will only occur collectively, and in an organised manner; the gradualist approach, hitherto endorsed by many workers in the field, has manifestly failed. Although it might be rational to introduce a number of revised spellings it might be still more rational not to break the unwritten consensus.

In view of this fact, which has become apparent over a long period of time, enthusiasts for spelling reform have had to content themselves by inventing a variety of orthographies and writing numerous articles about the subject. But these theoretical considerations have done very little to advance the cause; praxis is an essential ingredient of language development. In Esperanto and other constructed languages we already have enough negative examples of the purely academic approach. It is now time for a coherent and co-ordinated initiative in which reforms might be assessed pragmatically.

As is well known, the democratic process demands that, after a due period of consultation and reflection, a single united programme be adopted, and then continued for a set period of time; the central principle being, not so much that the popularly chosen manifesto should be correct in all its aspects, as that everyone should endorse and uphold it for a trial period until the next election. In this way an incorrect policy or decision might be modified as a result of experience; without a run out in practice, there is no way of telling whether or not a theory is workable.

The international stage is now set for the redevelopment of a language which has redefined itself at roughly 200 year intervals since the 10th Century. In King Alfred's time there was a somewhat artificial standard national language based on the Wessex dialect. In the 12th Century the Chancery made the English of London standard and determined the orthography. Many neologists, grammarians, orthoepists and lexicographers later made important contributions. The language today known as English was quite different in the past, even as recently as the 18th Century, and it has been pointed out how much it has changed in our own lifetimes.

It is a myth that English, like Topsy, "just grewed". There has been a good deal of planning in the development of English, but it has taken place in an atmosphere of goodwill and consultation that would now be difficult to replicate, either in or between the diverse political systems of the English-speaking world. The forces of creativity have moved on to the international arena, as all the great movements of the late 20th Century testify, and it is within that matrix of modern idealism, the international auxiliary language, that the transformation of English must take place.

Glossary

Accent The mode of utterance or pronunciation peculiar to an individual or locality, including stress, tone and pitch.

Accusative The grammatical case which expresses the destination of the action signified by a verb.

Angles A Northern European people from the Jutland peninsula speaking a West Germanic dialect of the proto-English type; known to themselves as "Engle". They gave their name to the English language.

Argot The jargon, slang or peculiar phraseology of a class; originally that of thieves and vagabonds.

Aspirated The manner of articulation of a consonant whereby an audible rush of air accompanies the production of the consonant.

Auxiliary language A third language used as a means of communication by speakers from two different language groups (see Lingua Franca).

Brittonic The earlier language of lowland Britain: its descendents being Welsh, Breton, Cornish and Cumbric. Often referred to less correctly as Brythonic.

Celt or Kelt The generic name of a people, the bulk of whom lived in the central and western part of Europe. Ancient writers applied the term Celt to folk of great stature, with fair hair and blue or grey eyes. Queen Boadicea, strictly "Boudicca", said to have been a red-headed six footer, is representative. In Britain the most Celtic type is to be found in the South of England.

Celtic The languages and cultures of the continental Celts and related peoples in Britain and Ireland.

Conventional Spelling One established by the need for grammatical consistency rather than by orthography.

Colloquial Pertaining to or used in common conversation.

Common-Irish The shared literary language used by educated people in Scotland and Ireland prior to the evangelising of the Highlands at the end of the 18th Century.

Consonant Cluster e.g. "strengths, twelfths".

Copula The word that unites the subject and the predicate of a sentence.

Creole A pidgin which has been adopted as a mother tongue. New Guinea pidgin English is the best known example.

Diacritic A mark added to a letter or symbol indicating a change in its usual pronunciation, e.g. á, ê, ü.

Dialect Any variety of a language including the standard or literary form.

Diaphone All the different forms of a phoneme that collectively occur in all the dialects of a language.

Digraph Two letters denoting one sound: /ph/ in "digraph".

Diphthong A union of two vowels pronounced in one syllable.

Dvorak Keyboard Layout Designed in 1936 by August Dvorak and William Dealey.

" , . P Y F G C R L / =

A O E U I D H T N S

; Q J K X B M W V Z

Ellipsis The omission of a word, or part of a sentence, as being understood by the reader.

Engle See Angles

Erse An early Scottish variant of the word "Irish".

Esperanto See Chapter 5 for main reference.

Etymology The facts relating to the formation or derivation of a word.

Euphony Phonetic tendency towards ease of pronunciation and a pleasing acoustic effect.

Farsi Modern Persian - the official language of Iran.

Friese A language of about 300,000 speakers in Northern Holland, Schleswig, Jutland and over 20 islands in the North Sea. Mutually intelligible with English until the 15th Century. Gives some indication of what a pure form of English would have been like.

Genitive Noun case expressing origin or possession, e.g. "Rome's citizens, John's book".

- Glosa** An update of "Interglossa" - the elementary Greek and Latin based constructed language invented by Hogben.
- Goidelic** The earlier language of Ireland: its descendants being Modern Irish, Scottish Gaelic and Manx.
- Grammar** A system of principles for speaking and writing.
- Homonyms** Words with different meanings looking and sounding the same.
- Homographs** Words with different meanings looking the same.
- Homophones** Words with different meanings sounding the same.
- Ideogram, Ideograph** A symbol signifying meaning directly and visually, e.g. a Chinese character.
- Ideogrammatic, Ideographic** Conveying meaning rather than sound. English spelling is perhaps more ideogrammatic than phonemic - making minimal reference to the parallel phonetic system of speech.
- Idiom** The language of a particular nation or region; or a mode of expression peculiar to a nation or region. An expression characteristic of a particular language which is not logically or grammatically explicable.
- Idiomatic** Mother-tongue competence, whether or not it is the speaker's first language.
- Indo-European** A family of languages characteristic of Europe and India. English and Hindi belong to it. Finnish and Tamil do not. Latin, Greek and Persian were descended from it.
- Inflection** The modification of the form of a word including the declension of nouns, adjectives and pronouns, and the conjugation of verbs.
- International Phonetic Alphabet (I P A)** A set of phonetic symbols for international use introduced in the late 19th Century, constructed on the basis of the Roman and Greek alphabets with the addition of special symbols and diacritics to indicate fine distinctions in sounds, e.g. nasalisation of vowels, lengths, stress and tones.
- Intonation** Modulation, or the rise and fall in pitch of the voice.
- Ladino** An old-fashioned form of Spanish spoken by Sephardic Jews.
- Lexicon** A word-book or dictionary. A vocabulary of terms used in connection with a particular subject.

Lingua franca A language used as a means of communication by speakers who do not have a native language in common (see Auxiliary Language).

Linguistic Pertaining to languages.

Metonym A word used in a transferred sense, e.g. "the bottle" for "drink".

Monophthong A single vowel sound.

Mood A variable verb function expressing predication (indicative), command (imperative), potential or volition (subjunctive) or will (infinitive).

Morphemes Parts of a word which singly or together convey meaning.

Neologism A new word, or an old word used in a new sense.

Normalise To bring within normal or intermediate standards.

Notional Existing only as a concept.

Notional Pronunciation A pronunciation conceived as a compromise to reconcile a range of diverse accents in order to act as a model for spellings which would find the widest degree of acceptance.

Number Singular or plural.

Old-English (englisc) A West Germanic language almost identical to Old-Friese. Probably the lingua franca of the Roman Army in Britain. Named after the Engle.

Orthoepy The part of grammar that treats of the way a given language is spoken.

Orthography The part of grammar that treats of the way a given language is written.

Pali A Prakrit vernacular which became the sacred language of Buddhism.

Phoneme A notional phonological unit of language, which conveys meaning, and which cannot be analysed into smaller meaningful units.

Phonemic Symbols etc. representing particular phonemes.

Phonetic Representing vocal sounds.

- Phonic** Concerning speech sounds, esp. the orthoepic interpretation of words when reading aloud.
- Phonology** The study of the sound system of a particular language.
- Phrasal Verb** A verb and one or more additional words, having the function of a verb, e.g. "put down, put up, chop down, chop up"
- Picts** An earlier name of the inhabitants of Scotland. They disappeared from history when they united with the Irish-speaking Scots in the 9th Century.
- Pidgin** A linguistically simplified, mixed and restricted language used in limited contact situations between people who have no common language.
- Pitch** The degree of acuteness of sound.
- Prakrit** One of the "natural" languages of later schismatic Hindu scripts. Three have been used by the Jains.
- Pronunciation** The action of speaking or articulating.
- Received Pronunciation (R.P.)** The pronunciation of that variety of British English widely considered to be the least regional, being originally that used by educated speakers in Southern England.
- Received Standard** The spoken language of a linguistic area in its traditionally most correct and acceptable form.
- Reflexive Pronoun** A pronoun that relates back to the subject in a sentence.
- Relexification** Direct substitution of vocabulary: the process of replacing a word or group of words in one language with a corresponding word or group of words from another language but without adjusting the grammar.
- Rhotic** A dialect or accent in which [r] is pronounced when it occurs before a consonant or a pause.
- Romance** A general name for the vernaculars which developed out of popular Latin - French, Provencal, Italian, Spanish, Portuguese, Romanian, Romansch, with their various dialects.
- Sanskrit** The "perfected/purified" language of the ancient Hindu religious scripts.
- Saxons** A Northern European people from Northern Germany speaking a West Germanic dialect. The name was generalised to include all Northern Germans. In Britain, used for the Romano-British majority

which had adopted Saxon language and ways.

Schwa A short indeterminate vowel, like that at the end of "sofa". By far the commonest vowel sound in English.

Scot The usual name for the Irish in the early Middle Ages. Scots from Dalriada in Northern Ireland took the Irish language to Northern Britain in the 6th Century. Scotland takes its name from them.

Scotia One of the names for Ireland in the early medieval period.

Script A kind of writing, or a system of alphabetical or other written characters.

Semantic Relating to meaning, especially of words.

Shibboleth A word or pronunciation used to distinguish outsiders: originates from the incident described in the Bible - Judges 12: 4-6 (see also Zephaniah 3: 8-9).

Stress Relative loudness or force of vocal utterance through a syllable in a word or a word in a sentence.

Syllabification To divide a word or passage into syllables.

Synecdoche A figure of speech putting part for the whole, or the whole for part.

Syntax The orderly or systematic arrangement of the parts of speech in a sentence.

Tense The form of a verb which indicates the time of the action.

T.O. "Traditional Orthography": the present spelling of the English language, which is not really orthographic at all, by any current standard.

Tone The quality of sound, usually with reference to pitch: high, low, rising, falling, level etc..

Transliteration The action of rendering the letters or characters of one alphabet into those of another.

Verbal Pertaining to or concerned with words, especially in speech.

Vernacular A native or indigenous language. The idiom of the region.

Voice One of two verb forms: active (the object acts) or passive (the object is acted upon).

Voiced A sound whose production involves vibration of the vocal chords, as in [b, d, g, v, z].

Voiceless A sound whose production does not involve vibration of the vocal chords, as in [p, t, k, f, s].

Volapük An artificial language, chiefly composed of materials from European tongues, invented in 1879 by a German priest, Johann M Schleyer, as a means of international communication.

Welsh A name derived from the continental Volcae, which came to be applied indiscriminately to all Western European inhabitants of the Roman Empire. In Britain the word Welsh was probably first applied to speakers of Latin; on the Continent, variants such as Walloon, Wallon, Waalsch, Welsch, Velsk, and Vlach are still applied to the French, the Italians and the Romanians.

Zipf's Law The length of a word tends to decrease as its relative frequency of use increases: i.e. one can generally determine the relative age of a word or phrase by how short it has become.

WLP Proposal

This essay is from a proposal that was sent to the Universal House of Justice with the commitment that there would be no request for funds from any Baha'i institutions so as not to detract from any other priorities that they might have.

The response from the Universal House of Justice included the following statement:

"Your research into the development of a common language and your vision for the language institutes, undertaken to promote one of the important teachings of the Cause, are much appreciated. The time, however, is not propitious for the House of Justice to endorse, formally or otherwise, any project in this field of endeavor. Naturally, you are free to pursue this initiative as a private venture...."

The proposal contained considerable more material than repeated here, however the relevant Baha'i quotes are to be found in the following essay.

Why Baha'i Universal Auxiliary Language Institutes

(The numbers in the [square brackets] refer to both the attached references and the complete raw notes in the following Appendix A)

Universal Language is the Second Incumbency Upon Universal House of Justice

Universal auxiliary language concepts are a matter of global purview and a responsibility assigned by Baha'u'llah, directly to the Universal House of Justice. Baha'u'llah said, "It is incumbent upon the Trustees of the House of Justice to take counsel together regarding those things which have not outwardly been revealed in the Book, ... (regarding) languages, ... efforts must be made to reduce them to one,..." [1] He further says regarding that which "constitute(s) the fundamental principles for the administration of the affairs of men: **First:** It is incumbent upon the ministers of the House of Justice to promote the Lesser Peace **Second:** Languages must be reduced to one..." [2] and further that "We have enjoined upon the Trustees of the House of Justice ... to choose ... This ... is accounted as part of the Most Holy Book: The men of God's House of Justice have been charged with the affairs of the people. [3]

'Abdu'l-Baha further reinforced this point, saying, "Questions not treated of are left to the civil law of

each country, and to the decisions of the Bait-ul-Adl, or House of Justice, instituted by Baha'o'llah (sic). ... A universal language, and the creation of tribunals of arbitration between nations, are to suppress wars." [41]

Universal Language also Responsibility of Governments and *Individuals*

The call for a universal auxiliary language figured prominently in many of the presentations and interests of Baha'u'llah [4,5,6,7,8], 'Abdu'l-Baha [14,15,16,17,18,19,20, 22, 24,25,26,27,28, 29,30,31,32,33,34,35, 42,43], and Shoghi Effendi [44,45,46,47,48,49,50, 52,53,54,55, 57,58,59, 62]. Baha'u'llah placed the responsibility of establishing a universal language not only upon the Universal House of Justice but also upon "the sovereigns of the world" [4], "the ministers of the earth" [4], and the "members of parliaments throughout the world" [8], saying that it is "incumbent upon all nations" [5], and the "officials and ministers of the Government" [7]. He wrote individually "to the kings and rulers of the various nations, recommending that one language should be sanctioned and adopted by all governments" [29], even hoping that "the Persian Government" [7] would carry it out. In fact, He said that, "*It is incumbent upon every man of insight and understanding to strive to translate that which hath been written into reality and action....*" [6]

'Abdu'l-Baha has said that a universal language will be accomplished through "A committee appointed by national bodies" [15], "the matter to be determined by a confederation met for the purpose which shall represent all tribes and nations." [16] He has said that "the servants of humanity should meet together," [24] and that "An international Congress should be formed, consisting of delegates from every nation in the world, Eastern as well as Western." [24] That "It must be made by a Council representing all countries," [26] He said that it was His "hope that it may be perfected through the bounties of God and that intelligent men may be selected from the various countries of the world to organise an international congress whose chief aim will be the promotion of this universal medium of speech." [27] and that "Ere long significant and scientific discussions concerning this matter will arise among the people of discernment and insight and it will produce the desired result." [42]

Baha'u'llah's "injunction to the members of parliaments throughout the world, urging the adoption of a universal script and language;" [45] along with His exhortation that "the legislators to 'take counsel together,'" [44] is of course confirmed by Shoghi Effendi.

Universal Language is the Greatest Means for Promoting Unity

Baha'u'llah has stated that "the greatest means for the promotion of ... unity is for the peoples of the world to understand one another's writing and speech. ... Thus will the earth be regarded as one country and one home." [3] He says to the leaders of the world that a universal language is "that which shall profit you and enable you to be independent of others. ... This will be the cause of unity, ... and the greatest instrument for promoting harmony and civilization" [8] He repeatedly states that it is what will cause "the whole earth ... to be regarded as one city and one land. [1] or "as one country", [4,5,7] saying that, "When this is achieved, to whatsoever city a man may journey, it shall be as if he were entering his

own home. [6]

'Abdu'l-Baha has said that, " the question of an auxiliary international tongue has the utmost importance." [27] He adds that it is, "Through this means international education and training become possible;" [27] and that , "The explanation of divine teachings can only be through this medium." [27] He says therefore, "the very first service to the world of man is to establish this auxiliary international means of communication. It will become the cause of the tranquillity of the human commonwealth. Through it sciences and arts will be spread among the nations, and it will prove to be the means of the progress and development of all races." [27] He further points out that, "The causes of dispute among different nations are always due to one of the following classes of prejudice: racial, lingual, theological, personal, and prejudices of custom and tradition The differences in language cause disunion between nations. There must be one universal language." 25]

Today we realise that communication builds community and world wide communication will build world wide community so that as Baha'u'llah says, "...this ... is the means of the reconstruction of the world and the unity of nations." [3] Likewise, 'Abdu'l-Baha says, "the brightest ray is the coming of the universal language. Its achievement is the greatest virtue of the age ... and when the international auxiliary tongue becomes universal it is easily conceivable that the acquirement of knowledge and instruction will likewise become universal.

Today one of the chief causes of the differences in Europe is the diversity of languages. ...The greatest working basis for bringing about unity and harmony amongst the nations is the teaching of a universal tongue... His Holiness BAHÁ'O'LLAH declared that complete union between the various nations of the world would remain an unrealized dream until an international language was established.

Misunderstandings keep people from mutual association and these misunderstandings will not be dispelled except through the medium of a common ground of communication. A mutual language will become the mightiest means toward universal progress, for it will cement the east and the west. It will make the world one home and become the divine impulse for human advancement." [18]

Baha'u'llah, 'Abdu'l-Baha and Shoghi Effendi actively promoted Universal Language

Baha'u'llah's, 'Abdu'l-Baha's and Shoghi Effendi's interest and commitment to the development of a universal language were not limited to prophecies about the future or mere statements about the cultural and sociological benefits to be associated with such an ideal. They each and every one actively made positive efforts, in keeping with the circumstances of their times, to further the language cause.

Baha'u'llah offered to teach an inquirer a suitable international language. [7] Taherzadeh [83] speculates that this may have been Esperanto but this may be questioned because Baha'u'llah says that it also involved a new script, something which is not generally contributed to Esperanto. Anyway, as Marzieh Gail, states, "The language and script .. were never communicated to anyone by Baha'u'llah." Baha'u'llah actually would have preferred that Arabic become the universal language [79] but, as described above, he

has left the choice to mankind. Baha'u'llah also revealed a rather mystical language called Badi' [13] 'Abdu'l-Baha made reference to the same or a similar language. [36] 'Abdu'l-Baha also recommended the learning of Persian [40], but not specifically as a universal language.

While, as shown earlier, both Baha'u'llah and 'Abdu'l-Baha directly encouraged world leaders to immediately take action on the language issue, 'Abdu'l-Baha went much further in directly supporting Esperanto. [55] Although He acknowledged that Esperanto had many deficiencies, and His list of requirements for a universal language was in many ways a list of the deficiencies of Esperanto, [26,23] and although He emphasised that "no one person can construct a Universal Language", still He said, "Praise be to God, that Dr. Zamenhof has constructed the Esperanto language. It has all the potential qualities of universal adoption. All of us must be grateful and thankful to him for his noble effort, for in this matter he has served his fellow-man well. He has done a service which will bestow divine benefits on all peoples. With untiring effort and self-sacrifice on the part of its devotees it holds a promise of universal acceptance. Therefore every one of us must study this language and make every effort to spread it, so that each day it may receive a wider recognition, be accepted by all nations and governments of the world and become a part of the curriculum of all the public schools..." [18]

'Abdu'l-Baha concluded that, " Esperanto ...is a fine invention and a splendid piece of work, but it needs perfecting. Esperanto as it stands is very difficult for some people. [24] He further said, "This language will be spread and universalized to a certain degree, but later on a language more complete than this, or the same language will undergo some changes and alterations and will be adopted and become universal." [43] While pointing out Esperanto's deficiencies He nevertheless encouraged people to "strive untiringly to spread this language." [19] He, Himself inviting teachers of the language to go to Persia and asking Persians to go to Paris to study it. [18] He said, "Therefore appreciate 'Esperanto', for it is the beginning of the carrying out of one of the most important of the Laws of Baha'u'llah, and it must continue to be improved and perfected." [24] and assured that , "The love and effort put into Esperanto will not be lost," [26] in the hope "that Dr. Zamenhof, (would) become assisted by the invisible confirmation and do a great service to the world of humanity." [43]

Shoghi Effendi was also a major supporter of Esperanto, "invariably encouraging the believers, both in the East and in the West, to make an intensive study of that language," [54] pointing out that "the teaching of that language has been repeatedly encouraged by 'Abdu'l-Baha," [55] although further stating, "there is no reference either from Him or from Baha'u'llah that can make us believe that it will necessarily develop into the international auxiliary language of the future." [55] and that "Neither Baha'u'llah, nor even 'Abdu'l-Baha, ever stated that Esperanto will be the international auxiliary language." [54] so only "encouraging the Baha'is to learn it, if they wish to." [58] In fact, there were cases where, "He would not advise ... to teach ...Esperanto, as we have no way of knowing whether it will ultimately be chosen as the auxiliary language of the world." [59]

Still, Ruhiyyih Rabbani informs us that, "Shoghi Effendi had far more contact with certain non-Baha'i organizations than is commonly supposed. ... particularly ... the Esperantists, ..." That he "often took the initiative himself in sending Baha'i representatives, chosen by him, to various conferences ...", addressing them as his "'dear fellow workers in the service of humanity, ..." whom he reminded of the "'repeated

and emphatic admonitions of 'Abdu'l-Baha (to) His many followers ...(who were) strenuously and enthusiastically engaged in the study and teaching of Esperanto,'" [63] Indeed, the enthusiasm, interest and support of Baha'is for the language movement, just those few short decades ago, were amazing, It received not just a cursory mention in a listing of the principles of the Faith, nor the pious futuristic expectation presently about equally attributed to vegetarianism, but a predominance that might be properly associated with one of the seven candles of unity [20] and one of the "two signs for the coming of age of the human race". [8,9,10] In those days there were even Baha'i International Auxiliary Language Committees [48] and Baha'i international language study days. [49]

Present Day Baha'is are relatively inactive in promoting Universal Language Solutions

Today, among most Baha'is, any expression of interest in working on the language problem is met with the easy formulation that it is something for the future. That it is not an individual's concern, and indeed not even properly a present concern of the Universal House of Justice because, "The first stage will be the adoption of a universal language by the governments, while the second will have to wait until such time that the Universal House of Justice has emerged as the supreme institution of the World Order of Baha'u'llah and its authority is recognized. It is only then that it can possibly reconsider the choice of the language so as to either retain the one chosen by the governments or alter it altogether." [78] For this reason it is felt that a person devoted to this seemingly Quixotic language cause is really tilting with windmills and diverting energies from the present pressing needs for the expansion of the Faith. However, Baha'u'llah states in regard to our subject that, "These things are obligatory and absolutely essential" [6]. Moreover, He says, "It is incumbent upon every man of insight and understanding to strive to translate that which hath been written into reality and action...." [6] And, as the Universal House of Justice has pointed out in its letter of May 15, 1994, "The power of action in the believers is unlocked at the level of individual initiative...".

Indeed, far from diverting energies from the expansion of the Faith, the language issue may be central to its success. Aside from being referred to as, "The seventh candle ...(of) unity" [20], and one of the "two signs for the coming of age of the human race", [8,9,10] 'Abdu'l-Baha says that, "The explanation of divine teachings can only be through this medium. As long as diversity of tongues and lack of comprehension of other languages continue, these glorious aims cannot be realized." [27] In this connection Baha'u'llah has said, "Every age hath its own problem, ... The remedy the world needeth in its present-day afflictions can never be the same as that which a subsequent age may require. Be anxiously concerned with the needs of the age ye live in, and centre your deliberations on its exigencies and requirements." [6] "The All-Knowing Physician hath His finger on the pulse of mankind. He perceiveth the disease, and prescribeth, in His unerring wisdom, the remedy." [6]

The Possible Future Role of English as the Universal Language

Still, some persons have doubts about supporting the goal of the World Language Program. For instance, there are raised accusations of cultural imperialism when in fact there are more persons today who speak English as a Second Language than those who speak it as their mother tongue. Indeed, when 'Abdu'l-

Baha and Shoghi Effendi supported [62] the spread of the Romance Language culturally based Esperanto there were numerous contenders for an international language. French was still on the rise and recognised as the language of diplomacy, German was the recognised language of science, Latin was the language of law and medicine and Italian of music. 'Abdu'l-Baha and Shoghi Effendi made it very clear that they recognised the limitations of Esperanto and the unlikelyhood of its success, yet they gave it immense support.

Mario Pei, without question the world's foremost secular authority on universal languages, states that there have been over 650 attempts to develop a suitable solution. Notable attempts contiguous with Esperanto in the time of 'Abdu'l-Baha and Shoghi Effendi were Ido and Interlingua. The World Language Process may be simply a 651st+ attempt, but perhaps the important thing is to keep trying. In any case the World Language Program does not force English on anyone but only offers its ITM (Intermediate Teaching Method) as a service to the members of mankind who would like to learn English as a Second Language.

English, as it stands today, is deficient in a number of ways in meeting the standards established by Baha'u'llah and 'Abdu'l-Baha for a universal language. 'Abdu'l-Baha spelled out many technical details regarding a universal language, stating that it must:

- a. "... contain words from different languages." [26]
- b. "... be governed by the simplest rules ..." [26]
- c. "... there will be no exceptions..." [26]
- d. "... neither will there be gender..." [26]
- e. "... nor extra and silent letters." [26]
- f. "...Everything indicated will have but one name." [26]

The system used by the World Language Process meets all these requirements.

The Distinguishably Separate Call for a Common Script

Baha'u'llah, in combination (but distinguishably separate) with his call for a universal language also called for a "common script" [1,3,4,5,6,7,7,8,10], a call which was of course reiterated in the writings of Shoghi Effendi [44,45,46,52,53] but strangely not in those of 'Abdu'l-Baha.

Baha'u'llah's father was famed for his calligraphy, [94] knowing many scripts, but we are told that while Baha'u'llah's favourite script was shitastih-nasta'liq [95,94] the Revelation Writing of His amanuensis was in Khatt-i-tazili. [96] although Browne says the Babi's created a new writing called Khatt-i-Badi, possibly related to the Badi language [13] mentioned above.. The recognition of the significance of a common script is a subject within itself. Without belabouring the difference between scripts, fonts and faces, English commonly uses the Roman script but there have been others proposed and used.. For example the Mormon Deseret by Brigham Young, WES (World English Spelling), ITA (International

Teaching Alphabet), Pitman and other shorthands, to name just a few. Khatt-i-tazili could perhaps be compared in function to the latter.

Baha'u'llah stated that, "... before Adam. There was ... a system entirely different from the one which they now use. For a proper exposition of this an elaborate explanation would be required." [12], He was perhaps intimating that technologies previously existed beyond the comprehension of his contemporary audience. Today, electronic technology for digital storage and a law passed in 1994 by the U.S. Congress regarding the required inclusion of captioning decoders in all future home television receivers has dictated the design of the ANJeL Tug to conform with both the U.S. and 'Abdu'l-Baha's standards. To properly explain this to Baha'u'llah's contemporary audience would certainly have required an elaborate explanation.

Other Issues In the Development of a Universal Language

As 'Abdu'l-Baha was well aware, there were many other technical issues when He stated, "...Ere long significant and scientific discussions concerning this matter will arise among the people of discernment and insight and it will produce the desired result." [42] And indeed, as Esselmont stated, "Baha'u'llah commanded the adoption of a universal auxiliary language, and Dr. Zamenhof and others[39] obeyed His call by devoting their lives and genius to this great task and opportunity." [86], although as he also noted, their contributions have not always been willingly received. [85] The development of the ANJeL Tug stands upon the backs of giants too numerous to list but including Zamenhof, C.K Ogden, I.A. Richards and Mario Pei to name but four. These scholars, and many others, devoted their lives to developing principles that we discover in retrospect were already delineated in the Baha'i Scriptures, if we had but the wisdom to recognise them. A listing here of the principles, and their ramifications, would border on pedantry and would only be of interest to the technically inclined. Just as Baha'i spiritual economic principles find their fulfilment in the work of technical economists so also are the linguistic principles being implemented by technical linguists.

There are also many issues other than those which are technical. The question of universality [1,2,3,4,5,6,8,9,10,15,20, 22,24,26,28,31,32,33,34,41,42,43,44,45,46,50, 57,75,79,80, 81,82,88,93] versus auxiliary[7,14,16,18,19,27,29,30,35,47,48,53,54,55,57,58,59,63,64,75, 76,77,78,86,87], the subject of unity and diversity [51,74], the role of secular organisations [4,5,7,8] versus that of the Universal House of Justice [1,2,3,41], and even that of individuals [6,18,27,90]. The means of spread of the universal language through schools [2,3,4,5,6,7,15,18,26,29,53,75,87], and other means [8,16,45,24,28,30,31,32,55,93], the translation of Scripture [21,56,69,70,71,72,73] and its use for Baha'i publication [68], to name just a few. The purpose here, however, has not been to exhaustively examine any of these issues, technical or otherwise, but simply to demonstrate how regardless of the effort being spent or not spent on the language problem by Baha'is, the Divine Destiny still moves forward.

The Present Opportunity is Much Greater than those of the Past

The Divine Destiny has unfurled numerous technological advances (eleven of which are discussed

elsewhere in these pages) that have made both the necessity and possibility of a universal language infinitely more apparent. Although no human organisations are actively pressing for its realisation these Divine Destinies will, in the words of 'Abdu'l-Baha, "inevitably come to pass, inasmuch as the power of the Kingdom of God will aid and assist in their realization." [20] Still, does this relieve us individually from making an effort? Especially since Baha'u'llah has said that, "These things are obligatory and essential.", and "It is incumbent upon every man of insight and understanding to strive to translate that which hath been written into reality and action...." [6] Are not the technological changes of the last several decades simply a sign of the Divine Assistance towards our achieving the Divine Decree? Should we not, having the greater resources and opportunity, now press on even more eagerly than did those early pioneers under the guidance of 'Abdu'l-Baha and Shoghi Effendi?

Since 'Abdu'l-Baha has said that "it matters not what language man speaks or employs" [29] and that no matter which universal language is chosen it will be "revised" [26], for the time being does it hurt to teach that language which is most universally popular as a second language? He, Himself said that He would have learned Esperanto, had it been more universally accepted, [18] but, For Shoghi Effendi, [60] and others, [37,38] He required the learning of english which He considered to be a "world language". [60] Admittedly, it may not be officially called a universal language until decreed as such by those mechanisms designated by Baha'u'llah and 'Abdu'l-Baha and admittedly the ANJeL Tug prototype even if accepted through those mechanisms would be subject to those same revision procedures. Still, today, the ANJeL Tug is only being presented as a revolutionary ITM (Intermediate Teaching Method) that reduces the learning of english from years to a single month. Can we not say then that this would be a service to mankind?

This is an attempt, as Baha'u'llah says, "to translate that which hath been written into reality and action... That one indeed is a man who, today, dedicateth himself to the service of the entire human race. The Great Being saith: Blessed and happy is he that ariseth to promote the best interests of the peoples and kindreds of the earth." [6] Is it not obedient to the instructions of 'Abdu'l-Baha to make the effort to perform "the very first service to the world of man (which) is to establish this auxiliary international means of communication."? [27]

The Possible Role of North America

One cannot say definitively what the future holds but it would not be surprising, based upon the United States past record of non-support for the League of Nations and an effective United Nations, and as the last major bastion against the international metric system of weights and measures, but that the American people might be the last to willingly accept any modifications to the english language. Although, given world antipathy to American causes this too might work for the good of goal. However, 'Abdu'l-Baha says that He finds, "these two great American nations highly capable and advanced in all that appertains to progress and civilization. These governments are fair and equitable. The motives and purposes of these people are lofty and inspiring. Therefore, it is my hope that these revered nations may become prominent factors in the establishment of international peace and the oneness of the world of humanity; that they may lay the foundations of equality and spiritual brotherhood among mankind; that they may manifest the highest virtues of the human world, revere the divine lights of the Prophets of God and establish the

reality of unity so necessary today in the affairs of nations." [31]

In the Tablets of the Divine Plan, 'Abdu'l-Baha repeatedly told these two great American nations to "send to (the East and the West)... fluent speakers" [98] and teachers throughout the world. Particularly in the Tablet in which Kansas was addressed He says that it is, "like unto the heart of America, and the heart is connected with all the parts of man. If the heart is strengthened, all the organs of the body are reinforced, ..." [99] Moreover, He says in the same Tablet, America will assuredly evolve into a center from which waves of spiritual power will emanate... [100] How fitting then that Kansas should be one of the locations for one of the two proposed universal language institutes. How essential and favourable this location might be as a centre from which to institute mass teaching in the period of reconstruction after the universal great catastrophe.

The Possible Role of Baha'i Institutes

The Universal House of Justice has told us that, "institutes should not only be seats of Baha'i learning but also centres from which mass teaching and consolidation work over a large area must be inspired and conducted." [89] The goals, both of the Institutes themselves, and of the teachers that they would produce, would be to:

Category I.

- " * Encourage individual believers to adopt teaching goals for themselves.
- * Carry out activities designed to deepen the believers in both a spiritual and intellectual understanding of the Cause.
- * Encourage the believers to make greater use of Baha'i literature.
- * Encourage the believers to enhance their command of language to assist them to understand the Baha'i writings ever more clearly." [90]

These foregoing are surely worthwhile Institute and mass teaching goals but the specific goals of these Institutes would also include:

Category II.

- the encouragement of: * "the adoption of a world auxiliary language" [91],
- the advocacy of : * "the establishment of world government" [91],
- * "the promotion of education" [91],

* "the extension of social and economic development" [91],

and the mounting of a publicity
campaign for :

* "world peace through world language" [91].

Many of the Institutes goals may be accomplished through developing and administering

* "correspondence courses for teaching and deepening" [91]

particularly towards the goal of

* "teaching the concept of world citizenship" [92].

The above Category II goals, universalist and ambitious as they may be, are intentionally selective from the tasks commended to the Institutes by the Universal House of Justice. The reason for this is the unique relationship which these two initial Institutes, and the offspring which they would spawn, would have to the World Language Process. While the Baha'i Institutes would seek to inspire and deepen Baha'i teachers, and teachers of Baha'i teachers, the vehicle of service to humanity which they would be using, namely the World Language Process, remains much more narrowly focused and identifies itself with no sectarian religious or nationalistic or otherwise limited political agendas.

Raw quotes from the Baha'i Literature for
Why Baha'i Universal Auxiliary Language Institutes

[1] It is incumbent upon the Trustees of the House of Justice to take counsel together regarding those things which have not outwardly been revealed in the Book, and to enforce that which is agreeable to them. God will verily inspire them with whatsoever He willeth, and He, verily, is the Provider, the Omniscient. We have formerly ordained that people should converse in two languages, yet efforts must be made to reduce them to one, likewise the scripts of the world, that men's lives may not be dissipated and wasted in learning divers languages. Thus the whole earth would come to be regarded as one city and one land. (eighth leaf in the Kalimat-i-Firdawsiyyih (Words of Paradise) in Tablets of Baha'u'llah, Page 68)

[2] The utterances set forth therein by the Pen of the Lord of creation include the following which constitute the fundamental principles for the administration of the affairs of men: First: It is incumbent upon the ministers of the House of Justice to promote the Lesser Peace so that the people of the earth may be relieved from the burden of exorbitant expenditures. This matter is imperative and absolutely essential, inasmuch as hostilities and conflict lie at the root of affliction and calamity. Second: Languages must be reduced to one common language to be taught in all the schools of the world. (Lawh-i-Dunya (Tablet of the World) in Tablets of Baha'u'llah, Page 89)

[3] The sixth Ishraq is union and concord amongst the children of men. From the beginning of time the light of unity hath shed its divine radiance upon the world, and the greatest means for the promotion of that unity is for the peoples of the world to understand one another's writing and speech. In former Epistles We have enjoined upon the Trustees of the House of Justice either to choose one language from among those now existing or to adopt a new one, and in like manner to select a common script, both of which should be taught in all the schools of the world. Thus will the earth be regarded as one country and one home. The most glorious fruit of the tree of knowledge is this exalted word: Of one tree are all ye the fruit, and of one bough the leaves. Let not man glory in this that he loveth his country, let him rather glory in this that he loveth his kind. Concerning this We have previously revealed that which is the means of the reconstruction of the world and the unity of nations. Blessed are they that attain thereunto. Blessed are they that act accordingly. The seventh Ishraq The Pen of Glory counseleth everyone regarding the instruction and education of children. Behold that which the Will of God hath revealed upon Our arrival in the Prison City and recorded in the Most Holy Book. Unto every father hath been enjoined the instruction of his son and daughter in the art of reading and writing and in all that hath been laid down in the Holy Tablet. He that putteth away that which is commanded unto him, the Trustees are then to take from him that which is required for their instruction, if he be wealthy, and if not the matter devolveth upon the House of Justice. Verily, have We made it a shelter for the poor and needy. He that bringeth up his son or the son of another, it is as though he hath brought up a son of Mine; upon him rest My Glory, My Loving-Kindness, My Mercy, that have compassed the world. The eighth Ishraq This passage, now written by the Pen of Glory, is accounted as part of the Most Holy Book: The men of God's House of

Justice have been charged with the affairs of the people. (Ishraqat (Splendours) in Tablets of Baha'u'llah, Pages 127-128)

[4] The third Glad-Tidings concerneth the study of divers languages. This decree hath formerly streamed forth from the Pen of the Most High: It behoveth the sovereigns of the world - may God assist them - or the ministers of the earth to take counsel together and to adopt one of the existing languages or a new one to be taught to children in schools throughout the world, and likewise one script. Thus the whole earth will come to be regarded as one country. Well is it with him who hearkeneth unto His Call and observeth that whereunto he is bidden by God, the Lord of the Mighty Throne. (Bisharat (Glad-Tidings) in Tablets of Baha'u'llah, Page 22)

[5] Likewise He saith: Among the things which are conducive to unity and concord and will cause the whole earth to be regarded as one country is that the divers languages be reduced to one language and in like manner the scripts used in the world be confined to a single script. It is incumbent upon all nations to appoint some men of understanding and erudition to convene a gathering and through joint consultation choose one language from among the varied existing languages, or create a new one, to be taught to the children in all the schools of the world. (Lawh-i-Maqsud (Tablet of Maqsud) Tablets of Baha'u'llah, Pages 165-166)

[6] The day is approaching when all the peoples of the world will have adopted one universal language and one common script. When this is achieved, to whatsoever city a man may journey, it shall be as if he were entering his own home. These things are obligatory and essential. It is incumbent upon every man of insight and understanding to strive to translate that which hath been written into reality and action.... That one indeed is a man who, today, dedicateth himself to the service of the entire human race. The Great Being saith: Blessed and happy is he that ariseth to promote the best interests of the peoples and kindreds of the earth. In another passage He hath proclaimed: It is not for him to pride himself who loveth his own country, but rather for him who loveth the whole world. The earth is but one country, and mankind its citizens. The All-Knowing Physician hath His finger on the pulse of mankind. He perceiveth the disease, and prescribeth, in His unerring wisdom, the remedy. Every age hath its own problem, and every soul its particular aspiration. The remedy the world needeth in its present-day afflictions can never be the same as that which a subsequent age may require. Be anxiously concerned with the needs of the age ye live in, and centre your deliberations on its exigencies and requirements. (Lawh-i-Maqsud (Tablet of Maqsud) in Tablets of Baha'u'llah, Pages 166-167) (also partially in The Proclamation of Baha'u'llah, Pages 249-250)

[7] Our conversation turned to topics profitable to man. He said that he had learned several languages. In reply We observed: "You have wasted your life. It beseemeth you and the other officials of the Government to convene a gathering and choose one of the divers languages, and likewise one of the existing scripts, or else to create a new language and a new script to be taught children in schools throughout the world. They would, in this way, be acquiring only two languages, one their own native tongue, the other the language in which all the peoples of the world would converse. Were men to take fast hold on that which hath been mentioned, the whole earth would come to be regarded as one country, and the people would be relieved and freed from the necessity of acquiring and teaching different

languages." When in Our presence, he acquiesced, and even evinced great joy and complete satisfaction. We then told him to lay this matter before the officials and ministers of the Government, in order that it might be put into effect throughout the different countries. However, although he often returned to see Us after this, he never again referred to this subject, although that which had been suggested is conducive to the concord and the unity of the peoples of the world. We fain would hope that the Persian Government will adopt it and carry it out. At present, a new language and a new script have been devised. If thou desirest, We will communicate them to thee. Our purpose is that all men may cleave unto that which will reduce unnecessary labor and exertion, so that their days may be befittingly spent and ended. God, verily, is the Helper, the Knower, the Ordainer, the Omniscient. (Epistle to the Son of the Wolf, Pages 137-139)

[8] 189. O members of parliaments throughout the world! Select ye a single language for the use of all on earth, and adopt ye likewise a common script. God, verily, maketh plain for you that which shall profit you and enable you to be independent of others. He, of a truth, is the Most Bountiful, the All-Knowing, the All-Informed. This will be the cause of unity, could ye but comprehend it, and the greatest instrument for promoting harmony and civilization, would that ye might understand! We have appointed two signs for the coming of age of the human race: the first, which is the most firm foundation, We have set down in other of Our Tablets, while the second hath been revealed in this wondrous Book. (The Kitab-i-Aqdas, Page 88)

[9] 9. The selection of a single language and the adoption of a common script for all on earth to use: one of two signs of the maturity of the human race (Notes: The Kitab-i-Aqdas, Page 163)

[10]194. We have appointed two signs for the coming of age of the human race :PP189 The first sign of the coming of age of humanity referred to in the Writings of Baha'u'llah is the emergence of a science which is described as that "divine philosophy" which will include the discovery of a radical approach to the transmutation of elements. This is an indication of the splendours of the future stupendous expansion of knowledge. Concerning the "second" sign which Baha'u'llah indicates to have been revealed in the Kitab-i-Aqdas, Shoghi Effendi states that Baha'u'llah, ". . . in His Most Holy Book, has enjoined the selection of a single language and the adoption of a common script for all on earth to use, an injunction which, when carried out, would, as He Himself affirms in that Book, be one of the signs of the 'coming of age of the human race'". .. (Notes: The Kitab-i-Aqdas, Page 250)

[11]118. The Lord hath granted leave to whosoever desireth it that he be instructed in the divers tongues of the world that he may deliver the Message of the Cause of God throughout the East and throughout the West, that he make mention of Him amidst the kindreds and peoples of the world in such wise that hearts may revive and the mouldering bone be quickened. (The Kitab-i-Aqdas, Page 62)

[12] Moreover such forms and modes of writing as are now current amongst men were unknown to the generations that were before Adam. There was even a time when men were wholly ignorant of the art of writing, and had adopted a system entirely different from the one which they now use. For a proper exposition of this an elaborate explanation would be required. Consider the differences that have arisen since the days of Adam. The divers and widely-known languages now spoken by the peoples of the earth

were originally unknown, as were the varied rules and customs now prevailing amongst them. The people of those times spoke a language different from those now known. Diversities of language arose in a later age, in a land known as Babel. It was given the name Babel, because the term signifieth "the place where the confusion of tongues arose." Subsequently Syriac became prominent among the existing languages. The Sacred Scriptures of former times were revealed in that tongue. Later, Abraham, the Friend of God, appeared and shed upon the world the light of Divine Revelation. The language He spoke while He crossed the Jordan became known as Hebrew ('Ibrani), which meaneth "the language of the crossing." The Books of God and the Sacred Scriptures were then revealed in that tongue, and not until after a considerable lapse of time did Arabic become the language of Revelation... Witness, therefore, how numerous and far-reaching have been the changes in language, speech, and writing since the days of Adam. How much greater must have been the changes before Him! (Gleanings, Pages 172-174)

[13] Mirza Aqa Jan further related to Nabil that, one day in Kazimayn, when both he and Aqa Muhammad-Hasan-i-Isfahani were in the presence of Baha'u'llah, in the house of Haji 'Abdu'l-Majid-i-Shirazi, He asked the host whether he wished to hear the Badi' (Unique) language, which, He said, was the language used by the denizens of one of the worlds of God. He then proceeded to chant in that language. Mirza Aqa Jan said that hearing this language had a wonderful effect on the listener. One day, Mirza Aqa Jan related, Baha'u'llah said to Haji 'Abdu'l-Majid: 'Haji, you have heard the Badi' language, and witnessed God's supremacy over His worlds. Render thanks for this bounty and appreciate its worth.' (Baha'u'llah, The King of Glory, Page 113-114)

[14] The sixth is the universal auxiliary language. ('Abdu'l-Baha on Divine Philosophy, Page 25)

[15] 6. A UNIVERSAL LANGUAGE A universal language shall be adopted and taught in the schools and academies of the world. A committee appointed by national bodies shall select a suitable language to be used as a means of international communication. Every one will need but two languages, his national tongue and the universal language. All will acquire the international language. ('Abdu'l-Baha on Divine Philosophy, Page 27)

[16] "In order to facilitate complete understanding between all people, a universal auxiliary language will be adopted and in the schools of the future two languages will be taught--the mother tongue and this international auxiliary tongue which will be either one of the existing languages, or a new language made up of words from all the languages--the matter to be determined by a confederation met for the purpose which shall represent all tribes and nations. This international tongue will be used in the work of the parliament of man--a supreme tribunal of the world which will be permanently established in order to arbitrate international questions. . ('Abdu'l-Baha on Divine Philosophy, Page 84)

[17] His Excellency ABDUL BAHA, addressed the Paris Esperanto group on February 12, 1913, at a banquet which was accorded him at the Hotel Moderne in that city. M. Bourlet, President of the Paris Esperanto Society, in introducing Abdul Baha, said that one of the principles of the great world religion which he was promulgating, was the establishment of a universal language. ('Abdu'l-Baha on Divine Philosophy, Page 141)

[18] The universal light for this planet is from the sun and the special electric ray which to-night illumines this banquet hall appears through the invention of man. In like manner the activities which are trying to establish solidarity between the nations and infuse the spirit of universalism in the hearts of the children of men are like unto divine rays from the sun of reality and the brightest ray is the coming of the universal language. Its achievement is the greatest virtue of the age for such an instrument will remove misunderstandings from amongst the peoples of the earth and will cement their hearts together. This medium will enable each individual member of the human family to be informed of the scientific accomplishments of all. The basis of knowledge and the excellencies of endeavor in this world are to teach and to be taught. To acquire sciences, and to teach them in turn, depends upon language, and when the international auxiliary tongue becomes universal it is easily conceivable that the acquirement of knowledge and instruction will likewise become universal. No doubt you are aware that in the past ages a common language shared by various nations created a spirit of solidarity amongst them. For instance, thirteen hundred years ago there were many divergent nationalities in the Orient. There were Copts in Egypt, Syrians in Syria, Assyrians and Babylonians in Bagdad and along the rivers of Mesopotamia. There existed among these peoples rank hatred; but as they were gradually brought nearer through common protection and common interests, the Arabic language grew to be the means of intercommunication and they became as one nation. They all speak Arabic to this day. In Syria, if you ask any one of them, he will say, "I am an Arab," though he be a Greek, an Egyptian, Syrian or Jew. Today one of the chief causes of the differences in Europe is the diversity of languages. We say "this man is a German, the other an Italian, a Frenchman, an Englishman," etc. All belong to the great human family yet language is the barrier between them. The greatest working basis for bringing about unity and harmony amongst the nations is the teaching of a universal tongue. Writing on this subject fifty years ago, His Holiness BAHÁ'U'LLAH declared that complete union between the various nations of the world would remain an unrealized dream until an international language was established. Misunderstandings keep people from mutual association and these misunderstandings will not be dispelled except through the medium of a common ground of communication. Every intelligent man will bear testimony to this. The people of the Orient are not fully informed of the events in the west and the west cannot put itself into sympathetic touch with the east. Their thoughts are enclosed in a casket. The universal language will be the master key to open it. Western books will be translated into that language and the east will become informed of the contents; likewise eastern lore will become the property of the west. Thus also will those misunderstandings which exist between the different religions be dispersed. Religious prejudices play havoc among the peoples and bring about warfare and strife and it is impossible to remove them without a common medium. I am an Oriental and on this account I am shut out from your thoughts and you likewise from mine. A mutual language will become the mightiest means toward universal progress, for it will cement the east and the west. It will make the world one home and become the divine impulse for human advancement. It will upraise the standard of oneness of the world of humanity and make the earth a universal commonwealth. It will create love between the children of men and good fellowship between the various creeds. Praise be to God, that Dr. Zamenhof has constructed the Esperanto language. It has all the potential qualities of universal adoption. All of us must be grateful and thankful to him for his noble effort, for in this matter he has served his fellow-man well. He has done a service which will bestow divine benefits on all peoples. With untiring effort and self-sacrifice on the part of its devotees it holds a promise of universal acceptance. Therefore every one of us must study this language and make every effort to spread it, so that each day it may receive a wider recognition, be accepted by all nations

and governments of the world and become a part of the curriculum of all the public schools. I hope that the business of the future international conferences and congresses will be carried on in Esperanto. In the coming ages, two languages will be taught in the schools, one the native tongue, the other an international auxiliary language. Consider today how difficult is human communication. One may study fifty languages and travel through a country and still be at a loss. I myself speak several Oriental languages, but know no western tongue. Had this universal language pervaded the globe, I should have studied it and you would have been directly informed of my thoughts and I of yours and a special friendship would have been established between us. Please send some teachers to Persia so that they may teach Esperanto to the younger generation. I have written asking some of them to come here to study it. May it be promulgated rapidly; then the world of humanity will find eternal peace; all the nations will associate with one another like mothers and sisters, fathers and brothers, and each individual member of the community will be fully informed of the thoughts of all. I am extremely grateful to you and thank you for these lofty efforts, for you have gathered at this banquet in a selfless endeavor to further this great end. Your hope is to render a mighty service to the world of humanity and for this exalted aim I congratulate you from the depths of my heart. ('Abdu'l-Baha on Divine Philosophy, Pages 143-145)

[19] One sign of unity is the construction of an international auxiliary language, Esperanto. Let us strive untiringly to spread this language. ('Abdu'l-Baha on Divine Philosophy, Page 172)

[20] The seventh candle is unity of language, i.e., the choice of a universal tongue in which all peoples will be instructed and converse. Each and every one of these will inevitably come to pass, inasmuch as the power of the Kingdom of God will aid and assist in their realization. (Selections From The Writings of 'Abdu'l-Baha, Page 32) (also in The World Order of Baha'u'llah, Page 39:2)

[21] Regarding the translation of the Books and Tablets of the Blessed Beauty, ere long will translations be made into every tongue, with power, clarity and grace. At such time as they are translated, conformably to the originals, and with power and grace of style, the splendours of their inner meanings will be shed abroad, and will illumine the eyes of all mankind. Do thy very best to ensure that the translation is in conformity with the original. (Selections From The Writings of 'Abdu'l-Baha, Page 66)

[22] And among the teachings of His Holiness Baha'u'llah is the origination of one language that may be spread universally among the people. This teaching was revealed from the pen of Baha'u'llah in order that this universal language may eliminate misunderstandings from among mankind. (Selections From The Writings of 'Abdu'l-Baha, Page 301) (also in Foundations of World Unity, Page 29:4)

[23] As to the Esperantists, associate with them. ... It is evident that the Esperantists are receptive and thou art familiar with and expert in their language. Communicate also with the Esperantists of Germany and other places. The literature which thou circulatest should deal only with the teachings. The dissemination of other literature is at present not advisable. My hope is that the divine confirmations may continually assist thee.... Grieve not over the apathy and coldness of the Hague meeting. Put thy trust in God. Our hope is that among the people the Esperanto language may hereafter have a powerful effect. Thou hast now sown the seed. Assuredly it will grow. Its growth dependeth upon God. (Selections From The Writings of 'Abdu'l-Baha, Page 308:2)

[24] One of the great steps towards universal peace would be the establishment of a universal language. Baha'u'llah commands that the servants of humanity should meet together, and either choose a language which now exists, or form a new one. This was revealed in the Kitab-i-Aqdas forty years ago. It is there pointed out that the question of diversity of tongues is a very difficult one. There are more than eight hundred languages in the world, and no person could acquire them all. The races of mankind are not isolated as in former days. Now, in order to be in close relationship with all countries it is necessary to be able to speak their tongues. A universal language would make intercourse possible with every nation. Thus it would be needful to know two languages only, the mother tongue and the universal speech. The latter would enable a man to communicate with any and every man in the world! A third language would not be needed. To be able to talk with a member of any race and country without requiring an interpreter, how helpful and restful to all! Esperanto has been drawn up with this end in view: it is a fine invention and a splendid piece of work, but it needs perfecting. Esperanto as it stands is very difficult for some people. An international Congress should be formed, consisting of delegates from every nation in the world, Eastern as well as Western. This Congress should form a language that could be acquired by all, and every country would thereby reap great benefit. Until such a language is in use, the world will continue to feel the vast need of this means of intercourse. Difference of speech is one of the most fruitful causes of dislike and distrust that exists between nations, which are kept apart by their inability to understand each other's language more than by any other reason. If everybody could speak one language, how much more easy would it be to serve humanity! Therefore appreciate 'Esperanto', for it is the beginning of the carrying out of one of the most important of the Laws of Baha'u'llah, and it must continue to be improved and perfected. (Paris Talks, Pages 155:3-157:1)

[25] The causes of dispute among different nations are always due to one of the following classes of prejudice: racial, lingual, theological, personal, and prejudices of custom and tradition.... The differences in language cause disunion between nations. There must be one universal language. (Abdu'l-Baha in London, Page 60)

[26] A friend enquired concerning Baha'u'llah's prophecy in the Words of Paradise, that a universal language would be formed, and desired to know if Esperanto would be the language chosen. "The love and effort put into Esperanto will not be lost," he answered, "but no one person can construct a Universal Language. It must be made by a Council representing all countries, and must contain words from different languages. It will be governed by the simplest rules, and there will be no exceptions; neither will there be gender, nor extra and silent letters. Everything indicated will have but one name. In Arabic there are hundreds of names for the camel! In the schools of each nation the mother tongue will be taught, as well as the revised Universal Language." ('Abdu'l-Baha in London, Page 94)

[27] TODAY the greatest need of the world of humanity is discontinuance of the existing misunderstandings among nations. This can be accomplished through the unity of language. Unless the unity of languages is realized, the Most Great Peace and the oneness of the human world cannot be effectively organized and established because the function of language is to portray the mysteries and secrets of human hearts. The heart is like a box, and language is the key. Only by using the key can we open the box and observe the gems it contains. Therefore, the question of an auxiliary international tongue

has the utmost importance. Through this means international education and training become possible; the evidence and history of the past can be acquired. The spread of the known facts of the human world depends upon language. The explanation of divine teachings can only be through this medium. As long as diversity of tongues and lack of comprehension of other languages continue, these glorious aims cannot be realized. Therefore, the very first service to the world of man is to establish this auxiliary international means of communication. It will become the cause of the tranquility of the human commonwealth. Through it sciences and arts will be spread among the nations, and it will prove to be the means of the progress and development of all races. We must endeavor with all our powers to establish this international auxiliary language throughout the world. It is my hope that it may be perfected through the bounties of God and that intelligent men may be selected from the various countries of the world to organize an international congress whose chief aim will be the promotion of this universal medium of speech. (The Promulgation of Universal Peace, Pages 60-61) (also partially in #1138 Lights of Guidance, Page 340)

[28] Eighth, education is essential, and all standards of training and teaching throughout the world of mankind should be brought into conformity and agreement; a universal curriculum should be established, and the basis of ethics be the same. Ninth, a universal language shall be adopted and be taught by all the schools and institutions of the world. A committee appointed by national bodies of learning shall select a suitable language to be used as a medium of international communication. All must acquire it. This is one of the great factors in the unification of man. (The Promulgation of Universal Peace, Page 182)

[29] Diversity of languages has been a fruitful cause of discord. The function of language is to convey the thought and purpose of one to another. Therefore, it matters not what language man speaks or employs. Sixty years ago Baha'u'llah advocated one language as the greatest means of unity and the basis of international conference. He wrote to the kings and rulers of the various nations, recommending that one language should be sanctioned and adopted by all governments. According to this each nation should acquire the universal language in addition to its native tongue. The world would then be in close communication, consultation would become general, and dissensions due to diversity of speech would be removed. (The Promulgation of Universal Peace, Page 232)

[30] Baha'u'llah has proclaimed the adoption of a universal language. A language shall be agreed upon by which unity will be established in the world. Each person will require training in two languages: his native tongue and the universal auxiliary form of speech. This will facilitate intercommunication and dispel the misunderstandings which the barriers of language have occasioned in the world. All people worship the same God and are alike His servants. When they are able to communicate freely, they will associate in friendship and concord, entertain the greatest love and fellowship for each other, and in reality the Orient and Occident will embrace in unity and agreement. The world is in greatest need of international peace. Until it is established, mankind will not attain composure and tranquility. (The Promulgation of Universal Peace, Page 300)

[31] Eleventh, one language must be selected as an international medium of speech and communication. Through this means misunderstandings will be lessened, fellowship established and unity assured. These are a few of the principles proclaimed by Baha'u'llah. He has provided the remedy for the ailments which

now afflict the human world, solved the difficult problems of individual, social, national and universal welfare and laid the foundation of divine reality upon which material and spiritual civilization are to be founded throughout the centuries before us. Praise be to God ! I find these two great American nations highly capable and advanced in all that appertains to progress and civilization. These governments are fair and equitable. The motives and purposes of these people are lofty and inspiring. Therefore, it is my hope that these revered nations may become prominent factors in the establishment of international peace and the oneness of the world of humanity; that they may lay the foundations of equality and spiritual brotherhood among mankind; that they may manifest the highest virtues of the human world, revere the divine lights of the Prophets of God and establish the reality of unity so necessary today in the affairs of nations. (The Promulgation of Universal Peace, Page 318)

[32] Baha'u'llah has announced the necessity for a universal language which shall serve as a means of International communication and thus remove misunderstandings and difficulties. This teaching is set forth in the Kitab-i-Aqdas ("Most Holy Book") published fifty years ago. He has also proclaimed the principle that all mankind shall be educated and that no illiteracy be allowed to remain. This practical remedy for the need of the world cannot be found in the text of any other sacred Books. He teaches that it is incumbent upon all mankind to become fitted for some useful trade, craft or profession by which subsistence may be assured, and this efficiency is to be considered as an act of worship. The teachings of Baha'u'llah are boundless and without end in their far-reaching benefit to mankind. The point and purpose of our statement today is that they are new and that they are not found in any of the religious Books of the past. This is in answer to the question, "What has Baha'u'llah brought that we have not heard before?" Therefore, it is conclusive and evident that the Manifestation of God in this day is distinguished from all former appearances and revelations by His majesty, His power and the efficacy and application of His Word. (The Promulgation of Universal Peace, Page 434)

[33] His teachings, which embody the divine spirit of the age and are applicable to this period of maturity in the life of the human world, are: The oneness of the world of humanity The protection and guidance of the Holy Spirit The foundation of all religion is one Religion must be the cause of unity Religion must accord with science and reason Independent investigation of truth Equality between men and women The abandoning of all prejudices among mankind Universal peace Universal education A universal language Solution of the economic problem An international tribunal. Everyone who truly seeks and justly reflects will admit that the teachings of the present day emanating from mere human sources and authority are the cause of difficulty and disagreement amongst mankind, the very destroyers of humanity, whereas the teachings of Baha'u'llah are the very healing of the sick world, the remedy for every need and condition. In them may be found the realization of every desire and aspiration, the cause of the happiness of the world of humanity, the stimulus and illumination of mentality, the impulse for advancement and uplift, the basis of unity for all nations, the fountain source of love amongst mankind, the center of agreement, the means of peace and harmony, the one bond which will unite the East and the West. After every night there is a morn. (The Promulgation of Universal Peace, Page 440)

[34] Religion must be the cause of unity. Religion must accord with science and reason. Independent investigation of truth. Equality between men and women. The abandoning of all prejudices among mankind. Universal peace. Universal education. A universal language. Solution of the economic

problem. An international tribunal. ('Abdu'l-Baha, HMB, Page 330)

[35] 'Abdu'l-Baha's address was chiefly concerned with an auxiliary international language. Sir Patrick Geddes spoke afterwards to propose a vote of thanks. ('Abdu'l-Baha, HMB Page 364)

[36] Verily, I pray my Lord to teach thee a language and writing of the Kingdom which will satisfy thee, so as to dispense with all things; for that spiritual writing and instructive tongue are eloquent, clear, laudable, legible, read by the tongue and preserved in the heart. Blessed is he who knows it in the world of man! (Tablet of Abdu'l-Baha to Mr. Kanithi Yamamoto January 1903 in Japan Will Turn Ablaze! Page 14) (also in Tablets of 'Abdu'l-Baha Abbas, Vol. III Page 559)

[37] Endeavor as much as thou canst to acquire the English language with the utmost eloquence and excellence, so that thou mayest be enabled to translate the Tablets into the Japanese tongue. This is my advice. Certainly exert thy utmost endeavor to attain this bounty. (To Kanichi Yamamoto, Date not known in Japan Will Turn Ablaze! Page 16)

[38] The Japanese youth, K. Yamamoto ... must acquire the English language well, so as to enable him to translate the Divine Tablets into the Japanese language. (To Mrs. J. D. Brittingham, October 18, 1906 in Japan Will Turn Ablaze! Page 17)

[39] Thou hast taken much pain in inventing the new Japanese writing. Thou hast rendered a service to the world of humanity -- May God reward thee! Today, however, there exist many kinds of writing. That which is more necessary and is assisted by divine confirmations is the propagation of the heavenly Call. It is this which bestoweth life unto the dead souls, which refresheth the dried tree and ornamenteth it with leaves, blossoms and fruits. Concentrate all thine energy in this that thou mayest make heavenly progress, that thou mayest attain to the light of the Sun of Reality... This is most important! (To Sensui Saiki, October 15, 1920 in Japan Will Turn Ablaze! Page 30)

[40] "Acquire the Persian tongue, so as to learn of the meanings of the Divine words and to know the Divine mysteries, to develop an eloquent speech and to translate the blessed Tablets of Baha'u'llah. The Persian language shall become noteworthy in this cycle; nay, rather, the people shall study it in all the world." (Tablets of 'Abdu'l-Baha, Vol. II, Page 306) (also in Lights of Guidance, Page 340-341)

[41] Questions not treated of are left to the civil law of each country, and to the decisions of the Bait-ul-Adl, or House of Justice, instituted by Baha'o'llah. Respect toward the head of the State is part of respect toward God. A universal language, and the creation of tribunals of arbitration between nations, are to suppress wars. "You are all leaves of the same tree, and drops of the same sea," Baha'o'llah has said. Briefly, it is not so much a new religion as Religion renewed and unified, which is directed today by Abdul-Baha.-- (quoted from Nouveau Larousse Illustre, supplement, p. 66 in Tablets of 'Abdu'l-Baha Abbas, Vol. I. Page viii)

[42] But regarding the universal language: Ere long significant and scientific discussions concerning this

matter will arise among the people of discernment and insight and it will produce the desired result. (Tablets of 'Abdu'l-Baha Vol. III Page 596)

[43] "Thou hast written regarding to language of Esperanto. This language will be spread and universalized to a certain degree, but later on a language more complete than this, or the same language will undergo some changes and alterations and will be adopted and become universal. I hope that Dr, Zamenhof, become assisted by the invisible confirmation and do a great service to the world of humanity." (Tablets of 'Abdu'l-Baha, Vol. III Page. 692)

[44] Some of the weightiest passages of His Epistle to Queen Victoria are addressed to the members of the British Legislature, the Mother of Parliaments, as well as to the elected representatives of the peoples in other lands. In these He asserts that His purpose is to quicken the world and unite its peoples; refers to the treatment meted out to Him by His enemies; exhorts the legislators to "take counsel together," and to concern themselves only "with that which profiteth mankind"; and affirms that the "sovereign remedy" for the "healing of all the world" is the "union of all its peoples in one universal Cause, one common Faith," which can "in no wise be achieved except through the power of a skilled and all-powerful and inspired Physician." He, moreover, in His Most Holy Book, has enjoined the selection of a single language and the adoption of a common script for all on earth to use, an injunction which, when carried out, would, as He Himself affirms in that Book, be one of the signs of the "coming of age of the human race." (God Passes By, Page 211)

[45] The significant summons issued to the Presidents of the Republics of the American continent to seize their opportunity in the Day of God and to champion the cause of justice; the injunction to the members of parliaments throughout the world, urging the adoption of a universal script and language; (God Passes By, Page 215:1) (The Kitab-i-Aqdas, Page 15) (King of Glory, by HMB Page 352)

[46] The injunction to "consort with all men in a spirit of friendliness and fellowship" He further emphasizes, and recognizes such association to be conducive to "union and concord," which, He affirms, are the establishers of order in the world and the quickeners of nations. The necessity of adopting a universal tongue and script He repeatedly stresses; deplores the waste of time involved in the study of divers languages; affirms that with the adoption of such a language and script the whole earth will be considered as "one city and one land"; and claims to be possessed to the knowledge of both, and ready to impart it to any one who might seek it from Him. To the trustees of the House of Justice He assigns the duty of legislating on matters not expressly provided in His writings, and promises that God will "inspire them with whatsoever He willeth." (God Passes By, Pages 218:3-219)

[47] ... that `Abdu'l-Baha expounded, with brilliant simplicity, with persuasiveness and force, and for the first time in His ministry, those basic and distinguishing principles of His Father's Faith, which together with the laws and ordinances revealed in the Kitab-i-Aqdas constitute the bed-rock of God's latest Revelation to mankind. ...the adoption of a universal auxiliary language; (God Passes By, Page 281:1)

[48] The mere enumeration of the national committees which, originating mostly in the West and functioning with exemplary efficiency in the United States and Canada, now carry on their activities with

a vigor and a unity of purpose which sharply contrast with the effete institutions of a moribund civilization, would suffice to reveal the scope of these auxiliary institutions which an evolving Administrative Order, still in the secondary stage of its development, has set in motion:... the International Auxiliary Language Committee; (God Passes By, Pages 333:1-334)

[49] They include, moreover, "study days" held in Baha'i homes and centers, classes for the study of Esperanto and other languages, ... (God Passes By, Page 341:1)

[50] In 1920," is the declaration made in his testament by the distinguished Swiss scientist and psychiatrist, Doctor Auguste Forel, "I learned at Karlsruhe of the supraconfessional world religion of the Baha'is founded in the Orient seventy years ago by a Persian, Baha'u'llah. This is the real religion of 'Social Welfare' without dogmas or priests, binding together all men of this small terrestrial globe of ours. I have become a Baha'i. May this religion live and prosper for the good of humanity! This is my most ardent desire." "There is bound to be a world state, a universal language, and a universal religion," he, moreover has stated, "The Baha'i Movement for the oneness of mankind is, in my estimation, the greatest movement today working for universal peace and brotherhood." (God Passes By, Page 375:2)

[51] This Faith, Shoghi Effendi wrote, "does not ignore, nor does it attempt to suppress, the diversity of ethnical origins, of climate, of history, of language and tradition, of thought and habit, that differentiate the peoples and nations of the world." (The World Order of Baha'u'llah, Page 41:3)

[52] It calls for no less than the reconstruction and the demilitarization of the whole civilized world--a world organically unified in all the essential aspects of its life, its political machinery, its spiritual aspiration, its trade and finance, its script and language, and yet infinite in the diversity of the national characteristics of its federated units. It represents the consummation of human evolution--an evolution that has had its earliest beginnings in the birth of family life, its subsequent development in the achievement of tribal solidarity, leading in turn to the constitution of the city-state, and expanding later into the institution of independent and sovereign nations. (The World Order of Baha'u'llah, Page 43:1-2)

[53] A world metropolis will act as the nerve center of a world civilization, the focus towards which the unifying forces of life will converge and from which its energizing influences will radiate. A world language will either be invented or chosen from among the existing languages and will be taught in the schools of all the federated nations as an auxiliary to their mother tongue. A world script, a world literature, a uniform and universal system of currency, of weights and measures, will simplify and facilitate intercourse and understanding among the nations and races of mankind. In such a world society, (The World Order of Baha'u'llah, Page 203)

[54] As to your suggestion regarding a more widespread use of the Esperanto among the Baha'is as a medium of correspondence. Shoghi Effendi, as you know, has been invariably encouraging the believers, both in the East and in the West, to make an intensive study of that language, and to consider it as an important medium for the spread of the Cause in international circles. He has been specially urging the friends to have the Cause well represented in all Esperanto Congresses and associations, and by this

means cultivate greater friendship and cooperation between them and the Esperantists. But in this connection, he feels, he must make it clear that although the Cause views with much sympathy and appreciation the activities which the Esperantists are increasingly initiating for the spread of their language, yet it considers that the adoption of the Esperanto by the entire world is by no means an inevitable fact. Neither Baha'u'llah, nor even 'Abdu'l-Baha, ever stated that Esperanto will be the international auxiliary language. The Master simply expressed the hope that it may, provided certain conditions were fulfilled, develop into such a medium. 24 December 1935 (Lights of Divine Guidance, Vol 2 Pages 36-37)

[55] #1140. "Regarding the subject of Esperanto; it should be made clear to the believers that while the teaching of that language has been repeatedly encouraged by 'Abdu'l-Baha, there is no reference either from Him or from Baha'u'llah that can make us believe that it will necessarily develop into the international auxiliary language of the future. Baha'u'llah has specified in His writing that such a language will have either to be chosen from one of the existing languages, or an entirely new one should be created to serve as a medium of exchange between nations and peoples of the world. Pending this final choice, the Baha'is are advised to study Esperanto only in consideration of the fact that the learning of this language can facilitate inter-communication between individuals, groups and Assemblies throughout the Baha'i world in the present stage of the evolution of the Faith." (From letter written on behalf of the Guardian to the National Spiritual Assembly of the United States and Canada, June 4, 1937: Baha'i News, No. 109, July 1937, Page. 1) (republished in Lights of Guidance, Page 341)

[56] #2033. The Teacher Should Use Whatever Method of Expression That Will Attract the Listener "English is, compared to Latin and oriental languages, lacking (as spoken in daily use) in flowery terms, and the Guardian feels that in teaching you should always use whatever method will most attract your hearers. If such term as 'The Glory of god' are not suited to certain individuals' mentality you should refrain from using them until they draw really close to the spirit of the Cause. The teaching is of primary, the words of secondary importance." (From a letter written on behalf of Shoghi Effendi to an individual believer, January 23, 1945) (Lights of Guidance, Pages 600-601)

[57] #1141. The Present Need of An Auxiliary Language "What Baha'u'llah is referring to in the Eighth Leaf of the Exalted Paradise is a far distant time, when the world is really one country, and one language would be a sensible possibility. It does not contradict His instruction as to the need immediately for an auxiliary language. (From a letter written on behalf of Shoghi Effendi to an individual believer, March 16, 1946) (Lights of Guidance, Page 341)

[58] 29 July 1946 - He feels that the subject of the Baha'i work in Esperanto in Germany is a matter for you to take up with the National Spiritual Assembly; we Baha'is do not claim Esperanto will be the auxiliary language of the future--but as we firmly believe in the necessity of an auxiliary language we are glad to support this work by publishing books in Esperanto and encouraging the Baha'is to learn it, if they wish to. Cooperation with this society is an excellent means of spreading the Cause, as Martha Root demonstrated in her travels. However, all details in this matter must be decided by the N.S.A. You can contact Baha'i Esperantists in England and the U.S.A. through their respective N.S.A.s. (to Dr. Hermann Grossmann 29 July 1946, in Lights of Divine Guidance, Vol 2 Page 53)

[59] He would not advise you to teach them Esperanto, as we have no way of knowing whether it will ultimately be chosen as the auxiliary language of the world. He thinks the most direct and quickest way of communicating with them in a common tongue should be chosen; in other words either you should learn their language or they yours, whichever will yield the quickest results. (a letter dated December 12, 1942) (High Endeavors, Page 6)

[60] There followed another long pause, then the Master turned again to me and said: "At the present time the British Empire is the greatest and is still expanding and its language is a world language. (The Priceless Pearl, Page 12)

[61] From his Beirut days until practically the end of his life Shoghi Effendi had the habit of writing vocabularies and typical English phrases in notebooks. Hundreds of words and sentences have been recorded and these clearly indicate the years of careful study and he put into mastering a language he loved and revelled in. For him there was no second to English. He was a great reader of King James version of the Bible, and of the historians Carlyle and Gibbon, whose style he greatly admired, particularly that of Gibbon whose Decline and Fall of the Roman Empire Shoghi Effendi was so fond of that I never remember his not having a volume of it near him in his small room and usually with him when he travelled. There was a small Everyman's copy of part of it next to his bed when he died. It was his own pet bible of the English language and often he would read to me excerpts from it, interrupting himself with exclamations such as "Oh what style; what a command of English; what rolling sentences; listen to this." With his beautiful voice and pronunciation - in the direction of what we call an "Oxford accent", but no exaggeratedly so - the words fairly glowed with colour and their value and meaning came out like shining jewels. (The Priceless Pearl, Page 37-38) Also partly in (The Guardian, Page 12)

[62] In addition to this he devoted much attention, during the early years of his Guardianship, when Esperanto was rapidly spreading, particularly in Europe, to encouraging the publication of a Baha'i Esperanto Gazette, explaining to its editor that his interest was due to "my great desire to promote in such parts of the Baha'i world as present circumstances permit the study of an international language". (The Priceless Pearl, Page 207)

[63] In addition to these personal relationships Shoghi Effendi had far more contact with certain non-Baha'i organizations than is commonly supposed. This was particularly true of the Esperantists, whose whole object was to bring about the fulfilment of the Baha'i principle that a universal auxiliary language must be adopted in the interests of World Peace. We have copies of his personal messages to the Universal Congress of Esperantists held in 1927, 1928, 1929, 1930 and 1931, and he no doubt sent many messages of a similar nature at other times. Shoghi Effendi not only responded warmly when there was any overture made to him, but often took the initiative himself in sending Baha'i representatives, chosen by him, to various conferences whose interests coincided with those of the Baha'is. We thus find him writing to the Universal Esperantist Association, in 1927, that Martha Root and Julia Goldman will attend their Danzig Congress as official Baha'i representatives, and that he trusts "will serve to strengthen the ties of fellowship that bind the Esperantists and the followers of Baha'u'llah, one of whose cardinal principles . . . is the adoption of an international auxiliary language for all humanity." In his letter

addressed to the delegates and friends attending this nineteenth Universal Congress of Esperantists he writes: My dear fellow workers in the service of humanity, I take great pleasure in addressing you and wishing you . . . from all my heart the fullest success in the work you are doing for the promotion of the good of humanity. It will interest you, I am sure, to learn that as the result of the repeated and emphatic admonitions of 'Abdu'l-Baha His many followers even in the most distant villages and hamlets of Persia, where the light of Western civilization has hardly penetrated as yet, as well as in other lands throughout the East, are strenuously and enthusiastically engaged in the study and teaching of Esperanto, for whose future they cherish the highest hopes . . . (The Priceless Pearl, Pages 271-272) also in (The Guardian, Pages 124-125)

[64] A fundamental lack of communication between peoples seriously undermines efforts towards world peace. Adopting an international auxiliary language would go far to resolving this problem and necessitates the most urgent attention. (The Promise of World Peace, Page 106)

[65] In keeping with the requirements of the times, consideration should also be given to teaching the concept of world citizenship as part of the standard education of every child. (The Promise of World Peace, Page 102)

[66] Two points bear emphasizing in all these issues. One is that the abolition of war is not simply a matter of signing treaties and protocols; it is a complex task requiring a new level of commitment to resolving issues not customarily associated with the pursuit of peace. (The Promise of World Peace, Page 110)

[67] One out of every five adult Americans is functionally illiterate, meaning that they cannot read newspapers, recipes or fill out job applications. There are literacy councils and community colleges which will send literacy teachers to classes organized by the Baha'is. (Developing Distinctive Baha'i Communities, Pages 13.15-14.1)

[68] #348 ... "Baha'i authors may submit their works for review to any National Spiritual Assembly, and may send their works, once approved, to any publisher they like, Baha'i or non-Baha'i, at home or abroad. It should be remembered, however, that the approval should be given by the National Spiritual Assembly of the country where the work is to be first published. And in the case of a nonBaha'i publisher the author should insist on use of the system of transliteration at present used by the Faith for languages employing the Roman alphabet. "It is hoped that Baha'i authors will provide a constant stream of new works. Introductory books, commentaries, dissertations on various aspects of the Revelation, text books, histories, reviews, audio-visual material are all needed to stimulate study of the Faith and to promote the vital teaching work." (The Universal House of Justice: From Memorandum on Baha'i Publishing -- Ridvan 1971) (Lights of Guidance, Page 101)

[69] The Universal House of Justice, in response to your letter of 20 April concerning translations into French or Creole using simpler words than the original text, has requested us to send the following three quotations. These make it clear that a quotation in English may be rendered into simple English in order to facilitate its translation into another language or dialect. However, it is not permissible to publish

simplifications and paraphrased extracts of Baha'i Writings as Baha'i Scripture. "We have noticed a tendency in a number of countries to attempt to translate Baha'i literature into the current, easy, everyday language of the country. This, however, should not be an overriding consideration. Many of the Tablets of Baha'u'llah and 'Abdu'l-Baha are in exalted and highly poetic language in the original Persian and Arabic and you will see, for example, that when translating Baha'u'llah's Writings into English the beloved Guardian did not use present-day colloquial English but evolved a highly poetic and beautiful style, using numbers of archaic expressions reminiscent of the translations of the Bible." (From a letter dated 7 October 1973, written by the Universal House of Justice to a National Spiritual Assembly) (#370 Lights of Guidance, Page 108)

[70] "Obviously teaching literature and books about the Faith can be written in Simple English. However, we feel that when the Sacred Writings are published the standard English translation should be used, but there would be no objection to printing alongside it the translation into Simple English which should be described as a paraphrase of the Holy Word. Thus, for the people of ... who have difficulty in comprehending standard English, the simple English version would be in the nature of an explanation of the Writings which they could understand. In the case of teaching literature in which quotations from the Writings appear, these could either be paraphrased or a simple English version could be used with the standard version printed as a footnote. This method would also provide a means whereby the people of ... could improve their knowledge and understanding of the English language." (From a letter dated 20 September 1973 written on behalf of the Universal House of Justice to a National Spiritual Assembly) (#370 Lights of Guidance, Pages 108-109)

[71] "...It is, of course, permissible to translate Baha'i Writings into other languages and dialects of languages. It is also possible to simplify or paraphrase the Baha'i Writings in order to facilitate their translation into languages and dialects having small vocabularies. However, it is not permissible to publish simplifications and paraphrases of Baha'i Writings as Baha'i Scripture." (From a letter dated 13 March 1969 written on behalf of the Universal House of Justice to a National Spiritual Assembly) (#370 Lights of Guidance, Page 109)

[72] "The Universal House of Justice has requested us to advise you to base your translations on current editions of all the books referred to, if translation is involved. In each instance you should consult the original publisher and obtain a copy of the latest printing or edition to ensure that all approved corrections are embodied in your translation." (From a letter written on behalf of the Universal House of Justice to the National Spiritual Assembly of Taiwan, May 22, 1984) (#371 Lights of Guidance, Page 109)

[73] "The National Spiritual Assembly which undertake the translation, usually through a committee of Baha'i translators, is the body which "authorizes" the translation, if it is approved. In some instances, if there are no Baha'i translators available, there is no objection, in principle, to employing non-Baha'is for this purpose. It is usual for the National Spiritual Assembly to appoint a Reviewing Committee, or establish some means of providing review of the completed translation. You will note from the enclosed memorandum that, with the exceptions enumerated therein, new translations of the Sacred Text into languages other than English must be made from the Guardian's English translation where it exists; and when no such translation exists, advice should be sought from the Universal House of Justice. (From a

letter written on behalf of the Universal House of Justice to the Spiritual Assembly of Guadeloupe, May 13, 1986) (#367 Lights of Guidance, Pages 106-107)

[74] In the Baha'i view, recognition of the oneness of mankind "calls for no less than the reconstruction and the demilitarization of the whole civilized world--a world organically unified in all the essential aspects of its life, its political machinery, its spiritual aspiration, its trade and finance, its script and language, and yet infinite in the diversity of the national characteristics of its federated units." Elaborating the implications of this pivotal principle, Shoghi Effendi, the Guardian of the Baha'i Faith, commented in 1931 that: "Far from aiming at the subversion of the existing foundations of society, it seeks to broaden its basis, to remold its institutions in a manner consonant with the needs of an ever-changing world. It can conflict with no legitimate allegiances, nor can it undermine essential loyalties. Its purpose is neither to stifle the flame of a sane and intelligent patriotism in men's hearts, nor to abolish the system of national autonomy so essential if the evils of excessive centralization are to be avoided. It does not ignore, nor does it attempt to suppress, the diversity of ethnical origins, of climate, of history, of language and tradition, of thought and habit, that differentiate the peoples and nations of the world. It calls for a wider loyalty, for a larger aspiration than any that has animated the human race. It insists upon the subordination of national impulses and interests to the imperative claims of a unified world. It repudiates excessive centralization on one hand, and disclaims all attempts at uniformity on the other. Its watchword is unity in diversity. . . ." (The Promise of World Peace, Pages 120-126)

[75] 193. Select ye a single language . . . adopt ye . . . a common script. v.189 Baha'u'llah enjoins the adoption of a universal language and script. His Writings envisage two stages in this process. The first stage is to consist of the selection of an existing language or an invented one which would then be taught in all the schools of the world as an auxiliary to the mother tongues. The governments of the world through their parliaments are called upon to effect this momentous enactment. The second stage, in the distant future, would be the eventual adoption of one single language and common script for all on earth. (Notes: Kitabi-Aqdas, Page 250)

[76] In His Writings, Baha'u'llah has given three signs for the maturity of mankind. One is the above statement concerning the decline in the fortunes of kings. Another, to which we have made a reference in the previous volume, is the transmuting of elements, the achievement of alchemy. The third, mentioned in the Kitab-i-Aqdas, is the adoption of an international auxiliary language. (The Revelation of Baha'u'llah, Volume 3, Page 157)

[77] In each Ishraq of the Tablet of Ishraqat Baha'u'llah reveals some of His weighty counsels to mankind in general and to His followers in particular. He enjoins upon all mankind to establish the Lesser Peace, urges His followers to 'observe God's holy commandments', reminds them that the Cause of God will become victorious through 'praiseworthy deeds and upright character', addresses special counsels to the Universal House of Justice (the supreme body ordained by Baha'u'llah which came into being in 1963), affirms that its members 'have been charged with the affairs of the people', refers to it 'all matters of state', and asserts that this instruction is to be considered as 'part of the Most Holy Book'. He moreover affirms that justice is 'upheld by two pillars, reward and punishment', counsels 'everyone regarding the instruction and education of children', announces the purpose of religion to be the establishment of 'unity and concord

amongst the peoples of the world', forbids His followers to make religion the cause of dissension and strife, advocates the adoption of a universal auxiliary language, and enjoins upon the Trustees of the House of Justice 'either to choose one language from among those now existing or to adopt a new one'. (The Revelation of Baha'u'llah, Volume 4, Page 159)

[78] It is interesting to note that in the Tablet of Bisharat Baha'u'llah enjoins upon the governments of the world to adopt the international language. These two statements, which seem to be contradictory, may be regarded as two different stages in bringing about a world auxiliary language. The first stage will be the adoption of a universal language by the governments, while the second will have to wait until such time that the Universal House of Justice has emerged as the supreme institution of the World Order of Baha'u'llah and its authority is recognized. It is only then that it can possibly reconsider the choice of the language so as to either retain the one chosen by the governments or alter it altogether. In one of His Tablets (Nafahat-i-Quds) revealed in 'Akka, Baha'u'llah emphasizes the importance of adopting the auxiliary international language ordained in the Kitab-i-Aqdas. He states that its implementation will provide a means for safeguarding the unity of the human race and will facilitate intercourse and understanding among the peoples of the world. (The Revelation of Baha'u'llah, Vol 4, Pages 159-160)

[79] In this Tablet Baha'u'llah praises the Arabic language for its expressiveness and eloquence, and remarks that no other language can match its vast possibilities. He further states that God would be pleased if all the peoples of the world were to speak the Arabic language. But He does not require humanity necessarily to adopt it as the international language; rather He leaves the choice to the appropriate institutions. (The Revelation of Baha'u'llah, Vol 4, Page 160)

[80] It has not been possible so far to identify the person for whom the Tablet of Bisharat (Glad-Tidings) was revealed... On the other hand, Baha'u'llah after the preamble, addresses the peoples of the world. ... In this Tablet Baha'u'llah advocates the adoption of a universal language, advises the sovereigns of the world or their ministers... to choose a new or an existing; language for the purpose,... (The Revelation of Baha'u'llah, Vol 4, Pages 161-162)

[81] (Kalimat-i-Firdawsiiyyih- in Tablets of Baha'u'llah 57-80) urges the establishment of a universal language; (The Revelation of Baha'u'llah, Vol 4, Page 215)

[82] In this Tablet (Lawh-i-Dunya, Tablet of the World, in Tablets of Baha'u'llah, Pages 83-97) Baha'u'llah promulgates some of His Teachings aimed at the reconstruction of human society. These mostly reiterate teachings previously revealed, such as the establishment of an international language, (The Revelation of Baha'u'llah, Vol 4, Page 341)

[83] At present, a new language and a new script have been devised.' This is possibly a reference to Esperanto which was invented about four years before Baha'u'llah wrote this Epistle. (The Revelation of Baha'u'llah, Vol 4, Page 437)

[84] The language and script referred to on p. 138 were never communicated to anyone by Baha'u'llah. (Marzieh Gail, in preface to Epistle to the Son of the Wolf, Page xvi)

[85] When Stephenson invented his locomotive engine, European mathematicians of the time, instead of opening their eyes and studying the facts, continued for years to prove to their own satisfaction that an engine on smooth rails could never pull a load, as the wheels would simply slip round and round and the train make no progress. To examples like these one might add indefinitely, both from ancient and modern history, and even from our own times. Dr. Zamenhof, the inventor of Esperanto, had to battle for his wonderful international language against the same sort of ridicule, contempt, and stupid opposition which greeted Columbus, Galvani, and Stephenson. Even Esperanto, which was given to the world so recently as 1887, has had its martyrs. (Baha'u'llah and the New Era, Page 199)

[86] Baha'u'llah commanded the adoption of a universal auxiliary language, and Dr. Zamenhof and others obeyed His call by devoting their lives and genius to this great task and opportunity. (Baha'u'llah and the New Era, Page 236)

[87] A world language will either be invented or chosen from among the existing languages and will be taught in the schools of all the federated nations as an auxiliary to their mother tongue. A world script, a world literature, (Baha'u'llah and the New Era, Page 280)

[88] Other examples are: The equality of men and women; the universalization of knowledge (education); the creation of one universal language; (December 9, 1920 Tablet of 'Abdu'l-Baha to Miss Yuri Mochizuki (later Mrs. Furukawa), the first Japanese woman to become a Baha'i) (Japan Turn Ablaze! Page 27)

[89] "Your institutes should not only be seats of Baha'i learning but also centres from which mass teaching and consolidation work over a large area must be inspired and conducted. The Institute is not merely a building, nor solely a place where Baha'i classes can be held for a few days. It should be the centre of complex activities which systematically assist your Assembly in the achievement of its goal in teaching and consolidation." (From letter of the Universal House of Justice to the National Spiritual Assembly of India: June 23, 1966) (#1909 Lights of Guidance, Page 564)

[90] * Encourage individual believers to adopt teaching goals for themselves. * Carry out activities designed to deepen the believers in both a spiritual and intellectual understanding of the Cause. * Encourage the believers to make greater use of Baha'i literature. * Encourage the believers to enhance their command of language to assist them to understand the Baha'i writings ever more clearly. * Develop and foster Baha'i scholarship and lend support to the Associations for Baha'i Studies. (Six Year Plan 143-149, 1986-1992, of The Universal House of Justice, February 25, 1986, Page 17)

[91] In addition to projects to be initiated at the World Centre, these ideas include: ù Calling upon local and national Baha'i communities to sponsor a wide range of activities which will engage the attention of people from all walks of life to various topics relevant to peace, such as: the role of women, the elimination of racism, the eradication of prejudice, the promotion of education, the extension of social and economic development, the adoption of a world auxiliary language, the establishment of world

government; ù Mounting a publicity campaign which will make use of such themes as "world peace through world religion," "world peace through world education," "world peace through world language," "world peace through world law"--a campaign which could lead to discussion of these subjects in small or large gatherings, at local or national levels, and perhaps in collaboration with organizations promoting such ideas; ù Urging the publishing within and without the Baha'i community of a wide assortment of literature, posters and other graphic materials on peace; (A Wider Horizon, Pages 31-32)

[92] Develop and administer correspondence courses for teaching and deepening. (Six Year Plan 143-149, Page 16)

[93] Eleventh- One language must be selected as an international medium of speech and communication. Through this means mis-understandings will be lessened, fellowship established and unity assured. ('Abdu'l-Baha In Canada, Page 42)

The Universal House of Justice
Bahá'í World Centre
Haifa, Israel
June 22, 2002

Dear Respected Friends,

I am writing to you with questions that I have been researching for some months and for which I have not yet found conclusive answers. In the meantime, my proposal for a paper on the subjects outlined below was accepted by the Association for Bahá'í Studies conference at the end of August. My plans are to present it in Toronto at that time. I would be very grateful for your response to my inquiry.

My questions center on the image of God as “Father,” masculine pronouns used in reference to the Divinity, and the use of “man” to represent humanity as well as individuals – usage that is standard in the authorized English translations of the Bahá'í scriptures as well as the English writings of the Guardian and, most often, the Universal House of Justice. My understanding from the Teachings is that this usage is a product of convention and the images are generic and intended to be inclusive. While I don't doubt that intention, these practices nevertheless raise certain questions because of the importance of language in the formation of worldview.

To my knowledge, Bahá'u'lláh and the Báb abided by the conventions of Arabic and Persian regarding these matters, as did 'Abdu'l-Bahá. Shoghi Effendi translated their Writings into an English that was also faithful to conventions of the time. All of these languages utilize the masculine when referring to God. It appears that Shoghi Effendi often chose to translate words that referred to the generality of humankind as “man” per the standard. None of them chose to create new forms by which to render either “God” or “humanity” differently or opted to

use alternatives, and so masculine is the norm when referring to God in Bahá'í literature.

Of course, any language is inadequate to express the Divine, and both the Revealed Word and the translations are of singular quality, but the Word of God was revealed in language from the nineteenth-century Middle East, and the translations by the Guardian, the Expounder, were into a form of English characteristic of a time that preceded even his own. Language, however, changes to reflect the realities of the age; for example, it would seem unlikely that, were the Guardian writing and translating today, he would use “colored” or “Negro,” which were legitimate during his life, but in the short time since have come to be regarded as archaic, even offensive.

According to my understanding, two important spiritual features of this age will be the deanthropomorphization of God in the minds of human beings and the equality of the sexes. The language of the Bahá'í scriptures, however, can be seen to repeat and reinforce the sense that the Divine is somehow male. This concept characterized previous religions with many cumulative, undesirable consequences, which our Faith addresses. Similarly, the consistent use of “man” and masculine pronouns in the Writings to represent humanity and individuals contributes to an image that the human archetype is male, particularly when even in private personal prayer, the gender of pronouns -- overwhelmingly masculine -- is not to be changed, no matter who is praying or for whom, with the exception of the prayer for the dead.

My specific questions to you are:

§ Since the selection of words were divinely-inspired in the case of the Central Figures and consciously made choices by the Guardian, does that mean that in order to preserve faithfulness to their intent, Bahá'í English with regard to gender was crystallized at the point of the Guardian's translations?

§ Will his specific use of gender in the language serve as the model

for translations henceforth?

§ Will all references to God and human beings throughout this dispensation be masculine?

§ Is this the image translators should endeavor to replicate, even in languages whose constructs regarding gender and the Divine may pose no such dilemmas or different ones?

§ Will the universal auxiliary language need to retain masculine imagery in order to be true to the message or will it be able to establish new forms?

§ Are there spiritual implications to sex-specific imagery -- which the Faith's own teachings seem to indicate is not correct -- being fixed in holy Scriptures for all time or at least until the end of this dispensation?

I deeply appreciate your attention to my questions. I request your guidance regarding my sharing the response with the audience at the Association for Bahá'í Studies Conference, should it come in time to be incorporated as part of my presentation, and later with interested Bahá'ís and the general public.

With deepest respect and love,

Nancy Branham Songer
Columbia, SC

Mrs. Nancy Branham Songer
U.S.A.

Dear Bahá'í Friend,

The Universal House of Justice referred your emailed letter dated 22 June 2002 to its Research Department for comments, and it commends to your study the enclosed memorandum prepared in response to your queries concerning the use of masculine pronouns and images in the Sacred Writings of the Faith. We hope this information will prove useful to your endeavors, and you are free to use any of the contents in your presentation at the Association for Bahá'í Studies conference.

With loving Bahá'í greetings,

Department of the Secretariat

To: The Universal House of Justice

Date: 25 July 2002

From: Research Department

Use of Masculine Pronouns and Images

The Research Department has studied the questions on the above-mentioned subject raised by Mrs. Nancy Branham Songer in her emailed letter dated 22 June 2002 to the Universal House of Justice. Mrs. Songer observes that in the authorized English translations of the Bahá'í Scriptures and in the English writings of the Guardian, God is invariably termed “Father”, masculine pronouns are used in reference to the Divinity, and the term “man” is used to represent humanity as well as individuals. From her study of the Bahá'í teachings Mrs. Songer is aware that “this usage is a product of convention and the images are generic and intended to be inclusive”. She is also cognizant of the fact that “these practices nevertheless raise certain questions because of the importance of language in the formation of worldview”. In this regard she states that “according to [her] understanding, two important spiritual features of this age will be the deanthropomorphization of God in the minds of human beings and the equality of the sexes”. However, it is her view that the present “language of the Bahá'í scriptures ... can be seen to repeat and reinforce the sense that the Divine is somehow male”, and the “consistent use of ‘man’ and masculine pronouns in the Writings to represent humanity and individuals contributes to an image that the human archetype is male”. In light of these observations, Mrs. Songer poses a number of detailed questions concerning the work of translation—the implications of present practice for future translations, whether “Bahá'í English with regard to gender was crystallized at the point of the Guardian’s translations”, whether the universal auxiliary language will need “to retain masculine imagery in order to be true to the message or will it be able to establish new forms”, and whether “there are spiritual implications to sex-specific imagery ... being fixed in holy Scriptures for all time or at least until the end of this dispensation”. We provide the following comment.

By way of introduction, we wish to note that the Research Department has not, to date, been able to locate detailed guidance concerning the specific technical issues raised by Mrs. Songer about the practical implications of present translation practices for the future work of translation, especially as they relate to gender issues. To assist Mrs. Songer in

thinking about the questions she poses, we attach the following four compilations:

q “The Use of the Masculine Gender in the Bahá’í Writings”, a compilation of extracts from letters written by and on behalf of the Universal House of Justice. The extracts in the compilation set out a number of general principles in relation to this subject and the Bahá’í perspective on it. We note, for example, the House of Justice indicates that:

§ “In many languages the use of the masculine gender, unless intended specifically to denote masculinity, is generic” (extract 1, see also extracts 2 and 6).

§ “The translation of the Writings of the Central Figures of the Faith must of necessity agree in full detail with the original in conveying the exact meaning of the Words as

The Use of Masculine Pronouns and Images

25 July 2002

Page 2

they have been revealed” (extracts 2, 8 and 9). In addition, the Universal House of Justice indicates that it “does not feel it appropriate to change Shoghi Effendi’s usage of certain nouns in his translations” (extract 8). Indeed, “The style of translation into English was set by Shoghi Effendi” (extract 10).

- “... the Sacred Writings of the Faith and those of the Guardian do not use the ‘gender inclusive language’ now in vogue...” (extract 7).
- In relation to images of God, while using “conventional wording” Bahá’u’lláh “devoted vast numbers of Tablets to conveying the truth that God is not only neither male nor female, but is far above all human understanding” (extracts 8 and 10).
- With regard to the English language, “the issue of gender-specific nouns may be resolved either by changing the usage of nouns, or by permitting the consciousness of sexual equality to modify the meaning of nouns as they are now used. No doubt both courses will be followed in the evolution of the language. It is generally considered preferable to permit the change of consciousness to change the meaning that people attribute to words, rather than to press the use of forms of words, which may seem

contrived” (extract 8).

§ “The challenge ... is to accept the use of pronouns in their generic sense, which will lead one to view the matter in terms of a spiritual response, rather than one of semantics” (extracts 8 and 10).

q “Literary Style—Translation”, a compilation of materials that was prepared some time ago. The compilation includes a statement from ‘Abdu’l-Bahá about translation, extracts from letters written on behalf of Shoghi Effendi and the Universal House of Justice, and a description of the writings of Shoghi Effendi excerpted from RúHíyyih Rabbani’s “The Priceless Pearl” (London: Bahá’í Publishing Trust, 1969), pages 196–204.

q “The Difficult Art of Translation—Selected Extracts from Letters Written By and on Behalf of the Universal House of Justice Concerning the Translations of Shoghi Effendi”. Extracts in the compilation address such issues as:

§ The status of Shoghi Effendi’s translations (extracts 1 and 6). The importance of his translations as a starting point for translations into other European languages (extract 1).

§ The Guardian’s approach to translation (extracts 2, 4, and 7).

§ The interpretative aspect to Shoghi Effendi’s translations (extracts 1, 5, and 6).

§ Translators are encouraged to “strive to render the words of the Báb, Bahá’u’lláh and ‘Abdu’l-Bahá into English in a way that reproduces as accurately as possible the meaning of the originals, that is as beautiful as possible, and that harmonizes closely with the style used by Shoghi Effendi” (extract 4).

q “Importance of and Guidance on Translating the Bahá’í Writings into Indigenous and Other Languages”. This compilation, consisting mostly of the correspondence of the Universal House of Justice, was prepared some time ago. Despite the fact that there is a degree of

The Use of Masculine Pronouns and Images

25 July 2002

Page 3

repetition in the content, it is included because of Mrs. Songer's interest in the importance and use of language.

As to Mrs. Songer's question concerning whether "the universal auxiliary language needs to retain masculine imagery in order to be true to the message or will it be able to establish new forms", the Research Department has not, to date, been able to locate any references to this subject in the authoritative literature of the Faith. However, we call attention to the following statement of the Universal House of Justice in a letter dated 8 December 1964, which is included in extract 1 of the attached document "The Difficult Art of Translation":

We also feel that it is still premature to decide upon the question of the International Auxiliary Language. It is quite clear from the Texts that any living or invented language may be chosen, but the time and manner of its choosing and propagation are not yet decided.

The Use of the Masculine Gender in the Bahá'í Writings

Extracts from Letters Written By and on Behalf of the Universal House of Justice

In many languages the use of the masculine gender, unless intended specifically to denote masculinity, is generic. For instance, in English we speak of the race of man, or mankind, in both instances meaning every member of the human race—men, women and children. There would be no reason to interpret “O Son of Being”, or “O Son of Man” as addressed only to males. It is the same with pronouns.

(5 April 1981, written on behalf of the Universal House of Justice to an individual believer) [1]

The principle of the equality of men and women which is firmly established by the Author of the Faith and forms one of the basic tenets of our belief will be fully realized as the human race matures in its understanding of the significance of Bahá'u'lláh's Revelation. Equality will be achieved as a direct result of the adjustments the friends are required to make in their attitude towards this fundamental issue so essential to the establishment of the unity of mankind, and despite the exigencies of the languages in which the revealed Words have been received and in which they have been translated. ‘Abdu’l-Bahá says: “...in His estimate there is no question of sex.” “In the estimation of God there is no gender.”¹...

The translation of the Writings of the Central Figures of the Faith must of necessity agree in full detail with the original in conveying the exact meaning of the Words as they have

been revealed. The Guardian did not even approve the changing of pronouns in Bahá'í prayers when they are read. Therefore, no deviation in translation from the actual meaning of the words, to accommodate the general trend of thought and behaviour affecting a language, is conceivable, unless, of course, the equivalent of the original word does not exist in a given language. In one of His talks quoted in "The Promulgation of Universal Peace", page 76, 'Abdu'l-Bahá says:

The truth is that all mankind are the creatures and servants of one God, and in His estimate all are human. "Man" is a generic term applying to all humanity. The biblical statement "Let us make man in our image, after our likeness" does not mean that woman was not created. The image and likeness of God apply to her as well. In Persian and Arabic there are two distinct words translated into English as man: one meaning man and woman collectively, the other distinguishing man as male from woman the female. The first word and its pronoun are generic, collective; the other is restricted to the male. This is the same in Hebrew.

Concerning the English language, it is interesting that the 1983 edition of the Concise Oxford English Dictionary gives "human being" as the first meaning of "man"; and only as the fourth meaning "adult human male, opp. to woman, boy, or both." Therefore, the use of "man" or "men" in translating the intent of the Revealer of the Words to embrace all humankind seems a good choice.

(20 May 1984, written on behalf of the Universal House of Justice to an individual believer) [2]

1 "The Promulgation of Universal Peace: Talks Delivered by 'Abdu'l-Bahá during His Visit to the United States and Canada in 1912", rev. ed. (Wilmette: Bahá'í Publishing Trust, 1995), pp. 174 and 374.

We have considered your memorandum of 6 June 1989 and appreciate the points you have raised concerning the sensitivity of women, both Bahá'í and non-Bahá'í, to the use of what are construed to be exclusively masculine words in the Sacred Writings of the Bahá'í Faith.

While we recognize that the problem of gender in language presents difficulties at the present time, we must also recognize that the problem varies considerably from language to language, depending on the number of grammatical genders that each language uses.

Since the immediate concern in the translations ... centres on usage in English, we shall concentrate on the problem as it exists in that language. English is fortunate in having a common gender. The problem of gender-specific nouns is, therefore, susceptible of two lines of solution. One is to change the usage of nouns, the other is to permit the consciousness of sexual equality to modify the meaning of nouns as now used. Undoubtedly both courses will be followed in the evolution of the language. The word "doctor" for example, is now clearly of common gender in English, although originally masculine. Our feeling is that, in general, it is preferable to permit the change of consciousness to change the meaning that people attribute to the words, rather than to press the use of forms of words that seem contrived and, to many people, ridiculous—a reaction that does not help the advancement of the cause of the equality of the sexes. Following this reasoning, as you will have noted, we used the word "chairman" in relation to the sessions of the International Convention, although all were women.

In respect to the Sacred Writings, the originals, clearly, cannot be changed, and we do not feel at liberty to change Shoghi Effendi's usage of "man" or "mankind" to "humanity" or "humankind".

(27 November 1989, from a memorandum from the Universal House of Justice to a Bahá'í Office of Public Information) [3]

There are, as you indicate, many conventions of expression in use at the present time which reflect the male dominance of human society in the past. We must hope that as the

consciousness of human beings changes and as the equality of the sexes comes to be accepted in theory and in practice throughout the world, the meanings attached to certain words will change accordingly, as will the usage of words. Language is a living thing and changes as the culture which it reflects changes....

The important point here is that one will not persuade people to change their usage of language until one has convinced them of the true understanding of the reality of things; but when they once understand the truth, the meaning that they attach to words changes, and thus a change in usage becomes much less important, if not irrelevant. (8 March 1990, written on behalf of the Universal House of Justice to an individual) [4]

... the House of Justice is well aware that, at various times, the meaning attached to certain words becomes influenced by emotions and can assume overtones which are offensive to some segments of the population. In the case of the generic terms in the English translations of the Bahá'í Writings, the tendency to take such terms as being applicable only to males is a reflection of the male-dominated society which has prevailed for so long, and to which there is

The Use of the Masculine Gender in the Bahá'í Writings
2002

25 July

Page 3

a reaction from women who are seeking legitimate recognition and equality. Bahá'ís can well sympathize with such concerns, while pointing out that language is a living thing and that the intended meaning of the generic terms will doubtless become more readily apparent as the influence of the Bahá'í commitment to equality of the sexes permeates human society more fully.

It is understandable that some non-Bahá'ís are initially disturbed by the use of those terms in our Writings which are associated conventionally with a male orientation. Seekers

after truth should be assisted to determine the intended meaning of such terms through reference to the Bahá'í Teachings, rather than through assuming that these terms have the meaning now prevalent in the world; thus they will find that they should seek that meaning which is consistent with equality of men and women, and which also happens to be the primary meaning associated with classical usage of the English language to convey spiritual truths. A similar approach is called for when a seeker encounters a number of other terms and phrases in the Writings.

Members of the Bahá'í community should not fall unconsciously into the error of labelling the Bahá'í Writings as being “sexist” or “discriminatory”, or of feeling a need to apologize to non-Bahá'ís for the terms used. Such an attitude would be indicative of a lack of understanding of the Bahá'í approach to this issue, and a lack of confidence in the position adopted by the Faith in regard to use of generic terms.

(26 September 1993, written on behalf of the Universal House of Justice to a National Spiritual Assembly) [5]

We regret the very long delay in responding to your request ... for help in locating something in print regarding the use of the male pronoun in the Bahá'í Writings. In this regard we are enclosing a copy of extracts from letters written on behalf of the Universal House of Justice to individual believers regarding the use of the masculine gender in the Writings. Related to this subject is the reference on page seven in the introduction to “The Kitáb-i-Aqdas” where it is stated that it is apparent from the writings of the Guardian that “where Bahá'u'lláh has given a law as between a man and a woman, it applies ‘mutatis mutandis’ between a woman and a man unless the context makes this impossible”.

(26 June 1994, written on behalf of the Universal House of Justice to an individual believer) [6]

In relating the Teachings of the Faith to the discussion of contemporary social issues, Bahá'í publications are challenged by the need to adapt editorial policies to the ever-changing public perceptions of those issues, without compromising the fundamental Bahá'í principles

and concepts involved. The question of “gender inclusive language” guidelines is a case in point. The editors of a publication like the Journal will certainly have acquainted themselves with the various points of view on the subject current among the readership which they and their authors are addressing, together with prevailing modes of expression. These factors will exercise an influence on Bahá’í editorial policy, but must do so within the context of the Teachings.

Clearly, the Scriptures of the Faith, as revealed by the Founders and interpreted by ‘Abdu’l-Bahá and the Guardian, impose their own requirements on Bahá’í authors and editors

The Use of the Masculine Gender in the Bahá’í Writings
2002

25 July

Page 4

alike. On the one hand, an editorial board will quite properly be concerned to take into account the preferences and convictions common to the great majority of the intended readers of its publication. On the other, Bahá’í authors must be left entirely free to discuss the Revelation of Bahá’u’lláh in its own terms and language as set out in the Bahá’í Scriptures themselves and in their authorized interpretations, irrespective of current fashions in academic and other public discourse. That is to say: the Sacred Writings of the Faith and those of the Guardian do not use the “gender inclusive language” now in vogue, and it would therefore not be appropriate for the Editorial Board to impose such current standards on Bahá’í authors.
(26 July 1996, written on behalf of the Universal House of Justice to a National Spiritual Assembly) [7]

Your letter of 19 September 1996 expressing your concern regarding the use of inclusive masculine terms in the Sacred Writings has been received by the Universal House of Justice, and we have been asked to reply.

The point you have raised regarding the sensitivity of women, both Bahá’í and non-Bahá’í, to the use of masculine nouns and pronouns when referring to God is noted and your

concern appreciated. It is recognized that the question of gender in language presents difficulties at this time; however, it must also be recognized that the problem varies considerably from language to language, depending on the number of grammatical genders that each language uses.

English is fortunate in having a common gender. Therefore, the issue of gender-specific nouns may be resolved either by changing the usage of nouns, or by permitting the consciousness of sexual equality to modify the meaning of nouns as they are now used. No doubt both courses will be followed in the evolution of the language. It is generally considered preferable to permit the change of consciousness to change the meaning that people attribute to words, rather than to press the use of forms of words, which may seem contrived.

Likewise, when considering the manner in which masculine nouns and pronouns are used to refer to God, it is important to bear in mind that when Bahá'u'lláh was revealing His Scriptures He had to use language and forms of expression which could be understood by those whom He was addressing. This is the case with every Prophet; He is compelled to use old forms through which He will raise humanity to a new level of understanding. In Arabic and Persian, as in English and most European languages, it has been customary to refer to God as "Lord" and "Father", rather than "Lady" and "Mother". While using the conventional wording Bahá'u'lláh approached the matter on two levels. In relation to God He devoted vast numbers of Tablets to conveying the truth that God is not only neither male nor female, but is far above all human understanding. If you study deeply the Writings of Bahá'u'lláh that portray both the transcendence and immanence of God you will find that the entire question of sex in this context falls into total insignificance.

On the human level, the Bahá'í Teachings stress again and again the equality of men and women. They do not ignore the differences between the sexes, but repeatedly emphasize their equality. This is a universal concept, irrespective of the language in which it is expressed. Regarding the pronouns which refer to the Deity, in Arabic there is a distinction between

the masculine and feminine; however, the Persian language does not make such a distinction in pronouns between the sexes. As you have noted in your letter, the style of translation into

The Use of the Masculine Gender in the Bahá'í Writings
2002

25 July

Page 5

English was set by Shoghi Effendi. In respect to the Sacred Writings, the originals clearly cannot be changed, and the House of Justice does not feel it appropriate to change Shoghi Effendi's usage of certain nouns in his translations. The Guardian did not even approve the changing of pronouns in Bahá'í prayers when they are read. Therefore, no deviation in translation from the actual meaning of the words, to accommodate the general trend of thought

and behavior affecting a language, is permissible, unless, of course, the equivalent of the original word does not exist in a given language.

'Abdu'l-Bahá says: "...in His estimate there is no question of sex." "In the estimation of God there is no gender."

The challenge, therefore, is to accept the use of pronouns in their generic sense, which will lead one to view the matter in terms of a spiritual response, rather than one of semantics.

The principle of the equality of men and women, which is firmly established by Bahá'u'lláh and forms one of the basic tenets of our Faith, will be fully realized as the human race matures in its understanding of the significance of His Revelation. Equality will be achieved as a direct result of the transformations the believers make in their attitudes toward this fundamental issue, and despite the exigencies of the languages in which the revealed Words have been received and translated.

(24 October 1996, written on behalf of the Universal House of Justice to an individual believer) [8]

In response to your email of 21 August 1998 requesting guidance concerning the use of "gender-sensitive language" for use in your "discussions with potential authors and in the editing of their work", we are able to provide the following comments.

The Universal House of Justice has previously stated in response to a similar query that the use of “gender inclusive language” is one of the many contemporary issues which challenge Bahá’í publications to adapt editorial policies to the ever-changing public perceptions without compromising the fundamental Bahá’í principles and concepts involved. It is the responsibility of authors and editors to acquaint themselves with the various points of view on the subject current among the readership which they are addressing, together with the prevailing modes of expression. These factors will exercise an influence on Bahá’í editorial policy, but must do so within the context of the Teachings.

Clearly, the Scriptures of the Faith, as revealed by the Founders and interpreted by ‘Abdu’l-Bahá and the Guardian, impose their own requirements on Bahá’í authors and editors alike. On the one hand, an editorial board will quite properly be concerned to take into account the preferences and convictions common to the great majority of the intended readers of its publication. On the other, Bahá’í authors must be left entirely free to discuss the Revelation of Bahá’u’lláh in its own terms and language as set out in the Bahá’í Scriptures themselves and in their authorized interpretations, irrespective of current fashions in academic and other public discourse.

It is not surprising that the struggle to achieve such a balance during an era of unprecedented social and intellectual turmoil is very challenging to Bahá’í publishers. Inevitably, there will be certain segments of the public who will object in some degree to

The Use of the Masculine Gender in the Bahá’í Writings
2002

25 July

Page 6

whatever resolution is arrived at in any given case, but this should not unduly distress either Bahá’í authors or Bahá’í editors.

(16 September 1998, written on behalf of the Universal House of Justice to a

Bahá'í Publisher) [9]

The Universal House of Justice has received your email message of 17 September 1999 requesting guidance on the question of gender as it relates to the Deity and the use of gender specific pronouns when referring to God.

When considering the manner in which masculine pronouns are used to refer to God, it is important to bear in mind that when Bahá'u'lláh was revealing His Scriptures He had to use language and forms of expression which could be understood by those whom He was addressing. This is the case with every Prophet; He is compelled to use old forms through which He will raise humanity to a new level of understanding. In Arabic and Persian, as in English and most European languages, it has been customary to refer to God as "Lord" and "Father", rather than "Lady" and "Mother". While using the conventional wording, Bahá'u'lláh devoted vast numbers of Tablets to conveying the truth that God is not only neither male nor female, but also is far above all human understanding. If one studies deeply the Writings of Bahá'u'lláh that portray both the transcendence and immanence of God it becomes clear that the entire subject of sex in this context is essentially irrelevant....

The style of translation into English was set by Shoghi Effendi, and in respect to the Sacred Writings the originals clearly cannot be changed. The Guardian did not even approve the changing of pronouns in Bahá'í prayers when they are read. Therefore, when translating the Sacred Writings it is not possible to alter the actual meaning of the words to accommodate the general trend of thought and behavior affecting a language.

The challenge, therefore, is to accept the use of pronouns in their generic rather than gender sense, which will lead one to view issues in terms of a spiritual response, rather than one of semantics. The Bahá'í Teachings stress again and again the equality of men and women. They do not ignore the differences between the sexes, but repeatedly emphasize their equality.

This is a universal principle of the Faith, irrespective of the language in which it is expressed.

(7 October 1999, written on behalf of the Universal House of Justice to a National Spiritual Assembly) [10]

LITERARY STYLE—TRANSLATION

From the Writings of ‘Abdu’l-Bahá

Regarding the translation of the Books and Tablets of the Blessed Beauty, ere long will translations be made into every tongue, with power, clarity and grace. At such time as they are translated, conformably to the originals, and with power and grace of style, the splendours of their inner meanings will be shed abroad, and will illumine the eyes of all mankind. Do thy very best to ensure that the translation is in conformity with the original. (“Selections from the Writings of ‘Abdu’l-Bahá”, number 31.13)

From the writings of Shoghi Effendi and letters written on his behalf

This is one more attempt to introduce to the West, in language however inadequate, this book of unsurpassed pre-eminence among the writings of the Author of the Bahá’í Revelation. The hope is that it may assist others in their efforts to approach what must always be regarded as the unattainable goal—a befitting rendering of Bahá’u’lláh’s matchless utterance.

(Shoghi Effendi, Foreword to “The Kitáb-i-Iqán” (Wilmette: Bahá’í Publishing Trust, 1985)

It must have been very distasteful to you to read some of the off-hand and ungrammatical

translations that more out of necessity than choice won circulation and were even published. Furthermore, it was always the expressed wish and desire of 'Abdu'l-Bahá to have proper and adequate translations that would not only convey the true spirit of the original but also possess some literary merit. And for this he emphasized the necessity of a board of translators. Such a board it has unfortunately been impossible to form as yet.
(28 March 1926 to an individual believer)

Shoghi Effendi hopes that before long we will obtain a group of competent English and Persian scholars who would devote their whole time and energy to the translation of the Words and bring out things that are really deserving. For whatever we have at present, even the very best, is only a mediocre rendering of the Persian or Arabic beauty of style and fertility of language that we find in the original.
(4 July 1929 to an individual believer)

Shoghi Effendi wishes me also to express his deep-felt appreciation of your intention to study the Qur'án. The knowledge of this revealed holy Book is, indeed, indispensable to every Bahá'í who wishes to adequately understand the writings of Bahá'u'lláh. And in view of that the Guardian has been invariably encouraging the friends to make as thorough a study of this Book as possible, particularly in their Summer Schools. Sale's translation is the most scholarly we have, but Rodwell's version is more literary, and hence easier for reading.
(23 November 1934 to an individual believer)

-2-

He feels the highest literary standard possible should be maintained in any future translations of Bahá'í writings into Spanish, and for this reason he heartily welcomes the suggestion to refer such work to Spanish professors....
(14 December 1938 to an individual believer)

There is no objection to using, in translations of the Master's words, a uniform style such as

“he does” or “he doeth”. It certainly creates a ridiculous impression to use both. One or the other may be chosen.

In Persian it is impolite not to use the word “FaGrat” before the name of the Prophet, so that strictly speaking a proper translation should always have “His Holiness Moses” etc.; however, as this seems peculiar in English, and not in the best usage of our language, he feels it can be dispensed with. Pronouns referring to the Manifestation, or the Master, should, however, invariably be capitalized.

(8 November 1948 to a National Spiritual Assembly)

Shoghi Effendi himself uses the King James version of the Bible, both because it is an authoritative one and in beautiful English.

(28 October 1949 to an individual believer)

He is interested in accomplishing two things—he would like in the European languages to have as much uniformity with the English translations as possible; he does not wish the Bahá’í translations to be in any way a flagrant violation of the rules of the language into which our literature is being translated.

Your Committee must conscientiously study this question, and then do the best you can to have the Bahá’í literature in French meet the high standards of the French language and grammar.

If the possessive and demonstrative adjectives and pronouns in French are never capitalized where they stand for “God”, then this should not be done in the Bahá’í literature. If there is a precedent for doing so in the French language, however, they should be. The same is true of the attributes of God.

(15 February 1957 to the National Translation and Publication Committee of France)

From letters written by the Universal House of Justice

We realise that translation is a very difficult task and that however good a translation is there are always differences of opinion, both as to accuracy and style. However, in translating

Bahá’í Scripture it is important to remember that the style in the original is an exalted one and this aspect should not be lost when it is translated into other languages. It can be noted, for example, that when the beloved Guardian was making his translations into English he

used a style that is far from being that of modern English usage but is admirably suited to the richness and imagery of the original.

(12 August 1973 to a National Spiritual Assembly)

-3-

A translation should of course be as true as possible to the original while being in the best possible style of the language into which it is being translated. However, you should realize that it will not be possible to translate the Tablets adequately into easy, modern Dutch. Many of the original Writings of Bahá'u'lláh and 'Abdu'l-Bahá are written in very exalted and poetic Persian and Arabic and therefore a similar flavour should be attempted in the language into which it is translated. You will see, for example, that in translating the Tablets of Bahá'u'lláh into English the beloved Guardian has created a very beautiful and poetic style in English using many words which might be considered archaic and are reminiscent of the English used by the translators of the King James version of the Bible.

As you point out, a literal translation is often a bad one because it can produce a phraseology or imagery that would convey the wrong impression, thus a translator is at times compelled to convey the meaning of the original by means of a form of words suited to the language. However, a person translating the Bahá'í Writings must always bear in mind that he or she is dealing with the Word of God, and, when striving to convey the meaning of the original, he should exert his utmost to make his rendering both faithful and befitting.

(29 October 1973 to an individual believer)

From letters written on behalf of the Universal House of Justice

Those who are entrusted with the task of translating the Sacred Writings from the original into English should study the original very closely, and then attempt to express as accurately and as beautifully as possible in English that which the original conveys. To do this they frequently have to use various different synonyms in English to give the best translation of the same Arabic or Persian word when it appears in different contexts. Conversely, they may have to use the same English word in different contexts to translate various different words in the original. In doing this they attempt to follow the example set by Shoghi Effendi in his magnificent translations.

(31 May 1981 to a National Translation and Revision Committee of a National

Spiritual Assembly)

Translation is a very difficult art—an art in which absolute perfection is unattainable. However good a translation, there will always be those who would have preferred it otherwise, for taste, which is undefinable, plays such a large part in such judgements. (20 September 1982 to an individual believer)

From memoranda prepared by the Research Department at the instruction of the Universal House of Justice

The question of which style of Swedish should be used for the translation of Bahá'í Writings is one that, we feel, must be decided by the National Assembly of Sweden after considering the views of those who are expert both in translation and in Swedish literary style. While it is not obligatory for them to follow the practice that the beloved Guardian adopted in English, it would be useful for them to bear in mind certain aspects of the problem which have been solved in English by Shoghi Effendi.

-4-

The originals of the Bahá'í Writings are not only in three different languages (Arabic, Persian and a few in Turkish), which have very different characteristics, but are also in a number of different styles. Some are highly poetic and metaphorical, others more precise and specific. In English-speaking countries, as in most others, religion and spirituality are in a phase of eclipse; therefore the vocabulary used to convey many profound religious concepts has fallen into disuse. To attempt to express the highly poetic and allusive terminology of the Bahá'í Writings in plain, modern English would either be banal or would make the passages sound very strange and foreign. The Guardian's use of a style of English that is slightly archaic, a style in which there is an abundance of spiritual and poetic terminology, acts as a bridge between the English of today and the style of the Persian and Arabic Writings of the Founders of the Faith.

(1 July 1985 to the House of Justice from the Research Department for the Swedish Publishing Trust)

Those devoted believers who are currently engaged in translation work have a difficult task, for the originals of the Bahá'í Writings are not only in three different languages (Arabic, Persian, and a few in Turkish) but are also composed in a number of different styles. Some are highly poetic and metaphorical, others more precise and specific. The translators must study the original closely in order to attempt an accurate and beautiful rendition in English suitable for the style and language of the original text.

(27 May 1987 to an individual believer)

From "The Priceless Pearl"

THE WRITINGS OF THE GUARDIAN

In an age when people play football with words, kicking them right and left indiscriminately with no respect for either their meaning or correct usage, the style of Shoghi Effendi stands out in dazzling beauty. His joy in words was one of his strongest personal characteristics, whether he wrote in English—the language he had given his heart to—or in the mixture of Persian and Arabic he used in his general letters to the East. Although he was so simple in his personal tastes he had an innate love of richness which is manifest in the way he arranged and decorated various Bahá'í Holy Places, in the style of the Shrine of the Báb, in his preferences in architecture, and in his choice and combination of words. Of him it could be said, in the words of another great writer, Macaulay, that "he wrote in language ... precise and luminous." Unlike so many people Shoghi Effendi wrote what he meant and meant exactly what he wrote. It is impossible to eliminate any word from one of his sentences without sacrificing part of the meaning, so concise, so pithy is his style....

The language in which Shoghi Effendi wrote, whether for the Bahá'ís of the West or of the East, has set a standard which should effectively prevent them from descending to the level of illiterate literates which often so sadly characterizes the present generation as far as the use and appreciation of words are concerned. He never compromised with the ignorance of his readers but expected them, in their thirst for knowledge, to overcome their ignorance. Shoghi Effendi chose, to the best of his great ability, the right vehicle for his thought and it made no difference to him whether the average person was going to know the word he used or not. After all, what one does not know one can find out. Although he had such a brilliant command of language he frequently reinforced his knowledge by certainty through looking up the word he

planned to use in Webster's big dictionary. Often one of my functions was to hand it to him and it was a weighty tome indeed! Not infrequently his choice would be the third or fourth usage of the word, sometimes bordering on the archaic, but it was the exact word that conveyed his meaning and so he used it. I remember my mother once saying that to become a Bahá'í was like entering a university, only one never finished learning, never graduated. In his translations of the Bahá'í writings, and above all in his own compositions, Shoghi Effendi set a standard that educates and raises the cultural level of the reader at the same time that it feeds his mind and soul with thoughts and truth....

The supreme importance of Shoghi Effendi's English translations and communications can never be sufficiently stressed because of his function as sole and authoritative interpreter of the Sacred Writings, appointed as such by 'Abdu'l-Bahá in His Will. There are many instances when, owing to the looseness of construction in Persian sentences, there could be an ambiguity in the mind of the reader regarding the meaning. Careful and correct English, not lending itself to ambiguity in the first place, became, when coupled with Shoghi Effendi's brilliant mind and his power as interpreter of the Holy Word, what we might well call the crystallizing vehicle of the teachings. Often by referring to Shoghi Effendi's translation into English the original meaning of the Báb, Bahá'u'lláh, or 'Abdu'l-Bahá becomes clear and is thus safeguarded against misinterpretation in the future. He was meticulous in translating and made absolutely sure that the words he was using in English conveyed and did not depart from the original thought or the original words. One would have to have a mastery of Persian and Arabic to correctly understand what he did....

The Guardian was exceedingly cautious in everything that concerned the original Word and would never explain or comment on a text submitted to him in English (when it was not his own translation) until he had verified it with the original.

(Rúhíyyih Rabbani, *The Priceless Pearl* (London: Bahá'í Publishing Trust, 1969), pp. 196–204)

**The Difficult Art of Translation—Selected Extracts
From Letters Written By and On Behalf of the Universal House of Justice
Concerning the Translations of Shoghi Effendi**

The matter of translation is a major problem. As you yourself know only too well, to convey exactly the meaning and flavour of a passage from one language to another is often impossible and one can but labour to approach as near as possible to the unattainable perfection.

Even our beloved Guardian, whose skill in this art amounted to genius, characterized his translation of the “Kitáb-i-Iqán” as “one more attempt to introduce to the West, in language however inadequate, this book of unsurpassed pre-eminence among the writings of the Author of the Bahá’í Revelation” and he expressed the hope “that it may assist others in their efforts to approach what must always be regarded as the unattainable goal—a befitting rendering of Bahá’u’lláh’s matchless utterance.”

The difficulty of translation increases when two languages express the thoughts and metaphors of widely differing cultures; thus, it is infinitely more difficult for a European to conceive the thought patterns expressed in Arabic or Persian than to understand a passage written in English. Moreover, the beloved Guardian was not only a translator but the inspired Interpreter of the Holy Writings; thus, where a passage in Persian or Arabic could give rise to two different expressions in English he would know which one to convey. Similarly he

would
 be much better equipped than an average translator to know which metaphor to employ in English to express a Persian metaphor which might be meaningless in literal translation.

Thus, in general, speakers of other European tongues will obtain a more accurate translation by following the Guardian's English translation than by attempting at this stage in Bahá'í history to translate directly from the original.

This does not mean, however, that the translators should not also check their translations with the original texts if they are familiar with Persian or Arabic. There may be many instances where the exact meaning of the English text is unclear to them and this can be made evident by comparison with the original....

We also feel that it is still premature to decide upon the question of the International Auxiliary Language. It is quite clear from the Texts that any living or invented language may be chosen, but the time and manner of its choosing and propagation are not yet decided. (8 December 1964, from a letter of the Universal House of Justice to an individual believer) [1]

A translation should of course be as true as possible to the original while being in the best possible style of the language into which it is being translated. However, you should realize that it will not be possible to translate the Tablets adequately into easy, modern Dutch. Many of the original Writings of Bahá'u'lláh and 'Abdu'l-Bahá are written in very exalted and poetic Persian and Arabic and therefore a similar flavour should be attempted in the language into which it is translated. You will see, for example, that in translating the Tablets of Bahá'u'lláh into English the beloved Guardian has created a very beautiful and poetic style in English using many words which might be considered archaic and are reminiscent of the English used by the translators of the King James version of the Bible.

25 July 2002

Page 2

As you point out, a literal translation is often a bad one because it can produce a phraseology of imagery that would convey the wrong impression; thus, a translator is at times compelled to convey the meaning of the original by means of a form of words suited to the language. However, a person translating the Bahá'í Writings must always bear in mind that he or she is dealing with the Word of God, and, when striving to convey the meaning of the original, he should exert his utmost to make his rendering both faithful and befitting. (29 October 1973, from a letter of the Universal House of Justice to an individual believer) [2]

Translation is, indeed, a very difficult art, and 'Abdu'l-Bahá has explained that, ideally, all translations of the Sacred Texts should be made by competent committees, rather than by individuals. At the present time, unfortunately, there is seldom in any country a large enough number of sufficiently skilled persons who can be called upon to constitute such committees, and the institutions of the Faith have to rely on the services of such individuals as they can find with adequate time and skill to undertake the arduous work of translation.

The Writings of the Faith are not in the nature of scientific treatises. One must remember that the Manifestation of God is using the inadequate instrument of human language to convey truths and guidance which can raise mankind high above its present level of development and understanding. He makes extensive use, therefore, of metaphor and simile, and often approaches a subject from several different points of view so that its various facets and implications can be better understood. It would not be possible, therefore, to compile a list of meanings for specific symbols, expressions and words, since they may vary in their implication from passage to passage.

The translation of a passage can seldom be an entirely faithful rendering of the original—one just has to strive to make it as faithful and befitting as possible. At the present time many of the translations of the Writings fall far below the desirable standard, especially in those

languages spoken by a relatively small number of Bahá'ís, but time and an increase in the number of Bahá'ís who have a profound understanding of the Teachings as well as an exemplary command of the languages concerned will enable new and improved translations to be produced. For the time being we must do what we can with what we have. (8 September 1985, written on behalf of the Universal House of Justice to an individual) [3]

With regard to your question about the style of English used in the translation of Bahá'í prayers, we are asked to point out that finding an adequate style in English for expressing beautifully the poetic, metaphorical and allusive style of many of the Bahá'í Scriptures is not easy. The Persian and Arabic of the Bahá'í Writings are themselves considerably different from the current styles and usages in those languages. Shoghi Effendi's solution of using a slightly archaic form of English, which is somewhat equivalent to the use in the original languages, makes possible the use of images and metaphors that might seem strange if expressed in modern English.

Furthermore, styles of writing are changing comparatively rapidly. If it were already found necessary to use a style different from that used for translations fifty years ago, one can estimate that a further change would be called for fifty years hence. One merely has to consider the large number of new translations of the Bible that have appeared, and are still appearing, and yet many English-speaking Christians prefer to continue using the Authorized Version in

The Difficult Art of Translation – Selected Extracts...

25 July 2002

Page 3

spite of its proven inaccuracies. Holy Scriptures have a profound meaning for their readers, and to change the familiar words too often can be gravely disturbing.

Books of Scripture themselves mould the language in which they are written. The House of Justice believes that if translators strive to render the words of the Báb, Bahá'u'lláh and 'Abdu'l-Bahá into English in a way that reproduces as accurately as possible the meaning of the

originals, that is as beautiful as possible, and that harmonizes closely with the style used by Shoghi Effendi, these Writings themselves will have a far-reaching effect on the ability of Bahá'ís, and especially Bahá'í children and youth, to use the English language effectively for thought and for expression.

(3 February 1988, written on behalf of the Universal House of Justice to an individual believer) [4]

It must be remembered that Shoghi Effendi's translations carry with them a large measure of interpretation of the intent and purpose of the Author of the text he set about to translate—an interpretation which he, as Interpreter of the Sacred Text, could alone authoritatively provide.

(27 February 1989, written on behalf of the Universal House of Justice to a National Spiritual Assembly) [5]

You ask whether the translations of Shoghi Effendi should be considered as the “standard” and whether, because of his function as infallible interpreter, the Guardian's translations provide “the true interpretation of the Writings”. We are asked to call attention to the Introduction to “The Kitáb-i-Aqdas” where the Universal House of Justice describes the essential qualities of the Guardian's translations and the fact that they “are illumined by his uniquely inspired understanding of the purport and implications of the originals”.

(15 December 1994, written on behalf of the Universal House of Justice to an individual believer) [6]

The Universal House of Justice has received your letter dated 9 August 1999 in which you seek to know how soon will the Writings of Bahá'u'lláh be published in “the common language of standard English to facilitate teaching”. We have been asked to respond as follows.

The House of Justice appreciates your desire to make the Writings of Bahá'u'lláh accessible to your relatives and others who may dismiss them as illogical because of the style in which they are written. Nevertheless, to attempt to express the highly poetic, metaphorical and allusive terminology of the Bahá'í Writings in plain, modern English would either be banal or would render many of the passages strange and foreign. The Guardian's use of a style of

English that is slightly archaic, a style in which there is an abundance of spiritual and poetic terminology, acts as a bridge between the English of today and the style of the Persian and Arabic Writings of the Founders of our Faith.

In comparing the translation of the Bible with that of Bahá'í Texts, you may realize that the Hebrew of the Old Testament is far more blunt and straightforward than the Persian and Arabic of the Bahá'í Writings. Additionally, the koine Greek of most of the New Testament is the everyday speech of that time. The challenges posed to translators of the Bahá'í Writings are much more exacting than those that confront translators of the Bible. It is therefore not advisable to use one kind of translation as a standard for the other.

The Difficult Art of Translation – Selected Extracts...

25 July 2002

Page 4

Finally, although it is not possible to translate the Writings in a manner that brings them in conformity with the standards of common English, you may be confident that if the hearts of those to whom you present the Writings are ready, the style of the Sacred Texts will not stand as a barrier to their understanding and accepting the teachings.

(2 September 1999, written on behalf of the Universal House of Justice to an individual believer) [7]

Importance of and Guidance on Translating the Bahá'í Writings into Indigenous and Other Languages

From the Writings of 'Abdu'l-Bahá

Regarding the translation of the Books and Tablets of the Blessed Beauty, ere long will translations be made into every tongue, with power, clarity and grace. At such time as they

are translated, conformably to the originals, and with power and grace of style, the splendours of their inner meanings will be shed abroad, and will illumine the eyes of all mankind. Do thy very best to ensure that the translation is in conformity with the original. (“Selections from the Writings of ‘Abdu’l-Bahá”, number 31.13) [1]

From Letters written by the Universal House of Justice

It is, of course, permissible to translate Bahá’í writings into other languages and dialects of languages. It is also possible to simplify or paraphrase the Bahá’í writings in order to facilitate their translation into languages and dialects having small vocabularies. However, it is not permissible to publish simplifications and paraphrases of Bahá’í writings as Bahá’í Scripture.

(13 March 1969 to a National Spiritual Assembly) [2]

With the exception of certain oriental languages such as Turkish, Arabic and Urdu, which are related to the original Persian or Arabic, new translations of the Sacred Text into languages

other than English must be made from the Guardian’s English translation where it exists.

When there is no translation into English by Shoghi Effendi of a particular passage, the National Spiritual Assembly concerned should seek the advice of the Universal House of Justice.

When translations already exist, which are not made from the Guardian’s English text, but have been

published and approved, they may be used.

(28 March 1971 to all National Spiritual Assemblies) [3]

The point is well taken that it would unduly delay fundamental Bahá’í teachings being published in a number of languages if we were to await the availability of Bahá’ís competent to

make the translations. Summaries, commentaries and simple re-statements of the Guardian’s writings, provided the text itself is not attributed to the Guardian, are to be encouraged.

(13 August 1972 to the Hands of the Cause of God in the Holy Land) [4]

We realise that translation is a very difficult task and that however good a translation is there are always differences of opinion, both as to accuracy and style. However, in

translating

Bahá'í Scripture it is important to remember that the style in the original is an exalted one and

this aspect should not be lost when it is translated into other languages. It can be noted, for example, that when the beloved Guardian was making his translations into English he used a style that is far from being that of modern English usage but is admirably suited to the richness

and imagery of the original.

(12 August 1973 to a National Spiritual Assembly) [5]

We have noticed a tendency in a number of countries to attempt to translate Bahá'í literature into the current, easy, everyday language of the country. This, however, should not be

Importance of and Guidance on Translating the Bahá'í Writings into Indigenous and Other Languages

Page 2

an overriding consideration. Many of the Tablets of Bahá'u'lláh and 'Abdu'l-Bahá are in exalted and highly poetic language in the original Persian and Arabic and you will see, for example, that when translating Bahá'u'lláh's Writings into English the beloved Guardian did not use present-day colloquial English but evolved a highly poetic and beautiful style, using numbers of archaic expressions reminiscent of the translations of the Bible.

(7 October 1973 to a National Spiritual Assembly) [6]

As to Counsellor ...'s question in his letter of January 22, it may be pointed out to him that the translation and recording of some of the Holy Writings into native dialects not only helps the teaching work and pays honour to the native languages, but also provides the way to achieve an objective established by the Master and the beloved Guardian. Both 'Abdu'l-Bahá and Shoghi

Effendi often encouraged the friends to memorize passages from the Writings and such a practice acquires added importance in areas where there is a shortage of printed literature or a

high degree of illiteracy. Consequently, availability of passages from the Holy Writings in native dialects is an important aspect of a successful deepening programme.

(19 February 1975 memorandum to the International Teaching Centre) [7]

From Letters written on behalf of the Universal House of Justice

In most languages each word has a range of meanings and also a penumbra of connotations. Certain of these overlap, giving rise to synonyms which are interchangeable in some contexts but not in others. It is seldom that there is an exact correspondence between the range of meanings and connotations of a word in one language and those of its nearest equivalent in another language. This lack of correspondence is particularly evident between the words of languages used in widely separate parts of the world or in very different cultures.

The House of Justice feels, therefore, that to construct a rigid list of Dutch words which are always used to translate certain other English words would not only be unnecessary but definitely misleading. As the beloved Guardian pointed out, the word “Bahá” signifies at once the “Glory”, the “Splendour” and the “Light” of God; there is no single word in English which can express all these. Thus, as you have noted, it is translated as “Glory” in the use “Bahá’u’lláh”, while in the list of the months, where “Jalál”, the second month, is translated “Glory”, “Bahá” is translated “Splendour”. All translations are, to some degree, inadequate.

Those who are entrusted with the task of translating the Sacred Writings from the original into English should study the original very closely, and then attempt to express as accurately and as beautifully as possible in English that which the original conveys. To do this they frequently have to use various different synonyms in English to give the best translation of the same Arabic or Persian word when it appears in different contexts. Conversely, they may have to use the same English word in different contexts to translate various different words in the original. In doing this they attempt to follow the example set by Shoghi Effendi in his magnificent translations.

The House of Justice suggests that, although your committee should, of course, follow the instruction of the Guardian to make your translations into Dutch from the English translations rather than from the original Persian or Arabic, you may find it helpful to consult Persian believers who are well-versed in Dutch and who could check with the original Texts for

Importance of and Guidance on Translating the Bahá’í

Writings into Indigenous and Other Languages

you. This could help you to make the correct choice of word in Dutch when the English wording seems ambiguous.

(31 May 1981 to a National Translation and Revision Committee) [8]

Translation is, indeed, a very difficult art, and ‘Abdu’l-Bahá has explained that, ideally, all translations of the Sacred Texts should be made by competent committees, rather than by individuals. At the present time, unfortunately, there is seldom in any country a large enough number of sufficiently skilled persons who can be called upon to constitute such committees, and the institutions of the Faith have to rely on the services of such individuals as they can find with adequate time and skill to undertake the arduous work of translation.

The Writings of the Faith are not in the nature of scientific treatises. One must remember that the Manifestation of God is using the inadequate instrument of human language to convey truths and guidance which can raise mankind high above its present level of development and understanding. He makes extensive use, therefore, of metaphor and simile, and often approaches a subject from several different points of view so that its various facets and implications can be better understood. It would not be possible, therefore, to compile a list of meanings for specific symbols, expressions and words, since they may vary in their implication from passage to passage.

The translation of a passage can seldom be an entirely faithful rendering of the original—one just has to strive to make it as faithful and befitting as possible. At the present time many of the translations of the Writings fall far below the desirable standard, especially in those languages spoken by a relatively small number of Bahá’ís, but time and an increase in the number of Bahá’ís who have a profound understanding of the Teachings as well as an exemplary command of the languages concerned will enable new and improved translations to be produced. For the time being we must do what we can with what we have.
(8 September 1985 to an individual) [9]

With regard to your question about the style of English used in the translation of Bahá’í prayers, we are asked to point out that finding an adequate style in English for expressing

beautifully the poetic, metaphorical and allusive style of many of the Bahá'í Scriptures is not easy. The Persian and Arabic of the Bahá'í Writings are themselves considerably different from the current styles and usages in those languages. Shoghi Effendi's solution of using a slightly archaic form of English, which is somewhat equivalent to the use in the original languages, makes possible the use of images and metaphors that might seem strange if expressed in modern English....

Books of Scripture themselves mould the language in which they are written. The House of Justice believes that if translators strive to render the words of the Báb, Bahá'u'lláh and 'Abdu'l-Bahá into English in a way that reproduces as accurately as possible the meaning of the originals, that is as beautiful as possible, and that harmonizes closely with the style used by

Importance of and Guidance on Translating the Bahá'í Writings into Indigenous and Other Languages

Page 4

Shoghi Effendi, these Writings themselves will have a far-reaching effect on the ability of Bahá'ís, and especially Bahá'í children and youth, to use the English language effectively for thought and for expression.

(3 February 1988 to an individual) [10]

Of course the most fundamental requirement for the attainment of a good translation is the availability of a translator who has not only a thorough understanding of the original language, but also is able to write in clear and beautiful French, so that he can re-express in French not only the true meaning of the original, but can clothe it in language which appropriately reproduces in the French idiom the beauty of style of the original. While a literal translation is almost inevitably a bad translation, the translator must guard against departing from or adding to the meaning of the original even though he may have to use a phrase to translate a word, or reduce a phrase in the original to one word in the French, or recast the order

of a sentence, or replace a metaphor which would be meaningless if translated literally by an equivalent one which conveys the same meaning. In translating Shoghi Effendi's writings in particular you may find that many of his long sentences, which are perfectly clear in English, are impossible in French and must be divided into shorter ones.

If there is no French-speaking Bahá'í with the requisite command of both English and French, or if such friends are over-burdened, you may most certainly employ non-Bahá'í translators. Here, however, you may face another problem, that of the translator's understanding of the Bahá'í teachings which underlie the words. It would be essential for you to have such translations carefully checked by knowledgeable Bahá'ís, who can raise with the translator any passages which they feel convey the wrong meaning.

When you are having any of the Sacred Texts translated on the basis of authorized English translations, you should involve in the work one or more Bahá'ís who are fluent in French and are also familiar with the original Arabic or Persian. Thus, when the translator finds he is unable to grasp the exact meaning of the English words, his understanding can be illuminated by reference to the original texts.

(2 December 1988 to a Bahá'í Publishing Trust) [11]

Translation is indeed a difficult issue, and it is for this reason that the official version of the messages and letters of the Universal House of Justice are sent in the original English.

Any translation offered is unofficial and simply intended as an assistance to those who might wish to avail themselves of it, and National Spiritual Assemblies are free to make their own translation in accordance with local language needs. This also applies to the statement on Bahá'u'lláh which the House of Justice requested you to translate into Chinese.

(7 August 1991 to an individual) [12]

You ask what is the purpose and wisdom of the translation of the Bahá'í Writings, and what is the philosophy behind it.

As you know, one of the principles of the Bahá'í Faith is for a single language to be adopted as the universal auxiliary language of mankind, to be taught in the schools of all the

nations. When that time comes, the need for so many translations will be greatly reduced, since there will be one common medium of communication for all who dwell on earth. Alas, however, it will take some time yet for the governments of the world to adopt such a far-reaching and fundamental measure.

Importance of and Guidance on Translating the Bahá'í Writings into Indigenous and Other Languages

Page 5

In the meantime it is essential for the Bahá'ís to convey the Word of God to all the peoples of the world, as quickly and as completely as possible. For this, translation is essential.

The Writings of the Báb and Bahá'u'lláh are, as you know, in Arabic and Persian, as are those of 'Abdu'l-Bahá Who also wrote some Tablets in Turkish. Shoghi Effendi, for his part, wrote

many of his most important works in English. To expect the Japanese Bahá'ís to learn Arabic,

Persian and English sufficiently well to really understand the Bahá'í literature in those three tongues would be too great a demand. Fortunately, there is already a wealth of the Arabic and

Persian Writings translated into English, but even if the friends' command of English is sufficiently good for them to fully comprehend such Writings, there is an important emotional

and psychological advantage to their being able to read the Word of God in their own mothertongue. Thus we engage in translating the Writings into even tribal languages which have quite a small number of native speakers.

(14 December 1992 to an individual) [13]

Your letter of 9 May concerning the translation of Bahá'í literature into Georgian has been received and we have been instructed to reply as follows.

You have asked whether Bahá'í literature should be translated from English or Russian.

In principle, the desirable course is to translate from English, as the English translations have been made by the Guardian or authorized by the Bahá'í World Centre. If this is not practical at

the moment, then provisional translations can be made from Russian until such time as proper

translations from English can be prepared. Such a solution is far better than waiting and

being

without Bahá'í literature in the native tongue of your region.

(23 May 1995 to a National Spiritual Assembly) [14]

Equally important is the right of the members of indigenous populations to learn, speak, write and communicate in their native tongue, if they so wish, in addition to the official language of the country in which they reside, for language is the expression of the spirit of a people and the vehicle of its cohesive and inspiring traditions. Facility in one's native language

in addition to the official language of one's country can produce an enrichment of the heritage

of the entire people and can act as a stabilizing influence in society, while the cultural oppression which seeks to obliterate minority languages can have a deracinating and demoralizing effect that will be very difficult to correct. Furthermore, Bahá'ís advocate the development or adoption of an international auxiliary language by which all the peoples of all

countries and cultural backgrounds will be able to communicate.

(25 July 1995 to an individual) [15]

THE UNIVERSAL HOUSE OF JUSTICE
DEPARTMENT OF THE SECRETARIAT

Bahá'í World Centre • P.O. Box 155 • 31 001 Haifa, Israel

15 August 2002

Transmitted by email: nsonger@sc.rr.com
Mrs. Nancy Branham Songer
U.S.A.

Dear Bahá'í Friend,

The Universal House of Justice has received your email dated 28 July 2002, and referred it to our Department for response. In answer to your request for materials on universal auxiliary language and universal language, we are providing for your use two documents which address these general concepts, namely, an extract from a Research Department memorandum dated 7 July 1994, and its attachment entitled "The Principle of an International Auxiliary Language". You may also find of interest the enclosed documents "International Auxiliary Language", providing references to this topic in the Bahá'í writings, and "Bahá'í World Centre Library: A Partial Bibliography of Published Works on an Auxiliary Language", which lists some papers by Bahá'ís on this subject.

Regarding your request for guidance on translating the Bahá'í Writings, we trust that the Research Department's memorandum dated 25 July 2002, and its accompanying enclosures, which were previously sent to you by email, will provide ample information on this topic.

You have asked that email attachments be sent to you in a form other than Portable Document Format (PDF), such as Microsoft Word format. As it is the practice for communications from the Bahá'í World Centre to be sent in only two formats, namely, plain text (ASCII) and PDF, we regret that we are unable to provide electronic copies of the above documents in any other form.

We hope that you will be able to glean adequate information from these materials to assist you in your endeavors to make a presentation at the upcoming Association for Bahá'í Studies conference.

With loving Bahá'í greetings,
Department of the Secretariat

Enclosures

Extract from a Research Department memorandum dated 7 July 1994

The Research Department has studied the questions concerning an international auxiliary language raised by.... He expresses the view that there is an urgent need for the world to adopt an international auxiliary language and for the Bahá'ís to be in the forefront of helping to make this a reality. He indicates a willingness to spend time researching and promoting this undertaking, and to this end, he raises a number of issues about the nature of such a language, its promotion and its relationship to the Lesser Peace....

1. An International Auxiliary Language

-
We attach a compilation of extracts entitled "The Principle of an International Auxiliary Language" which addresses, in broad terms, the issues raised by Mr. ... and which serves as the basis for the comments which follow. There are, of course, many other references in the published Writings and in the talks given by 'Abdu'l-Bahá during His travels in the West, many of which were collected in Paris Talks and The Promulgation of Universal Peace. Additional talks on this subject can be found in a number of the volumes of Star of the West, for example:

volume III, no. 3, pp. 23-24

volume III, no. 19, p. 5

volume IV, no. 2, pp. 34-37

In addition, there is a chapter on the universal language in Payám-i-Malakút, a compilation prepared by Mr. Ishráq-Khávarí. Some of the Persian friends living in ... would, undoubtedly, have a copy of this book.

1.1 Degree of Priority?

With regard to the role of the Bahá'ís in promoting an international auxiliary language, Mr. ... enquires about the degree of priority that the believers should give to this activity at this point in time. We call attention to the following points, gleaned from the attached compilation:

- Shoghi Effendi underlines the importance of an international auxiliary language. In a letter dated 24 April 1939, written on his behalf, he refers to it as “an indispensable element in the upbuilding of the coming New World Order”.

- The Guardian summarizes the “whole question of an international language and its relation to the Faith” in the following extract from a letter dated 17 October 1944, written on his behalf to an individual believer:

We, as Bahá'ís, are very anxious to see a universal auxiliary tongue adopted as soon as possible; we are not the protagonists of any one language to fill this post. If the Governments of the world should agree on an existing language, or a constructed, new tongue, to be used internationally, we would heartily support it because we desire to see this step in the unification of the human race take place as soon as possible.

- The Universal House of Justice in a letter dated 2 June 1982 written on its behalf indicated that “the important thing now ... is for the Bahá'ís to promote the principle” of an international auxiliary language. It invited individual believers, who have “a particular

interest in this subject” and who feel so inclined, to study Esperanto.

- With regard to overall priorities, in a letter dated 2 March 1976 written on its behalf, the Universal House of Justice stressed the importance of “teaching the Cause and winning the goals of the ... Plan”.

1.2 The Nature of an International Auxiliary Language

Mr. ... enquires whether the Universal House of Justice sees the immediate need for creating or adopting a complex language, suited to “the exchange of ideas and the advancement of understanding at scientific, technological, commercial, literary and translation levels,” or the development of “truly a universal ‘second language’” that would enable people “to communicate on a merely social level”. We wish to note that, in the first instance, the governments of the world will select the international auxiliary language. See section 1.3 below for a discussion of the timing of the adoption of an international language.

In a more general sense, Mr’s question impinges on the subject of the nature of an international auxiliary language. Though the extracts contained in the attached compilation deal mostly with Esperanto, they appear to shed some light on the potential complexity of and the functions which such a language might be expected to serve. For example:

- Shoghi Effendi, in letters written on his behalf, appears to have regarded Esperanto as a vehicle for “introducing the Teachings into important social and intellectual circles” (28 May 1937). He called upon the believers “to learn it and to translate Bahá’í literature into it” (17 October 1944), and he recognized its value in fostering “unity and understanding” (5 April 1947).

- ‘Abdu’l-Bahá envisaged the development of a language “more complete” than Esperanto, as it existed at that time. The Guardian indicated that the international language of the future was to serve as “an international medium of communication” (26 December 1936), as “a medium of exchange between the nations and peoples of the world” (4 June 1937). And, the Universal House of Justice indicated that it would “be used in all international commerce” (8 June 1980).

The following two extracts from letters written on behalf of Shoghi Effendi ... are also of

interest as they were responses to questions from individuals about the suitability of specific languages to serve as an auxiliary language. The final sentence of the first excerpt appears to contain a general principle to guide the selection of an international language:

He was interested in your efforts to make the English language, which undoubtedly is the most generally spoken and widely understood, the world's auxiliary language, and we must wait and see how other European nations receive it. Of course as you had well put it, the mere existence of prejudice is no argument against the possibility of making an existing language universal. The world must try to overcome its many defects and not reinforce it. Perhaps the main consideration in future will be the specific qualities of a language as being exact, rich and easy to learn for both East and West.
(18 May 1928 to an individual believer)

Regarding your question of "Basic English's" usefulness as an international language: He is not very familiar with it, as he is too preoccupied with the tremendous amount of work he has to do here. But what little he has read about it makes him doubt whether it would ever be adequate to meet the requirements of an auxiliary tongue.
(30 June 1944 to an individual believer)

1.3 Relationship to the Lesser Peace

Mr. ... asks whether the adoption of an international auxiliary language will be one of "the most important steps that needs to be taken to bring about the Lesser Peace" or whether it will be adopted "as a result of the process of establishing such a political peace". Before addressing this issue it is important to consider the way in which the international auxiliary language will be adopted. In a letter dated 8 June 1980 written on its behalf to an individual believer ... the Universal House of Justice calls attention to two stages in this process:

...there are two different provisions in the Sacred Texts for the selection of an International Auxiliary Language. On the one hand, this task is given to the governments of the world, on the other it is given to the House of Justice. It is not possible now to foresee exactly how this will come about, but it would seem reasonable to suppose that, long before the Bahá'í community is large enough or can exercise the authority to produce such a world-embracing change, events will compel the governments, either progressively or all in concert, to select an International Auxiliary Language to be taught

as a second language in all schools and to be used in all international commerce. At a much later stage, possibly at the time of the Bahá'í World Commonwealth, the Universal House of Justice may well decide to review the situation and either confirm the decision that the governments had made, or change the choice to a more suitable language.

As to whether the adoption of an international auxiliary language is a prerequisite to the Lesser Peace, the Research Department has not been able to locate any clear statement in the Bahá'í Writings that relates specifically to this question. It is, however, interesting to note that

the Universal House of Justice in the Peace Statement identifies a “fundamental lack of communication between peoples” as a factor which “seriously undermines efforts towards world peace”. And the House of Justice indicates that the adoption of an international auxiliary language “would go far to resolving this problem and necessitates the most urgent attention”.

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE

The difficulties of international communication in a polyglot world are strikingly evident to any Bahá'í who has gone travel teaching to foreign lands or has attended international conferences. The Universal House of Justice feels that for it to choose any language for the Bahá'ís to use as an international auxiliary language would give rise to greater difficulties

than
 would thereby be solved at the present time. The friends, however, remembering that this is one of the very important principles of the Faith, would do well to support the concept whenever possible, and to pray that the time is not far removed when the governments of the nations will adopt a single language to be taught in all the schools of the world as an auxiliary
 to the pupils' mother-tongue. This compilation has been prepared at the World Centre of the Faith, on instruction of the Universal House of Justice, to assist the friends everywhere to arrive
 at a greater understanding of this principle, to which 'Abdu'l-Bahá addressed Himself in a number of His talks in the West.

From the Writings of 'Abdu'l-Bahá

Thou hast written regarding the language of Esperanto. This language will be spread and universalized to a certain degree, but later on a language more complete than this, or the same
 language will undergo some changes and alterations and will be adopted and become universal.

I hope that Dr. Zamenhof may become assisted by the invisible confirmation and do a great service to the world of humanity.

(Tablets of Abdul-Baha Abbas, vol. 3 (Chicago: Bahá'í Publishing Committee, 1930 printing), p. 692) [1]

As to the Esperantists, associate with them. Whenever you find one with capacity, convey to him the fragrances of Life.... It is evident that the Esperantists are receptive and thou
 art familiar with and expert in their language. Communicate also with the Esperantists of Germany and other places.... Grieve not over the apathy and coldness of the Hague meeting. Put thy trust in God. Our hope is that among the people the Esperanto language may hereafter
 have a powerful effect. Thou hast now sown the seed. Assuredly it will grow. Its growth dependeth upon God.

(Selections from the Writings of 'Abdu'l-Bahá (Haifa: Bahá'í World Centre, 1982), sec. 228, p. 308) [2]

From letters written on behalf of Shoghi Effendi

What Bahá'u'lláh says is that the Supreme House of Justice will appoint a committee that will study the whole matter and then either choose one of the existing languages or create a new one, to function as an international language. The Master never went beyond that, i.e. He never tried to solve the problem Himself and choose that language. He still leaves it to the Supreme House of Justice. But He says that Esperanto will spread and even went so far as to encourage all the friends who possibly can to study it. In fact the knowledge of Esperanto has proven very useful for one who tries to teach in different countries of the world. But whether Esperanto will become the international language which is to be a part of our religious and social duties to

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE Page 2

study, no one knows, and we have no evidence that the Master made any definite statement along that line. The Master has scarcely ever assumed the solution of a problem that Bahá'u'lláh has referred to the Supreme House of Justice. Esperanto may become an international language, but it depends upon the House of Justice to choose it as the international language. And no one is in a position to foretell.
(30 August 1928 to an individual believer) [3]

As to your suggestion regarding a more widespread use of Esperanto among the Bahá'ís as a medium of correspondence, Shoghi Effendi, as you know, has been invariably encouraging the believers, both in the East and in the West, to make an intensive study of that language, and to consider it as an important medium for the spread of the Cause in international circles. He has been specially urging the friends to have the Cause well represented in all Esperanto

Congresses and associations, and by this means cultivate greater friendship and co-operation between them and the Esperantists.

But in this connection, he feels, he must make it clear that although the Cause views with much sympathy and appreciation the activities which the Esperantists are increasingly initiating for the spread of their language, yet it considers that the adoption of Esperanto by the entire world is by no means an inevitable fact. Neither Bahá'u'lláh, nor even 'Abdu'l-Bahá, ever stated that Esperanto will be the international auxiliary language. The Master simply expressed the hope that it may, provided certain conditions were fulfilled, develop into such a medium. (3 August 1935 to an individual believer) [4]

Concerning your study of Esperanto: the Guardian does not feel it advisable that you get too busy introducing any changes in that language, as this is not only a type of activity for which you are not qualified, but is also void of any use or advantage as far as your Bahá'í work is concerned, in view of the fact that it is by no means certain that Esperanto will necessarily develop into the world auxiliary language referred to by Bahá'u'lláh in His writings. (17 April 1936 to an individual believer) [5]

Regarding the teaching of Esperanto: the Guardian thoroughly appreciates the efforts you are exerting for the spread of this language, and fully realizes that through them you can find many openings for teaching the Cause. He wishes me, however, to bring to your attention the fact that neither Bahá'u'lláh nor 'Abdu'l-Bahá did specifically state that Esperanto would certainly become the international auxiliary language of the future. Neither did they enjoin its teaching upon the believers. What 'Abdu'l-Bahá chiefly did was to highly praise it, and to reveal its possibilities. The teaching of Esperanto is, therefore, not a command or an obligation in the sense that praying is for instance. What is enjoined by Bahá'u'lláh is either the creation of a new language, or the adoption of one of the existing languages for use as an international medium of communication. Let us hope that Esperanto may some day develop into such a medium. (26 December 1936 to an individual believer) [6]

As to your question as to what constitutes indirect teaching: it essentially consists in presenting some of the humanitarian or social teachings of the Cause which are shared by those whom we are teaching, as a means of attracting them to those aspects of the Faith which are

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE Page 3

more challenging in character, and are specifically and solely Bahá'í. The teaching of Esperanto, for instance, has been a very useful way of presenting the Cause indirectly to many people. It has opened many doors of contact for the believers, and has lately proved to be of tremendous help in introducing the Teachings into important social and intellectual circles. (28 May 1937 to an individual believer) [7]

Regarding the subject of Esperanto: it should be made clear to the believers that while the teaching of that language has been repeatedly encouraged by 'Abdu'l-Bahá there is no reference either from Him or from Bahá'u'lláh that can make us believe that it will necessarily develop into the international auxiliary language of the future. Bahá'u'lláh has specified in His Writings that such a language will have either to be chosen from one of the existing languages, or an entirely new one should be created to serve as a medium of exchange between the nations and peoples of the world. Pending this final choice, the Bahá'ís are advised to study Esperanto only in consideration of the fact that the learning of this language can considerably facilitate intercommunication between individuals, groups and Assemblies throughout the Bahá'í world in the present stage of the evolution of the Faith. (4 June 1937 to a National Spiritual Assembly) [8]

One thing, however, the Guardian feels the believers should be very careful to avoid in all such contacts with the Esperantists: namely that of giving them the impression that they consider Esperanto as necessarily constituting that international auxiliary language of the

future
referred to by Bahá'u'lláh and stressed by Him as an indispensable element in the upbuilding
of
the coming New World Order.

To give them such a false conception of the true Bahá'í attitude regarding the choice of
the future world international language would not only be an act of dishonesty and disloyalty
towards the Cause, but would lead to serious misunderstandings and misapprehensions, and
eventually result in counteracting the effect of any temporary gains or advantages which may
accrue to the Faith through such association and contacts with the Esperantists.

It is not so much that language as the central idea it embodies and inculcates which the
Bahá'ís endorse, and only through keeping firm to such an attitude can they hope to establish
any fruitful and enduring contacts with various Esperanto groups and associations
throughout
the world.

(24 April 1939 to an individual believer)

[9]

He feels that this is a very important opportunity which you have now obtained of
teaching the Faith to the Eskimo people, and he hopes your efforts will be crowned with
success.

He would not advise you to teach them Esperanto, as we have no way of knowing
whether it will ultimately be chosen as the auxiliary language of the world. He thinks the
most
direct and quickest way of communicating with them in a common tongue should be chosen;
in
other words either you should learn their language or they yours, whichever will yield the
quickest results.

(12 December 1942 to an individual believer)

[10]

We have no authentic record of ‘Abdu’l-Bahá’s in which He states that Esperanto will be the universal language of the future. It may be Esperanto, it may be some other language, we do not know; but as we believe so firmly in the necessity of an international language, we are always eager to co-operate with the Esperantists.

The thing of primary importance at present, especially in America, is the teaching of the Cause. With good will and determination an auxiliary language—especially one of the nature of Esperanto—can easily, and relatively quickly, be learned; whereas the Cause requires that people change not only certain ideas but their very characters and habits, and this is much harder to do and often takes a long time!
(25 January 1943 to an individual believer) [11]

Regarding the whole question of an international language and its relation to the Faith: We, as Bahá’ís, are very anxious to see a universal auxiliary tongue adopted as soon as possible; we are not the protagonists of any one language to fill this post. If the Governments of the world should agree on an existing language, or a constructed, new tongue, to be used internationally, we would heartily support it because we desire to see this step in the unification of the human race take place as soon as possible.

Esperanto has been in wide use, more so than any similar language, all over the world, and the Bahá’ís have been encouraged by both the Master and the Guardian to learn it and to translate Bahá’í literature into it. We cannot be sure it will be the chosen international language of the future; but as it is the one which has spread most, both East and West, we should certainly continue to co-operate with its members, learn to speak it and translate Bahá’í literature into it.

He feels you can rest assured that ‘Abdu’l-Bahá’s statement, made in Paris, was prompted by His insight and wisdom and not due to the opinions of anyone else. Naturally the money of the Cause should not be spent on translating and publishing literature in international languages that have no following worth mentioning!
(17 October 1944 to an individual believer) [12]

He feels that the subject of the Bahá’í work in Esperanto in Germany is a matter for you to take up with the National Spiritual Assembly; we Bahá’ís do not claim Esperanto will be

the
 auxiliary language of the future—but, as we firmly believe in the necessity of an auxiliary
 language, we are glad to support this work by publishing books in Esperanto and
 encouraging
 the Bahá'ís to learn it, if they wish to. Co-operation with this society is an excellent means of
 spreading the Cause, as Martha Root demonstrated in her travels. However, all details in this
 matter must be decided by the National Spiritual Assembly. You can contact Bahá'í
 Esperantists in England and the U.S.A. through their respective National Spiritual
 Assemblies.

(29 July 1946 to an individual believer)

[13]

Regarding your question about the Esperantists: for many years they have been one of
 our closest contacts in Europe, and many of them have become believers. They are working
 for
 one of our greatest principles, and we certainly should associate with them. In Germany the

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE Page 5

Bahá'ís published an Esperanto magazine, and Martha Root represented the Cause at
 Esperanto
 congresses. We cannot say we are sure this language will be the international one, but we are
 anxious to see it spread as it fosters unity and understanding. By all means foster your
 contact
 with them. Whether Esperanto will be chosen as the international language or not we cannot
 say, but we can say we hope it will spread because it nearly fulfils such a noble purpose.

(5 April 1947 to an individual believer)

[14]

He was also very pleased to see the contact with the Esperantists is being maintained.
 This friendly co-operation with them, and attendance at their Congresses, is very good, and
 will
 no doubt bring the Bahá'í Cause to many of their members' attention. Also, he hopes, it will
 lead to many of them becoming Bahá'ís in the future.

(24 March 1949 to an individual believer)

[15]

From letters written by or on behalf of the Universal House of Justice

Your letter of 9 'Aimat, 128 expressing your feeling that the endorsement by the Universal House of Justice of an international auxiliary language for Bahá'í conventions would not prejudice any future World Government in its choice of world-wide tongue for official use, and that Esperanto is widely used by clerical, businessmen's and scientific conventions, has been received.

Regarding your first comment, inasmuch as Bahá'u'lláh has said that the Supreme House of Justice will appoint a committee that will study the whole matter and then either choose one of the existing languages or create a new one to function as an international language, when such a choice shall have been made the action will automatically constitute an endorsement of the chosen auxiliary language.

With reference to Esperanto, we share with you an excerpt from a letter written on behalf of the beloved Guardian by his secretary to an individual in 1937:

The interest which the Bahá'ís have and should have in this language is essentially because of the vital significance of the idea it represents rather than the belief in its inherent worth as a suitable and adequate international medium of expression.

The Bahá'ís indeed welcome Esperanto as the first experiment of its kind in modern times. They are in full sympathy with the Esperantists in so far as they stress the absolute necessity for the creation of an international language to be studied by all the peoples of the world in addition to their respective national languages.

As to the most propitious time for the choosing of an international auxiliary language, we feel that it is not feasible for the House of Justice to make the choice at this time.
(8 June 1971 to an individual believer) [16]

We have consulted about your joint proposal for the formation of a League of Bahá'í Esperantists, a "Bahá'í Esperantista Ligo" (BEL), and have sought the advice of the Hand of the Cause Adelbert Mühlischlegel because of his long interest in Esperanto as an approach to

overcoming the language obstacles which confront the world. He is enthusiastic. And we

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE Page 6

concur that such a League would be helpful to the Faith as well as providing a useful channel for teaching Esperantists the world over.

1. You are free to name the League as you have suggested. The significance of the initials is a happy sign.
2. Responsibility for the League will be exercised by the National Spiritual Assembly of the country in which the secretariat is established. You have suggested that, at the outset, the secretariat of the new League might be in Brazil, under Professor Paul Amorim Cardoso as Secretary. In that case the National Spiritual Assembly of Brazil will assume jurisdiction of the League in whatever ways may be required during Professor Cardoso's tenure.
3. Whenever there are Esperantist events, congresses and the like, in various lands, the National Assemblies of those countries should be informed of the prospective Bahá'í participation, their permission requested and their instructions followed with respect to any Bahá'í activities at the congresses. For example, for the forthcoming *Universala Esperanto-Kongreso* in Belgrade, you should seek the advice and follow the guidance of the National Spiritual Assembly of the Bahá'ís of Austria, which has jurisdiction over Bahá'í activities in Yugoslavia, as well as in Hungary and Czechoslovakia.
4. You may, of course, publish whatever literature in Esperanto the League will be able to afford, remembering that each publication must be reviewed and approved by the National Spiritual Assembly in whose area it is to be published. Such an Assembly may well, of course, use members of the League to review the translations. We ourselves shall bear in mind the need for increased literature in Esperanto, but the needs for literature in so many languages is pressing and we cannot hold out hope of providing any considerable amount of financial assistance at this time.
5. A request for special messages by National Assemblies or by the Universal House of Justice may be made by the League as a part of its function of dissemination of the name and principles of the Faith.

Your zeal on behalf of Esperanto as a functional international language will, we feel, be well rewarded by the entry into the Faith of many of your Esperantist associates who will thus take the step from universality in language to the greater universalities of one religion and one mankind. We assure you of our prayers for your labors on behalf of our matchless Cause. (19 March 1973 to a group of Bahá'í Esperantists) [17]

As English and Persian are the two official languages of the Universal House of Justice we regret that we cannot write to you in Esperanto but we will be glad to enclose an Esperanto translation of our letter for you in view of the fact that you do not understand English well. We hope that it will be possible for Mr. Habibullah Taherzadeh to make such translations if his time allows.

With regard to the enquiry in your letter of 11 Jalál, our understanding of the aim of the Bahaa Esperanto-Ligo when we agreed to its formation was that it was to be an official nonneutral department of the Universal Esperanto Association comprising those Esperantists who are also Bahá'ís with the aim of encouraging collaboration among such friends and promoting the Bahá'í teachings among their fellow Esperantists.

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE Page 7

While individual Bahá'í Esperantists are, of course, free to encourage their fellow Bahá'ís to study Esperanto this should not be an activity of the Bahaa Esperanto-Ligo and it should be borne in mind that whereas it is clear that the Bahá'í Faith upholds the principle of an international auxiliary language no decision as to which language this shall be has yet been made.

(10 May 1974 to the Secretary of the Bahaa Esperanto-Ligo) [18]

Further to our letter to you of 2 December 1974, and with reference to your question on the world language, the Universal House of Justice has asked us to draw your attention to the

statement of Bahá'u'lláh in the Eighth Leaf of the Exalted Paradise (see Bahá'í World Faith, p. 182): “We have formerly declared that speech was decreed to be in two languages, and that there should be an effort to reduce it into one.”

When the beloved Guardian was asked by an individual believer about the meaning of this passage, his secretary gave the following reply on his behalf:

What Bahá'u'lláh is referring to in the Eighth Leaf of the Exalted Paradise is a far distant time, when the world is really one country, and one language would be a sensible possibility. It does not contradict His instructions as to the need immediately for an auxiliary language.

(29 December 1974 to a National Spiritual Assembly)

[19]

The House of Justice instructs us to say in reply to Mr. ...'s letter to the Local Spiritual Assembly of ... that he should be advised that the time has not yet come for the Universal House of Justice to take any such step as he suggests. There is no doubt of the vital importance

of the establishment of a universal language and it will inevitably come about but the believers

have more urgent matters to attend to at the present and are asked to concentrate on teaching the

Cause and winning the goals of the Five Year Plan.

(2 March 1976 to a National Spiritual Assembly)

[20]

The House of Justice realizes that you must sometimes be faced with somewhat embarrassing situations in relation to your fellow-Esperantists since, as Bahá'ís, you are fully

aware that, for all its undoubted qualities, Esperanto may well not be the international language

that is ultimately chosen, and that it is the concept of an international language that the Bahá'ís

are enthusiastic in supporting rather than any particular solution to the problem.

The Guardian's advice that Bahá'ís must be entirely open about this matter in relation to Esperantists so as to avoid serious misunderstandings and misapprehensions in the future will

no doubt be of great assistance to you in your work and enable you to forge ahead with full

enthusiasm without, in any way, appearing to sail under false colors.

(6 October 1976 to the Bahaa Esperanto-Ligo)

[21]

You are quite correct in stating that there are two different provisions in the Sacred Texts for the selection of an International Auxiliary Language. On the one hand, this task is given to the governments of the world, on the other it is given to the House of Justice. It is not possible

THE PRINCIPLE OF AN INTERNATIONAL AUXILIARY LANGUAGE Page 8

now to foresee exactly how this will come about, but it would seem reasonable to suppose that, long before the Bahá'í community is large enough or can exercise the authority to produce such a world-embracing change, events will compel the governments, either progressively or all in concert, to select an International Auxiliary Language to be taught as a second language in all schools and to be used in all international commerce. At a much later stage, possibly at the time of the Bahá'í World Commonwealth, the Universal House of Justice may well decide to review the situation and either confirm the decision that the governments had made, or change the choice to a more suitable language.

Of course, conditions may produce a development very different from the one just outlined. One of the characteristics of Bahá'í Administration is its flexibility which enables it to deal with unforeseen developments and continually changing conditions. The one certain thing about the choice of an International Auxiliary Language is that the Universal House of Justice does not judge the present time propitious for it to take any action in this regard.
(8 June 1980 to an individual believer)

[22]

It is not yet timely for the House of Justice to make a pronouncement in favour of any particular language—the important thing now, in this particular field, is for Bahá'ís to promote the principle. Learning Esperanto, or one of the other proposed auxiliary languages, brings one into touch with people all over the world who are conscious of the need, who are internationally minded, and who may well be attracted to the Faith. Therefore, if you have a particular interest in this subject and an inclination to study Esperanto, you should feel no inhibitions about doing so.
(2 June 1982 to an individual believer) [23]

INTERNATIONAL AUXILIARY LANGUAGE

‘Abdu’l-Bahá’s talks on this subject are found as follows:

Paris Talks	pp. 155–157

ESSENTIAL WORLD ENGLISH [ewE]

Being a preliminary mnemotechnic programme]
for proficiency in English self-expression]
for international use,]
based on semantic principles

© by

Lancelot Hogben FRS, Honorary Senior Fellow in Linguistics,
Birmingham University
with the assistance of Jane Hogben and Maureen Cartwright
London. Michael Joseph. 1963

Précis by Doug Everingham 1997.

SR1 [Lindgren's Spelling Reform step One] used:

Thus any clear short vowel used as that in hemorrhage and led may here be read as e instead of any spellings wider spread, as approved by a Sydney Morning Herald Education Supplement, a Teachers' Federation and other journals and Australia's two Nobel laureate Fellows of the Royal Society: Sir Mark Oliphant, Sir Macfarlane Burnet.

The aim:

decimate social costs (illiteracy &c.) of old spellings by reviving their prime purpose: recording sound categories as pronouncing dictionaries do despite local brogue etc. versions of the tongue. English spelling lags centuries behind language merger and change, and anglophone resistance to scriptage debate is increasing anglophone illiteracy, already four times that of Finnish and other updated scriptages.

[J Simpl'd Spel'g Soc 1995 #1, 7-18,37-44]

The Argument

English is the language most in use for 'communication' in what we hope will be the One World of tomorrow.' The written word is still the main medium used for international communication for those who most seek such a medium. At least 30 000 dictionary items are needed for wide reading or sophisticated conversation. The 1500 words most frequently used

- (a) include no more than 300 of the less than 1500 needed for self expression and
- (b) are in nearly all cases the words most liable to semantic erosion (widening of meanings with frequent use; cf. Zipf).

C K Ogden's Basic English was among early acknowledgments of this. Basic enables clear expression within the limit of 850 words plus some technical terms, in a style consistent with the 'Authorized Version (of the English Bible) or of Winston Churchill at his best'. The main defects of the word list are

- (a) Many of the words have each several different meanings (with several 'different words in any other language').
- (b) Basic requires many idioms using particles with no intrinsic semantic sanction. It is probably as hard to learn several meanings of a word as 'to learn the same number of different words, each with a clear-cut' meaning, e.g. 'put up with' for 'tolerate' or 'forbear'.
- (c) This requirement could prompt 'not easily broken habits of unacceptable usage' for learners 'with no native knowledge of English'. [Perhaps like 'he scratched them till they died' an official interpreter's version of 'they were tickled to death'.]

ewE provides LESU (a list of 1300 essential semantic units, esu's) to replace Ogden's 850 words.

An esu is

- (a) a word and where necessary
- (b) a particle or
- (c) other usage to accompany the word.

Compare

- (a) laugh atŠ: contrastŠwith Š: the sameŠasŠ and
- (b) to do not always interchangeable with doing or for doing as object of a transitive verb, e.g. cease/ finish doing = cease (NOT finish) to do.

Fewer than half a dozen esus (with, to, that, have, be) each has more than one (unequivocal) reference, subject to readily recognizable metaphorical extension e.g. Holy Father, Mother Superior But several esus have in standard English (sE) more than one meaning, so our LESU restricts them to one meaning each. This prevents the usual vicious circle of dictionary definitions, repeating forever. We can use (for the ultimate meaning constituents) pictorial or other non-verbal or internationally current usage e.g. =, 5, Homo sapiens, diphtheria.

The rest have paronymic specification (a nexus of non-esu words which share a common semantic territory, e.g. state and condition, each with more than one other unrelated meaning). A bilingual dictionary listing the paronyms can then guide the beginner to the appropriate distinct meaning. Paronyms are added even to terms definable by terms listed earlier in LESU. This broadens the range of recognizable terms for readers and listeners, and reiterates previous esu items for rote learning.

Henceforth esu items are in UPPER CASE and paronymic or recognition aids in italics. Ogden's The General Basic English Dictionary with [primarily 'standard', mainly southern British] pronunciations shown in International Phonetic script, and Linguaphone type records, serve to indicate pronunciation.

[Other regional pronunciations differ from sE mainly in consistent ways, with sound shifts among regions but fewer phoneme categories differing from each other. A phoneme is a category or range of speech sound units that distinguishes spoken words from each other within a speech community. Thus pronouncing dictionary versions of a word are sounded differently from region to region but the words distinct in the dictionary's

phonetic respellings remain generally just as distinct from each other in speech within each regional usage -- DE].

We list homonyms in a separate glossary. Some have the same spelling but come from different word roots e.g. base = bad or bottom.

Ch. 1 The Need for a Global Auxiliary

In the mid seventeenth century the British Royal Society and French Academy each followed the lead of Italy's Lincei by adopting the national vernacular for learned communication. The Latin lingua franca was lost. In 1664 the Royal Society commissioned an inaugural member, Bishop Wilkins, to seek a remedy. Leibniz devoted his leisure in later years to this end. Their published efforts were harder to learn than Latin and less flexible to later development. Linnaeus, Lavoisier and scientists generally for 200 years produced only piecemeal moves toward a world language of science. The vast growth of mails and movements in the 19th century increased the need for a global code. Leibniz proposed comparative language study as a useful next step. Several schemes emerged. Pirro devised Universal-Sprache before German Catholic priest Schleier produced Volapük that was actually spoken and promoted by scientists and societies. Zamenhof's 1887 Esperanto soon eclipsed it, and several schools taught it briefly after World War 1. More than 300 alternative schemes have been published since but none with such broad and persistent following as Esperanto. All are put forward as a second, bridging, helping/ auxiliary, not a dominant or sole language or replacement for mother tongues. Only after World War 1 did the US emerge as predominant in science and technology developments. Proposed auxiliaries then took words from predominant technical speech communities, mostly Romance and Teutonic. They discarded irregularities and grammatical quirks (as e.g. English, alone among Indo-European and Semitic languages, has discarded grammatical gender).

Phonetics pioneer Alexander Melville Bell in 1888 published World English, the universal language. He lectured in Edinburgh and London before migrating to the US where he devoted his talents to instruction of deafmutes. He died in 1905.

English excels Esperanto for the East in

(1) grammatical simplicity. [Like Chinese, English relies on word order rather than affixes to convey inter-word relationships]. (Peano's flexionless Latin [and many later schemes] are even less inflected, but Esperanto relies heavily on inflections).

(2) access to books, and probably to

(3) global forms of technical terms. English distorts less than most

languages [including Esperanto] the growing global technical terminology.

The post-World-War-2 Bandung conference of 29 Asian and African nations speaking over 100 tongues, none of them anglophonic, chose English as their prime official language even for the Red Chinese, although the conference opposed colonialism, east and west, cultural and military. The only plausible alternative is a number of zonal auxiliaries of which English would be one.

As English becomes a more widespread global medium it may risk even faster semantic erosion at a time when

classic language studies and etymology are declining. Historically oriented literati and critics, however, cannot formulate the desiderata of a global auxiliary without reorientation of habitual attitudes to language uses.

In 1932, after ten years' work with help, C K Ogden compiled Basic English. His 850-word list on a sheet of note paper avoids the need for scores of verbs. This word economy eased the memorizing (mnemotechnic) load, and ewE carries this relief further. Ogden edited the internationalist Cambridge Magazine during World War 1 and later was a leader in the new powerful semantic movement in philosophy. Basic's main drawbacks are

- (a) orthographic burdens [whimsical spellings],
- (b) complex verb/ particle syntax idioms and
- (c) a huge vocabulary of multivalent and homophonic terms. Also,
- (d) Basic became tagged as an Anglo-American cultural weapon in the Cold War when Churchill [and Roosevelt] embraced it as such. [With its translingual semantics ewE should be less prone to this drawback].

ewE, like Basic, is no pidgin [or creole --DE]. It is a program for learning standard English (sE) with a better semantic basis than Basic. It marries Ogden's philosophical semantics with his vocabulary economy. It should be a better introduction to the English than Basic is, and may lead to an auxiliary better than the more than 300 predecessors. Semantics in ewE prompts native speakers to think first and talk later. This cannot exclude emotive content, but on the other hand parochial poetry or the sentiments of vernacular idioms must not veto clear expression or the breakdown of cultural prejudices.

I discount the childhood 'osmosis' approach to learning a global auxiliary. The current trend to teach foreign languages first by the spoken word overlooks the prime need of a global auxiliary to convey the written word.

Ch. 2 Principles and Definitions

We define TERM as a dictionary headword and probably its flexional or paradigmatic derivatives. A term may be multivalent (with several homonymous meanings) or eunymic (with one characteristic meaning e.g. numerals, with comparatively clear distinguishability of metaphorical senses). Translation sometimes helps distinguish multiple senses of a word, e.g. always = at each time or ceaselessly. The meaning of one eunym may embrace several others, e.g. cook (poach, broil etc.), container (urn, vase etc.)

Where there is no single term for a concept one may use two overlapping terms to identify the sense intended. Such couples we call paronyms* e.g. government = STATE = CONDITION = prerequisite. Verbal or social context gives paronym senses by etiquette, syntax, taxonomy or arbitrary limits thus:

Etiquette. 'Pardon' is more formal than 'forgive'. This follows the general rule that Romance-derived words tend to be more formal than Anglo-Saxon near-synonyms. The Romance elements also usually have a wider international currency. This tends to make them more suitable for a (most usually formal) auxiliary.

Syntax. During, while, meanwhile are different syntactic, but not semantic, elements. Sometimes very, too require a following much, sometimes not.

Taxonomy. tall/ high and thick/ fat are interchangeable with some referents but not with man.

Arbitrary limits are those where the formula for distinguishing appropriateness is difficult.

Synonyms with subtle dictionary distinctions help poetry, variety to avoid monotony, and word games among literati and pedants but put no restraint on the seemingly accelerating semantic erosion in English.

Definitions for an esu can be non-circular if we use

- (a) pictures of things, time/ space relations, actions, processes and attributes,
- (b) international signs like 5, O₂, Fe,
- (c) science terms (Homo sapiens, theobroma, cacao, sucrose, vertebrae etc.), international roots that are both widely current and semantically consistent,
- (d) combinations of these,
- (e) for about 300 highly eunymic terms by listing its paronyms and using a bilingual dictionary*
- (f) idioms (or more specifically word clusters that do not reflect the usual meanings of each word < holophrases). These are needed perhaps most in French and least in English among major European languages. Some use particles that are often elsewhere eunymic (to, at, from, in, for etc.) where an 'empty particle of unspecified relationship' (of) would suffice (for e.g. turning an intransitive verb into a transitive couplet like laugh at, or for copulative empty words as in be in good health, different from...). Similarly arbitrary rules make to [vb] and for [ing] interchangeable (in a purposive context) and [ing] can replace to as a 'verb noun object of a transitive verb', thus cease working/ to work but finish work(ing), be in (not with &c.) good health, use it for cleaning/ to clean (with usually added). So Basic's word list needs to become a holophrase list (LESU).

But definitions are not always needed. An adequate replacement formula (rf) suffices with parenthetical phrases omitted in miss = (1) feel (unhappy because of) the loss of, (2) (aim at but) fail to hit.

Basic's word economy includes oligolexics (few terms to learn) and oligology (minimizing the need for circumlocutions that waste time and space, e.g. even = contrasted with what one knows or would deem likely from what was said before this. Ogden therefore sought

- (a) highly multivalent (with multiple meanings) terms, e.g. fair = equitable; pale; pretty < this involves use of scores of abstract nouns, a construction that tempts users to think in terms of Plato's universals, a perennial philosophic superstition (that an abstraction is a 'real' thing etc.)
- (b) utmost use of holophrases, e.g. go on = fit; act; continue, mount; prosper; and put off = remove;

delay &c. This involves ambiguities due to multivalence of get, put, on = ewE on or sE onward, off = away; from..

Basic's limiting verbs to 18 illustrates overlaps among them, as ask = put a question (to), make a request (of), give an invitation (to). 'The mnemonic load of learning n totally different meanings of one item of a word list is no less than that of learning n terms each with a clearly defined reference'. (Hogben 'dogma'. Neither grammar texts nor dictionaries define enough the role of holophrase and arbitrary restrictions of context in socially acceptable communication. See jargon (p. 49 footnote and later).

*This trick occurs in Chinese pidgin English, e.g. look-SEE makes clear that sea is not indicated.

Dictionary get away with circular definitions because few educated people so far realize the irrelevance of the simple dichotomies of Aristotle's (or Boole's) binary logic to biological taxonomy, and the overriding importance for that taxonomy of the definitive principle of the identity parade. E.g. a farmer could recognize a starling in a line-up of museum exhibits of birds of his country, but not one in 1000 could frame a verbal definition to distinguish it.

Ch. 3 Mnemotechnics of Language Learning

Writing, reading, speaking and interpreting speech are skills that may be separately lost in local brain damage but are not always all addressed by language teachers. The 'transmitter' (writer or speaker) needs a limited (recall) vocabulary and grammar knowledge. The 'receiver'/ decoder (reader or listener) needs a wider (but only nodding) acquaintance with more (recognition) vocables and grammar rules. The LESU covers the former. Orthography is more necessary for reading, phonetics for listening. For years to come a global auxiliary will be useful primarily to people who will rarely meet in domestic surrounds, will communicate mainly in writing and print, especially about international concerns. Poetry may emerge later. Casual contact by tourists and traders may roam erratically around a few dozen set phrases, not necessarily contributing to more serious conflicts or cooperation. Reading has advantages over radio communication. One can

- (a) skim over less crucial written parts,
- (b) retrace and compare earlier and later parts,
- (c) check a dictionary at any stage,
- (d) learn more systematically,

reversing the order of natural (native tongue) learning. Decoding speech is harder than encoding it and so appropriately it should be the last of the four skills to be learned.

We prefer semantic comprehensiveness before vernacular (including some school) usage, to encourage a sense of early completed achievement with comparatively little effort. This 'recall first' approach need not delay 'recognition' skills.

Writers can rearrange and revise, take time for recall Traditional teaching tends to emphasize first skill in

reading plus parrot learning. This may suit technicians seeking mainly access to technical data in languages related to their own. Pen-friendship movements combine writing training with incentive to expand recognition skills.

Most-used words are also most multivalent/ semantically eroded. LESU omits specific fruits (apple, orange of Basic) but keeps imported world trade items (wheat, rice, tobacco, tea, coffee, cocoa). We need no technical nautical terms but do need technical legal terms (verdict, customs, arbitration) in a world striving for unity, a peaceful order under law as in speech. We can use terms already international for species, anatomy, diseases, substances, and the local names for countries and cities.

We can omit eponyms, mythological terms, terms for animal cries or movements in different species (bray, caw, hiss; flit, toddle, gallop etc.) and terms intelligible only in the context of 'western' philosophies, and terms expressing gradations of personal value judgments. We similarly prefer general terms like vehicle, tool, device, machine, container, fastener.

Short words are simple in structure but are likely to be those most semantically eroded or overloaded with emotive associations. LESU seeks single items for commonly used and useful terms, by choice highly eunymic in everyday speech or defined as such by semantic prescription. We seek too all terms other than common nouns recognizable in meaning by most educated adult English-speakers, or a replacement formula made up of other most highly multivalent LESU items (3000 adjectives or particles, 4000 verbs, 1500 abstract nouns).

So we collate highly eunymic terms other than common nouns, then explore semantic restrictions on more multivalent terms, then see how far these include or provide adequate substitutes or not too prolix replacement formulae for all terms in a recognition vocabulary of anglophone adults (and Basic's list with its holophrastic extensions). We avoid more than a minimum of terms for personal value-judgments, e.g. too, very, high, not un-, not very, un-, not, very un- , not sufficiently with pleasing (to the eye), daring, worthy (of esteem), etc. for e.g. valiant, reckless, rash, brave, bold, intrepid, valorous, timid, cowardly, craven etc. We separate definitive and derivative terms, thereby imposing opportunities for automatic revision by 'transmitters'. We help learners and especially receivers using ewE glossaries to build recognition vocabulary beside recall vocab. 'Cement' words can be learnt in 4 weeks at 50 per week but to do so using (250) common nouns for context we allow 9 weeks. Then we give priority to adjectives, but with them need many verbs for replacement formulae (e.g. lazy = unwilling to work, eager to avoid work). We use Graeco-Latin derived technical terms, not to press for general knowledge of these but because they may provide mnemonic aids in relating a group of terms, familiar or not, but with some interest with the common origin, rather than learning a lifeless label.

We aim in LESU to provide adequate self-expression, not possible with the 2000 most essential words based on frequency in the Interim Report on Vocabulary Selection for the Teaching of English as a foreign language sponsored by the Carnegie Corp., NY. Multivalency gives these word (4000 semantic units by their count, 6000 by our not excessive estimate, with no comprehensive tool for self-expression.

Ch. 4 Criteria of Word Choice

In compiling LESU, unlike Hogben's list, we use terms

(a) eunymic by custom or restriction, not overloaded unless a definitive alternative would be unwieldy circumlocution, not multivalent/ semantically eroded

(b) paronymic,

(c) definitive in terms previously chosen; or replacing a prolix holophrase.

(d) specifying arbitrary restrictions imposed by context, and used only if no term is available with a wider contextual range of admissibility. We list speaker with talk because talker has a derogatory nuance.

(e) demanding (an) arbitrary accompanying particle(s). These must occupy a niche accommodating the partner terms, or

(f) more taxonomic rather than those less so, especially if reducing need for quasi-technical terms.

(g) more formative preferred *ceteris paribus* (derivatives formed by affixes of a dominant grammatical pattern, e.g. start(ed) preferred to begin etc. even tho less eunymic.

(h) common and 'highly' eunymic (less multivalent/ semantically eroded) e.g. again tho replaceable by once more or a second time.

(i) common nouns if interesting for persons that seek world-wide cultural collaboration. More international terms e.g. commence may be less semantically eroded than e.g. start, begin but less formative (compare starter &c.). Abstract nouns are attractive here if identical with verb forms. Thus Ogden's keep gives way to (cause to) remain, retain = continue to have, not give back; take, get give way to procure, receive, become &c.

(j) affixes: un-/in- &c, -ly, a,i-ble (like Latin gerundive passive = able, fit to be Šed), -er active or subject thing/ person, -less with noun or -ing form of verb which is also an abstract noun = without

(k) particles: (preposition, conjunction, simple adverb). since (not in the sense of because), while (not in the sense of though), if AND whether; just, quite are superfluous AND multivalent. We find too multivalent eny, some, only, ever.

(l) auxiliaries: shall/ should dispensable, will preferred to be going to e.g. in complex tense/ aspect phrases like they'll've been working six hours; would for conditional clauses, can/ could displaces may/ might = is able/ free/ allowed/ knows how to; permit displaces let; is/ has/ ought / needs to, (certainly) is/ will displaces must; at one time/ usually displaces used to.

(m) verbs with adjectival predicates: be(come), keep, feel, remain, seem, deem (it) Š

(n) adjectives: meny dispensable from Ogden's list by

€allowing verb status to 300 of his abstract nouns (3d sing -s, Aorist -ed).

€verbs like contain, fasten with Basic -er added give coverage of vessel, reservoir, box, chest, can &c., button, clip, latch, bolt, lock &c., lov|er,ing,less,ed,able, un-.

€about 75 LESU verbs + -less and another 25 LESU verbs are adjective forms, another 50 with -able ±un-/in-, in all 300 adjectives, more than half of these tallying with substantives.

There remain about 200 adjective entries. right <> left preclude other senses of these two words (true, fitting, ethical, privilege, remaining &c.)

Ch. 5 The Mnemotechnics of Spelling

Substantial reform would temporarily increase costs of publications so should await (as it can't promote) acceptance of English as a global auxiliary. Homophones from diverse source languages discourage unitary phoneticizing of English but there is a case for reversing counter-etymological changes e.g. Middle English/Anglo-Saxon s for current French c in once, ice, mice, hence, pence, cinder, since or false analogy with Teutonic light, naughty in delight, haughty, sprightly from Old French. "Errors of poets, schools and master printers have saddled English orthography with anomalies which prevent us from fully exploiting so great an advantage" (the ability of Romanced or Teutonic speakers to recognize English words by spelling with a knowledge of sound shifts in derivation of English words from Romance or Teutonic sources).

In ewE, IPA symbol q is shown by th, for the sound as in thin,
 IPA symbol like ʔ (or rather • with ~ overwritten) is shown by dh for the sound as in then,
 IPA c is shown by kh for the sound as in Scots loch,
 IPA symbol like n with lower half of j overwritten is shown by nh for the sound as in linking, linger,
 IPA ũ or s is shown by sh for the sound as in ash, tŭ by tsh for the sound as in each,
 IPA ʒ is shown by zh for the sound as in fusion, dʒ by dzh for the sound as in judge.

Etymology indicators:

An English word is usually Teutonic in origin if it contains ng for the nh sound, th for the dh sound, kn (Old English cn) or sh at the start of a word, w(h) for the w sound (and wh still fully aspirated by Scots), th for the th sound except in scholarly words where th represents Greek theta, and faith derived from the Old French feid; gh silent or sounded as f records a ded aspirated guttural in Old and Scots English.

Norman French is indicated by j with the zh sound, c sounded s before e or i, French by ch with sh sound, French or Latin by ti or ssi with sh sound. Greek origin words have ph sounded f, ch sounded k, and words starting ps, pt, rh or mn.

We gain from having a single form for differently sounded affixes -ed, -s sometimes sounded t, z. There is no prospect of forcing the same vowel values on immensely varied dialects, so 'Sprinting consistently phonetic English spelling is a hoax, as anyone who has tried to teach shorthand to a Yorkshire pitboy will have found out.'

We accept some Americanisms, e.g. classic [Latin form] odor, color before Norman-British -our but not -ic for -ical in historic(al).

Ch. 6 Pathology of Grammar

> Inessentials include genitive form of nouns [?and pronouns?], old second person pronouns (thou thee thy thine singular, ye plural), indirect objects (gave him this), and conditional inversion (were I to do so). -ing is an abstract noun (gerund), periphrastic aspect-tense tag and adjective (gerundive).

do takes over inflectional functions for interrogative, negative and continuous[/ repetitive] or emphatic affirmative. Subject-verb inversion is no longer needed when there is an initial qualifier.

-ly is adverbial, formerly adjectival only (kingly, monthly, earthly &c. Existential be (there is/ are/ was &c.) is holophrastic.

Ch. 7 Essential English Grammar

Disappearance of grammatical gender is 'one of the indisputable merits of English'.

The genitive case is now optional.

Personal pronouns have two(it, you, she) or three (I, we, they) case forms, interrogative and relative pronouns two (who(se), that/ whose) demonstratives one (this, that and plurals).

Other adjectives are invariant in number, gender and case. Most monosyllabic adjectives (and disyllabic ones in -y, changing to -i) add -er, -est for comparative and superlative forms.

Adjectives except with -ly (daily &c.) add -ly for adverb, plus -ier, -iest affixing as for adjectives and monosyllabic adjectives.

Plurals are regular (-es after ch, sh, x, s, ss, -y changes to -ie, f to v) except for 7 native words (wo)man, child, ox, sheep, tooth, foot) and recent imports (axis, synopsis &c.)[but see Cambridge -DE].

Word order. (Pro)noun subject, verb, direct (primary) object, particle connecting secondary object.

Single term precedes one it qualifies. Phrase qualifier follows it. SE exceptions:

(a) eliminate particle, put secondary before primary object (gave him the book),

> (b) conditional inversion omitting if were I to do this)

(c) emphasis inversion (never shall I forget) < the 3 above not needed in ewE

(d) direct or secondary object may precede subject in relative clause (the man I had it from) but retain whose for e.g. the man whose house I purchased.

Negations put particle not right after helper verb and

Questions put subject right after a helper verb (and not in a negative question) with subject (next) before main verb.

Interrogative pronoun, pronoun couplet or adverb (whose hat, which book did he use?) comes first in a question followed by be, have, can, will, do &c. then the subject (where can he be?) if the interrogative is the object of the verb or of a preposition, but if it is the subject or complement of be/ become it comes

first without a do(es)/, did construction (who made it? &c.)

Beginners for safety should give subordinate clauses and phrases precedence in the sequence, e.g. avoid the buildings, few of which remain, were once admired greatly.

In interrogation pronouns I he she we they that follow the verb, otherwise precede it; me him her us them follow it. In interrogation who?, what? precede the verb.

EwE replaces Chaucer's relative pronouns who, whose, which by earlier Teutonic that. It may be omitted in initial teaching on introducing a noun clause.

Impersonal pronoun one(s), one's is preferred to you and common gender pronoun they, them, their(s) paralleled in Scandinavian den = (s)he, him, her, dens = his/ her(s).

Articles are degenerate forms of the numeral one (Scots ane) and demonstrative that, not so separately developed in several languages.

Verbs (excluding derivatives with -er, -able, -ment, -ation &c.) have not more than 5 forms except be (8 forms). Some have only 3 (cut, hit, put, shut, split &c.) Each of the 5 forms except -s has more than one use. We classify the 5 forms as L(exicon) form e.g. give

-s Š gives

-ing Š giving

4th Š gave } most verbs (weak or regular)

5th Š given } combine these 2 forms with -ed. -s form is used with (s)he, it, one, that or a noun) and indicates continuing or habitual action, process, state or sentiment &c.

4th form when distinct from L and 5th forms indicates a happening in the historic past or in a clause starting if to imply doubt or conjecture (exceptions: were, was).

5th form serves as

(a) perfective with has/ had.

(b) passive after be &c.

(c) passive adjective, often in effect a contraction of a relative clause

(d) occasionally active (fallen tree, dear departed &c.) with intransitive verb.

-ing form as

€an abstract noun may displace to + L form, employable with an object like Latin gerund.

€abstract noun or gerund following ('in apposition to') the object of a verb of perception (he saw me reading the book) like Latin accusative and infinitive construction, commonly interchangeable with sole L-form

€adjectivally, so comparable to active present participle of Latin and Greek; active meaning not always clear (hanging lump = suspended lump).

€with be, active periphrastic: he is, will/would be, can/could be, ought/has/had to be,

was/has/had been &c. going. L-form

€ s- form but when subject is I, we, you, they, this/ that/ these/ those one(s) or a plural noun.

€ imperative, softened by kindly Š for polite usage.

€ interrogative and/or negative periphrases and negative imperative (kindly do not read this).

€ after auxiliaries can/ could (not), will/ would (not), ought (not) to.

€ like second use of -ing form and with make (make it go faster).

L-form with preposited to particle in next 6 cases:

€ with be and have for future &/or compulsive [SEE Table 1, 2 below]

€ to Š = for Šing or abstract noun, as direct object of transitive verb (to please her = for her pleasure).

€ after we, him, her, it, one, us, you, them or sing. noun or plural + to, after verbs of counsel, compulsion, cognition, desire, assistance, permission and request in a construction replaceable by a substantival clause [Latin accusative + infinitive] < and if transitive may then directly precede a noun object, demonstrative, or one of the preceding object pronouns as in they helped / forced him to do it.

€ after noun + to, a non-purposive passive adjectival value like Latin gerundive: a woman to fear = to be feared. Not always clearly distinct from purposive, e.g. bre(a)d to eat = bre(a)d for food or fit to be eaten = fitting for food.

€ after to = Šing as abstract noun which may have an object, e.g. to do/ doing that is not easy. }

Not easy to € after adjective + to like Latin supine: eager to work = industrious; impossible to believe = incredible; eager to be successful = ambitious. } distinguish if } is inverted: to do that is not easy = that is not easy to do.

The last three cases are not easy for beginners, e.g. to distinguish a grammatically predicative it is bad to be without food from a factually predicative statement it is eager to feed. If we reverse order for rhetoric or scansion, one it disappears as it has no semantic reference, just a courtesy to grammatical habits: eager for food it is; to be without food is bad < or replace to + L-form by -ing form: being without food is bad. SE it is/ was may be omitted in learning self-expression when it has no factual reference except in climatology e.g. it is hot there. Note: to fear = to be feared (conveys passive content in adjectival construction) but this is dispensable by use of impersonal relative: a man to fear = a man one fears/ has to fear.

The last usage can be split as

(a) if adjective to + verb intransitive (e.g. to come) no ambiguity if adjective is prone, eager, (un)re(a)dy, (un)willing, (un)likely;

(b) if verb transitive with such qualifiers meaning is active, differs from that of a construction invoking an adverbial derivative of adjective and 5-form, e.g. eagerly re(a)d;

(c) if adjective is difficult or easy, passive substitution noted doesn't essentially change meaning: a window easy to break = a window easily broken.. With easy &c. set we rule out the option easy to be broken but with eager we have 3 choices:

eager to select, to be selected, -ly selected.

Table 1 (with set 01) HAVE and BE

 GIVE n HAVE GIVEN n BE GIVING n HAVE BEEN GIVING n

Orthography: -ie replaces cons.+y before -s affix in s form, -es replaces -s after -o, sh, ch, ss, x.

Terminal n. t, p, m, b after a short vowel is doubled, terminal e is dropped, -ie becomes y, before -ing.

Other irregularities as in LESU.

Ch. 8 Syntax of verb.

Be €inks different names for the same thing or creature €inks attribute or class specification for thing or person Only Dutch among related languages has a term comparable to there is etc. (existential

holophrase).

Have overlaps be (compare French j'ai faim, c'est à moi) and own of LESU.

He goes (indefinite), will go to London the month after this. I don't know when he will come (temporal=may, substantival=may be willing to).

4-form in protasis (if clause) when appropriate form in apodosis (main clause) is would + verb (e.g. if he came they would know). Corresponding form of be is were. When apodosis has would have + 5-form, have + 5-form replaces 4-form (if he had come they would have known).

Otherwise 'preterite, aorist, past indefinite' etc. is narrative past form Was with singular subject, otherwise were are forms of be prescribed. 4-form is neither perfect nor imperfect per se (he helped her) but meaning of verb may be inconsistent with continuity, e.g. he ceased willingly.

'Perfect' with have is redundant where completion of the event is explicit by context, e.g. have you been, were you, in London during the week? 'Pluperfect' is redundant when context dates completion: she (hads) helped him till then.

Imperfect with was/ were is redundant when context safeguards duration in a sequence such as while he was reading it = while he read it. But we don't yet accept 4-form went in while he was going to London < similarly for come, make. We can dismiss one use of sE be toŠ[vb] if we keep have/ had to + verb as compulsive auxiliary. Similarly would have + 5-form covers hypothetical was/were to have; he was to have come, but he had too much work to do = if he had not had too much work to do, he would have come.

Auxiliary be and have. [p.135-6].

(1) be have break procure } am, is, are, was, were, to be

(2) be being be having be breaking be procuring } may replace be

(3) have been have had have broken have procured } has, had, to have

(4) have been having have been breaking have been procuring } may replace have.

In the last column having may replace have in sE but ewE does not need it, e.g. having been broken, the container was useless = the container was useless because it was broken.

In all rows toŠ form (as earlier noted for first row forms) can be replaced by to + L-form, e.g. it would have been useless to have helped him = to help him would have been useless. All items can follow auxiliaries: With (1) (2) (3) (4)

€will indicates continuing future completed future event previously continuing event indefinite future completed at future date shown by context

€can indicates immediate present completed event event that went on to date possibility possibility shown by context

€would like can but indicates unfulfilled condition or intention (whence a suggestion of doubt)

€could has both uses of the ordinary 4-form. In utterance expressing

doubt or main clause of conditional utterance it conveys possibility &c.

Before (1) it can also express possibility in the past, equivalent to sEused to be able/ permitted to.

€have to, ought to have time, continuity, completion restrictions as for can, expressing respectively necessity, obligation. Subject and negative particle in question and denial are fixed by treating to as a link to following L-form.

Immediate present is ordinary use of [be] Šing (now is then redundant), sE uses this form also in a future context (I am going to town tomorrow).

Past is shown by was/ were breaking, have/ has / hadbroken/ (been breaking), broke. Context can help decide tense, aspect &c.: during the time, while. Implications from a connected clause may make clear the temporal or circumstantial context in a 'compound' sentence. The other clause(s) then use(s) the simple past form. Thus While/ because he was dying, he gave all his goods to the poor. When he gave all his goods to the poor, he was dying. He was reading this while he was on the train. Before he started to read it, the train had ceased to move. While she was singing, he made it differs from While she sang, he was making it. Thus make and verbs implying motion are restricted in use of the simple verb form more than verbs like sing

Where the essential meaning of a main verb is consistent with persistence or repetition (continuing, repeated) we interpret its -ing form so, (I have been breaking stones the whole day = I was breaking stones during today. I had been brteaking stones the whole day = I was breaking stones during that day etc.) otherwise we substitute the conceptpremonitory as inwas/ were, has/ have been dying. The forms without -ing signify completed events with no notion of duration.

The have + 5-form construction is preferred to the simpler form if the circumstantial or temporal context is recent or there is no reference to the date or circumstances in the context. I have broken my leg. I have broken six cups during this week.

To make clear that the event came before a past date or event not specified in the context, we use had as in he had died when she was married, otherwise we can use he died before she was married.

When a situation continues throughout some past period of time (not necessarily yet terminated) we use the form was/ were dying. When we need to emphasize that this period has ended, we use the form he has been dying = he was dying till now.

Recent past may be shown by be rather than have as in They were married yesterday. Otherwise be has a passive connotation. Sometimes changing this to an active form makes it longer, e.g. This window

is broken. Someone has broken this window. We advise beginners to use the 'perfect participle' only when it works like a simple predicative adjective as wet in The window is wet.

Another passive construction It has frequently been stated by other writers is more succinct in the active form Other writers have frequently stated

Existential there is/ are/ was/ were/ have,has,hadbeen/ will/ would/can/ could/ ought to/ have to be, will/ would have been is dispensable. There are no snakes in Iceland= one can meet/ see/ locate/ detect no snakes in Iceland or No snakes live in Iceland. A singular noun with or without an indefinite article follows the forms with is, was, has and a plural noun with or without a preceding no (preferred to not) follows the are, were, have forms. The others can precede a singular or plural noun.

Prospects for The World Language Process

Jonathan B. Britten
Nakamura University
Japan Chancellor, World Language Process

(Abstract)

The World Language Process (WLP) is a potentially important "wave of the future" in language education. Becoming better known since the advent of widespread Internet access, the decades-old WLP is rooted in the much older quest for a true International Auxiliary Language (IAL). The author introduces the WLP's essential characteristics in light of JALT members' needs and interests. The author points out the dubious status of "Global English" in view of multiple World Englishes, ever-increasing billions of non-English-speakers, and widespread illiteracy in any language. He then clarifies the need for alternatives to English in light of these facts. He finally introduces the WLP's innovate ACCESS method of teaching the ANJeL Tun (Angel Tongue) pidgin.

Prospects for The World Language Process

The World Language Process (WLP) may represent a powerful "wave of the future" in language education. Increasingly well-known since the advent of the Internet's world wide web, this decades-old program is the crest of an old, long-building wave - the tidal movement toward an International Auxiliary Language. This essay introduces the program's essential characteristics in light of JALT members' needs and interests. Persons wanting more detailed information about the theoretical basis of the WLP may consult the extensive web site. (World Language Process.)

Before describing the WLP, this essay outlines the status of "Global English" so that readers may better appreciate arguments for the utility and merit of the WLP. Although English is sometimes spoken of as "the world language," or as "the global lingua franca," the present and future role of English remains both ambiguous and controversial. Not only must we consider the existence of various "World Englishes," 1 we must also weigh other factors working against "Global English" : more than four billion persons worldwide who do not speak English at all,

(WLP web site) and the harsh reality of widespread illiteracy in any language (Wallraff, 2000). Moreover, the population of poor and poorly educated persons in non-English-speaking countries is rising more rapidly than that of affluent, educated groups, thus disproportionately increasing the number of non-English-speakers. For these and other reasons, it seems likely that "Global English" will be restricted to a minority of well-educated persons who travel or communicate around the globe in relatively high-level professions.

Readers interested in English's prospects will appreciate Barbara Wallraff's excellent essay, "What Global Language?" The author's essential point is this: "English isn't managing to sweep all else before it - and if it ever does become the universal language, many of those who speak it won't understand each other . . . we monolingual English-speakers may never be able to communicate fluently with everyone, everywhere. If we want to exchange anything beyond rudimentary messages with many of our future fellow English-speakers, we may well need help from something other than English." (Wallraff, 2000, p. 52-54.)

If Wallraff's view is correct -- and I think it is -- the WLP may offer precisely the "something else" lying outside the scope of her essay. The WLP may provide an International Auxiliary Language (IAL) for global mutual intelligibility not only among elites, but also among the general populace. To achieve this goal, of course, the WLP would need to be acceptable -- and widely accepted -- as a second/auxiliary language by native speakers of English. I believe such acceptance is plausible, given the essentially English foundation of the WLP. Whether or not all this comes to pass depends on the success of the WLP in the global intellectual marketplace, as well as the future role of "standard" English.

Given the central role of English in JALT conferences and publications, I want to emphasize the uncertainties about the future of "Global English.". Wallraff (58) points out that even basic facts about the present role of English are hard to ascertain. For example, estimates of the number of speakers of English as a Second Language (ESL) are remarkably imprecise, dependent on varying definitions of a "speaker" as well as other ambiguous variables. Citing scholars including David Graddol and David Crystal, Wallraff shows estimates of ESL speakers stretching from 98 million to 518 million, and estimates of speakers of English as a Foreign Language (EFL) ranging from 100 million to 1,000 million. In Wallraff's summation: "No one is arguing that English is not widely spoken and taught. But the vast numbers that are often repeated - a billion English-speakers, a billion and half - have only tenuous grounding in reality." (Wallraff 2000, p. 56)

Walraff explores many other impediments to the spread of English. Other evidence comes from the United Nations, which shows most educational funding going to affluent groups, with poorer persons receiving inferior schooling or none at all (UN Population Fund. 2002). This bodes poorly for English. Worse, in many countries, a dismaying large number of men and women are entirely illiterate in any language. (Walraff, 2000, UN Population Fund 2002) Such persons are highly unlikely to receive English language education, and it is among such persons that the most rapid population increases are occurring. This makes "Global English" seem quite

unlikely, particularly in view of the intricacies, irregularities, idioms, and irrationalities of , say, standard American English; the concomitant expense of long-term schooling needed to produce competency, let alone fluency, is very high. The outlook for the WLP, with its innovative, low-cost, and rapid teaching methodology, is quite different; competency reportedly comes with only 30 days of study, with costs of about US \$20.00 per learner.

The WLP aims at reaching educationally marginalized persons through an innovative, well-developed, "each-one-teach one" volunteer methodology based on Auxiliary Closed Captioned English with Simplified Spelling (ACCESS). ACCESS is the methodology WLP volunteers use to teach ANJeL Tun (Pronounced Angel Tongue), which by a strict definition is a Pidgin based on "phonetization," "elementalization," (both terms neologisms) and "regularization." I will define these three terms below, albeit briefly. This point here is that using ACCESS to teach ANJeL Tun is reputedly inexpensive, fast, and effective. If successful, ANJeL Tun via ACCESS, or some variation on the WLP language and methodology, may provide a basis for a true world language studied by all the members of the world community. Students would include today's "native speakers" of English. I will suggest several reasons for considering this outcome credible.

The first reason is that the WLP emphasis on English as the foundation affords powerful advantages. As Walraff makes clear, despite the dubious status of "Global English," English is widely taught and clearly does have an important status in the world. A simplified, rationalized version of English -- the current core of the WLP -- exploits the indisputable strengths of English's status, while avoiding, or at least ameliorating some of the well-known weaknesses inherent to the language. For many English learners in classrooms around the world, "standard" English (i.e., American or British) may seem arbitrary, difficult, expensive, excessively idiomatic, culturally intrusive, and much too time-consuming. In contrast, the WLP may seem relatively easy, fast, and inexpensive, comparatively culturally neutral, and evidently designed with the long-term needs and benefits of worldwide users foremost in mind. If learners see the WLP in this light, it may spread steadily.

The merits of the WLP's English foundation are threefold. First, the WLP bypasses the towering obstacles to fully artificial or "constructed" languages: more than 650 such efforts have failed (WLP web site); and "all such attempts are now considered linguistic esoterica, mere symbols of the desire for universalist thinkers for a code of communication that would cut across cultures." (Kacuhu, 1992, p.2) Arguably, only Esperanto still manages to muddle along in the modern world, with almost no prospect for growth. Second, the WLP can thus serve as a springboard to those who may later want to learn the demanding variety of English used for communication between international businesspersons, educators, scientists, and other professionals. This dual role of the WLP overcomes objections that it's better to study English from the beginning -- no matter how difficult, time-consuming, and costly --- than to master the essential elements of the WLP, no matter how easy, quick, and cheap. Finally, and I think crucially, because the WLP is rooted in English, native speakers and current non-native speakers of English can very easily adapt to this proposed IAL, with minimal investment of time

and effort. Most can learn the ANJeL orthography with just a few days of memorization.

Advocates of the WLP are prepared to evolve from the existing ANJeL Tun model in future, a laudable posture based on a willingness to go with the flow - - a very useful metaphor when we think about "waves of the future." Certainly, some persons object to an alleged "linguistic imperialism" inherent in the English roots of ANJeL Tun, and other philosophical and practical impediments to the current WLP model will emerge as the program evolves. Nevertheless, the WLP's strong initial emphasis on English seems eminently pragmatic to me. Indeed, the pragmatism and flexibility of the WLP are key reasons for my own participation. In my mind, the "P" in WLP can be read as "Proposal," "Project," and "Process" -- a long-term, co-evolutionary process characterized by a wonderfully flexible attitude needed to help the WLP succeed. For this reason, I believe that volunteers can make very important and creative contributions to the WLP. The web site makes this clear:

. . . the World Language Process is in NO way 'solely committed' to the ANJeL Tun and . . . will willingly, happily and cheerfully support instead any IAL that humanity may select . . . in the interim, with the ACCESS System we hope to provide economically deprived individuals in developing countries an opportunity to learn to speak English as a second language so that they may improve their economic situation. " (WLP web site)

Thus, even after decades of steady progress and remarkable achievements -- the ACCESS system with videos and textbooks; ANJeL Tun with online translator and tutorial; extensive dictionary projects in multiple languages; teacher training programs, and much more -- the WLP remains open to innovation, and a great deal of important work remains to be done. Thus, the WLP may attract many creative and active members of groups such as JALT. Moreover, the pending designation of the WLP as a United Nations NGO, if granted, may greatly enhance the prestige of the program, and make more rapid progress possible. The WLP is already a project of a separate, independent UN NGO, the International Association of Educators for World Peace (IAEWP), and the WLP enjoys other important professional affiliations, including strong support by the admirable Project Gutenberg. (Project Gutenberg web site.) Recently, WLP volunteers began a training program in China, an important breakthrough for the program, and perhaps the first step in the global spread of a true International Auxiliary Language.

At last I will briefly outline some essential components of the ANJeL Tun system. What follow are slightly edited web site definitions of the ANJeL Tun phonetic system, followed by explanations of the three characteristics mentioned above: phonetization, elementalization, and regularization. The WLP web site includes a complete online tutorial for persons wishing to learn ANJeL Tun, which English speakers can master in about two days.

The ANJeL Tun Orthography

The Angel alphabet consists of 39 symbols, each of which represents a unique sound. Unlike the traditional English alphabet, there is no duplication whereby different letter combinations can sound alike. For example, in English "threw" and "through", "bough" and "bow", "blue" and "blew", "write" and "right" have identical sounds but varied spellings. In Angel, all identical sounds have identical spellings.

The Angel alphabet assigns a unique symbol to each unique vowel and consonant sound. The symbols used are similar to those of the traditional English alphabet, with one big difference: Upper case letters have one unique sound, and lower case letters have another. In addition, sounds composed of multiple letter groupings (such as "oo", "ow" and "oy") are represented by single symbols in the Angel alphabet.

Unlike traditional English, Angel has no "silent" letters that can change the pronunciation of other letters in the word. (In traditional English, silent letters often change "short" vowels to "long" vowels: "cut" becomes "cute" even though we never hear that "e" on the end). In Angel, every letter in a word is essential and is pronounced.

In short, Angel is CONSISTENT. Its purpose is to permit new English learners to "See what we Say" on captioned TV, using the closed captioning decoder standards imposed by the U.S. Congress.

Phonetization

Phonetization is the Simplified Spelling portion of the ACCESS System . . . Because the ACCESS system is tied to the character set encoded in new television sets under the law of the U.S. Congress we must use only the Roman Characters presented there. This, however, has the additional advantage of permitting materials to be developed anywhere there is type-generating

equipment that uses the standard English alphabet. . . .

Elementalization

Elementary or basic ANJeL Tun uses Chomsky's concept of the distinction between 'form' and 'function' words (the latter including what some people call 'glue' words) to determine those words which should be taught and learned first. The English language has hundreds of thousands of form words which designate both concrete (words like boat, house, hammer, nail) and abstract concepts (like boating, housing, hammering, nailing and more particularly love, truth, beauty and other 'spiritual' ideas). . . . English, however, has at most only a few hundred 'function' words. These are the words that glue and relate the form words together. They are words like (of, to, if, and, for) and include relational words like (above, below, next, after). The function words are necessary to any form or discussion or writing that arises above pointing and naming. . . The most Elementary or most basic level of ANJeL Tun therefore seeks to teach only the function words . . .

Once persons have learned the several hundred function words of the ANJeL Tun, they know the language. But of course they still cannot talk about anything since they do not have the form words. But it is now simple to teach persons the form words for, say, their employment. . . (After that) there may be (learning involving) a culturally shared experience involving a set of form words that are understood by most 12 year olds of average brightness. To learn these words would be a second level of accomplishment. Beyond that, the vocabulary for college admission or some particular profession may be still higher standards . . .

Regularization

English is a language of exceptions but the ANJeL Tun reduces the language as much as possible to a logical system of rules. Some of these concepts, but not nearly so extensively, were applied by Ogden and Richards. In regards to using the ANJeL Tun as an Intermediate Teaching Method (ITM) the idea is that it is easier to first understand and learn a system of rules and then later to comprehend the exceptions. This conformity to rules is what makes the ANJeL Tun a pidgin.

The essential aspects of the WLP are easy to understand. Although sensible persons avoid emphatic predictions, it seems reasonable to claim that the WLP can help advance the goal of an International Auxiliary Language, and in the interim provide a means of thinking more clearly about the roles of English and World Englishes. Given the stated pragmatism and flexibility of the WLP's goals, volunteers may be able to overcome obstacles and objections that their efforts may meet. Ongoing efforts in China will offer some of the first glimpses into the future prospect of the WLP.

Jonathan B. Britten has been employed at Nakamura University since 1992 and in Japan since 1989. He is currently the Japan Chancellor of the World Language Process.

Notes

1. Space limitations regrettably prohibit even a brief discussion of World Englishes (WE), even though the topic is very pertinent to prospects for the WLP. The key issue in the relationship between English, World Englishes, and the World Language Process is that of mutual intelligibility. The WLP might someday provide the most-acceptable global standard for worldwide communication, particularly if varieties of English diverge greatly in future, as some scholars anticipate.

Information about WE is available from the web site of the International Association for World Englishes (IAWE) from <http://www.we.pdx.edu/conf.html>

Another useful starting point is: Kachru, B. B. (1986) *The Alchemy of English: The Spread, Functions, and Models of Non-native Englishes*. Urbana and Chicago, University of Illinois Press.

Criticisms of the World Language Process.

There have been many criticisms of the World Language Process. The following attempts to answer the most frequent.

[Return to Main WLP Directory](#)

Criticism #1:	<i>The World Language Process is culturally imperialistic since it is promoting English as the universal auxiliary language.</i> Go to Response #1
Criticism #2:	<i>If you are committed to world literacy would it not be better to teach people to read and write in their native tongue, so that they may preserve their independent cultures, and find more usefulness in their immediate surroundings?</i> Go to Response #2
Criticism #3:	<i>There is already a universal auxiliary language. It is called Esperanto.</i> Go to Response #3
Criticism #4:	<i>The World Language Process is a plot towards the one world government to be run by the Anti-Christ. God did not mean for men to all speak one language or He would not have destroyed the Tower of Babel. The World Language Process is a humanistic anti-religious plot that is part of the satanist world conspiracy.</i> Go to Response #4
Criticism #5:	<i>The teacher requirements of the World Language Process do not conform to recognised educational standards for the profession.</i> Go to Response #5
Criticism #6:	<i>The World Language Process does not use recognised pedagogical methods, that is to say a method that is accepted and taught in academically accredited ESL teacher training schools in North America.</i> Go to Response #6
Criticism #7:	<i>The World Language Process creates or at least reinforces class differences.</i> Go to Response #7
Criticism #8:	<i>The World Language Process teaches people to speak and read a pidgin rather than traditional English with traditional English orthography.</i> Go to Response #8

Criticism #9:

The World Language Process is entirely impractical because it does not have sufficient funding or the sufficient backing of any large government organization.

[Go to Response #9](#)

[Return to Main WLP Directory](#)

Criticism #1: *The World Language Process is culturally imperialistic since it is promoting English as the universal auxiliary language.*

Actually, the UNKOMMON Foundation, of which the World Language Process is a program, does not at this point advocate English, or any other language, as being a universal auxiliary language. The Foundation's official position is that in the natural progress of humanity some still undetermined world authorized administrative body will in the future select an official universal auxiliary language. Until that time the World Language Process is responding to the international need that has manifested itself in the following facts:

- a. English is the language of choice by more people, to learn as a second language, than any other language in the world.
- b. There are now more people in the world who speak English as a second or foreign language than there are people who speak it as their mother tongue.
- c. Over ninety-five percent of all scientific literature is now originally written in English or is translated into it.
- d. English is the official language of air traffic control and maritime communication.
- e. English is the defacto international language of much of the business communication in the world. If in the common market a Frenchman, an Italian and a German were to meet they would be most likely to conduct their discussion in English.
- f. A 1994 national medical conference in China, which has fourteen official chinese dialects, was conducted in English.
- g. Over ninety-five percent of the material on the World Wide Web is in English.
- h. By learning English many economically deprived individuals in developing countries can obtain jobs in the tourist industry or with foreign employers.

- i. Most parents when asked which language they would prefer their children learn as a second language reply, "English". If your children's first language was not English, which language would you prefer that they learn as a second language if you only had a choice of one?

[Return to List of Criticisms](#)

Criticism #2: *If you are committed to world literacy would it not be better to teach people to read and write in their native tongue, so that they may preserve their independent cultures, and find more usefulness in their immediate surroundings?*

- a. There are over 3,500 languages in the world that are spoken by over ten thousand people. There are many more if we include the dialects spoken by numerous small tribes. Many of these have no script or only have had one devised in recent decades by someone like Bible missionaries. These latter often have no written tradition and very little scientific literature, if any at all.
- b. There are a number of historical world languages that are the source for broad historical traditions (such as Sanskrit, Hebrew, classical Chinese, Arabic, Greek, Latin and so forth) but the teaching of these is useful mostly to scholars.
- c. There are a number of modern world languages that contribute to modern science and culture (such as Japanese, German, French, Italian, Spanish and some Russian and Chinese dialects) but a large percentage of the intelligentsia and leaders of thought in those languages already speak English.
- d. The countries in the world which are technologically advanced generally already have widespread literacy programs and many of these countries (such as France, Chile, Japan and many others) already require their advanced students to learn English. The World Language Process is devised to reach the socially and economically deprived classes throughout the world.
- e. The cost of developing a single literacy program in a language with which we are familiar is over two million dollars. We cannot imagine how we could obtain the funding to develop thousands of such programs. If, one were to say, "then just select a few", which one would they suggest that would be more beneficial than English?

[Return to List of Criticisms](#)

Criticism #3: *There is already a universal auxiliary language. It is called Esperanto.*

- a. Yes, and a very noble and inspirational attempt it was but it never quite caught on. For one thing it may have been too Romance language oriented. For whatever reason, it and over 650 other attempts (according to the People's Encyclopedia) have not yet been successful. This may be just one more such attempt but we must keep trying. There were many unsuccessful attempts at heavier-than-air flying machines before the Wright Brothers were successful at Kitty Hawk.
- b. Fifty years ago there were a number of contenders for the universal language. Besides Esperanto there was Interlingua and Ido. French was also very much on the rise and was considered the language of diplomacy. German, however, was the language of science and without which one could hardly get an advanced degree in science. Latin, however, was the language of medicine and the law, not to mention the Catholic church. Greek, Hebrew and Arabic all had their place among Western scholars and there were other languages popular among the orientalist. Italian, of course, was the language of music. Today, however, they have all descended, or at least have nowhere near ascended in popularity as much as English.

[Return to List of Criticisms](#)

Criticism #4: *The World Language Program is a plot towards the one world government to be run by the Anti-Christ. God did not mean for men to all speak one language or He would not have destroyed the Tower of Babel. The World Language Process is a humanistic anti-religious plot that is part of the satanist world conspiracy. Or something to that effect.*

Please!! While the World Language Process is neither officially or unofficially associated with any religious or political organization of any kind and has no hidden agenda it is neither anti-religious or opposed to the just aspirations (religious, political, nationalistic, or cultural) of any group. In point of fact, the founder and the vision holder of the World Language Process feels himself to be a very religiously motivated individual wishing the spiritual unity of all the world's religions and working for a world peace that will result in the unification of all humankind. What more can be said that will satisfy these questioners?

[Return to List of Criticisms](#)

Criticism #5: *The teacher requirements of the World Language Process do not conform to recognised educational standards for the profession.*

- a. While many professional teachers feel that only people with their qualifications should be allowed to teach ESL, in fact most people who learn English do so from supposedly entirely unqualified persons, their mothers. Just as the medical profession in North America would have us believe that only M.D. obstetricians can deliver a baby although most babies in history have been delivered by midwives, much of the ESL profession would have us believe they are the only ones qualified to teach English as a Second or Foreign Language. The World Language Process might be considered as being the mid-wifery program of ESL.
- b. The World Language Process is designed more along the lines of an Each One Teach One type of program. We hope that the teachers that we train will teach other teachers, and so forth. The World Language Process is not aimed at the professional although any one is welcome to use it. Let the professional teachers teach in the Universities, this program is dedicated to those who cannot find or afford a teacher otherwise.

Many of the World Language Process teachers that we first send out might be looked upon as teacher interns, getting their first experience in the teaching field by giving a year of voluntary service. This puts their services within a range that many secondary schools and other establishments that could not otherwise have the benefit of a trained native English speaker will now be able to have a teacher in their school or other organization.

- c. There are almost four billion people in the world today who do not speak English. If English, or any other language, were to be taught to four billion people in the next twenty years (and at the present rate there will be well over two billion more people born in that time) then 300 million people have to be taught each year, which is more than twenty million people per month, assuming that it only takes a month to teach a person English.

Many people will think such a goal is hopeless, and it certainly is under present teaching methods. Today, many people in non-English speaking countries learn English in a university where it is taught by a professional individual who most usually holds a special graduate certificate in teaching ESL. The current teaching methods are such that it usually takes several years to learn to speak well enough to be able to travel to a different country and go into a restaurant and sit down and order a meal.

[Return to List of Criticisms](#)

Criticism #6: *The World Language Program does not use recognised pedagogical methods, that is to say a method that is accepted and taught in academically accredited ESL teacher training schools in North America*

- a. It is true that the system being used by the World Language Process, is a radically different system that seeks to teach the learner to speak in just thirty days with only three hours per day involvement. The nature of this system is so radically different that it is very unlikely that it will be accepted by the present ESL establishment. What this system is designed for is the ordinary individual rather than the scholar, scientist or professional. Someone who is perhaps going to meet tourists in a hotel, or while driving a cab, or in a retail shop. This system is meant to be ideal for someone needing to read specially translated technical manuals in a factory or communicate with English speaking business people or technicians.
- b. World Language Process Teacher volunteers will receive, through a correspondence course, a thorough explanation of the pedagogical methods used in the ACCESS system. The ACCESS system uses a variety of techniques that have been tested individually. It is the manner of their combination in this system that is unique.

[Return to List of Criticisms](#)

Criticism #7: *The World Language Program creates or at least reinforces class differences.*

The World Language Process is meant as a grassroots program. It is language sharing by ordinary people with ordinary people, rather than a rarefied university level linguistic and scholarly exchange. For this reason it is intended to be the effort of thousands of ordinary but dedicated individuals rather than that of a select and chosen and highly credentialed few. The typical teacher would be either a recent university graduate or student, or retired individual, who is willing to get some life experience by spending a year teaching ESL in another culture. It is the simplicity of the designed program that is supposed to assure their success, rather than extensive previous credentials.

[Return to List of Criticisms](#)

Criticism #8: *The World Language Program teaches people to speak and read a pidgin rather than traditional English with traditional English orthography.*

- a. It is true that the World Language Process seeks in less than a thirty day period to teach the learner to speak, read and write a simplified form of English that may be properly called a pidgin. However:
 1. any English speaking person will be able to understand them
 2. they may then be sufficiently encouraged that they will go ahead and learn traditional English syntax and orthography
 3. they will be able to read any of the English classics because these are all machine translatable into their simplified spelling
 4. they will be able to read any of the files on the Internet because these are all machine translatable into their simplified spelling

- b. Please note, however, that we have not said that within thirty days they will be able to:
 5. to understand the rapid speech, extensive vocabulary, or convoluted syntax of every English speaker that they meet
 6. to understand the sophisticated concepts of all the English classical literature and scientific journals that they will be able to read.
 7. or be able to speak English like an Oxford scholar.

[Return to List of Criticisms](#)

Criticism #9: *The World Language Program is entirely impractical because it does not have sufficient funding or the sufficient backing of any large government organisation.*

The World Language Process is a grass roots program of people to people. Hundreds of volunteers have supported it in the past and it will hopefully have the assistance of thousands - even millions in the future. At the moment it is still in a development phase but time and circumstances change in this world, and if its timing is right then it will be able to fulfill the destiny of its vision.

1: *What is the World Language Process?*

The World Language Process promotes the selection or formation of an international auxiliary language and script (IAL) according to scientific criteria by a globally representative congress or committee. We envisage the IAL as the first step towards a single world language and script in the distant future. The World Language Process is also pursuing a number of related projects including online translation and electronic databases.

[Return to List of Questions and Comments](#)

2: *Assuming a globally representative congress or committee could agree on an IAL, wouldn't it be an unwieldy compromise? Wouldn't a functionable language require the coherent vision that only an inspired individual could provide?*

No single person can possibly know enough to construct the IAL. The history of the movement has demonstrated this, though Schleyer, Zamenhof and others deserve every plaudit for their valiant attempts. Informal collaborations have fared no better: they have always split on controversial issues.

A congress or committee solves these problems by vesting authority in its unanimous or majority opinion. Of course there is a danger in this too, so a properly constituted arrangement is necessary - one which incorporates systematic consultation with all interested parties into the decision-making process. There is no reason, in fact, why the official committee and their consultees should not collaborate for the benefit all concerned.

[Return to List of Questions and Comments](#)

3: *Wouldn't each member of the international committee seek only that the IAL conformed as far as possible to their own language, in whose favour they were likely to be prejudiced, albeit unconsciously?*

The common language question has returned to the fore as rising international tensions have raised the tempo and importance of communications. The deepening global recession has also served to move the IAL question up the political agenda. In the context of straitened economic circumstances the increasing cost of translation (and mistranslation) in the world's expanding unions of nation states has come into focus, as has the cost of foreign language teaching in state education systems. International agencies are becoming ever more receptive to the idea that an IAL would begin to eliminate these costs. At some stage in the not-so-distant future an international committee is likely to be appointed and told to get on

with it - and its members may have no choice but to give at least as much weight to facility of global communication as to sectional familiarity, i.e. "user-friendliness" for various peoples .

The advance of scientific linguistics is another factor that will help to maintain a proper balance with political interests. A great deal of high-quality research now exists concerning subjects which might be expected to inform and influence the course of IAL discussion and decision-making: comparative grammar and phonology, childhood speech and literacy acquisition etc..

[Return to List of Questions and Comments](#)

4: *Isn't English already the international auxiliary language for all practical purposes?*

Not really, though some of its proponents in the media might convey that impression. English does have semi-official status in a few specialised fields, including air and maritime telecommunications, but even there its use is far from universal. Having said that, it's undoubtedly true that English is the leading auxiliary language in the world today, and will continue as such for a long time to come - whatever is decided concerning the IAL. As for English itself being officially selected, we think it most unlikely - for historical political reasons, and because of an irregular spelling system which has proved highly resistant to reform.

Moreover, as has often been pointed out, the pre-eminence of the English language relates more to the current status of English-speaking civilisation than to its inherent qualities. If the dominance of the English-speaking countries - which has arguably lasted from 1815 to the present - were to be superseded, the English language might consequently be expected to go the way of Ancient Greek, Latin, Arabic and French. The demise of the British Empire, the relative economic decline of America, the reversion of several ex-colonies to native languages, the establishment of rival languages in former English-speaking heartlands, and the continued political and cultural opposition to the English language from various quarters in several countries - all these are indications that the dethronement of English might already be proceeding.

The following statements are pertinent in this regard, though over a decade old:

....."In 1989 a study conducted in Belgium, France, Germany, Italy, the Netherlands and Spain concluded: "The real correct understanding of English in all the countries studied is notably inferior to the most pessimistic existing evaluations and our own guesstimates" Van de Sandt, Report in "Initiative Media News Bulletin" (London: Lintas Worldwide, January 1989)

.....In 1990 Sir (now Lord) Randolph Quirk, Professor of English at University College in London, put it thus: "Despite the persistent and glib assumptions in Britain and America, we are witnessing a significant relative decline (perhaps even an absolute decline) in the currency of English worldwide. This may come as a surprise to those who think of English as the medium of high-tech skills, international conferences, and professional journals: here indeed continued growth is doubtless the order of the day. But these are relatively slim and specialized lines of communication."

.....In 1991 Richard Bailey, Professor of English Language and Literature at the the University of Michigan and Associate Editor of the "Oxford Companion to the English Language" was even more specific: "The proportion of the world's population who regularly use English is 15% - and falling".

[Return to List of Questions and Comments](#)

5: *Esperanto is a perfectly adequate IAL which only needs support. Esperanto's official adoption and consequent implementation through educational systems worldwide would be hastened if sites such as this promoted it.*

We believe that the international congress or committee which chooses or forms the IAL will in effect be revising Esperanto. The love and effort put into Esperanto will be realised in the coming IAL, which will be constructed very much upon its basis and inspired by its continuing influence. However, Esperanto as presently constituted looks most unlikely to gain the popular support necessary to become de facto IAL, or even to be officially appointed for the role. The absence of a thorough reform to make Esperanto more globally acceptable must be partly responsible: for instance, Esperanto's grammar is especially difficult for various peoples. There are a number of criticisms of Esperanto on the Internet, including <http://www.xibalba.demon.co.uk/jbr/ranto.html> .

[Return to List of Questions and Comments](#)

6: *"East is East and West is West and never the twain shall meet!" Kipling's sentiment remains as true today: cultures are essentially self-contained and will remain so; no more than the most basic IAL will ever be required.*

There are two schools of thought here. On the one hand, there are those who believe that, after the IAL is officially instituted, everyone will always and for all time speak at least two languages - the various mother-tongues for domestic consumption and the IAL for international communication. These hold that the primary focus of culture is national or ethnic, but that international agencies are necessary in order to support the requisite level of material civilisation - through trade, tourism, transport, communications, science, peace-keeping and the like. In other words, the international agencies deal in mundanities, whereas the more spiritual side of life - whether found through historic religions, secular philosophies, national treasuries of literature etc. - is not "global" or "international" in any real sense, since it is always linked to a particular culture or tradition.

On the other hand are those who discount the possibility of self-sufficient or autonomous entities communicating indefinitely on a second-hand basis, believing that all languages will eventually merge into a single language by way of an official IAL, and claiming that this process is merely a conscious continuation of what is already occurring. Decades or centuries after the official IAL inauguration,

everyone might still learn at least two languages at school, but they would expect the IAL to develop relative to the mother tongues.

They would point to the precedent of pidgins and creoles, inasmuch as pidgins were IALs on a smaller scale, formulated for essentially the same reason - the pertinent fact about pidgins being their tendency to become creolised: a process shown to derive from children learning and using the pidgin as a mother tongue. Thus, although pidgins were originally employed as purely auxiliary trading languages - second languages that nobody used as a mother tongue - children of certain traders, seafarers etc. evidently learned the pidgins as mother tongues, and elaborated them with borrowed or intuitive grammatical constructions and new words from various sources - exactly as tends to happen with mother tongues or primary languages in their developmental phase.

Correspondingly, since the IAL will begin its life essentially as a global pidgin, there is every chance that it will be elaborated by future generations in a similar way and for the same reasons. The modern world contains an ever-increasing number of itinerant key workers and administrative personnel employed by transnational corporations and international agencies. Such people will find the IAL particularly useful, whether or not they possess other second languages such as English, and consequently the children of some of them are likely to pick up the IAL as a mother tongue. The intuitive elaboration of the IAL might then be expected to follow, in concert with more formal and conscious innovative attempts by authors, advertisers, film-makers etc. who might well wish to write in the IAL directly in order to access the global market, the whole being co-ordinated and kept within acceptable bounds by the IAL committee.

Assuming this process of development came to pass, the relationship between the IAL and every national tongue would be comparable to that which formerly existed between the minority ethnic tongues and the great national languages which entirely surrounded them. Thus, even as islands of minority ethnic tongues have been surrounded by a sea of English, every language would eventually find itself within the matrix of the IAL. And correspondingly, even as English formerly diluted and absorbed minority ethnic tongues in its midst, English would itself be absorbed, along with all other languages, into one universal tongue of enormous capacity and subtlety.

The history of the dogged survival of certain minority ethnic tongues clearly shows that such a process would never be achieved by force, rather would it happen for cultural and economic reasons. Thus, if speakers and writers were to deliberately use the international auxiliary language to reach the widest possible audience or readership, and listeners were to learn it - and tune into it - to keep up with the latest news and newest thought from anywhere in the world, there is little doubt that this common language would develop its own character as a truly global tongue, even as primary creative impetus went into it. If this did indeed happen - whether through neologism, transliteration, or other aspects of linguistic development - the national languages of the world could be expected to successively abandon their separate identities, over a period of centuries, in order to become part of it: in the same way that some minority ethnic tongues have hitherto become submerged in national languages.

Thus there is no reason to suppose that an international auxiliary consciously developed for creative usage would not gradually obtain the linguistic and euphonic capacity to incorporate all useful features, whether structural or decorative, from both "national" and constructed languages. Indeed, it might well display these assets more precisely and harmoniously than their own more or less irregular grammars, partial phonologies and ramshackle orthographies. In such a scenario the mother-tongues would continue to be preserved in written and recorded form, but ultimately for sentimental value rather than linguistic information.

[Return to List of Questions and Comments](#)

7: *Shouldn't the international committee choose an entirely neutral language, equally easy or difficult for all nationalities?*

An entirely neutral language would be very difficult if not impossible to realise in practice. For instance, unless the script were bi-directional, or vertical perhaps, it would favour either the left-to-right majority or the right-to-left minority. Similarly, there would have to be a choice between logographic and alphabetic script - the former benefiting East Asian countries such as China and Japan, and the latter the rest of the world. Much the same might be said about phonology and grammar. Moreover, even if a "horizontal" neutrality were achievable between the very diverse languages and scripts of the world, there might still be the problem of finding a "vertical" neutrality, or median position, between linguists and non-linguists. Briefly, there is no advantage in reinventing the wheel, so far as the IAL is concerned. Even a brand new solution of apparently impeccable political correctness would inevitably contain hidden inequities - quite apart from its difficulty for everyone due to unfamiliarity. An equally fair, but much more practical and realistic system would borrow linguistic features from as wide a variety of languages as possible, perhaps to some extent on a population pro rata basis. There would then be a certain amount of give and take. For instance, those who had to master a quite alien script for the IAL might see a relatively large proportion of their grammar and/or vocabulary incorporated into it, and so on.

[Return to List of Questions and Comments](#)

8: *Would it be possible to guess what kind of IAL the international committee might select?*

They might well operate within certain established norms endorsed by many IALers, as by others with an interest in the subject. These include:

a.. alphabetic script - logographic scripts take many times longer to learn

- b.. orthographic script - one-to-one correspondence between letters and sounds with no duplicated or silent letters
- c.. regular grammar, with the simplest possible rules, and no exceptions
- d.. no linguistic genders
- e.. an international vocabulary - with the eventual goal of words from as many languages as possible
- f.. no synonyms - only one word or name for each thing

[Return to List of Questions and Comments](#)

9: *Does the World Language Process have any additional preferences?*

Only one at this early stage: an IAL Hierarchy - which from the practical viewpoint is the gradual introduction of a single IAL in stages. An IAL Hierarchy addresses the problem of universal acceptability. A median IAL, pitched somewhere between the usages of the various national languages, and between linguists and non-linguists, might purport to do this but actually discriminates against those at the extremities. Although suiting those towards the middle, it might well be regarded with suspicion as too easy by one part of the population, and with trepidation as too difficult by another part.

Orwell's "Newspeak", probably based on his perception of Esperanto and Basic English, is an old chestnut that might be brought out by way of illustration. Orwell's inference that an imposed IAL might be used to limit the thought and expression of speakers of more complex languages evidently struck a chord with his readers - unless it is purely coincidental, and related only to the ascendancy of the English language, that both Esperanto and Basic English have declined so much since his book was published.

On the other hand, a median IAL such as Esperanto is beyond the capacity of many non-linguists, particularly those whose own languages have a very different or more restricted grammatical structure or sound system. Certainly, speakers of creoles and some Asian tongues have found Esperanto very difficult. Many English speakers have also found Esperanto challenging, since it uses grammatical constructions that English manages without, apart from vestigially.

The two alternatives to a median IAL have, of course, been an advanced IAL and a basic IAL: Schleyer's "Volapuk" and Hogben's "Interglossa" (forerunner to "Glosa") are respective examples. However, for the reasons mentioned, neither of these IALs would now be acceptable. The inadequacies of Volapuk became evident when people tried to use it in everyday conversation; it obviously lacked a basic version. Conversely Interglossa, with its three tenses and absence of inflections, was in many ways an ideal IAL - though its lack of expandability was a fatal drawback. No current IAL is expandable or contractable: that is the problem with all of them.

Any language taught to children begins with "infant-speak". Those transmitting the language to the very

young instinctively employ the simplest grammar, the easiest speech sounds and the shortest words, often internally repetitive. However, the "infant-speak" is really the same language as that used by adults, as are the other gradations and variations.

The essential problem with IALs at the present time is that none of them have a "infant-speak" version and an advanced version and all the versions in between. For practical reasons, it's necessary to start with an "infant-speak" as the official IAL, whilst the other IALs in the hierarchy are developed in the background. At the requisite time, when all (or nearly all) peoples have attained the next level as a result of cultural and linguistic development, the second IAL on the hierarchy (which many if not most people in the world would already be using unofficially) would be designated as the official IAL, and so on. Thus the IAL hierarchy is really a single IAL, introduced in stages.

The table below, reproduced for illustrative rather than prophetic purposes, shows the kind of scheme the World Language Process has in mind. For mnemonic purposes, the number of consonants and vowels accords with the year of introduction. Thus Lang25, with 25 phonemes in its sound system - 20 consonants and 05 vowels - would be introduced in the year 2005 AD.

Lang25 would have an alphabetic script (possibly English-type, without diacritics), a very basic grammar (possibly Chinese-type, word-order based, wholly analytic), and the core vocabulary without consonant clusters etc. would be limited to the twenty most universal consonants identified by the UPSID survey and the five vowels (a, e, i, o, u) which most languages employ, and to which Spanish, Japanese and other tongues are restricted.

Perhaps the year 2005, at least, will be prophetic since the beginning of the construction of the World Language Process Universal Language Institute at Horning's Mills, Ontario, Canada is scheduled for that year.

Provisional IAL Name	Number of Consonants & Vowels	Inaugural Year as Official IAL	First Language or Mother Tongue	Second or Auxiliary Language
Lang53	27 C 26 V	2726 AD	100%	0%
Lang49	26 C 23 V	2623 AD	98%	2%
Lang45	25 C 20 V	2520 AD	90%	10%
Lang41	24 C 17 V	2417 AD	70%	30%
Lang37	23 C 14 V	2314 AD	30%	70%
Lang33	22 C 11 V	2211 AD	10%	90%
Lang29	21 C 8 V	2108 AD	2%	98%
Lang25	20 C 5 V	2005 AD	0%	100%

World Language Process Picture Gallery

The World Language Process has continuously progressed for many years. There should be, by now, many pictures for our picture gallery but we are just starting this page and hope to soon add more pictures to it.

The proposed architectural center piece of the UNKOMMON Foundation and the World Language Process is the [Universal Language Institute](#) at Bahji du Canada.

These are pictures of a model of the building that we hope will be built sometime in the next ten years. This picture is a [side view](#). The building won first prize in 1988 for Canadian Architectural Design.

The site for the Universal Language Institute is a beautiful rural setting divided by a stream and waterfall. On the other side of the stream is the [dormitory building](#).

The Universal Language Institute is located in the highest county in Ontario and is located on one of the highest hills in the county. From this height a [tall antenna](#) is intended to give it a broadcast reach all across North America.

The [overall site](#) has a deep spiritual significance in the history of Aboriginal Americans whose oral tradition prophesized that it is where a Great Treasure of the world would be discovered - which we hope to mean the Universal Auxiliary Language.

The Universal Language Institute is being dedicated as a memorium to [Bahji Barrett Beach](#) whose [memorial](#) is located on the site and who is buried beneath the [rock](#) located there.

In July of 2002 we held the first annual World Language Process picnic [picnic](#) at Bahji'i du Canada [with attendees](#) from Ontario, Quebec, Michigan, Oklahoma, and Washington.

CHINA GOALS of The World Language Process

The **UNKOMMON** (**UN**iversal **KOM**unications por la **MON**de - *Esperanto*) Foundation and its World Language Process have always considered China as being one of the **MAJOR** players in establishing a global Universal Auxiliary Language.

[\[Link](#) to the main page and the history of the World Language Process.]

[Picture is of a model of the Universal Language Institute to be built in Canada.]

The Coordinator of the World Language Process has made several trips to mainland China regarding the establishment of Language Teaching Institutes.

[Picture is of the coordinator's son and his son's family. The WLP coordinator's son taught English for a year in Northern China and now operates a Montessori method and English language school in Taiwan.]

While in Jiangsu, China, the World Program Language coordinator and the UNKOMMON Foundation, was granted a corporate charter for **EDCO** (**ED**ucation **CO**rporation) which was the first corporate charter ever granted by the modern state of China to a non-Chinese person or entity.

A primary goal of the UNKOMMON Foundation and EDCO is to establish non-profit language teaching institutes in China.

[Picture is of Bruce Beach,
Coordinator of the World
Language Process.]

The intent of the Olympic Committee in China to train guides, coordinators, facilitators and other personnel who speak English provides an exceptional opportunity for service by the UNKOMMON Foundation and its World Language Process.

The World Language Process has developed a system called:

The **ACCESS** System
(**A**uxiliary **C**losed **C**aptioned **E**nglish with **S**implified **S**pelling)

which is a revolutionary new language teaching system, based upon:

a new **Technology**
a new **Methodology**
a new **Pedagogy**

that permits a person who has never spoken English, and who is perhaps even illiterate in their own language, to learn *in less than one month* to:

read the *MOST COMPLICATED POSSIBLE* directions
to a person who speaks English.

give full explanations in English

regarding their specialty such as maid service, waitering, etc.

take simple directions

in English from a person who speaks English

Not only that - but a person who has learned all this by using the ACCESS System, at the end of the month they have spent learning it, can then use the same system to teach others.

Thus it is - that by each person who spends one month learning the system, spending another month teaching just ten others, within a year millions of Chinese who do not presently speak English can have learned to speak, regarding their trade, skill or specialty, so that English speaking persons can understand them.

It is our great hope that the officials responsible for these services and capabilities at the Olympics in China - will allow us to further explain in detail **The ACCESS System**.

VOLUNTEER TEACHERS

The World Language Process presently has requests for hundreds of teachers to teach English. Many of these requests are from Governors of Provinces in Thailand, but there are many requests from other places in the world including from the State of Florida for teaching English to Spanish speaking prisoners.

Unfortunately, while the positions just mentioned provide room and board for the volunteers and have no cost to the volunteers, except transportation, they do require the availability of the World Language Process ACCESS System which, because of economies of scale, we cannot implement until we have requests for thousands of teachers.

While in the past we maintained a registry of teacher volunteers we discontinued doing so because we found that obtaining volunteers was not going to be a problem since there are many university students and retired people willing to volunteer. The problem is that we need requests for *THOUSANDS* of teachers so that we can implement the ACCESS System. For this, our present hope is that the Government of China will want to use many thousands of volunteers to teach English for the upcoming Olympics in China.

In the interim, we are assisting an affiliate in China to obtain volunteer teachers for the affiliate's English teaching program. Please understand, that while there is some expense to the volunteers for this program that the World Language Process *does not receive one penny* of the fees or any remuneration *of any sort* for helping make the placements. We do it completely in a spirit of service to China and the world.

The Chinese affiliate is called CNteach.net and is an independent, non-political and non-religious network for placement of native speakers of English and international volunteers to teach in China and for hosting international students to learn Chinese in China under the sponsorship and guarantee of Yantai Jianwen College. Presently, there are two programs.

The Two Programs

One program is a **VOLUNTEER TEACHING** program and the other program is a **STUDY** program. The participant may enroll in one *or* the other. The different mission statements of the two programs are as follows:

1. The Volunteer Teaching Program

Placement of native speakers of English, international travellers and volunteers to **TEACH** conversational

English in various kinds of Chinese schools, colleges and universities on both short-term and long-term basis.

2. The Chinese Study Program

Hosting/receiving international students to **STUDY** Chinese language and culture in Chinese schools or universities.

The Teaching Program

The mission of CNteach is to promote volunteerism and improve the quality English education in China as well as enhance intercultural understanding and friendship through English education.

CNteach volunteer positions are available year round for both short-term and long-term placements with associate schools, colleges and universities in China.

Requirements

The qualifications required for teaching and volunteering on any of the associate campuses are as follows:

1. Must be a native speaker of English
2. Must be 18 years of age or older
3. Must be healthy
4. Should be enthusiastic

The package of benefits offered by all Chinese schools through CNteach are as follows:

1. Free standard quality room on campus with daily living facilities and necessities.
2. Monthly living allowance (pocket money), which will cover the basic daily expenses during the teaching placements.

3. Free local tour and sightseeing during weekends and/or holidays.
4. Teaching and living assistance provided.
5. Free Chinese language learning class arranged.
5. Free airport pick-up at local airport.

The volunteer will have to cover the following costs:

1. International round-trip airfare and China domestic airfare.
2. Phone bills if any.
3. Overseas travel and health insurance.
4. Other personal spending and costs not mentioned above.

The volunteer will be teaching conversational English for 16-20 hours per week. No classes on Saturdays and Sundays.

Fees

There is a modest administrative program cost for both the Volunteer Teacher Program and the China Study Program and which the volunteer or student must pay.

There is a ONE TIME administrative fee of \$350
and
A \$50 per month maintenance fee.

The volunteer or student can extend their stay up to any period of time that they wish providing that they can obtain the required government visa. Fees are payable upon completion of arrangements and should be compatible with the visa period. For example the total fee for a planned stay of three months would be \$500 and the total fee for one year would be \$950 with annual extension fees of \$600 payable at the time of visa extension for those who stay for multiple years.

Benefits of the Volunteer Teacher Program

The CNteach program fee covers an administrative charge, placement arrangement, accommodation, three meals/per day during the teaching periods, local transportation for volunteers and supervision, daily coordination between volunteers and the sponsoring schools as well as the organization of social activities such as parties, conferences, family visits/stays and so on.

The program fee is also taken as the contribution and donation from the volunteers to the China Teach and Volunteer Program to help the students and schools in development of the curriculum, and cover the costs of the library facilities, the textbooks and teaching materials.

As this is a teaching and volunteering program, the volunteers should not expect financial gain from the program. However the volunteers do benefit from living with the local Chinese community, experiencing the Chinese culture, visiting the relics of the Chinese heritage and as well in the making of Chinese friendships.

For the moment, the CNteach program focuses on the placement of volunteers in Yantai City and its neighbouring cities, Shandong Province, China. The people in Shandong are hospitable, friendly and easy-going and show great respect to the foreign teachers and volunteers.

Additional Costs of The Chinese Study Program

While there are free Chinese language classes for the Teacher Volunteers there is an additional program fee for students who prefer to spend full time studying the Chinese Language. This fee varies from school to school, and will be quoted separately depending on the requests of individual applicants.

Additional Information

For information on Yantai and Shandong Province, please refer to the following sites for details:

State Maps and Information for Nuclear Survival

(Updated as of October 1st, 2002)

For the last several years, these pages **USED TO** include a list of *hundreds* of (Email VERIFIED) Intentional Communities and Survival Preparedness Groups along with an Ark Two state TEAM Leader in forty-eight of the 50 States.

Because of the changing circumstances that some see as the increasing immediacy of the threat, and because of a perception that there has been a recent change in the social / governmental attitude towards individual rights regarding freedom and property there has been a growing consensus among the individuals that were listed here that it is no longer prudent for them to make their names and locations public. It has become too arduous to maintain the list in response to the growing number of requests for deletion, and the fact that the list was going to become too skimpy to be useful has now led us to have to regrettably abandon it altogether after these many years of effort spent to assemble it.

While for years we have encouraged people to form survival communities and groups and to build shelters and otherwise make preparation - most of those who have done so are of the opinion that there may not any longer be sufficient time to integrate further members into their groups and communities. They are concerned that if the threat situation continues to increase, at the rate that it presently is, they will be overwhelmed by individuals who are not prepared and that those individuals instead of adding to their resources would only be a drag and potential for depletion to what they have prepared.

It is with regret that we have come to this point. Ark Two itself still welcomes any who wish to join its community in Canada AND we are still maintaining the structure of these pages AND THE REGISTRY so that in case of a nuclear war we may be able to implement these structures for providing assistance during the RECOVERY and REORGANIZATION phases. We hope at that time to be able to re-establish contact with, or appoint new, TEAM leaders in all the states and localities and then provide a network for developing assistance and cooperation among them.

**The following States in "red" Generate the MAJOR FALLOUT
According to FEMA**

Click on *your* STATE'S NAME in the DIRECTORY below to see its targets and other IMPORTANT information. Also look at the *TWO* maps at the botom of this page.

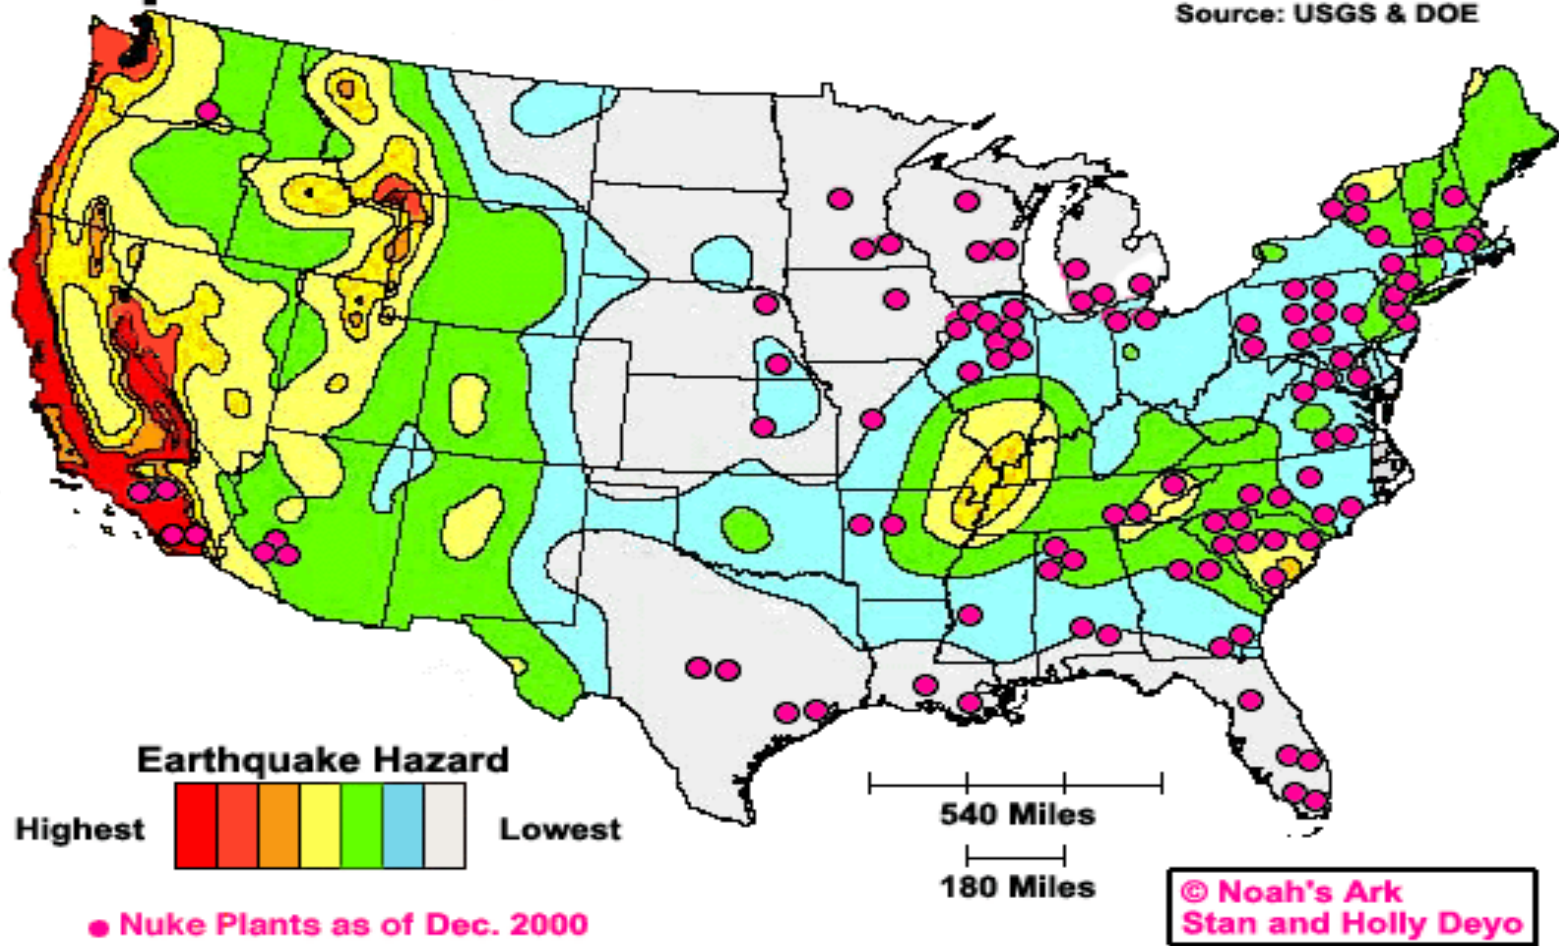

<u>Alabama</u>	<u>Alaska</u>	<u>Arizona</u>	<u>Arkansas</u>	<u>California</u>
<u>Colorado</u>	<u>Connecticut</u>	<u>Delaware</u>	<u>Florida</u>	<u>Georgia</u>
<u>Hawaii</u>	<u>Idaho</u>	<u>Illinois</u>	<u>Indiana</u>	<u>Iowa</u>
<u>Kansas</u>	<u>Kentucky</u>	<u>Louisiana</u>	<u>Maine</u>	<u>Maryland</u>
<u>Massachusetts</u>	<u>Michigan</u>	<u>Minnesota</u>	<u>Mississippi</u>	<u>Missouri</u>

Nuclear Survival in **Alabama**

This is the nuclear target map for Alabama, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Alabama](#) that follows it.

This link will take you back to the [Index of all the States](#)

Nuclear Weapon Target Map for Alabama (FEMA-196/September 1990)

[UPDATE to Target Information!!!](#)

Information for Alabama

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to Alabama.

1. Look at the [State Map](#) above to see the target nuclear areas in Alabama.
2. Look at the [general expected fallout map](#) to see where Alabama (according to the **prevailing wind pattern**) gets fallout from other states.

3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of STATES](#) for

- **Montana**
- **North Dakota**
- **South Dakota**
- **Nebraska**
- **Missouri**
- **Colorado**

These six states contain what is called DENSE PACK which I explain on each of those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "**prevailing**" wind pattern.

4. Bookmark the present URL or make a copy of this present address so that you can come back to it after going to

[Blast Mapper](#).

This mapper is on someone else's web site so that you will need to save this address in order to return here if your back button doesn't work. However, you want to be sure to go the mapper site and calculate the damage to probable targets (cities) around you.

5. Memorize the THREE top rules for survival. They are:

- Number One - **Get out of the cities!**
- Number Two - **Get out of the cities!**
- Number Three - **Get out of the cities!**

6. The follow-on rules are:

- a. Have a shelter

- b. Work with a group (you are going to need the manpower, brainpower, and skillpower).
- c. Stock supplies.

7. My [Main Survival Page](#) contains links to lots of other information such as free books to download about nuclear survival, links to plans for building shelters, and even free consultation about building a shelter.

8. If you are SUPER concerned about nuclear survival you might consider moving within 20 miles of the

[Ark Two Community](#)
(in Canada)

9. And finally if you would like to be on the mailing list of the author of this site - send a blank email to:

Updated October 1st, 2002
UPDATE to Target Information !!!

By Bruce Beach - Radiological Scientific Officer

The FEMA Maps

Target selection continuously changes, for a variety of reasons, most of which are either political or technological. The FEMA target maps are the only official ones that we have and some persons have criticized them because they feel that they are quite old and do not reflect recent military base closings, new facilities and so forth.

Even at their best - the FEMA maps only painted a conceptual picture of a perceived threat. No one could say, then or now, for sure what criteria foreign military target planners would use to select targets, how many missiles they'd commit, how powerful they'd be, how many would actually get through or how accurate they'd be.

One could be CERTAIN, both then and now, that nowhere near the number of targets shown on the maps would actually be struck. Many years ago there was a movie called - "On the Beach", which envisioned total annihilation of human life upon the earth. Nuclear scientists took up the term to measure the strength of the world's nuclear arsenals and concluded that there exists somewhere between 4 and 5 Beaches. That is to say - enough nuclear armaments to eliminate from fallout all human life on earth (four or five times over) if they were all exploded.

Anyone who simply looks at a FEMA map and says - "Ahhh - all those little yellow spots, that is where the bombs are going to fall," or "Ahhh - that yellow spot was a military base near me which no longer exists - so now I am safe", simply does not understand the problem. To begin with, as I explain in my booklet [YOU Will Survive Doomsday](#) a very small percentage of the population will have a bomb fall on them. It is other causes, resulting from the bombing, that will actually kill them. For one thing - fallout can go anywhere and it can be very deadly. As I repeatedly point out - death from fallout radiation is not a pleasant way to go, but death from that cause is avoidable.

The yellow dots on the FEMA maps were 'potential' targets. The criteria in originally selecting them included not only military sites, (which may or may not still exist) but also industrial, transportation, energy producing, and population centers which may have subsequently radically changed. Generally, for the latter, there are simply more.

You should use the FEMA maps only as a general guide to the targeting criteria foreign military planners

would likely use in selecting their targets. A few things have changed dramatically since the maps were drawn. For one thing, the Titan Missile Wings (sites) in western Missouri and eastern Kansas have been deactivated.

HOW MANY NUCLEAR WEAPONS WILL BE USED?

The REAL question then - in evaluating the nuclear threat - is to determine FOR YOURSELF how many nuclear weapons YOU think will be used. The information that I am presenting here, is to help you in making that decision.

Here are some possible conclusions:

- All will be used.
- None will be used.
- Some will be used.

If one thinks that ALL the nuclear weapons will be used - then it is goodbye world. I will accept this as a distinct possibility, or at least the possibility that such a number will be used so as to have the same effect. If you believe *definitively* that is what will occur - then very simply you won't (and don't) have to worry about it. However, I believe (and it is only my personal belief) that because of Divine Intervention, through what will appear to be natural causes, that the event will be extensive - but limited.

On the other hand - there are those who think that because of man's rationality, or God's kindness, that none will be used and we don't have to worry about it. Many of these people feel that I am insane for my concerns. I can only say that I hope they are right.

It is only the third case that I present here. I feel that nuclear WWII is inevitable. Others may feel that it is only probable - or somewhat probable or possible. The degree of your concern will determine the value that you will put on the information that I am about to present, and the action that you will take based upon it.

First - my own conclusions. I feel that a sufficient number of weapons will strike North America to destroy 80% of its population. What that number of weapons will be is what I am trying to estimate. The information presented here is what I base my estimates on.

Presently, in the world, there may be fifty-thousand (50,000) nuclear warheads. Many of these are tactical (for use by field artillery) rather than strategic (for use on ICBMs - Intercontinental Ballistic Missiles). Two years ago, under Clinton, the US had recalled its tactical weapons from the field, and they were no longer under the control of field commanders. HOWEVER, as of this date, under Bush, they have now been again deployed to the field and Bush has cancelled many of the disarmament treaties and has definitively repudiated Clinton's policy of "No FIRST Use" saying that the US may use nuclear weapons -

even pre-emptively.

Of the strategic nuclear warheads, many (most) are now obsolete. They certainly are not mounted on warheads and ready for launch. It is really only the latter than we need to concern ourselves about, and if we wish to take a narrow view of self interest, it is only the potential enemy's that we need to concern ourselves about.

The US owns by far the largest current tested arsenal of nuclear weapons. Russia the second largest, and France may still have the third largest. Israel is thought to have about 400 (up from an estimate of 200 about a year ago). The major change, and it is a big one, is that they have put three nuclear ballistically armed submarines in service. China too, in the last year, has made considerable advance in its nuclear arsenal, particularly as applies to ICBMs of which it now has a number capable of reaching the US.

There are over 20 other countries in the world who are thought to have perhaps joined the nuclear club - but not all, like India and Pakistan, have tested their weapons. These latter, in the last year have made threats to each other - something inconceivable that a nuclear power would openly do even three years ago.

Weapons alone are not enough. One must also have delivery systems. While there is talk of suitcase weapons for terrorist purposes, the delivery system of choice is still the ICBM (Intercontinental Ballistic Missile) or the SLBM (Submarine Launched Ballistic Missile). Complete delivery capability has been defined as the TRIAD. Land, Air and Sea. Of late, one leg of the TRIAD has fallen into disfavor. Russia still has Bisons, and the US both B-52s and B2s, but they are beginning to be recognized as a technology that is becoming rapidly obsolete for nuclear delivery. Improved radar, satellite detection systems, and the much improved accuracy of interception missiles has much decreased their usefulness. They have also become relatively less cost effective. Consequently, the US under the Bush administration has announced that bombers - even the B2 - will no longer be nuclear armed. In the future this will mean that their bases, and bases that would have been used for refueling will no longer have as much priority as a target. This US policy and strategic change is just taking place and will require time to be reflected in the thinking of Soviet target planners.

Theatre nuclear weapons still include aircraft and ship mounted nuclear weapons such as the Cruise Missile, but our major concern here is the ICBM and the SLBM (Submarine Launched Ballistic Missile). So far, we are not aware of, nor are there supposed to be, (but I wouldn't bet on it) any space launched ballistic missiles. In fact, there are only three countries known to have operational SLBMs. The US, Russia, and Israel. Under normal circumstances it is possible to have only about one third of one's fleet on station at a time. For the US and Russia this means a half dozen each, and for Israel one or two because the latter has a total of three subs. If this gives you any particularly comfort it should be pointed out that each of the subs (particularly the US and Russian) carries more destructive power than was used by ALL the world's armies in the Second World War. There may be other terrible weapons (such as HAARP - don't ask) that we know nothing about. Who among us knew about the Atomic Bomb - until it was used.

Until the present US Administration there had been extensive discussion over the last decades about

reducing the world's nuclear armaments. In actuality they had become much more dispersed, efficient, reliable, and capable of being delivered with much greater accuracy. A reduction in their total number is not reflected in a reduction of their destructiveness or effectiveness. Actually, quite the opposite - more destructive power is being developed and deployed in manners that are more efficient. This is true, not only of the US, but also of a number of other countries. Pakistan, India, North Korea, and many others now have capabilities that would have made THEM a premier world power - a half century ago.

The United States currently has 7,295 deployed warheads compared to Russia's 6,094, and while the Bush administration is discussing making cuts down to 1,500 nuclear warheads in the US arsenal, these cuts are not to take place for years. In any case, as I have stated earlier, the ones that we need to be concerned about in making North American target estimates, is the ones held by the potential enemies.

China is thought to have fewer than 300 nuclear warheads capable of reaching the US. Some estimates put the number at even one-tenth of that. Whatever the present number, it is certain that they are in an all out effort to increase the number of their DF-31 and DF-41 rockets that will have that capability. Likewise, Russia, for the last three or four years, has been on a crash program to field as many as possible of their Topol-M, quite arguably the most advanced ICBM in the world. As a result of cancellation of the SALT agreements by Bush, Russia has said they will MIRV (Multiple Independent Re-entry Vehicles) their ICBMs. This is the same as multiplying by some factor the number being deployed. Americans may go on about other countries being backward and stealing their technology but they should remember that the Russians put the first satellite, the first man, and the first space station into space. Likewise the Chinese deployed a satellite and tested a nuclear weapon - decades ago.

But, let us only concern ourselves with what exists at the moment. Conservatively let us say that Russia and China combined currently have 7,500 nuclear warheads supposedly capable of reaching the US. So that we do not just scare ourselves to death, let us suppose that with their deteriorating economies that the maintenance on these have made about half of them operational. Let us say 4,000. And let us say that only half of these would be aimed at North America, the rest being aimed at Europe and other places in the world. This means that only 2,000 would be aimed at North America and let us further assume that US defenses are such that we will stop half of them (although I am not certain how one currently stops an ICBM or particularly a SLBM). But anyway, that leaves us with 1,000 nuclear weapons exploding over North America.

Now, please forgive me, but since I live in Canada, I am going to look at what share we might expect to fall where I live. Canada has ten percent the population that does the US, so I am going to say that Canada is going to get 10 percent of the North American warheads - or one hundred. In Canada we have a rule of thumb that the province in which I live has about 50% of the Canadian population, GNP, industry, and so forth, so I am going to say that we can expect about 50 nuclear weapons in Ontario.

What I am suggesting is that you make the same sort of extrapolation for your state, but I can tell you that when I start adding up the targets around Ontario, I find it hard to find a place to put 50 weapons. But here is an attempt.

- 1 at Niagara Falls - A big power generating source.
- 4 other power generating stations (mostly nuclear)
- 1 on Ottawa (the Capital of Canada)
- 1 at Sault Ste Marie (across the river from a US nuclear forces base)
- 4 other Canadian Military bases (about as threatening as boy scout camps)
- 5 on Toronto and what we call the Golden Horseshoe
- 1 on North Bay (if they don't know it has been deactivated as a NORAD site)
- 17 total

AND I feel that is really stretching it, but I wouldn't really know where to put anymore, without say bombing out some beaver dams or attacking my bus shelter. :) But, anyway, I expect the number is ridiculous, and I really wonder if the province could survive at all if 10% of the 50 weapons - that would be its North American share were used. That would be 5 nuclear weapons, each one more than a hundred times the size of the weapon used on Hiroshima or Nagasaki. Think about it. It is called the unthinkable for a reason. Now, do a similar extrapolation for your state.

On the same ratio of 10% of available weapons, as calculated above, and the 1% or 2% of total weapons existing world wide we would be talking about 100 weapons in North America and 200 world-wide. This would be like the energy release of two thousand SIMULTANEOUS Hiroshimas, along with the accompanying fallout. Lord, (I am not being facetious in addressing the Almighty) how could we possibly survive it? I can only pray that You have a plan.

So, when you look at all those yellow dots on the FEMA map - I think that you can forget that, and start trying to figure it out another way. Here is where I would put something less than 100 weapons in North America, and Lord, I hope it is a LOT less.

TARGET SELECTION

Targets are selected on a:

- Primary
- Secondary
- Tertiary

basis. That is to say - those which have first, second and third priority.

Primary Targets

- a. Three submarine launched high altitude bursts evenly spaced over continental US to create EMP (Electromagnetic Pulse) to knock out communications. The reason they would be submarine launched is because submarines can launch from off both coasts, are the least detectable and can get in the closest - for the least warning.

- b. Satellite to satellite strikes for weaponry, communication, control and surveillance technology that the general public does not know about. Who can guess about something we know nothing about - just as we knew nothing about the atomic bomb before Hiroshima.
- c. Submarine ports on both US coasts and at US controlled ports elsewhere in the world to prevent any submarines that are in port from getting underway. Normally only one third of the fleet is on station at a time. Number of subs that would be eliminated in this way depends on whether the attack comes as a "bolt out of the blue" or that navy is on some "high DEFCON status". The subs are considered the most threatening part of the "Triad".
- d. In the past, NORAD (North American Air Defense) communications centers at Colorado Springs, Colorado and North Bay, Ontario have included been included as Primary Targets. The latter has supposedly been deactivated, but what other 'secret' locations exist and how well the Russians and Chinese know those 'secrets' is problematical.
- e. SAC (Strategic Air Command) bases have been considered a priority for a strike out of the blue. Omaha Nebraska is of course the headquarters. Still, everyone knows that, so other arrangements have been made - such as 'Alice' and 'Looking Glass', which are airborne command centers - and as mentioned previously there is talk about new space and sub-sea elements. Air Bases are a good target for SLBM's (Submarine Launched Ballistic Missiles) especially forward bases in allied countries such as Turkey, Saudi Arabia, Britain, and France (which has its own nuclear force), and Navy Aircraft Carriers wherever they may be (and they would certainly wish they could find the submarines).
- f. Surprisingly, Washington D.C. and the Pentagon have often not made primary target lists. Washington D.C.. because there is one targeting theory that an enemy wishes the leaders to survive so that they have someone to negotiate surrender. The Pentagon, because while we hear of the famous war room and so forth, in actuality the Pentagon then becomes insignificant because we would be beyond the time of planning, policy, and procurement.

Secondary Targets

By this point there would have been used one or two dozen weapons against American Forces.

- g. Beyond first strike, to catch the bombers while on the ground, - air bases and nuclear bombers are no longer considered as prominent a part of the Triad targets as they once were. Previously, it was thought important to get all the ten thousand foot runways in the US to prevent the bombers from returning to refuel and rearm. Not seen as so likely today.
- Major metropolitan areas will of course remain major targets, but these are SECONDARY target issues because they will have little effect upon US retaliatory capability, which are the concern of PRIMARY target issues. Major cities remain major targets simply for the

confusion, affect on morale, and political, social, and economic disruption they will cause the US. Most everyone can identify what the top 20 US city targets will be in this regards. One must remember that there will be similar world targets of US allies, so that recovery assistance will not be available to the US. One must, however, begin to ask - exactly what the geo-political, and overall goals are that target planners wish to achieve. Targets such as these may be used as hostages for negotiation - assuming that the planners have as a part of their model, the ending of the war and achieving some particular goals.

- It used to be thought that US Military training bases, war materials production plants, and such, would be important targets. But that is WWII thinking - not WWIII thinking. Everything, used in the war will already have been made, deployed and trained upon. There will be no time for further preparation or deployment. The only thought will be how to get it stopped.

Tertiary Targets

Tertiary targets no longer have the prominence they once had in target planning, such as they did at the end of WWII when the bomber reigned. Then a bomber, assigned to a primary target, might carry multiple weapons and if it or a companion plane destroyed the primary target then it needed to go on to a secondary target so as not to waste the weapon in re-bombing the same target. This is particularly true of nuclear weapons - where one is sufficient.

A plane would then carry a priority list of additional targets within its range or return path, so that it could dispose of its weapons. With the little likelihood of getting a second chance, it is a matter of use them or lose them.

Between the Primary target sites and the Secondary target sites we have possibly used 50 weapons in North America. So what is left over? The question is - how completely do you want to devastate the land? There has already been enough damage done that the political and social organization has been destroyed. In North America aid flows in to limited disasters, a fire, tornado, earthquake. But now, everywhere would be in disaster. No electrical power, communication, or help available - from anywhere. The following map shows some principle North-South corridors, because I feel that the country would be severed East-West because of river crossings.

It is questionable that society could be restored but just to assure that the devastation is complete and that the country is severed a target planner might select as tertiary targets to destroy the bridges over the Mississippi and Missouri and the key railway passes through the mountains. Key nodes on the electrical, communications, and pipeline grids - and so forth. The following map is comprised of railway and highway nodes linking through Kansas City. You can do the same thing for any other major city.

You can take all those maps - and seek to designate targets. I have done it and I can tell you it is hard to find places to put another fifty bombs.

There are many academic studies that have been made on this subject, by VERY knowledgeable and capable people. If you wish to really study into it more then here is a link that has been highly recommended by both The Bulletin of Atomic Scientists and the Encyclopedia Britannica, both of which are very worthy sources:

<http://www.nukefix.org/>

I have said 100 weapons to devastate America. The nuclear subs alone carry hundreds between them. Launch and move on and wait. That would be the strategy. From satellite and other reports you would eventually be assigned another Tertiary target that hasn't been struck. The process could go on for months with nuclear powered subs. However, I hope that it won't last a week - before we find a way to end it.

How Likely Are the Weapons To Be Used?

By what insanity could mankind possibly pull down upon itself the destruction that I have described above and in [YOU Will Survive Doomsday](#)? My answer is by the same insanity that permits him to build such Abominations of Desolation in the first place. By the same insanity that expresses his selfishness and anger throughout the world almost daily in the killing of what amounts to at least tens of thousands of human beings annually. Men who are intellectual giants and spiritual midgets. Men who have turned from the will of God who loves all His creatures and wants them to all love one another.

One may say, "Yes, but we have gotten this far without using them - so why would it ever change?" But, the change is in the wind. The US says that it is abandoning the policy of MAD (Mutual Assured Destruction). In the past this was the rationale for not having an effective Civil Defense Program and a national civilian shelter program. It was thought that everyone on both sides would be destroyed anyway,

and to implement a shelter program would mean that one did not really believe in MAD - and therefore their shelter preparations would be seen as threatening by the enemy. So, one just wanted to be sure that they had total SECOND STRIKE CAPABILITY accompanied with ASSURED ANNIHILATION of the enemy and no enemy would ever attack them. Thus - the US under the Clinton and previous administrations maintained a "No first strike policy". The Russian's under their previous administrations did likewise, but just recently the Russians have said that they have changed their policy - in favor of first use.

Russia, China and some other countries never agreed that a nuclear war was not survivable and they continuously developed shelter programs. Under the US Reagan Administration it was felt that a defense - popularly called Star Wars - could be built against nuclear weapons. Most thinkers agree that it is an impossible idea, but the very attempt to try it was outlawed under the ABM (Anti Ballistic Missile) treaty. The reason the Russians (who were permitted under the treaty to maintain a few ABMs around Moscow - but which the US felt would be ineffectual) wanted such a treaty, was that they felt the very attempt to develop ABMs would create an arms race they couldn't afford. If any one nation DID come up with a defense - then other nations could be forced to surrender under nuclear blackmail. The US under Bush cancelled the treaty and has gone ahead with ABM development. Continuously, we now hear of some general in Russia or China who says they think that nuclear war is now inevitable.

And then there are all the Third World Countries with their axes to grind. Pakistan, Iran, Iraq, North Korea, Syria, Libya, and others. Yes, their conflicts can bring in the major players. Just the US preoccupation anywhere else can be incentive to China to solve its Taiwan problem. For some countries, such as Israel, nuclear may come to be seen as the only solution. Israel, greatly outnumbered, more than a hundred to one, could easily feel forced to nuke the capitals of its attacking enemies, and in the last few months it has indicated that it would take such "appropriate response" as needed.

For much of the last year, since 9-11-01, there has been expressed increasing concern about the existence of "dirty bombs", suitcase nuclear weapons, nuclear weapons concealed in sea shipping containers, and the delivery of bio/chem weapons, especially dealing with anthrax and smallpox, into North America by various terrorist organizations and the latest "empire of evil" of choice, which happens at this writing to be Iraq.

While the threat of Iraq (and Iran, Syria and Libya) are very great to Israel - these countries have no practical means of large scale attack on the US and for technical reasons widespread attack on the US by bio/chem is improbable. However, the use of WMD (Weapons of Mass Destruction) by ANY power, anywhere in the world, will undoubtedly have a very destabilizing effect. Thus it is that even limited powers can trigger an event that can bring about a world-wide conflagration.

Given the nature of modern weapons and the natural barrier of two great oceans, I do not expect there to be an invasion of any sort into North America. The perils of civil disorder, and responding military rule, rest within. Nevertheless, the threat of world cataclysm has never seemed greater.

No matter how irrational my analysis may seem to many - one fact remains. There are nuclear weapons in

the world. Plenty of them.

MYTHS

Here are twenty-three myths that are repeatedly heard (some much more often than others) that this document tries to dispel.

- [MYTH #01](#): Almost everyone will suddenly be killed on doomsday.
- [MYTH #02](#): Most people would be quickly killed by the bomb blasts, thermal radiation, or radioactivity.
- [MYTH #03](#): You can build an adequate shelter in your basement.
- [MYTH #04](#): You must filter the air coming into a shelter to remove the fallout.
- [MYTH #05](#): Water would become radioactive.
- [MYTH #06](#): There would be no dangerous radioactivity after a couple of weeks.
- [MYTH #07](#): Radiation sickness is not contagious so there is no danger in assisting those affected.
- [MYTH #08](#): Food exposed to radiation becomes radioactive and is therefore not edible.
- [MYTH #09](#): If you have a special *radiation suit* (like you see in the movies and on TV) you will be protected from the radiation.

You Will Survive Doomsday

- [MYTH #10](#): New crops of food grown in future years will not be radioactive.
- [MYTH #11](#): There is no such thing as a fallout pill.
- [MYTH #12](#): There is a fallout pill that will protect you from all radioactivity.
- [MYTH #13](#): There would be dangerous radioactivity for thousands of years.
- [MYTH #14](#): There would be no dangerous radioactivity after a couple of years.
- [MYTH #15](#): You are prepared if you have a two weeks emergency supply of food stored.
- [MYTH #16](#): You should be prepared to be self-sufficient and be able to survive on your own.
- [MYTH #17](#): Any survivors would have to live the rest of their lives underground.
- [MYTH #18](#): Life after doomsday won't be worth living.
- [MYTH #19](#): You need not make any preparation because you are either going to die in the holocaust or be *saved* (religious connotation).
- [MYTH #20](#): The bombs today are so large and there are so many they will destroy the world.
- [MYTH #21](#): You will receive adequate warning from your government.
- [MYTH #22](#): You will receive no warning, and there is no hope if you do.
- [MYTH #23](#): One of the primary targets will be nuclear power plants.

This document is published by a nuclear survival group. The group is not affiliated with any religious group or other organization. We welcome inquiries from all persons interested in joining our survival group. Send email to survival@webpal.org (*Bruce Beach*) for more details.

DOOMSDAY

MYTH #01: Almost everyone will suddenly be killed on doomsday.

You will survive doomsday. And here you thought that if it ever happened the bomb would fall right on you. Probably not. It will more likely go like this.

One day, the inferior Russian computers may make a mistake and decide that the US has already launched a pre-emptory attack against Russia. The US warning system has made that same sort of mistake many times and a number of times we have gotten just minutes away from launching our retaliation before the mistake was discovered. Who is to say the Russians will always be so smart?

Forty minutes after a missile is launched from Russia it will be landing on its target in North America. Before this occurs the US has just minutes within which to respond or it will be caught with its missiles down. The hotline to Russia happens to be not working (this has also happened a number of times before). That is one of the factors that entered into the Russians decision to launch.

So, what's his name in the White House reaches for a jellybean and pushes the button. Interception missiles of course try to stop the Russian missiles before they reach their first two primary targets, NORAD (NORthern Air Defense) headquarters in Colorado Springs, Colorado and its backup at North Bay, Ontario.

These are hardened underground computer and communication sites that may require several bombs to wipe them out. Given the number of missiles that may be intercepted the Russians have sent a handful.

A better way to wipe out the communications of North America is to just explode four thermonuclear devices at a high altitude over the continent. These will generate an EMP (Electro Magnetic Pulse) that will knock out most electric and electronic devices tied into the power grids. It will also knock out any new devices that contain IC's (integrated circuits) and that have an antenna over thirty inches long. That means that your car radio, portable radio, and television will be inoperable, even if the power ever does come back on.

All over the continent the power and lights will suddenly go off. If you happen to be listening to a battery operated old tube type radio (when did you last see one of those?) that is tuned into a "hardened" transmitter sight (I don't know where you will find one) that transmits (fat chance) the EBS (Emergency Broadcast Signal) then you will know that doomsday has begun.

Otherwise you will be standing out there with the rest of us survivors saying, "Nice day, eh? Strange the power would go off on a nice day like this." Silence. The sun will continue to shine, and the birds will sing, and the breezes will blow and you will still not know that they have a bit of a problem up in North Bay. They are no longer there. Silence.

Eventually word may drift in. On the chance that there is something to the rumor you decide to try to call someone. Your spouse, a friend, a relative. Don't bother. Silence. The telephone isn't working either. Even if the EMP hadn't done it in, a mere power outage causes such an overload of demand on the central exchange that you couldn't even get a dial tone.

You are a survivor. Doomsday has occurred and you are a survivor. While you are waiting for the spouse and kids to get home maybe you should do something practical. Like go down to the supermarket and lay in a bit of an extra stock.

You may notice that the little corner store has closed. If he has believed the rumor, he wants to save his stock. And besides, your money may not be worth anything tomorrow. You thought you had seen rapid inflation before but this is like from zero to a million in sixty seconds.

At the supermarket, if you are early enough, you will find pandemonium. If not, you will find practically nothing. Maybe a large bag of dog food (take it) and some cans of floor wax (forget it). The rest of the stuff was all in those carts that you met come flying up the walk as you came running down.

There won't be any girls at the cash registers, (they have done their shopping and gone). Besides, the cash registers aren't working anyhow, with no power. It may have taken the hired manager a little longer to figure out that he should grab what he can and head home to his family, but he has probably gone now. The only cops you will see are the one's grabbing stuff themselves.

If on the way back you spot a shopping basket with something in it - think twice before helping yourself. If there is an altercation there are probably no doctors at the hospital to sew up the lacerations. Everyone else is also too busy to bother calling an ambulance, if they could, and one wouldn't be available if they did.

Of course the trip to the supermarket may have been nothing like that at all. It may have just been a bit more active than usual but if most people haven't caught on yet then we are very lucky. You just keep mumbling under your breath. "Good people, good people - that's the way, that's the way, just stay calm." This way we can just go about doing what we have to do as quickly as we can, while trying to not stir up panic. "Yes. I understand the cash registers aren't working but please let me just help you add this up by hand. No, that's fine, just keep the change."

Then, of course, if everything is really this calm we can take that good old plastic credit card and go out and buy all the good survival stuff that we are going to need and should have gotten beforehand. Don't worry about paying for it, no one is ever going to send you a bill. Getting the stuff home may be a bit of a problem if the car isn't working (the EMP may have wiped out that fancy electronic ignition). "No, that's fine. You don't need to deliver it. I'll just put it here in my little red wagon." But you sure don't want to lug it all the way up to your thirty-second floor apartment, if there is somewhere safe that you can stash it. "Can you really believe that people are staying this calm? How is it that we seem to be so much smarter than the rest?"

More than likely you are now back home and all you have is the fifty-pound bag of dog food. Are you really going to be able to carry it up to your thirty-second floor apartment? You know the elevators aren't working of course. Then maybe you could hide it in the trunk of your car in the garage- if no one sees you.

Ah, back home in the apartment. Home sweet home. The kids are home from school now. Do you have enough guts after that scene at the supermarket to send them out to do some more scavenging? It isn't exactly a party going on out there. Did you see Watts, Detroit, Washington D.C., and Baltimore after some of their similar parties? I did. I think I would keep the kids home. Not much you can do except to wait for the spouse to walk home. Shouldn't be more than a few hours.

The spouse finally makes it home. "What do you mean all you got is fifty pounds of dog food? We don't even have a dog." The electricity isn't on. We can't cook anything anyway. Best to eat everything out of the refrigerator before it spoils. Won't be anymore water as soon as the gravity feed tanks on the roof empty. Hope you saved a few pot's full. If everyone filled up their bathtubs - it is all gone. It has gotten cold. Might as well go to bed. There is no light to see anything by anyway. Certainly not going out in those streets in this dark with all that noise going on down there. Hopefully, everything will look brighter in the morning.

Day Two

Morning comes early with the noise of people throwing pots and pans over the sides of their balconies along with the blankets, pillows and other things that it saves them carrying down. Apparently some of the residents are moving out. Perhaps you should too.

Everything looks better in the light, doesn't it? TV still doesn't come on. Telephone isn't working either. And you know what - the toilet doesn't flush. Can't cook anything. Got to eat what you've got. See, that wasn't so bad. Make it sort of a picnic. Eat it right out of the can. There is not going to be any water to wash dishes.

But see, **we survived doomsday**. Didn't even see an explosion, hear a bomb, or anything. Maybe we should sit down together and try to figure out what we are going to do from here. The bombs may still be coming. Probably are.

If the attacker's plans have gone according to schedule they have probably finished with their primary targets. They have hit the three Titan Wings in Kansas, Missouri and Arkansas (three wings, eighteen missiles each, for a total of fifty-four) or the things have landed in Russia by now, so why bother. They have certainly been knocking the bejammers out of Montana and the Dakotas. Can't hear or see a thing from here of course. [Author's update note: This point is a little dated. The Titan Wings have been decommissioned and both the U.S. and Russia have now put much greater reliance upon the MUCH greater and more reliable destructive power of MIRVed warheads aboard nuclear submarines. The primary targets are now most likely submarine bases, to prevent more subs from leaving port. Further update as of January 1st, 2002. The world keeps changing. Now not only Russia has missiles that can reach the US but China does also. There are now 14 nuclear nations and the number is growing).

Then they will start on the secondary targets. All the SAC (Strategic Air Command) bases both in the US and around the rest of the world. Oh, they have lots to keep them busy for a while. Cities themselves are pretty far down the list. Maybe they won't even go for them. Any airport with over a ten thousand foot runway is pretty important however because the SAC could land and refuel their bomber there. So you know where that puts us. They will probably get around to us in the next day or two.

There are two strategies of warfare. One is called *counterforce* and the other is called *countervalue*. With counterforce you knockout the enemy's forces so he can't harm you. This can be very chivalrous like the fighting codes of the knights of old. You never harm the women and children.

On the other hand, with countervalue, you go after everything the enemy holds dear in order to demoralize him. This was the technique of the Mongolian hordes.

"Take no prisoners." "Eliminate the enemy." "The only good Indian is a dead Indian." "Eliminate the Jews." "Sock it to the Japs."

Women, children, babies, everybody goes.

Now the problem with countervalue warfare is if everybody knows they are either going to win or die, some people can get very tough. So maybe the best thing is to knockout the military forces and hold the cities as hostage. "Now, either surrender or we bomb the cities." Anyway, the cities aren't generally the first targets.

And so here we sit. **Unscratched**, the day after doomsday. But we can see some problems on the horizon. Very possibly the city is going to be bombed in the next day or two. Even if it isn't, how can we stay here? The electricity is off. The heat is off. The water is off. And it isn't coming back on. The elevators aren't working. For older people it is "If we go down (if they can go down), we can't come back up."

There is no more food in the grocery store. And there won't be any more. (Unless you believe your government, which says they will start delivering it in about two weeks - want to bet?). Then there is that horrible stuff called fallout that is going to start showing up in about twenty-four to forty-eight hours, or sooner.

Now, we have all seen or heard about the book and the movie "On The Beach", and Beach himself shows up with the *solution*. A pocket full of cyanide pills. If you want one he will give you one for each of your kids or grandkids. There is only one catch. There are only so many and I don't want them wasted. So you will have to line up each of your children or grandchildren in a row and pop it down their throats right while I am here. How many of you will do it? "Here is your vitamin. Open wide..."

No? Then you really are a survivor. Here you always said you hoped the bomb would fall right on you and then when I offered you an easy out... Oh well, it won't be that bad. A world without electricity, automobiles, radio, television, telephones, and supermarkets. And maybe eventually with only twenty million people in North America. (They won't all be Canadians).

But then, that is the kind of world that was here in 1800. The people then didn't have cars, supermarkets, movies, TV, radio, telephones, modern medicine, airplanes, rockets, and computers. And they survived. They may have even enjoyed life. Maybe even more than many people do today with all their drugs, tranquilizers, and what have you.

People generally are survivors. Put them out on an ice floe in the middle of the arctic with no expectation of rescue, no supplies - nothing - and they will hold on. Some will even survive until they happen to be rescued.

So you are a survivor and you survived doomsday. But you will eventually die. We will all eventually die. That is the nature of this world. The question is not whether or not you will possibly die, but how long you will live, and what life will be like during that time.

So you have survived. And if you and your kids are going to continue to survive you had better get the heck out of the city. Not only is there the possibility that there will be bombs but those little scenes down at the supermarket, or anywhere else a little bit of food happens to show up, are going to become more and more unpleasant as anarchy prevails.

Moreover, without the toilets flushing and with no one removing the dead bodies, health conditions are really going to reach a state you just wouldn't want me to describe. So, off to the country. But, how? And, where?

Before actually departing for the country let us further consider the alternative of staying in the city. Perhaps you are convinced that the Russians would never really get around to bombing your city. Or you feel you have sufficient underground shelter if they do. Nothing, of course, would protect you if there were a direct hit on your shelter, but a good bomb shelter could certainly give you very good protection as little as five miles from ground zero.

The trouble is that subways and underground garages are not designed as blast shelters. They do not have blast vents and doors. Anyone in such a place, at the time of blast, within a couple of miles of ground zero will be subjected to a phenomenon called *popcorning*. Minute particles of greatly accelerated sand will cause blisters to pop out all over exposed parts of the body. This, combined with several other pathological mechanisms, will probably result in a rather painful death within a few days.

Although the blast protection in an underground shelter is much superior to being above ground there are reasons that one is better off staying in their high-rise apartment rather than going to a large public shelter if they feel there is little or no danger of blast.

The public shelters have no supplies and no equipment. The average designated public shelter is supposed to shelter over three thousand people. Can you imagine the anarchy and conditions there? Without food, the first to die will be infants who are not being breast fed. Other early candidates will be persons who require special medications (especially the elderly) and anyone who happens to be injured.

Not only will deaths have negative psychological effects on the survivors, they will create severe sanitation problems. There will be enough sanitation problems anyway if the water and sewage systems are not working. Most of the designated shelter locations do not have sanitary provision for three thousand people in the first place.

One of the greatest hazards in an underground shelter is carbon dioxide poisoning. The designated public shelters, almost without exception, do not have adequate ventilation for large numbers of people over a considerable period of time. And the existing ventilation systems generally depend upon electricity being available.

There are ventilation defense and survival techniques available. However, if you were to try to implement them in a large public shelter situation you would probably be one of the first persons killed by the other survivors. The reason is that most people have misconceptions about either the air becoming radioactive, or containing radioactive particles that they feel would be more dangerous than the carbon dioxide.

Add to these problems the fact that you might not have any light in the shelter, that anarchy may become rampant, and that there will almost certainly be no food, and perhaps, more importantly, no water and you will see why no trained survivalist would want to be caught dead in the place.

Returning to one's own high rise apartment, after the danger of blast is past, gives much more favorable opportunities for continued survival than given by remaining in a public shelter. If you are ten or fifteen stories above the ground the distance will probably adequately protect you from any radiation from the fallout on the ground. If there are ten or more stories above your head then that distance will also protect you from fallout on the roof.

The apartment dweller should try to secure an inner room without any windows. A blast fifteen or more miles away will knock out the windows and it is the glass shards that will kill most people. Pulling drapes and blinds are all helpful defenses. A blast wave will be preceded by a brilliant flash of light. The survivor will have from several seconds to three or four minutes, depending upon the distance from the blast, to duck behind a sofa or to take other shelter.

Training oneself to take similar immediate defensive action can also help give protection from the intense thermal radiation that accompanies a nuclear blast, and that can start fires *fifteen to twenty* miles from ground zero. Fires, in themselves, can be a problem and if you are downwind from a large fire or firestorm you have to watch out for carbon monoxide poisoning.

Fire defense techniques are generally well known so I will not dwell upon them here. One thing you need not do is call the fire department, if you could. There is little they could do, if they were still around, without central water supplies. But the thing you can do is improvise closings to seal off all the apartments above you, and those immediately below you, so that fallout will not blow

You Will Survive Doomsday

in and settle on the floors over your head, or otherwise near you.

Now, it may be possible to organize your activities with other survivors to become a cliff dweller like those of old. A bucket on a rope might be used to haul up water gotten from a nearby stream or pond, and waste could be let down in the same way.

Some ingenuity may be required in providing heat and light, but if you really have sufficient supplies of food for yourself and your fellow survivors to hold out until another crop can be planted and harvested (most survivalists recommend at least two years supply), and you seriously face up to the sanitation problems created by morbidity, and you and your co-survivors are sufficiently organized against anarchy, and there are no more nearer bomb blasts - then you are probably well on your way towards continued survival. At least you are many times better off than being in a public shelter.

There may be all sorts of reasons why you elect to remain in the city rather than head for the country. If the attack comes in the winter and you do not have a planned escape route, adequate clothing and supplies to make the trip, are not physically able to make the trip, and do not have a known destination of refuge, well then...

Those who have most prepared themselves and have made the best plans should pray that their flight does not come in the winter. During a storm, or severely cold weather, it is very likely that many more persons may be killed by exposure than by any other single cause. The roads and highways will most likely be jammed. If there has been an explosion in the vicinity then overpasses and utility lines may have been dropped onto the roadways making them unusable.

Even without a blast having occurred, traffic jams, accidents, or vehicles just running out of gas will probably create bottlenecks that completely clog the roads. Once people find themselves just sitting there, not moving, they will abandon their vehicles. My guess is you can forget using an automobile for escape unless you had a plan and immediately implemented it before the general panic set in.

A motorcycle, scooter, or even a bicycle might offer certain advantages over an automobile. One might carry a smaller form of conveyance on a larger one and then implement the smaller means of conveyance, such as a bicycle, when that became the necessity.

The most dependable means of escape would probably remain walking. If one had to walk all the way out, and they were in any physical shape at all, they could surely do it in two or three days. Once again, proper preparation can make all the difference. Proper walking gear, proper survival clothing, a planned escape route, proper selection of material to be packed, and proper allocation of loads.

And, as before, there are better alternatives. One could have pre-arranged pickup points and times with co-survivors coming from the refuge destination, or in a worsening pre-crisis situation you may have made an early dispersal. But the greater likelihood is that anyone with a practical survival plan who reacts immediately can get out well before the rush sets in.

Just getting out into the country, or to the other side of the mountain, will increase the survivability factors for many people. The threats of blast and thermal radiation will have been greatly reduced. But blast and thermal radiation while very nasty in their effects are not going to kill that many people anyway. Oh, they will kill millions, but as a percentage of the people living the day before doomsday they will, combined, kill only ten to fifteen percent. And most of these will be a considerable distance from the blast and will eventually die as a result of injuries caused by the broken glass shards.

As stated before, depending upon the time of year and the weather, many more may be killed by exposure. But there is still another big killer coming. That is of course the fallout from the weapon explosions that took place many hundreds of miles away. This fallout may require from a few hours to a day or two to arrive. If the weather permits, and the survivors know what they are doing, they may still have time to build an expedient shelter against the fallout.

Techniques for defense against fallout have been developed and tested at great expense by almost every nuclear nation. While information on these techniques has been made readily available, most people have not availed themselves of it.

Two basic techniques are available. One is to leave the contaminated area. But the extent of the contaminated area may be far too wide to escape, or one may not have accurate information as to the delineation of the contaminated area, or they may not have the means of transportation, nor the means of survival should they reach a radiation free area.

The other basic means is to provide shelter within the contaminated area. Weather, ground, and time conditions permitting it is possible to dig a trench and cover it with dirt supported by poles, wooden doors, or a vehicle. Properly designed, such an expedient shelter can make all the difference between avoiding the effects of fallout radiation, and not avoiding those effects.

The details of how to build an expedient shelter are to be found in books listed in the [bibliography](#). One of the most important and often overlooked factors in designing a shelter is the matter of providing an airpump so as to eliminate the problem of carbon dioxide poisoning. The technique for building such an expedient pump from materials readily available in time of crisis is also found there.

The effect of fallout radiation is not always death, although many times it is. Even if it is death it is not immediate death. Intense radiation causes a very painful, and horrible death (what the literature calls a *hard* death) over several days. More likely the effects are drawn out over a period of weeks, months, or even years. As the title of this document points out, all these people will have survived doomsday. It is not a question of survival but the condition of survival with which we must concern ourselves. Everyone will die eventually but it is the quality of life in the interim that is of importance.

MYTH #02 Most people would be quickly killed by the bomb blasts, thermal radiation, or radioactivity.

By the second year after doomsday the combined affects of blast, thermal radiation, and fallout will probably have resulted in some immediate, but mostly delayed, deaths accumulating to 35% of the population that were living on doomsday. Deaths that can be directly attributed to radiation and weapon related injuries will continue until five years after doomsday so that by that time 40% of the population that was living on doomsday may no longer be surviving because of the above named factors.

However, the total population surviving five years after doomsday will probably be only 20% of the number that was living on doomsday) Obviously, nearly half, or perhaps more than half, of the fatalities will be directly contributable to causes other than the bombs.

What then are these equally effective causes of post doomsday mortality? They are exposure, starvation, plagues, and anarchy. While the threat of chemical and biological warfare is not to be ignored the primary causes of these means of mortality can be looked upon as being more *natural*. That is to say they will just result naturally from the breakdown of the social infrastructure that we regularly depend upon for day to day survival.

The four factors that will determine survival are

- Location
- Knowledge
- Preparation
- Luck

On doomsday most people will be living outside of areas that will be struck in initial attacks by blast or thermal radiation. Many others will already be living in areas that will never be damaged by blast or thermal radiation. Both of these groups, if they have the knowledge of what to do, and have made the proper preparations, will very likely find themselves in the group of survivors who are living unharmed five years after doomsday when the surviving population has once again established some semblance of order and is once again multiplying and replenishing the earth.

Selecting and Designing a Shelter

MYTH #03: You can build an adequate shelter in your basement.

For a number of reasons, basement shelters do not offer the amount of protection that is commonly supposed. A proper analogy between them and a survival installation as described later in this document would be to compare a plank with a well-equipped and commanded lifeboat. This is not to say, that if someone finds themselves in the water from a sunken vessel, it is not well to advise them to grab hold of a plank and start paddling in the direction that one hopes there lies shore, if there is no better means of survival, such as a lifeboat, or raft.

Similarly, there is very little protection afforded (starting from the rooftop down) by a layer of shingles, a foot or two of light insulation (composed mainly of air-spaces for the purpose of retaining heat), a quarter to half inch of plaster board, some paint, a carpet on the floor, another layer or two of thin boards, and perhaps some paneling or ceiling tiles if the basement is finished. The distance between the roof and the basement (a two-story house offers more than a bungalow in this way) does allow some additional protection, but this factor, along with the combined density of all the matter described, would not equal more protection than would be afforded by six to eight inches of earth.

When, within such a basement situation, one starts to create an expedient shelter using, as is usually advised, such materials as bookcases and trunks (filled with earth if possible), there are certain design errors that are liable to creep in. Piling dirt or other material on the floor above will help but the greatest dangers will be from the areas outside the basement wall where the foundation extends above the ground. It is best to keep ones shelter at least three feet below the outside ground level, and to have at least three feet of soil above one's head.

The next most overlooked problem is that of proper ventilation, so as to avoid carbon dioxide poisoning. As stated before, most survival experts advise a location other than the basement for such reasons as the threat of carbon monoxide poisoning in case of fire, broken gas mains, and the threat of fire itself that may result from the wide spread firestorms caused by the thermal radiation associated with a nuclear blast.

There are certain advantages to a basement shelter. One may have access to necessities such as food, clothing, and blankets stored in the home. There may still be water available from the hot water tank. And, most importantly, one may feel certain psychological comfort by being in the familiar surroundings of their own home. None of these advantages of course hold a candle to the advantage of being in a properly equipped and manned survival center.

MYTH #04: You must filter the air coming into a shelter to remove the fallout.

One of the general misconceptions regarding fallout and fallout shelters is that the air itself may become radioactive. This is simply not true. Those with a little learning will then say "Ah, yes, but it will contain radioactive particles of fallout". That is true, but a properly designed air intake, even for an expedient shelter, will cause most of the particles to drop out of the air flow before the air enters the shelter.

Should the number of particles still suspended in the air be a problem, an expedient filter, such as a damp sheet hung in the air intake passageway, will do an adequate job of filtering the air.

If the air vents do not have automatic blast valves then the air passage should be quickly shut and remain shut for a few minutes after the brilliant flash of a nearby nuclear explosion (so as to prevent the popcoming effect described earlier). The air passages will have to be shut in every case where there is a large fire nearby that is generating carbon monoxide that would otherwise seep into the shelter.

Most expedient shelters will not have precautions such as those just described. The danger of carbon monoxide poisoning is one of the main reasons that most survival experts recommend that even if one has a basement in their house it is preferable to build an expedient shelter a considerable distance outside and away from existing structures in case of fire.

MYTH #05: Water would become radioactive.

As has been mentioned before, the materials necessary for building an airpump, and an expedient radiation detector, are available in almost every home. Anyone planning on attempting to use the basement survival method should obtain ahead of time the detailed instructions for building these devices, and store these instructions in their home, along with an emergency supply of food and containers for storing approximately 14 gallons of water for each individual that is going to be accommodated.

There is a similar misconception about water becoming radioactive as there is about air becoming radioactive. This may have something to do with misconceptions about the nature of *heavy water*, but we won't go into that here. Radioactive particles do become suspended in water, however, and that is why for the shelter confinement period, you must make sure that you have a sufficient store of potable water available ahead of time.

During the recovery period, after radiation has decreased to the point where it is safe to work outside, there are techniques for letting fallout settle out of water, and for distilling water, in order to make sure that it is safe for drinking and cooking. However, far from keeping air and water out of a shelter, it is absolutely necessary to life that they be available.

While an expedient shelter could mean the difference between life and death, it is probably not something that you would want to continue to use for a very long time.

MYTH #06: There would be no dangerous radioactivity after a couple of weeks.

There is a wide range of misconceptions about what is safe and what is not. The matter is sufficiently complicated that a person should have professional advice. However, if there was no doctor going to be available to set a broken leg I presume you would go ahead and do the best you could. And if one had to build a bridge to get across a river and there was no structural engineer around, again I presume one would have a go at it.

Doctors would like to have their x-ray machines available when setting a leg, and engineers would like to have their surveying equipment, specification guides, and computers or slide rules when they are building a bridge. So you can well imagine a radiological defense officer would like to have radiation detection equipment available when giving advice in a radiation defense situation.

However, if the advice, expertise, or equipment, is not available, one must go on. One rule of thumb is that if there is not enough fallout that you can see it, then there is not enough of it that it will kill you. Fallout is usually small grain dust or grit, often having a light color, but not always. It depends upon its source. The best place to spot it is on a smooth surface, like the hood of a car.

The more dense fallout is, probably the greater the hazard, although there isn't necessarily a direct correlation. It may fall thick enough that quite a little heap of it may be brushed up from a surface that is one foot square. It is possible to build, from common materials found around the home, an expedient radiation detection meter. The details for such a meter are found in books listed in the [bibliography](#).

Even if one has commercially available radiation detection equipment there is still some considerable skill required in its use. For example, almost all survey equipment is designed to be used by an adult of normal stature. This means that if the equipment is held in the hand of a walking adult it will tell how much radiation is being received 3 1/2 feet above the ground, and particularly by the adult's vital organs which are above that level. A child's or an infant's vital organs will be below that level and will be exposed to much more hazardous levels than an adult's. For this reason, if one is passing through an area that is suspected to have any radiation at all, a child should be carried on an adult's shoulders.

There is another rule of thumb that for every seven fold increase in time radioactivity will decrease by ten fold. This is called the seven/ten rule. This is based upon standard decay. It is useful as an example, for training, and in building theoretical models, but in actual practice the decay rate is likely to be something quite different. It is determined by the isotopic composition of the matter under consideration.

There is another commonly held misconception among semi-trained individuals that low levels of radiation cannot be rapidly fatal. Someone, after several days in the confines of a cramped expedient shelter, might conclude that because their meters now indicate a very low level of radioactivity (or perhaps no radioactivity if it is a high-range instrument), that it would now be all right to go outside and sleep on the ground in the cool breezes beneath the bright summer stars.

The fallacy again arises from taking measurements at a level that assumes the vital organs are well above the radiation source. This is not the case when a person is stretched out on the ground for long hours of sleep. These long hours of low level radiation exposure to the vital organs will result in a fatality in just a few days.

Likewise, perfectly healthy adults who take infants out of the cramped, unpleasant, expedient shelter to allow them to play during the day on a blanket spread out on the ground will be quite shocked to see those infants sicken and die in just a few days while they themselves remain healthy. The infant's vital organs again being close to the weak radiation source for a long period while the adults' vital organs are being protected by distance.

MYTH #07: Radiation sickness is not contagious so there is no danger in assisting those affected.

The statement that radiation sickness is not contagious is often found in the literature. That is true. The erroneous conclusion is drawn, however, that being around persons with radiation sickness is not dangerous. The danger arises from the manner in which radiation kills.

Sufficient radiation can cook the vital organs, but more often what happens is that it kills the white corpuscles and the ability of the bone marrow to make more of them. It is the white corpuscles that are the body's defenders against viruses, bacteria, and other disease causing bodies.

Once these defenders are lost the person succumbs to a disease they might have otherwise warded off, and once that disease takes hold in the individual they may become highly contagious.

In this manner there is grave danger of plagues breaking out, and all sorts of illnesses one does not generally see, becoming very threatening. For this reason rigorous quarantine, sanitary measures, and health defense measures must be imposed and enforced.

Becoming aware of such unexpected and unpleasant snares may initially make one feel that the situation is hopeless. The danger really arises from a person's unfamiliarity with the circumstances. There is the story of the explorer who asked the young native if there were crocodiles in a certain stream. He was assured there were not. While then swimming in the stream he once again saw the young lad on the bank and asked for reassurance that there were no crocodiles. "Oh no sir!", replied the shocked young fellow, "They won't come here. They are all afraid of the piranha."

The young fellow would have found himself equally in danger from things with which he was not familiar in our society, like automobiles and electrical appliances. It is not that the hazards are so onerous, but simply that we are not familiar with them.

FOOD - Some Important Considerations

MYTH #08: Food exposed to radiation becomes radioactive and is therefore not edible.

Food is the most serious problem. Most food that is in the house will not be harmed by the radiation, no matter how intense. There are three types of radiation that are found in fallout. Alpha particles, beta particles, and gamma rays. As the first two names indicate, they are particles. They are minute (too small to be seen) pieces of atomic matter that attach themselves to the fallout (bits of dust that may or may not be large enough to be seen).

In any case, these particles may be simply washed off many types of foods that have a natural covering, such as eggs, bananas, potatoes, oranges, etc., or off well sealed foods such as those in vacuum packed cans. Foods such as grains (rice, dry cereals, etc.) that are in partially used packages that have been opened should be viewed with suspicion. Fallout dust may have crept in.

The food in its unopened container or natural covering should be rinsed under flowing water and then placed on a surface that has been similarly cleansed, before opening. Make sure that the hands (and under the nails) have been thoroughly cleansed before handling the food. There is little danger in handling such articles. The radiation given off by these particles is so weak that it will often not even penetrate something as thin as the cellophane wrapper on a package of cigarettes.

You may then ask "Why, then, be concerned?" The reason is that once these minute particles are ingested into the biological system they will get into the organs and the very bone marrow itself where they can do a lot of damage. This is not to say that you need not worry about getting the alpha and beta particles on your skin. You do. Because they can cause skin burns. However, good hygiene practice can eliminate that problem but they are a much more severe hazard internally than externally.

MYTH #09: If you have a special *radiation suit* like you see in the movies and on TV you will be protected from the radiation.

As an aside, this is one of the reasons that those *fallout or radiation suits* that you see in all the pictures and movies and on TV are such a **joke**. Those things are not going to protect the guy from anything, that a couple of good garbage bags wrapped around his feet and made into a hood to go over his head, would not do as well. In fact the garbage bags are in many ways better. They would be considered disposable.

The main purpose of the fallout suits is to prevent the wearer from tracking the fallout into the shelter. The user simply takes the suit off at the door. If the person were to wear it on inside, it would defeat the purpose. There are some clean handling techniques that are beneficial to know and practice, but in a wartime situation there is so much of the stuff around that peacetime standards of exposure and cleanliness lose their meaning.

The gamma rays are another matter. They are very penetrating. No fallout or radiation suit is going to protect you from them. It requires much more dense matter to protect you than you could lift, let alone lug around. This is why one must remain in a shelter when there is intense radiation. With good housekeeping there should not be so much dust inside a shelter as to create a hazard from gamma rays. However, be sure to dispose of the contaminated rinse water that you have used for cleaning the food containers and persons returning from outside. It may contain matter that is giving off gamma rays.

There will probably not be sufficient fallout on the food packages (or you can get rid of it quickly enough) that you need concern yourself about the amount of gamma radiation that you are going to get from that source during the decontamination process. However, the food may have been stored in an area that has received very intense radiation. That can of beans or peaches may have been stored right out there where it was receiving 1000 roentgens of radiation per hour. An amount that would have killed you right away. But it will not be harmed.

That is right. It is perfectly edible. If it were not so I would have told you. It is only living things that radiation hurts. Even then it depends upon the frequency and intensity of the radiation. For example, there are all sorts of radio and TV waves going right through where you are sitting right now and they are not harming you.

The food in the can is already dead and the gamma rays are not going to harm it. They will not make it radioactive. If the radiation is strong enough it may kill any bacteria that happen to still be living in the food and thus preserve it even further. If the food is supposed to contain bacteria (such as yogurt) I am not sure what it would do for that!

Radiation preservation of food is a technique that is already being used in industry and will probably become much more widely used in future years. Many people already have radiation (microwave) ovens in their homes today. One further analogy. Fire will kill living animals but we use it to cook our food. You really shouldn't be overly frightened about radiation, either.

MYTH #10: New crops of food grown in future years will not be radioactive.

Food that is grown in radioactive soil, or that has not yet been harvested when, fallout falls on it is another matter. This food will absorb the particles of radioactive matter into its own structure and thus become dangerous.

The biological food chain acts as a marvelous strainer and concentrator of radioactive isotopes. This was well demonstrated in certain tests that took place at Almagordo. From some intentional surface bursts and because of the unintentional venting of some underground bursts there was some fallout carried onto the milkshed for southern Utah.

The amount of fallout deposited over the surface was so slight that the most selective instruments could not detect it. An atomic or nuclear explosion releases its great amounts of energy by changing some matter into energy. It also changes certain amounts of matter into new and different types of matter. Without going into detail about atomic theory, the nature of the atom with its electron rings, and its nucleus consisting of protons and varying number of neutrons, let us simply say that these new forms of matter are generally unstable isotopes. That means they are going to change into another form of matter.

Once again, the matter, in the process of changing from one state to another, releases certain amounts of energy. It is this energy that we measure as radioactivity. The energy, depending upon the isotope involved, may be rapidly dispelled or it may continue to be released for a very, very long time. Most unstable isotopes release their energy and transform into a stable state within fractions of a second or at least within minutes after a nuclear explosion. Others take hours, and still others days, weeks, or months. Some take centuries.

Each isotope starts out with just so much energy. For all practical purposes we can say it is not going to get any more. Once that isotope has released all its excess energy it will become stable. Since the isotope releases its energy at a specified rate we can say how long it will take to lose half of its energy. After that, it will then take the same length of time again for it to lose (give off) one half of the remaining amount of energy. Question: When will all of the energy be given off by the isotope?

An ancient Greek philosopher posed the same problem. He said, "Suppose there is a bear at the back of a cave. On the first day the bear walks halfway to the entrance. On the next day he walks half of the distance that remained to the entrance after the first day. And on the day following the bear walks half of the distance that remained to the entrance from the previous day. The bear continues to do this same thing on each subsequent day. He walks half of the distance to entrance of what was left from the previous day. The question is: when will the bear get out of the cave?"

The answer is: "Never." This sort of regression is what mathematicians call asymptotic. That is to say the figures continue to approach zero, closer and closer, but they never reach it. So just as the bear never gets out of the cave, all of the energy is never lost. But much (one half) of the energy is lost in the first half-life. And three quarters of the energy is lost by the end of the second half-life. After ten half lives a very large percentage of the energy is gone.

It is because so much of the energy is lost in the early periods (half-lives), as compared to the later periods, that it is important to be in shelter during the early periods after fallout has fallen. We might divide the half-life times of radioactive isotopes into three categories. Very short term, medium term, and very long term.

As mentioned earlier, most of the unstable isotopes generated by an atomic or nuclear explosion are very short term. They give off all their significant amounts of energy in a matter of seconds. Unless you are within very close range of an atomic or nuclear bomb there will be no way for this radiation to reach you. It was this initial radiation that caused the horrible radiation burns and sickness at Hiroshima and Nagasaki.

First the good news. There will not be any persons subjected to long suffering from the initial radiation by the nuclear weapons of today. The bad news is that the reason why is that the weapons blast such a large hole or create such a large area of complete destruction that the initial radiation can't escape. That is to say the totally destructive blast extends beyond the range of the initial radiation.

On the other hand, the survivors of Hiroshima and Nagasaki did not have much problem with fallout. The first major victims of fallout were some fishermen many, many miles downwind from the Bikini Island tests. Fallout is a phenomenon much more associated with nuclear weapons.

Nevertheless, there was fallout in Southern Utah. As stated before, it was so slight it could not be detected by the most sensitive instruments. The specific matter of interest in southern Utah was the isotope 131 of iodine. This was absorbed by minute bacteria in the soil. In the process of filtering the iodine out of the soil the bacteria greatly concentrated it.

The bacteria were absorbed by legumes and other biological forms higher in the food chain. Each in turn further concentrated the iodine isotope.

Finally, after the iodine had found its way into the grass a cow came along and ate it. Now a cow is a very complex organism in itself. There are all sorts of biological activities going on in a cow. Various organs and the bone marrow filter out different minerals for different purposes. One of these complex systems forms milk. This particular cow, and hundreds of others like it, was milked, and the milk was bottled and distributed to children all over the area of southern Utah.

The children were also complex biological organisms. They in turn had numbers of specific organs that specialized in straining out various minerals and compounds from the food that they consumed. The end result was that their thyroids once again concentrated the iodine 131. And this to such an extent that if you held a radiation detector next to their necks it buzzed like a rattlesnake. This was not healthy.

In fact numerous problems developed among the population. There were a great number of mentally retarded children born, and a number of other unpleasant ramifications. This need not have occurred from the iodine 131 if we had known what we know today.

MYTH #11: There is no such thing as a fallout pill.

There is a simple pill that would have prevented the difficulty. It is supplied in every nuclear emergency kit in Russia and available in Denmark and Sweden. Unfortunately it is not sold in North America.

Fortunately, however, the pill is quite simple to make. Ahead of time, obtain a quantity of potassium iodide from your local drug store. Five dollars worth should be lots. When needed, take a regular glass and fill it a fourth or less full of water, and then slowly start pouring in the potassium iodide while thoroughly stirring the water.

Don't worry about how much you pour in. You cannot pour in too much. After a while you will notice that the chemical no longer dissolves in the water. It just lies there on the bottom. This means that the water is saturated. You can now stop pouring in the chemical. More will not help or hurt.

Next take an eyedropper, or a soaked piece of paper if you do not have an eyedropper, and drop four drops onto a little piece of bread for an adult. Or two drops for a child. If you get several times that amount it is not going to harm you (although in much larger amounts it is a poison).

Now take some butter or margarine and make a little ball out of the bread and pop it down. Tastes awful. Ugh. Take once a day for 100 days after the last bomb falls. This is good stuff and you should have it around for reasons other than defense in case of a nuclear war.

If you live anywhere within in a couple of hundred miles of a nuclear generating plant you might suddenly find yourself needing the stuff. The US department of Health rushed a supply of pills to Three Mile Island and they have a standard brochure all printed ready for distribution in case it or some similar site vents.

The department of defense also keeps a supply near the old Titan sites that are deteriorating and breaking down. [Author's update note: Once again those sites have been now decommissioned and no longer present a problem, but much greater concerns now arise from Terrorist Threat, and the U.S. Government is now stockpiling in many cities not only these pills but others for Bacteriological and Chemical Threats]. Canadians have nothing. I'll take that back. They do have lots of nuclear plants and the distinct possibility of bombs exploding over their heads and on their soil.

The reason why the potassium iodide works is that the thyroid will absorb only so much iodine. After that, any iodine taken into the body is passed off by the kidneys. Since the body already has all the good stuff it wants it passes out the bad stuff. This is what we call thyroid blocking.

Do not try to use the tincture of iodine that you put onto cuts. Taken internally it will kill you. And you cannot eat enough iodized salt to do you any good. You would get salt poisoning long before you got sufficient iodine to do the job.

MYTH #12: There is a fallout pill that will protect you from all radiation.

I wish I could tell you about another pill that would solve all your radiation and other problems. But there is none. Unless you mean the cyanide pill mentioned earlier and things really are not that
file:///E:/PROPHECYKEEPERS/data/POST-NUCLEAR-WAR/d_resources/survival/books/doomsday/index.htm (12 of 26) [9/11/2004 8:23:23 PM]

gloomy. As I hope I have carefully explained, most of the radiation we have to be concerned about from a nuclear bomb will decay in a matter of days or weeks to a level where we can deal with it.

MYTH #13: There would be dangerous radioactivity for thousands of years.

You may say "I've heard that some radiation will be around for thousands and even hundreds of thousands of years". Yes, but those isotopes are our friends. (That may be putting it a bit strongly.) Anyway, they are not near so harmful as many people think. There is the point of view that no radiation is good for you. Some dermatologists maintain that you should not even get a suntan. (Yes, that is radiation that you get from the sun.)

There is even the theory that it is cosmic radiation that causes both overall genetic change, aging, and death. In any case we are all subjected to many sources of radiation every day. The question is not whether or not you are going to receive radiation, but how much and how quickly. Let us compare the radiation we are concerned about with another type of radiation. Heat.

Just as we measure radioactivity in roentgens we measure heat in calories. If I were to tell you that that pipe over there was going to put off a million calories of heat, you might say, "Let me get away from it!". But, if I then said that it was going to be over the next million years, at the rate of one calorie per year, you would realize that you were in greater danger of freezing to death than of burning to death if you were depending upon that pipe for heat.

It is not how much heat is going to be given off (it may be a large amount) but how much over what period of time. A mere two hundred calories suddenly inflicted upon one point of the skin would create a bit of a sting, but hundreds of thousands might be comfortably absorbed from a heating pad over an appropriate period of time.

It is the same with radiation. Most isotopes give off their energy so rapidly that they are like flash bulbs. Flash and they are gone. It just happens right in the vicinity of the bomb. Others are like regular light bulbs that give off their light and heat for some period of time before they burn out. They may travel a long way from the bomb as fallout before they dissipate their energy. For these we need a shelter to protect us if we are in their vicinity. Nothing else will do.

Still others are like those small luminescent lights that some people put in their bathrooms for night-lights. Only weaker still. They just sit there and barely glow for a very long period of time.

Little miniature flashlight bulbs or matches are a good analogy to fallout particles. One or two of them in a room with you will not harm you. But surely you can imagine the situation where if you had thousands and thousands the light would either be blinding or the heat so intense that you would be incinerated.

Fallout is just the same way. A few pieces inside a shelter with you will not harm you, but if you go outside where there are millions of the little beasts lying around then you have had it. The only difference between their radiation and the radiation from a little flashlight bulb or a match is that it is invisible radiation that you cannot see or feel - like that from an x-ray machine.

MYTH #14: There would be no dangerous radioactivity after a couple of years.

After having explained all this, now I must tell you that there are some isotopes that unfortunately do not fall into either the short range of initial radiation (which we do not need to worry about because it does not extend out of the blast area), nor the medium range (that you will be protected from by a fallout shelter), nor the very long range (that decays over so many hundreds of years that their energy is too weak to concern us here).

These remaining isotopes are real meanies. There may be solutions to the problems they present but there are no simple solutions. There will not be enough of them around that they will make walking around dangerous for most people but the problem is that they get into the food chain and that they have relatively short half-lives, between five and 30 years.

That means that during the next couple of hundred years they are going to be giving off most of their energy. Fortunately, some of them are rather rare, and given that they are going to be widely dissipated in worldwide fallout we can largely ignore their effects.

Others may be concentrated in certain areas, certain types of soil and certain foods where we can avoid them also.

So they will not be that serious a problem.

You Will Survive Doomsday

Some others, however, particularly Cesium 137 and Strontium 90, present mayor problems in keeping them out of the food chain. Even here, there are available defense techniques. For example lime, gypsum, fertilizer, or organic matter (in practical amounts) may be applied to low calcium soil, or naturally high calcium soil may be used for growing certain crops which have an uptake preference for calcium over strontium.

There are known refining and purification techniques for some foods and milk, and there are some new techniques which I have discussed with some of the researchers at some of the leading nuclear laboratories, but which the world isn't ready to hear about as yet.

These methods along with others such as land denial, deep plowing, surface scraping, and selective utilization, are harsh realities that are going to have to be faced by the long-range survivors.

MYTH #15: You are prepared if you have a two weeks emergency supply of food stored.

More important to the present theme are questions as to what preparations survivors should be making ahead of time. Since it will take a while to get crops growing again because of social disorganization, ozone depletion in the atmosphere, climatic changes, crop adaptation, early crop failures, soil deprivation, and similar factors, survivors will need a couple of year's supply of food. Wheat and honey are the only two basic foods, of which I am aware, that have an indefinite shelf life. Thousand year old kernels found in the pyramids have still sprouted. Fortunately, these two foods, wheat and honey, meet most adult nutrient requirements. Powdered milk will be necessary if one wishes to reduce the infant mortalities. The infants will not survive otherwise, unless their mothers have adequate natural milk, which is unlikely. Salt is important as a preservative, among other purposes.

In addition to storing the four basic survival foods (wheat, honey, powdered milk and salt), it is highly advisable that one also store a couple of year's supply of a variety of (non-hybrid) seeds. Some seeds will not store very well and need to be continually replaced.

It is equally important to develop certain skills. *Gardening skills.* I particularly recommend the area of hydroponics because this would be one way to grow foods free of contamination. *Preserving skills.* Here I recommend learning to dry foods using hot air. Freeze-drying requires too much elaborate and expensive equipment and freezing itself is not reliable when electricity is not reliable. *Preparation skills.* Bread making, use of lentils, and making of many foods, or their substitutes, that today are commonly gotten in prepared form.

On all of these subjects one could write a book. Indeed many books have been written on them. Even if one does not have time to immediately develop all these skills they might do well to get themselves a survival library and then as a next step acquire the essentials in materials listed in checklists in most well organized manuals.

MYTH #16: You should be prepared to be self-sufficient and be able to survive on your own.

The very best thing that a survival minded person can do, after preparing for themselves an equipped place of refuge, and developing their own survival skills, is to associate themselves with other skilled survivalists. No one person can know everything, and almost everyone can contribute something. Agricultural, medical, mechanical, communicator, you name it, all skills will be needed.

Few people could afford the equipment that an organization can have. One well-equipped laboratory for testing for alpha and beta particles in food costs \$5,000. Along with other radiation detection equipment and many other types of emergency supplies, what individual can afford it? Yet no nuclear survival group should be without one.

Even in building a shelter the mayor expense is the entrance and support mechanisms such as emergency lighting, water source, etc. The incremental cost for space for one additional individual is quite small. Thus, the greater the number of people the overall cost can be spread over, the less the average cost.

Moreover, no individual has the personal resources that a group has. If the head of a single family survival group is injured or lost the chances of survival for that group are much reduced. However, if it is a large group then there are numbers of people available to continue to give support. Just like there are numbers of people available to maintain twenty-four hour watches, or to create a well manned convoy to go after necessary supplies. One more prepared and equipped individual added to such a group is an asset, whereas in a situation like a public shelter, one more unprepared and unequipped individual is just another liability.

A successful survival group will have to be either completely homogeneous or thoroughly committed to thoroughgoing tolerance and appreciation of a wide range of individual preferences regarding society, economics, religion, and future expectations. Still, a shelter is not a democratic society anymore than is a ship or an airliner. The captain's authority is absolute and one should have confidence in his credentials and ability before boarding.

Neither is a shelter a democracy in the sense that there must be much more stringent rules regarding behavior. Everyone must perform assigned duties. There are no wealthy passengers along for a
file:///E:/PROPHECYKEEPERS/data/POST-NUCLEAR-WAR/d_resources/survival/books/doomsday/index.htm (14 of 26) [9/11/2004 8:23:23 PM]

free ride to be served by others. There are many limitations to personal freedoms such as contraband materials. No drugs or alcohol (except under medical prescription and then as approved by the commander).

All firearms and weapons must be placed in the armory and will not be released except under orders from the commander. All valuables will be receipted and stored in the locker for safekeeping. No private stocks of foods because under survival conditions this can lead to social disorder. No tobacco or smoking inside the shelter, since it would cause discomfort to others.

No loud toys, devices, or other objects that would be environmentally disturbing to others. No large bulky items, or great quantities of any item without the permission of the commander. And no pets or animals unless the survival community has made prior special arrangements for their accommodation.

Tough. Yes, It is tough. But not nearly as tough as the conditions of survival will be for those who are not prepared. There are many items that are not prohibited, and in fact are encouraged. A reasonable supply of one's personal religious literature, the tools and resource manuals of their trade or profession, survival manuals and equipment of every sort, additional supplies of food to be put into the common larder, and extra supplies to be put into the common store.

MYTH #17: Any survivors would have to live the rest of their lives underground.

Many people ask how long they might expect to have to live in a shelter. There are no fixed answers. If your shelter is an expedient hole in the ground you might want to stay in it no longer than was absolutely necessary. Maybe as much as a couple of weeks. If you dug a pretty elaborate hole in the ground you might be able to expand upon it and make it into a place where you could survive through a winter.

If you owned space in a shelter city, like there is in southern Utah or southern California, you might plan to live there the rest of your life. The co-operative shelter that I have been describing in the previous paragraphs is not sufficiently elaborate that anyone would want to make it a permanent home. Some persons would probably be able to find larger and more adequate quarters elsewhere after a few weeks.

Others might improve upon the existing structure and remain there for a year or two until more adequate homes could be built elsewhere. Decontamination procedures would provide work areas, schools, and school grounds outside of the shelter where people would carry on their daily activities after a few weeks. However, it might be beneficial for young children and expectant mothers to sleep in the shelter or a similar structure for several months.

Certain occupations, such as decontamination crews, farmers who work on large un-decontaminated areas, explorers who go into unsurveyed areas, long distance truck drivers, and others who go out of well defined areas for the next several years, will have to be closely monitored to be sure their total exposure does not exceed established limits.

It should be apparent to the reader, from what has been said earlier, that a person may receive substantially larger total doses over a large period of time than over a short period of time, just as with sunlight. A person may easily recover from several small sunburns throughout the years, resulting from staying in the sun overlong for an hour or two each time. If they were to be exposed to the hot desert sun, that many hours all at once, they would succumb.

In the same way one may recover from a number of small radiation burns (although some controversy holds that one never recovers - this seems unlikely), and in just the same way one may receive small amounts of radiation and never feel ill. Just the same, certain biological conditions dictate that certain individuals, (particularly the reproductively active) should receive less radiation exposure and that others may receive much larger amounts.

MYTH #18: Life after doomsday won't be worth living.

Hearing descriptions of this sort some persons wonder if life will be worth living afterwards. For some, most assuredly so. Others do not find life worth living today. How many times have you heard of a person like a famous movie star, who had wealth, fame, beauty, health, the company of famous illustrious persons, opportunities to travel to all sorts of places, and to participate in all sorts of interesting events, the fulfillment of the very aspirations of thousands of young ambitious people and yet that same person committed suicide.

On the other hand there are many individuals who suffer daily from terrible physical afflictions and all sorts of personal misfortunes. Oftentimes in the greatest poverty. And yet, the world over, down through the centuries, they have gone on surviving. Many actually finding happiness, meaning, and perhaps even enlightenment in life. You will survive. The conditions of that survival are up to you.

Undoubtedly, the events that are about to transpire will have a profound effect upon the attitudes of many people and perhaps upon mankind itself. From the cauldron of the holocaust there may spring forth a new race of men who are less concerned with self-interest and who will come to understand man's true nature and his divine destiny.

Some of us may even feel that this event will herald the coming to maturity of the human race. Instead of no future, mankind may have a glorious future. There will be great amounts of resources available, combined with man's great advances in technology, to build a new and glorious world civilization. Providing, of course, that he has learned from this experience and does not just go about preparing for the next war in another twenty to thirty years.

But, I leave each man unto his own vision. While, to myself, looking upon the immensity of the visible universe, and pondering the events that have happened upon this one single planet circling a solitary sun among the uncountable millions in our but one of the innumerable galaxies, I cannot help but wonder if the events that are about to transpire are not less than all that unique in the repetitive cycles of life and nature that we see about us everywhere.

MYTH #19: You need not make any preparation because you are either going to die in the holocaust or be saved (religious connotation).

Men's philosophies today often go to one extreme or the other. Claiming that all is within man's power. Or that nothing is within man's power. There is a middle ground. One can simultaneously feel that nothing can be achieved except by the will of God and think that the results are dependent upon his own efforts. God sets the boundaries and within those boundaries man can have some effect upon the outcome.

MYTH #20: The bombs today are so large and there are so many they will destroy the world.

There are those who feel that the holocaust will destroy everything. And well it might, for there are certainly more than enough nuclear weapons in the world to achieve that end. "Except those days be shortened, none will survive, not even the very elect." But, if it is the Divine Will, those days will be shortened. There are those of us who feel that the Divine Hand is evidenced in the dealings of the world, every moment unto every moment.

The Divine happenings often seem quite natural. If one were to say unto a mountain, "Be thou removed and cast into the sea." and it should occur, another would say an earthquake just happened to happen right then. If the forces of nature should transpire so that in the midst of the holocaust the planet should suddenly tip on its side and place His sign (the Southern Cross) suddenly blazing in the sky above the heads of the people in the northern hemisphere, there are those who would only recognize the natural causes.

Such an event would certainly play heck with the astral, satellite based, and inertial, guidance systems upon which the individual and MIRVed warhead delivery systems depend.

Events would not even have to be as miraculous as I have described in order to limit World War III. There is serious concern on the part of the military that they will not even be able to fight the war because of such factors as the EMP. However, I have faith in the military. I am sure they will do an admirable job of trying to destroy the world.

None of us have an infallible insight into the future or its timetable. Whatever will be, will be. We can but wait upon events to prove our speculations to be right or wrong. While we are working and waiting some of us put our trust in God. Others put it in the Government.

MYTH #21: You will receive adequate warning from your government.

The government at first proposed the individual family shelter plan. Then it abandoned it. Next it proposed the community shelter plan. Then it abandoned it. Then it proposed the relocation plan. Then it abandoned it. Presently it has no plan. Don't you feel abandoned?

The government has millions to spend for destruction but not a penny for defense. The EMO (Emergency Measures Organization) has been completely shut down. The Ontario government was allocated three berths in the Radiological Defense Officers course (for the summer of 1982) given by the Canadian Emergency Measures College at the Emergency Planning Canada Federal Study Center in Amprior, Ontario, but it didn't feel it could afford to send anyone even after our group offered to pay expenses for three people. We appealed all the way up to the Solicitor General's office.

Admittedly, I am authorized to teach the course but during the last course that I taught at one of the community colleges (free gratis) I could not even get any resource personnel to come from

Camp Borden, who are responsible for administering the examinations. I feel abandoned. A radiological detection kit that I used to be able to get for sixty dollars, in the US, now costs in Canada, with import duties (they really want you to have one), federal and provincial taxes, exchange rate, custom's brokerage, and you name it, \$450. Who cares?

The last Radiological Scientific Officers Course taught in Canada was in 1977. No future courses are planned. There are no communities with a nuclear defense plan. I think I can make that an unqualified statement.

Millions for destruction and not a penny for defense. Your family's destruction bill for this year is \$1,300 per member of your family. Do you realize what \$1,000 a year for the last ten years would have bought you in the way of nuclear survival defense? Instead, your government has bought you destruction. Your family's destruction.

Oh, I am well aware of the argument that that pile of bombs has maintained peace in the world for the last ten years, and the belief that it will continue to maintain peace. Believe it if you want to. All the high government officials have their shelters. Why do they need them if you don't? [Author's update note: Curiously, even the government's shelters for civil authorities have now been closed].

If the government knew today that the Russians were going to attack next week, do you think they would tell you? If they did, what would you and the millions like you do? It would only create panic and get in their way. No, I do not think that you would be told. Do you feel abandoned?

MYTH #22: You will receive no warning, and there is no hope if you do.

The fact the government may not warn you, and is not giving you any assistance to defend yourself does not mean that you haven't been warned. There are many people who feel they can see the *signs of the times*. Anyway, if you have read this document, consider yourself warned. You may still have time to prepare. If an attack should occur you probably do not live in a primary target area and will have plenty of time to escape. If you have made preparation.

MYTH #23: One of the primary targets will be nuclear power plants.

Many persons come up with all sorts of rationalizations as to why they should not prepare for survival. One is that there is a sufficient number of weapons in the world, that if they were all used, they could destroy the whole of mankind. This is true.

However, it may be that all the weapons will not be used. Some may be destroyed by the other side. Some may misfire. Others may just fail to get launched. This is why each side has so many extra. Moreover, many persons make the mistake of assuming that it is all in man's hands and determined by man's will. Whatever. It may be that some limited amount of the potential for destruction will be used.

Another rationalization often heard is that the person feels they live in a target area such as in the vicinity of a nuclear generating plant. In actuality the Russians have little need to target the nuclear generating plants and probably can do more damage by not doing so. A bomb on the plant would just blow it to smithereens and the material in the plant might add little to the radioactive fallout. On the other hand, as a result of the EMP, if the plant is left on its own when it loses its computer control it will go into a meltdown and add substantial radioactive material to the atmosphere.

All of this is quite speculative, of course. There are no experts on nuclear war. There is no one living who has been through one. There is general agreement that it will be awfully terrible. It will probably take six or seven months just to bury the bodies. But, there will probably be someone around to it.

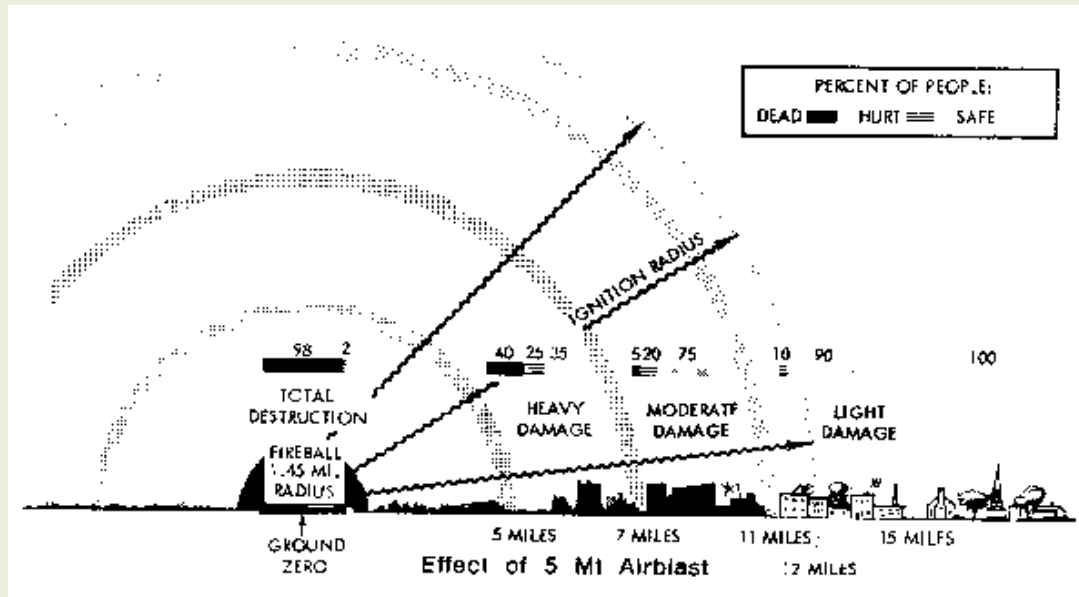

Useful Figures and Tables

This was the fallout pattern 36 hours after a single 15-megaton thermonuclear device (the Bravo shot of Operation Castle at Bikini Atoll - March 1, 1954) was detonated. The eventual extension of the fallout was more than 20 miles upwind and over 320 miles downwind. The width in cross section was variable, the maximum being over 60 miles. This means there was substantial fallout contamination over an area of more than 7000 square miles.

It is important to note that persons anywhere downwind would not have had to travel more than 40 miles in a direction crosswind to be perfectly safe. Secondly, assuming upperwinds of 150 miles per hour and descent times of 30 minutes, persons 150 to 200 miles away would have over an hour in which to either evacuate the area or to take shelter.

As noted from the chart on [the effects of radiation on humans](#), the 300 roentgens per hour would cause serious illness with some fatalities after an exposure of 1 hour and exposure of 2 hours would certainly cause a hard death occurring in hours to days.

This picture shows the effect of a 5-megaton airblast. While much larger weapons have been developed experimentally their use is unlikely. For one thing they are too hard to deliver and, more importantly, with a 20-megaton weapon we do only about one third the damage that will be caused by 4 five-megaton weapons. 5 to 8 megatons will probably be the average size of the strategic weapons. They will probably be detonated at some altitude around 2000 feet for maximum effect. At 15 to 18 miles on a clear day exposed people will be blistered, and from 18 to 23 miles they will be sunburned.

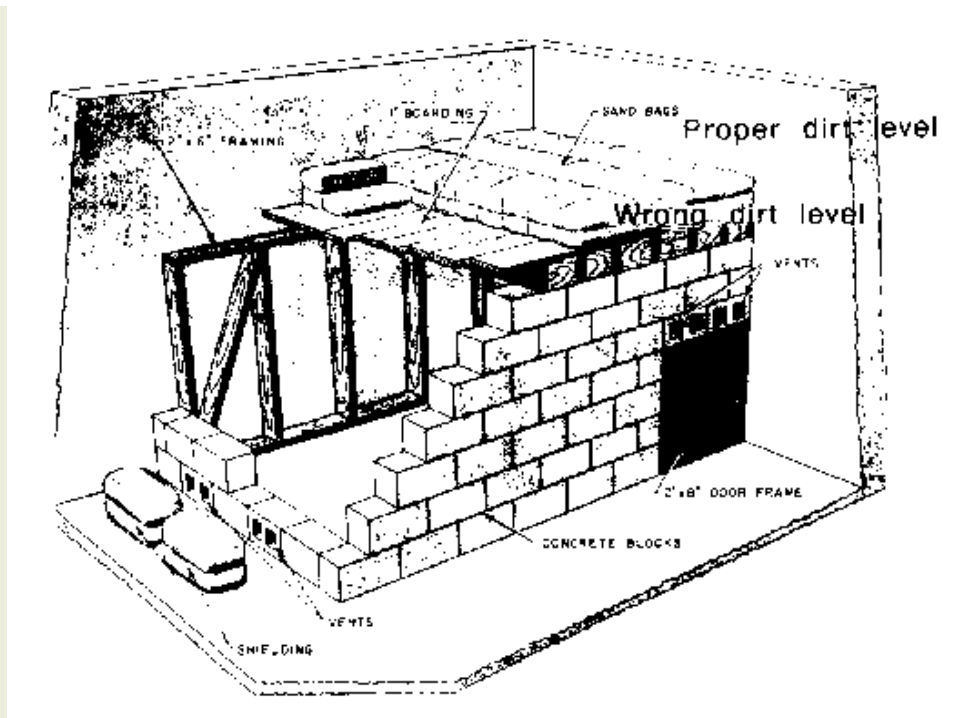

This map shows the principal targets in the US. Major airports, military installations, and railway passes would be targets in Canada. The number two target in North America is North Bay, Ontario.

In an all out nuclear exchange (WW III), with a multiplicity of devices being detonated over a relative short period of time (three days to two weeks is a common estimate), there would most likely be wide spread areas with general radiation levels (in the 5 to 20 roentgen per hour range) over 1000 miles down wind from the blast sites, two to three days after zero hour.

This map indicates the amount of radiation that a person would receive in various areas by remaining in the open for 14 days following the bombing of targets indicated in the map above. It is important to note from the map that even if Canada were not bombed that Ontario would receive 101 to 450 roentgens from the MinuteMan sites in Montana and the Dakotas.

The effect of a mere 10 roentgens per hour (arriving two or three days after a detonation and thus having already lost much of its rapid decay) would cause serious illness after one day's exposure, and (even with continued decay) would cause certain death within a couple of weeks. However, almost any expedient shelter would greatly minimize the effects.

The basement shelter shown here could mean the difference between life and death. As much care as possible should be taken to make sure the shelter roof is below outside ground level. Otherwise, radiation will come in at an angle through the narrow basement wall, as demonstrated.

Seven/Ten Rule

1 hour	-----	1000	roentgens/hour
7 hours	-----	100	roentgens/hour
49 hours (2 days)	-----	10	roentgens/hour
2 weeks	-----	1	roentgens/hour
14 weeks	-----	0.1	roentgens/hour
98 weeks (2 1/2 years)	---	0.01	roentgens/hour

This chart indicates that if one started off with one thousand roentgens of radiation per hour at zero plus 1 hour, that it would take 2 weeks for the radiation to get down to 1 roentgen per hour.

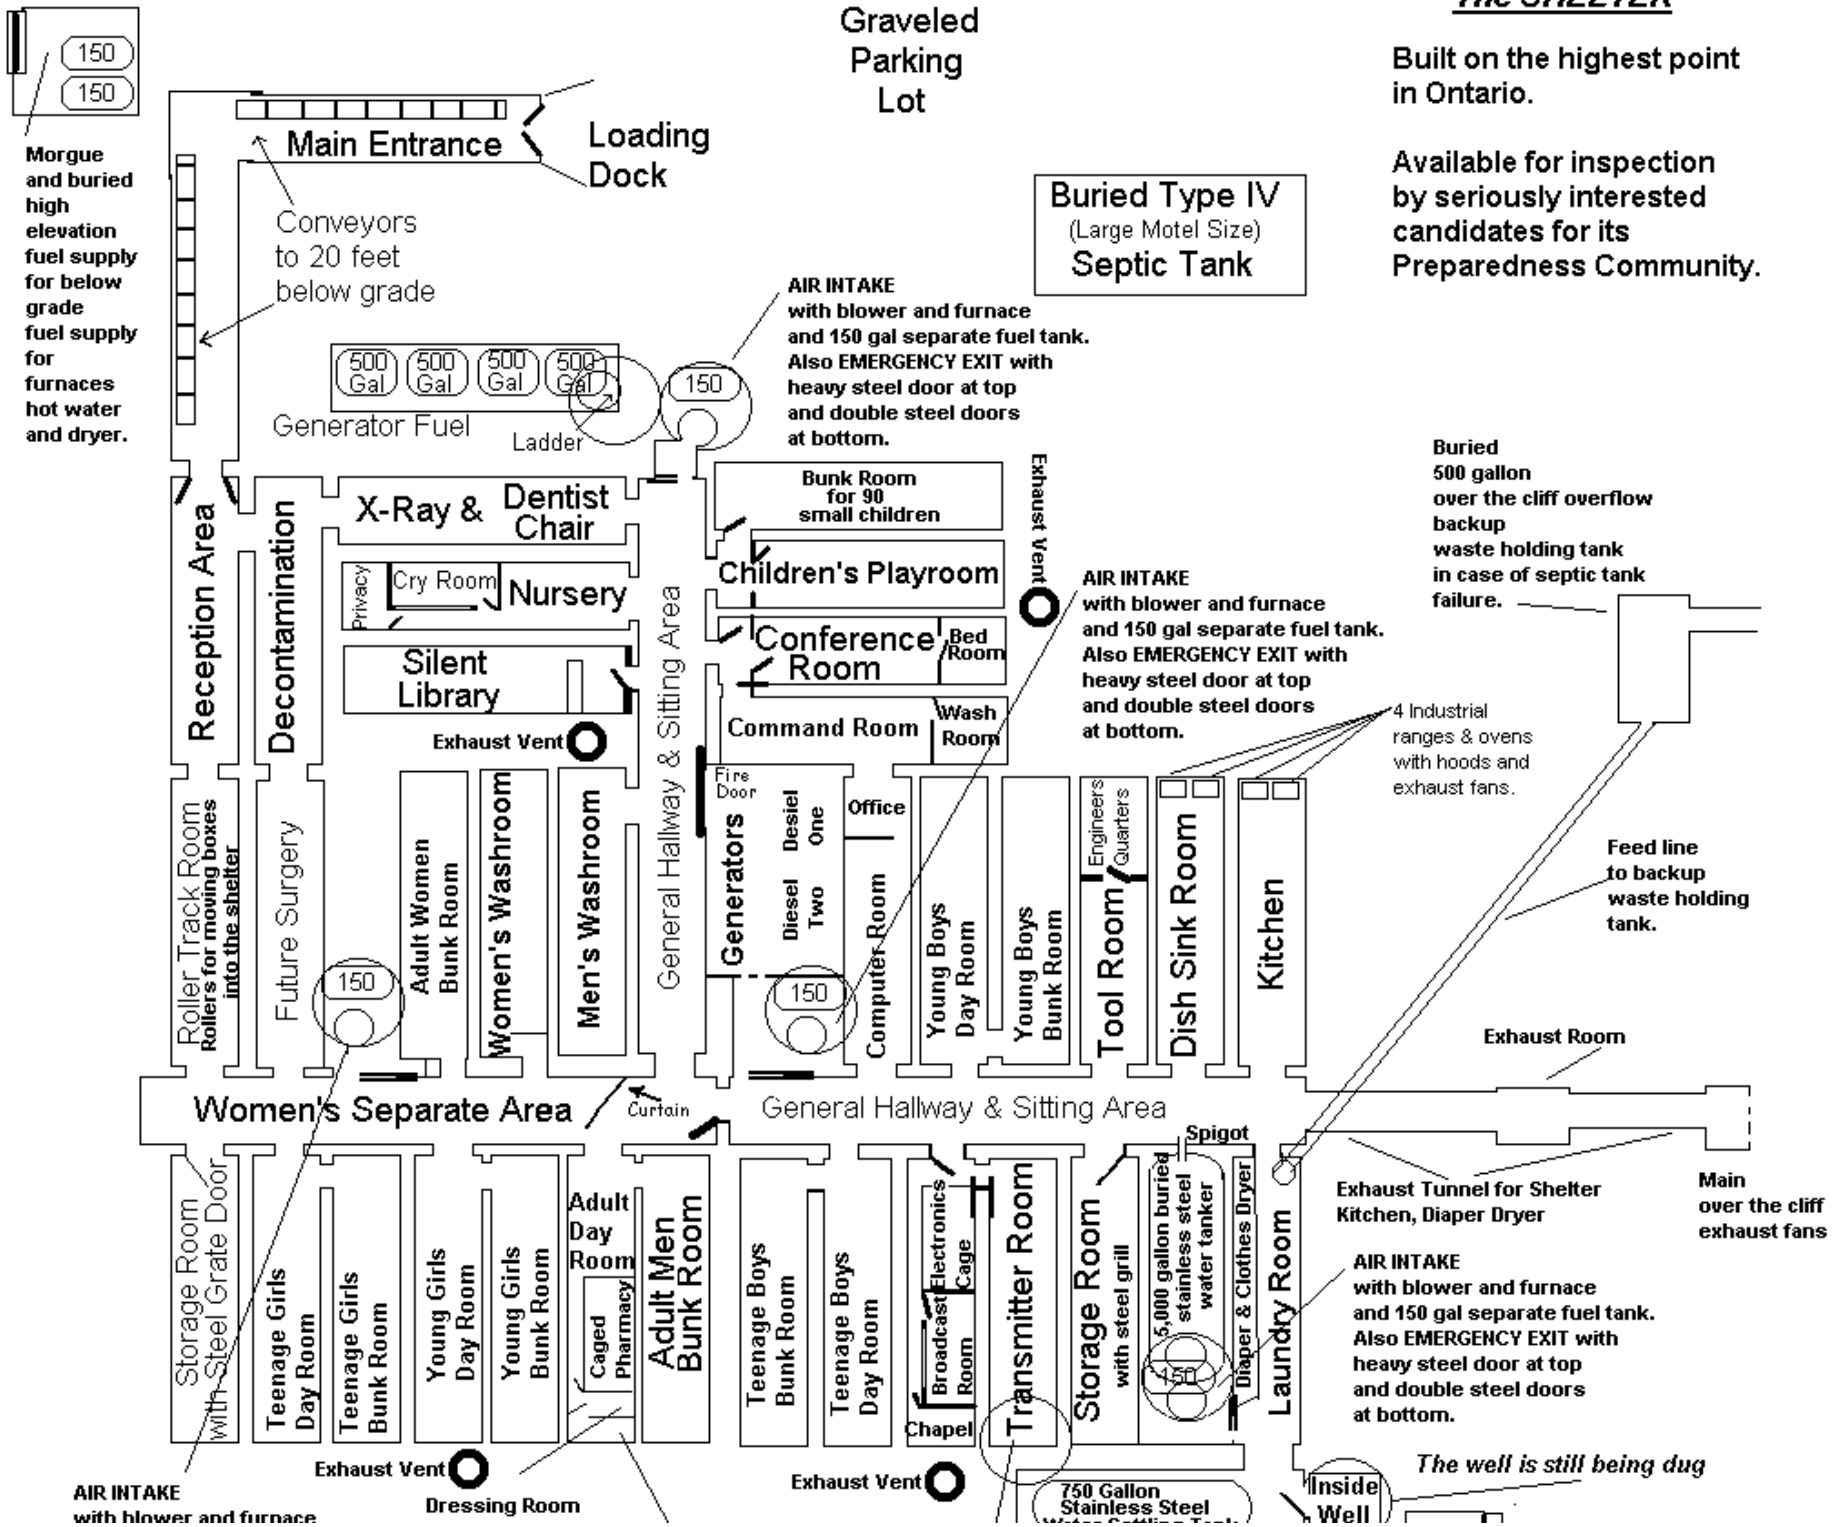

Since death would be almost certain after exposure for even 1/2 hr (see accompanying chart) it is apparent that shelter would be necessary.

The important thing to remember about the seven/ten rule is that it is only theoretical, and that actual decay may follow a different slope. Secondly, in order to use it, one must know the exact time of detonation for the weapon causing the fallout. And thirdly, it is only applicable for calculating the fallout from one weapon, and not for multiple sources.

The SHELTER

Built on the highest point in Ontario.

Available for inspection by seriously interested candidates for its Preparedness Community.

and 150 gal separate fuel tank. Also EMERGENCY EXIT with heavy steel door at top and double steel doors at bottom.

and pump room for Immersion Tank

SENSORY DEPRIVATION Immersion Tank
Kept at body temperature and saline level so that person won't sink. Individual placed in tank with classical music will sleep and overcome cabin fever.

Surface Hatch to Below Ground Balloon Launch Room for Antenna Balloon. Access from Transmitter Room to Shelter is through double steel doors.

150 150
Completely external buried bunker gasoline supply.

The secondary exit tunnel is still under construction. New improvements are constantly being made on the shelter.

General Information:

The shelter was designed under the guidance of a number of licensed engineers. It was also inspected by numbers of government agencies, particularly the Federal Government shelter inspection group who said it was the finest shelter they had seen.

There are many, many features to the shelter that cannot be described here because it would too greatly clutter the drawing.

The shelter contains extensive alternative methods of moving air, fighting fire hazards, providing lighting, internal and external communication, and every other conceivably necessary requirement.

For example, it has a great amount of radiological monitoring equipment.

Ramp Exit

Steel door Secondary Exit

Steel door and Grill to be installed at this level

The shelter is built out of extra strength concrete and is heavily reinforced throughout with steel. It far exceeds maximum recommendations both as to radiological and blast protection.

[Author's update note: The above is a map of the underground shelter actually built 90 miles northwest of Toronto. Anyone interested in joining the survival community where it is located should email the author for photos of the existing shelter.]

Examples of the Effects of Radiation on Humans

Roentgens per hour	Duration of exposure	Total dosage of radiation received	Number that will die	Deaths will occur in
5-10	2- 5 hours	10- 50R	none	
50	1- 4 hours	50- 200R	less than 5%	60 or more days
100	2- 4 hours	200- 400R	less than 50%	30 to 60 days
100	4- 6 hours	400- 600R	more than 50%	about one month
100	6-10 hours	600-1000R	all	less than two weeks
200 plus	3 hours plus	600R plus	all	the more intense the radiation the shorter the time before death
1.0	1 week	150R	none	
0.3	1 month	200R	none	
0.1	4 months	300R	none	
1.5	1 week	250R	5%	3 months
0.5	1 month	350R	5%	6 months

You Will Survive Doomsday

0.2	4 months	500R	5%	9-18 months
2.7	1 week	450R	50%	1-3 months
0.8	1 month	600R	50%	2-6 months

Example of the Effect of Shielding

Any material can be used for shielding against radiation. Even feathers. There is nothing magical about lead. It is only the density of the material that matters. A pound of lead and a pound of feathers weigh exactly the same. But it takes a much bigger stack of feathers than it does of lead to make a pound.

Neither feathers nor lead are generally particularly cheap to obtain, so it is usually better to use some other material like dirt or concrete. The more dirt or concrete in the barrier, the greater the protection. Since concrete is more dense (heavier) it only takes about 24 inches of concrete to give the same protection as 36 inches of dirt.

Thirty-six inches (three feet) of dirt will give good protection. Five feet of dirt will give better.

Nuclear Survival Groups

There are probably 12 nuclear survival groups in the city of Toronto. I personally know of four and I have heard of three or four others. (There may be some overlap. I can't be certain.) My guess is that there are another three or four I don't know about. Most such groups are very secretive, for various reasons. Three of the groups are headed up by instructors, like myself, who teach survival courses at the community colleges.

[Author's 1998 update note: The author was maintaining a listing of survival communities in North America].

[Authors October 2002 update note: The list had grown to several hundred intentional communities and survival groups in North America when as a result of consensus of opinion he ceased to
file:///E:/PROPHECYKEEPERS/data/POST-NUCLEAR-WAR/d_resources/survival/books/doomsday/index.htm (24 of 26) [9/11/2004 8:23:23 PM]

publish it because of government and social attitudes. People on the list were asking to be removed because of fear of repercussions. Waco had occurred his own Ark Two Community had been raided without warrant by 7 police vehicles, including a K-9 unit plus 4 fire vehicles. A total of over 40 personnel as was shown on the National News.]

Most of the groups contain a number of very well trained and experienced people. There are also many other groups scattered around both the US and Canada. They have their own training bases and survival courses. There is a magazine, Survive, where you can learn about some of these groups.

What is a Radiological Defense Officer?

Both in the Canada and the United States the Federal Governments have trained certain individuals to be advisors to mayors and other public officials in time of nuclear disaster. In Canada these individuals are called Radiological Defense Officers.

Certain Radiological Defense Officers have received additional training, so as to become qualified to teach Radiological Defense Officers. These individuals are designated as being Radiological Scientific Officers. The supposed requirement for becoming a Radiological Defense Officer is a Ph.D. in physics, but because of a lack of candidates, individuals with lesser qualifications have been selected.

About the Author

The author of this document built twenty-three fallout shelters in Kansas and Utah in the 1960's. He completed the US Office of Civil Defense course in 1970 after moving to Canada and then the Radiological Defense Officer's course at Arnprior, Ontario in 1976, and the Radiological Scientific Officer's course in 1977.

While in the USAF, he was a control tower operator and graduated as Honor Student from the AACS supply school. Because of this training he was asked to inspect the Titan missile sites after his honorable discharge. He refused because of his understanding of what the missiles could do to mankind. He has been a member of various anti-war groups and his personal motto is "Bell the Cat and Ban the Bomb", but he thinks it is now too late to do either.

His master's degree is in Economics from Texas Christian University, and he holds certificates in both data processing and information technology, the latter from MIT. [He has also written and edited several books in the field of computer science].

Prior to becoming a college teacher of computer science he was a telephony engineer and holds both US and Canadian patents.

He presently devotes a large amount of his time to the nuclear survival group mentioned in this document.

Bibliography

[Author's update note: The two books that I used to most highly recommend were]:

- [Life After Doomsday](#) by *Dr. Bruce D. Clayton*; click on the title of this book to order it from Amazon.com.
- [Nuclear War Survival Skills](#) by *Cresson H. Kearny*; click on the title of this book to order it from Amazon.com.

[Author's 1998 update note: While those two books are still very valuable, and it is a good idea to read more than one author's ideas on the same subject, still there is a new book about which I am quite enthused. This book is the most recent book of which I am aware and it gives some new and updated information. From the source, presentation, and approach of the book it somewhat makes me think that its writing may have been commissioned or supported by the Mormon Church, but (which is not a negative but) whatever its source it is excellent.]

The book is "Nuclear Defense Issues",
by " Paul Seyfried and Sharon Packer of Utah Shelter Systems".

You can order in on the net from:

[Utah Shelter Systems](#)

or by mail (for \$25) from:

Utah Shelter Systems
P.O. Box 638
Heber, Utah 84032-0638
U.S.A.

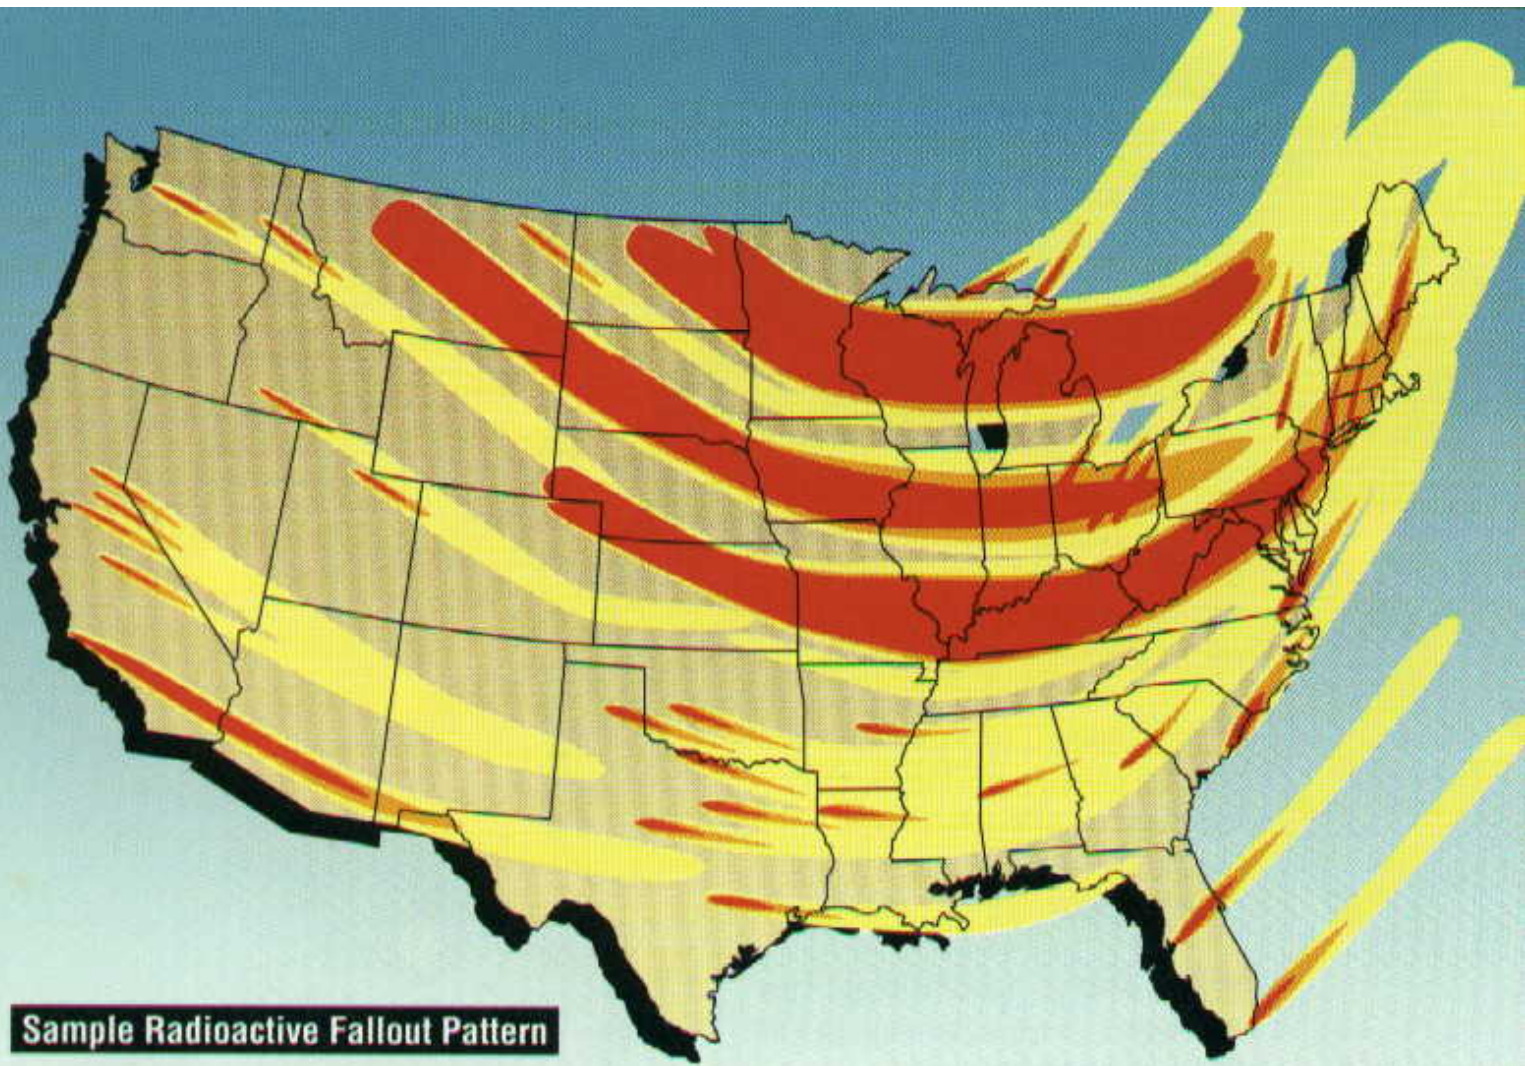

[Author's update note as of January 1st, 2002: I am now quite enthused about a still newer book.

The book is "No Such Thing as Doomsday",
by "Philip L. Hoag".

You can order it by mail (for \$25) from:

Yellowstone River Publishing
P.O. Box 206
Emigrant, MT 59027
USA

The Ark Two Community

The Ark Two Community is the largest pluralistic survival community in North America without any political, religious, or cultural bias. Its purpose is to ameliorate the catastrophe of a nuclear war and to help restore civilization. Inquiries from all are invited. Write an email to:

survival@webpal.org

The Ark Two Refuge Facility

The Ark Two Community in Canada has a 10,000 sq/ft nuclear shelter as part of its refuge facility. This may be the largest Privately Constructed nuclear fallout shelter in the world. 42 buses were used as forms to pour a minimum of 12 inches of high strength concrete that was heavily reinforced with rebar. A minimum of 5 feet to a maximum of 14 feet of earth was pushed back overtop.

Go to:

[PICTURES](#)

for a tour of the complex.

The Ark Two Community is founded and commanded by a government trained and certified Radiological Scientific Officer.

Anyone is welcome to join the Ark Two Survival Community (located in Ontario, Canada) - so long as they do so before the catastrophe occurs. There is no charge for membership nor any restriction other than one be tolerant of the other members. However, it is only practical to be a member if one makes arrangement to live within about 20 miles because it would not otherwise likely be possible to get to the Ark at the time of catastrophe.

The purpose of the Ark Two Survival Community is to ameliorate the effects of a Nuclear War and to help reorganize society afterwards. The community founder believes that a nuclear war is inevitable and therefore in 1980 built the first phase of the Ark Two Refuge and has since expanded it and prepared many ways to assist survivors - as listed on this web site.

The project has not been favorably received by the local and provincial governments. By 1990, when I stopped counting, it had been subject to over 30 court and commission appearances and the

number has greatly increased in the last few years. Legal costs have mounted to hundreds of thousands of dollars. In 1999 there was a raid without warrants involving 7 police vehicles, 4 fire units and over 40 personnel and a K-9 unit, coincidentally caught on video tape by the CBC. Subsequently the facility was hounded with repeated government inspections. Some of the inspectors candidly admitted that it was just harassment, but because of wanting to keep their jobs they of course were not going to put that into writing. It is for this reason that one might refer to the facility as Waco North. A kinder, gentler Canadian version in that The Ark doesn't have any weapons and in that so far no one has been killed by the raiders.

The general public views the project as being operated by an eccentric (in the most favorable terms) or by a nut-case in what is the more usual expressed attitude. For the forty years in which I have built over two dozen shelters and have consulted on many dozens of others, the general ridicule has been extensive, to say the least. "Why do it then?", I have often been asked. Why not get a life, enjoy life and quit worrying about doomsday? The answer is that I don't see the purpose of life, nor happiness in life measured in how many rounds of golf I might play, but rather in service to my fellowman. While I don't have any "visions" or hear any "voices" this appears to me to be the service to which I have been called.

General Information:

The shelter was designed under the guidance of a number of licensed engineers. It was also inspected by numbers of government agencies, particularly the Federal Government shelter inspection group who said it was the finest shelter they had seen.

There are many, many features to the shelter that cannot be described here because it would too greatly clutter the drawing.

The shelter contains extensive alternative methods of moving air, fighting fire hazards, providing lighting, internal and external communication, and every other conceivably necessary requirement.

For example, it has a great amount of radiological monitoring equipment.

A LOOK AT WHAT'S INSIDE

Photos of the Inside of the Ark II Shelter

Pictures of the inside of the shelter can be seen by clicking on the links below. If you have not already looked at photos of the outside, and the *map of the inside*, you may wish to look at them first for orientation.

Many, many times I have been asked - "When will the shelter be finished and ready?" I guess the answer is that, like Disney World, it will never be finished because there is always more that one can do. On the other hand it has been "ready" since 1980. At that time there were only four buses and there was no generator or pump. We brought the water in, in stainless steel milk pails and for lights we used twelve volt car batteries. Toilets were pails with garbage bags, and we would have had to sleep on the floor in sleeping bags. Still we had all the requirements for a survival shelter as listed in the government publications.

Over the years we added water pumps and generators, flush toilets and bunks. Lighting, heating, and dozens of other amenities besides lots of additional space, security and other functionality. I think what people really mean when they look at it and ask the question is, "When are you going to put up the curtains and put around the lace doilies?" Admittedly, twenty thousand dollars of painting and new tile on the floor would make it look a lot better, but then we always think of another purpose of funds that will increase functionality and which would take precedence over cosmetic appearance. Consequently, given the opportunity to spend another twenty thousand on the shelter - there is probably something else we would do, rather than make it look better.

Inside the Main Entrance

Inside the main entrance beyond the loading area there is a heavy steel grate door and electric conveyors that go down two levels.

[The Top Conveyor](#)

There is quite a bit more slope to the floor than is obvious from the photo. The conveyors can operate either direction - to take things into or out of the shelter. They are powered by powerful 220 motors.

[The Bottom Conveyor](#)

At the bottom of the second electric conveyor, which can be seen through the doorway, there is lighter steel grate which can be seen on the left, and another lighter steel entrance door which can be seen on the right.

[The Decontamination Room](#)

The first room inside the shelter is the decontamination room. It contains a shower, a stainless steel double sink and table for decontaminating such things as vegetables, and a full-size bathtub with shower head for decontaminating children and incapacitated individuals.

The Generator Room

[The two big diesel generators inside the facility](#)

There are two large diesel generators that supply the facility. There is on-site a three month fuel storage capacity for the generators. The main generator, in the foreground, was replaced in 1999 with a new 75KW.

Either of the diesel generators will more than completely supply the facility's needs. The yellow Caterpillar back up generator is started by a hand-pull pup engine.

There is also an external 5KW emergency gasoline generator that can actually light the whole shelter or run fire fans for emergency movement of air. Other electrical supply resources are being developed.

Great advances have been made, in the last five years, regarding inverter technology and the power generation system is currently being rennovated to take advantage of these advances.

[Main Generator being installed.](#)

The above picture is of one of the main generators being lifted in during the construction phase gives you some idea of their size.

[Main Power Distribution Panel](#)

Here we see the main power distribution panel. It includes feeds from the outside - which we have presently disconnected, and EMP protection. Below the panel is the tunnel to the main exhaust system.

Air Intake and Distribution

We have, in addition to the powerful exhaust fans, two portable large fire fans with air tubes that can be used to move air rapidly from any one place in the shelter to another. In point of fact, natural air flow seems to be adequate to supply the shelter, but we have made a variety of alternative provisions.

[Air Intake and Blower Bike](#)

This is one of the alternative provisions for moving air. We have stockpiled a number of bikes and blowers, and we have installed throughout the shelter venting systems to which they can be attached. Next to this blower bike there is one of the large air intakes. It can be opened with just the heavy grill, or closed altogether with the steel door.

The Bunk Rooms and Day Rooms

There are seven bunk rooms and six day rooms. (The adults share their day room but the women have a separate section in the facility where they can gather).

The children's bunk room for smaller children has capacity for over 90 children. In addition to this, there is a nursery, and play room.

[Photo of A Bunk Room](#)

Bunk room occupancy is separated by sex and age. People would of course prefer to be housed by families and each person have their own private bed that they could use at any time. However, in order to get the number of people into the shelter that the government standard says that a shelter this size is supposed to shelter, we have to do this in this manner. Each of the seven bunk rooms has 24 bunks. These are shared on three shifts by adults, and 2 shifts by children.

Each day room and bunk room suite is given the name of an animal so that children can remember which is their's, or their siblings.

The suite names are:

- A (Antelope - Adult Women)
- B (Bulls - Adult Men)
- C (Cats - (or Kittens - Young Girls)
- D (Deer - Teenage Girls)

- E (Elk - Teenage Boys)
- F (Frogs - Young Boys)
- G (Gerbels - Very young children)

[Photo of A Day Room](#)

In each of the day rooms there is storage for one's personal belongings. Each person gets a cubicle (a little square space as shown) in which to keep their toothbrush, towel, change of underwear and so forth. The size of the day room as seen in the picture is probably deceptive, and in reality it is twice as large as it appears here.

Wash Rooms

There are of course separate men's and women's washrooms. There is also a laundry room with a large diaper drying facility for babies diapers.

[Photo of Toilet Stalls](#)

There are rods to hold modesty curtains, but the curtains are not in place. Vandals broke the watertanks on the toilets. But that turned out to be a favor. The Health Department wanted us to replace them with low flush toilets - but in retrospect that would still not have been satisfactory. When the generators are off and we are working on low level lighting then the pressure pump will lose its pressure. We will have lots of water, but we will need to carry it in buckets to flush the toilets. By not having water tanks on the toilets this keeps people from emptying the pressure tank and also allows us to better control how often the toilets are flushed so that we don't overflow the waste holding tank before the next power-on pumping time.

[Photo of Men's Washbasins](#)

In the women's washroom there are also children's level wash basins. There were mirrors above the washbasins, but vandals broke them and they have not yet been replaced. Over the years, vandals broke in dozens of times and stole or did about \$15,000 worth of damage. Each time we strengthened the security of where they broke in and it has now been several years since any have gotten in (although there have been signs that many have tried). Curiously the police and local government considered us to be the criminals, because we had made an "attractive nuisance" that attracted the vandals. They have severely punished us for this. The vandals around here, even if caught - are not punished.

[Water Heater](#)

There are a number of hot water tanks located around the facility and there are two alternative ways of heating water, just as there are alternative ways of obtaining water, moving, heating and cooling air,

getting rid of waste disposal and so forth. Details about all the facility's systems are just too voluminous to include them all.

[Alternate Water Heater](#)

This is one of the alternative ways of heating water. It is a circulating tank that is suspended from the ceiling and is attached to a heater plenum. How much actual water heating we will be able to do other than for food and drink, is somewhat questionable. It is highly unlikely that people will be able to take long hot showers.

Water Supply

This is a good spot to discuss the shelter water supply. We are very blessed in having a river and a number of springs on the property. In years past we used a water ram from one of the springs. A water ram is a mechanical way of pumping water uphill by using the force of the water itself. We have presently dismantled the RAM and brought it inside along with a brand new much larger one that we have never installed as yet. The problem was that the ram was outside where it could be tampered with, but as of the summer of 2000 we now have an inside well and do not have to rely upon the rams. Later (afterwards), if there is no electricity, we can re-install the water rams.

[Photo of the Well during construction](#)

On the "construction page" I tell about the miracle of the well. You can read the story there if you like but here I will just explain a bit about the well itself. Water is one of the most essential features of a survival facility. Especially one that might have 500 or a thousand occupants, and we have a sufficient supply to handle that number of people.

[The Three Pumps for the Pressure and Storage System](#)

This picture shows the heart of the water pressure and storage system. The two lower pumps are both one horsepower pumps that together can pump better than 15 gallons per minute. We can refill the top half of our settling tank (the big 500 gallon stainless steel white tank that you can just see the end of on the right), in about 15 minutes, and then turn back off the generators. (We also have a back up hand winch and bucket).

The third pump (on the ceiling and at the very top right in the picture) fills both the big 5,000 gallon stainless steel milk tanker - (told about in a following picture) and pressurizes the vertical tank below it, from the settling tank.

In the year 2,000 when we completed the well we were, for the first time in many years, now able to keep both tanks full. (Years ago we used to fill them with a ram pump, but it was a very slow process). The

well is also what makes it feasible for us to now install a Fire Sprinkler System.

[Steel Steps Into the Well Area](#)

These are the steel steps that go out over the well and into the tunnel leading out the back of the shelter.

[The hand operated bucket winch for the Well](#)

Here we can see down through the steps over the well, the hand winch system which is used to pull water up by the bucket from the well, if all else fails. Every system, water, electric, waste disposal, air movement, and so forth, has several backup systems to it so that if all else fails, then there is a simple hand mechanical system that will permit survival.

[Milk Tanker](#)

Behind the spigots and the wall that I am leaning on, there is a 5,000 gallon stainless steel Milk Tanker, like the ones you see going down the highway. Nope, we don't store milk in it, although milk is admittedly important if infants are going to survive. (For that purpose we do have stored substantial quantities of powdered milk, although we would like to have still more stored). Nope, the Milk Tanker stores water as another backup. Water that we occasionally replace, but intentionally never use. When the water gets half way down in the main settling tank - then we intend to turn on the pumps and refill that tank - so the milk tanker (which is also filled by the same pumps) always stays full and is never touched.

Both of the water tanks are higher than the rest of the shelter and therefore will feed water to anywhere in the shelter by gravity feed. We now have a hose, attached to the spigot that I am pointing at, that will reach anywhere in the shelter. Likewise there is a hose attached to the pressure pump system, in case we have power when we wish to deliver water to some remote location.

[Fire Stations](#)

In addition to the garden hoses, when the shelter is occupied we will maintain throughout shelter manned fire stations which will have buckets of water, sand and fire extinguishers. There is really very little threat of fire, but because fire in a shelter like in an airplane or on a submarine, would be so calamitous (because one would have nowhere to go and could not leave the facility) we take extensive safety precautions.

Kitchens

[Photo of Kitchen](#)

There are actually two kitchens. The ovens shown in both of them have been removed. The ovens shown

were industrial size and had been equipped with new elements. However, it has been decided that they would be an inefficient use of energy, and therefore fuel, and so consequently they have been removed with plans to replace them with a more efficient system.

[Photo of Sink Room](#)

The second kitchen is primarily used as a sink room for doing the dishes.

There are also two locked rooms with grate doors for the storage food, besides other bulk food storage areas. The community has developed and is continuously implementing extensive plans for the storage and production of adequate food supplies.

Other Rooms in the Shelter

There are MANY other rooms in the shelter. While the pictures included here give one a flavor of the shelter environment, you must really study the shelter map to get an idea of its immensity. It is so large that maps are posted throughout the shelter to tell one where they are and how to find their way to another location.

[The caged electronic Repair room](#)

Adjacent to the caged electronic repair room is the transmitter room. We used to have four large transmitters (each about the size of a refrigerator) in the room, but after 15 years they became obsolete and we removed them a couple of years ago and have not yet replaced them.

Behind the repair cage, and down the hallway beside it, there is a glassed-in broadcast room, and behind that a chapel.

[Pharmacy](#)

The pharmacy is another caged area in the shelter.

[Computer Room](#)

Like many of the rooms in the shelter, the computer room currently consists of only desks and chairs. We hope to move-in at the last minute, computers and many other types of equipment (such as microwaves, tools, supplies and so forth). In the past, many types of equipment that we have stored have deteriorated because of the prolonged exposure to underground humidity.

[Dental Room](#)

The dental room has been a prime example of the problem of maintaining systems in the shelter. Vandals broke the X-ray (we have a replacement in storage) and humidity has caused considerable rust on the chair. We have left the chair in place because it is so heavy to move and we feel that we will be able to clean it up once we activate the shelter, .

Some of the many interesting rooms, for which photos have not been included, are:

- The Surgery (as yet still unequipped)
- The Laundry room
- The Silent Library (books are in offsite storage)
- The Conference Room
- The Tool Room
- The Chapel
- The Exercise Areas
- A Privacy Room
- The Nursery and its Cry Room

and numbers of still others as you will see on the map.

**The Men's Washroom
& Showers**

April 25, 2001 Outside Views of **Ark II**

The Front Gate

From the front gate gate of the property one cannot actually see the shelter area, (or even the second tall gate) although a new tall tower and some tall fence posts at one end of the property are now visible over the berm."

Front Gate Lock

This is only the first locked gate that one has to go through, to reach the shelter.

The Road In

This picture of the road in was taken last summer. It becomes impassable during snow storms unless we use snow removal equipment, and then it takes about an hour and a half to clear it and the parking lot.

Outside the Tall Gate

This is the second gate that one passes through in approaching the shelter. The fence is ten feet high, but the gate is much higher in order to allow semi-trucks to pass through.

The Tall Gate from Inside

This is another view of the tall gate from the parking lot inside. In the background you can see the berm that conceals the shelter from the road.

Bike Supply

This is the five-speed bike supply that we maintain in front of the shelter. These can be taken inside later to do such things as drive blowers that we store inside the shelter. They can also be used for other purposes such as running the wheat mill or even to generate low level lighting. There are numbers of other stockpiles around the shelter. Such as fuel bunkers, woodpiles, lumber and steel storage, and so forth. Bikes for transportation are kept in another storage location.

Main Entrance from the Parking Lot

This is the front entrance (which is also actually the loading dock) from the parking lot. In the background you can see a couple of the air-intake towers.

HEAVY STEEL Double Locked Front Door

We have no explosives in the shelter but several persons who have been in the explosive business have likened the shelter to the security of an explosive bunker. Before we put up the high fence, vandals used to damage the lock by putting glue in it although they have not gotten the door open since we put two locks on it several years ago, and now with the lock protector and the high fence about the property, it is even more difficult to get into.

The individual door is actually set inside a pair of wide opening steel doors for bringing in supplies and putting them on the conveyor from the loading dock. Inside these steel doors there is a heavy iron gate, and beyond that before entering the shelter, another steel door. One has to go through two steel doors to gain entrance to the shelter from any entrance or air shaft.

All the external doors open outward, at the insistence of the Fire Marshal, except for the loading dock doors. This latter is so that the occupants cannot be blocked in from the outside, although there are also other escape routes.

The Back Entrance

The back entrance to the shelter is heavily bermed about as protection from a possible but improbable target fifteen or twenty air miles away. The door itself faces away from the target. The shelter is theoretically designed to survive a mile and a half outside the crater of a nuclear weapon. A theory that I hope we don't have to test even at fifteen or twenty miles.

Inside the Back Door

From inside the back door you can see the two separated steel doors at this entrance and the steel steps between them leading down to the tunnel going into the shelter.

The Steel Tunnel from the Backdoor

Once past the two steel doors at the back, there is a steel tunnel (with more slope than the photo appears to indicate) leading down to another set of steel steps that go on down into the shelter. The front entrance was made wheelchair accessible at the Fire Marshal's insistence but the back entrance consists of steel steps and the four emergency exits through the air-intakes have steel ladders.

Hilltop View of the Compound

Looking down from a higher hill on the property one can see the entire compound. The prominent features in addition to the entrances are the surrounding 10ft high fence with its front and back gates, along with the tanks over the airshafts. The whole compound stands above a very high ravine.

Main Powered Exhaust

Although there are many others, the main powered exhaust for the shelter exhausts out over the ravine. Natural air flow might seem to be to pull cool air in from the ravine and to exhaust warmed air out the top, but because we are dealing with fallout we want to pull the air in from as high above ground level as possible, and exhaust it out at the lower level.

Looking down from the exhaust fans

The camera fails once again to give an appreciation of the depth, because the river is actually about 150 feet down from standing on the exhaust fan cabinet, from which this picture was taken.

Generator Room Air Shaft Tower

The air shaft housings are taller than a person and 8 feet in diameter. The air actually enters through a heavily screened pipe which faces down on the side. In this way, fallout will not fall into it. An actual air intake pipe is most easily seen on the air shaft tank in the background of the photo of the front entrance.

Air Shaft Tower

Inside each of the airshafts towers there is a vertical shaft that has in it a steel ladder.

Inside the Generator Room Air Shaft Tower

All the air shafts towers are pretty much alike. This is the one for the generator room with its door open.

Inside the Generator Room Air Shaft

Through the open door of the generator room air shaft tower, one can see an additional small (5KW) gasoline powered generator that is maintained OUTSIDE the shelter. The reason for this is that if there should be an emergency involving the main generator room, then we can provide power to air fans. This generator may be moved to any of the air shafts where it may be required.

The large fuel tank seen through the doorway was removed on the Fire Marshal's orders.

Adjacent to this Air Shaft is a highly insulated and muffled exhaust for the main generators down in the shelter. It is so quiet that one can stand right next to it and carry on a conversation in a normal tone of voice.

One of a number of typical exhaust vents.

There are a number of exhaust vents located around the shelter. Each of the vents have a cover and a protective barrier around them (because we have otherwise often damaged them driving over them with a tractor or truck).

Locks on the exhaust vents

All the exhaust vent caps are locked on. Like anything else, with enough time and effort they could be broken into. However, even if one were to hacksaw off the lock, there is no access to the shelter through the air exhausts. At the bottom of the one foot diameter pipe there are usually five inch pipes that run off a distance of five feet to the shelter.

Road Beside Small Fuel Bunker #2

The road has actually been graveled since this shot was taken last summer.

Entrance on Small Fuel Bunker #2

This is the entrance way to a small fuel bunker. There is NO access from the fuel bunker to the shelter.

Door on Small Fuel Bunker #2

Entrance on Small Fuel Bunker #3

This is the entrance way to another small fuel bunker. Again there is NO access from the fuel bunker to the shelter. This fuel bunker actually doubles as a morgue, and the main fuel bunker as a brig.

Observation Tower

At both corners of the compound there is an observation tower that is higher than the fence and which gives a view down both fence lines and to the opposite observation tower and the perimeter access roads. The Fire Marshal has requested that we provide outside storage for certain materials presently in the shelter, and for this reason we have had to build the pictured facility, and are in the process of moving the materials to it. Both this structure, and the fence have actually been built at the Fire Marshal's request but since we were having to build them we have sought to make them useful.

The fence was ordered by the Fire Marshal simply for the purpose of keeping vandals out, with the concern of protecting the vandals. Many improvements about the shelter have been at the Fire Marshal's insistence, such as the large tanks over the air vent escape hatches (to keep them free from snow) and the additional entrance/exit at the back of the shelter. While the total expense has been very large and we had not included them in our original design we are nevertheless pleased with these additional improvements.

It has been an interesting challenge to build the Ark, but as you can see - so far I have survived it.

Photos of Construction

For **free** consultation on how to build your own shelter (and other **free** nuclear survival information) by the only non-governmental RSO (Radiological Scientific Officer) in Canada [CLICK HERE](#).

Construction

Our reason for going into such detail about the construction of our shelter is not just to show how large and strong it is but to let others benefit from our experience.

This was the 24th shelter that the designer has personally built. He has used in other shelters almost every material and method imaginable. Wood structure and sandbags, gunite, corrugated metal, steel construction, steel tanks, concrete forms, and concrete block. The best method found to date has been the use of school buses as forms.

Mind you, one learns from experience, and there are still many things that would be done differently another time around. Mistakes had to be corrected - that now with the experience could be avoided. Still, all in all, the assessment of the Federal Government shelter inspectors who came from Ottawa to view the shelter that, "This is the best shelter that we have ever seen!", seems to be accurate.

[A GREAT DEEP HOLE](#)

To begin the facility, we first dug a DEEP hole. How deep the hole was, you can get an idea by looking at the road the concrete truck has to go up in the above picture. All the shelter lies below the truck and the big pile of dirt behind the truck is a very small part of the fill from the hole that was pushed back over the shelter.

[A MOUNTAIN OF BACKFILL](#)

The mountain of backfill gives you another idea of the depth of the hole, when you see the road used to bring the buses down into it.

[A LINE-UP of BUSES](#)

Here is a picture that shows all the buses being lined up in the hole. The far bus is just being jockeyed into place. On the left of the picture are stacked up forms that are placed around the whole complex. If the buses are accurately placed, each bus acts as a form for the next, and the concrete just fills in between. This is what makes this mode of construction so strong. It is formed like a beehive, with many, many, strong cells. The civil engineer who guided this construction was the engineer who designed the subway system in Toronto and he felt that the concept resulted in an IMMENSELY strong shelter. Especially with the immense amount of reinforcing steel that we put in and the extra strength concrete that we used.

PREPARATION of the BUSES

Here you see how the buses are completely gutted and stripped before being brought to the site, so as to cause no environmental damage. Their engines, transmissions, gas tanks, windows, and so forth, have all been removed at another site. They are brought to the site on their rear wheels only, and then the same tow truck takes those wheels away with it. If you look at the bus in the bottom of this picture you will see how all the windows have been sealed with fibreboard. After the concrete is poured, the fibre board and the buses remain in place. Only the outside forms will be removed.

FORMING and BRACING

Here you can see the outside forms being put in place and how strongly they are braced. This is VERY necessary. The buses are also greatly braced on the inside. Multiple 2 by 4's hammered together to make 4 by 8's and larger, running the length of the top inside and the floor of the bus with the same type of vertical bracing between them every 4 feet. NECESSARY, NECESSARY, NECESSARY. There is also cross bracing, at TWO levels every four feet. All this bracing is of course removed after the concrete is poured, and the AFTER the backfilling is done. The bracing is then used to build bunks and interior walls. There is not too much.

START of the POUR

Here you can see all the buses parked tightly together, and the concrete being poured in between. The framing of doors between the buses must also be securely braced. The importance of STRONG bracing EVERYWHERE can not be over stressed. The concrete is poured over the whole complex bit by bit. Some on every side of all the buses. This is important because otherwise the weight of the concrete would cause the buses to move. Between all the buses is HEAVY wire netting to reinforce the concrete, and because this was private construction we were able to force down in TONS more of scrap steel to further reinforce the concrete.

CLOSE UP OF CONCRETE POURING

Here you can see a close up of the pouring of the concrete. Notice the wire reinforcing rod over the top of the shelter. Every so many feet plastic and tin also had to be laid to create expansion joints. The big

pumper was rented for a week, at \$10K per week, and many concrete trucks were necessary to keep it serviced. One at the pumper, one waiting, one or two on the way back to the mixing yard. One at the mixing yard. One or two on the way to the pumper. From early morning till late at night. Make sure you pick a week of good weather. Talk with the airport meteorologists.

[ONE BIG CONCRETE BLOCK](#)

The one bus being formed up separate from the others is the fuel bus. The rest of the buses end up in one big concrete block, which then must be kept dampened and hosed down for a month to let the concrete set. After the outside forms are removed everything is sprayed with heavy black water proofing (we have never had a leak) and then the bulldozers move the top cover back into place, and after giving everything a week or two to settle we remove the interior bracing. In the following picture there is a corrugated pipe that extends up into the air to the left and in the foreground in front of the workmen. The back fill around this pipe will end up about a foot from the top so you can see how far underground the shelter is after the backfilling.

The Miracle of the Well

[Inside Photo of The Well](#)

[Photo of The Well During Construction](#)

[Photo of The Well During Blasting](#)

These photographs were taken when the inside well was still under construction - but it we completed it in the year 2000. It was a project that had been ongoing for over a decade. The well is wonderful, and I do consider it a true miracle - (just getting it paid for was one alone).

It was a miracle finding the right person to do it. He had been raised in this area and had family here, so answered my ad on the government employment net - just on that whim. He now lives in Northern Ontario and holds 14 mining tickets - including dynamiting. When the Safety Board was called in on us, the inspectors just shook their heads and said we were doing everything right.

We decided on the spot for the well before we ever put in the first bus over 20 years ago. My son Bonnar was the best in our family at water witching - (it is just a word - nothing to do with witchcraft, magic or any such thing - I now understand how it works scientifically) and we had him go out and survey the land.

This is the best spot for the well he said - but it was not where I really wanted to put the shelter. Well, try again I said. Three times we tried and he always picked that spot. Oh well, said I, this will do well for the well.

We lined up the first buses to that spot - and placed the water settling tank facing it. But immediately over the well location, I did not place cement - so that I could dig down through the dirt. And dig I did. Down, down, down. Thinking the water would only be another foot or two.

When the Fire Marshal ordered us to put in a back door, this was the area where it needed to go also, so I thought to just bring it in over the well and have the backhoe dig out the well for me at the same time. We brought in a 7ft in diameter big steel tank for the well casing and I had the backhoe dig down 20 feet to place it.

BUT, we ran into rock, so I had the well casing set on the rock, and later started digging under it. Eventually I put a concrete ring around under the casing to connect it to the rock. (Didn't do as good a job as I thought and we eventually had to scale away quite a bit).

Over the years I tried to dig the hole down further and further. First tried drilling and placing dynamite. But the first dynamiter I got years ago was terrible - and time and again I had to go down and dig out the dead heads. Had to stop that before I became a dead head.

Volunteer crews came and with jack hammers and we pressed on downward. Finally got down to 35 feet several years ago. In sort of an ice-cream cone shape - but no water. Decided that Bonnar was wrong. We know where the water comes out the side of the cliff in a spring, (which was the source we had been using) so we had the surveyor come and survey a tunnel path for us to there. We would dig the vertical shaft down and then tunnel over to the spring.

The water is at fifty-three (53) feet, the surveyor said, but he felt we wouldn't have to tunnel, because he thought we would hit a water table.

In the Summer of '98, the new blaster came and blasted away the thick concrete wall that had created a narrow door between the shelter and the well. We poured a new concrete supporting post, floor and wall and were ready to start.

Then in 2000 he came and widened the well to five feet all the way down from below the 7 ft concrete collar. We rented a tractor, and he brought from up north a marvelous winch to go on it. Also he brought powerful miner's drills, and two great helpers.

He thought they would do eight feet a day, but it averaged out to more like eight inches a day. Finally, weeks later we reached water at 52 feet and 10 inches. Just where the surveyor said we would. It is in a stream about the thickness of a broom stick, that came in through the wall, at the rate of a little over 6 gallons per minute.

We dug down another four feet to create a reservoir, and hollowed out the sides to capture 1500 gallons of water. Then we drilled around the incoming jet of water, to increase the flow. We drilled all around it

everywhere in a six inch circle. to a depth of four more feet back into the rock, but they were all completely dry. And we drilled all around the rest of the well. But this was the only real source of water and it came in only that one stream.

If we had put the well over a few feet in any direction we would have missed it. Thank you Bonnar.

The pumps are now installed. Two one horsepower pumps that together can pump better than 15 gallons per minute. We can fill our settling tank in about 30 minutes, and then turn off the generators. (We also have a back up hand winch and bucket).

A third pump fills the big stainless steel milk tanker - (like you see on the highways) that we have buried underground.

For the first time in many years, we now have both tanks full. (Years ago we used to fill them with a ram pump, but it was a very slow process). The well is also what makes it feasible for us to now install a Fire Sprinkler System.

The well ended up costing over a hundred thousand dollars. But its donation is also part of the miracle.

Current and Future Projects

There are always on-going construction projects to improve the facility. While we consider the facility ready there are always more items that come to mind for equipping it.

Radiological Scientific Officer

On [another page](#) you will find links to all sorts of shelters, if you need additional free help, you can **E-mail me for free consultation.**

While previously, I would have been glad to chat with anyone, about any ideas, the interest has now become so great, and the requests in such number, that I wish to restrict this FREE service to those who meet the following three requirements:

1. They wish to build a shelter IMMEDIATELY and they are not merely "thinking" about it.
2. They already have a place where they can build it.
3. They have some amount of monetary resources they are allocating to the project.

If you meet those three requirements and wish my FREE assistance, please write to me telling me:

- a. your location
- b. describing the nature of the property you have available
- c. any plans you have in mind
- d. what monetary resources you have available
- no matter how limited.

If I can help you in this way:

E-mail me for free consultation at

survival@webpal.org

The old man himself!

.
.
Bruce Beach
January 1998

I am the only non-governmental Radiological Scientific Officer in Canada. I graduated second in the last class that was taught. The pre-requisite for the course was supposedly a Ph.D in physics plus the previous required courses which I had completed with top grades.

While I did not have the required degree I had the good fortune to room next to the top student in the class who permitted me to study with him each evening and sit with him at each meal. We also sat next to each other in class and therefore were always able to team up on in-class projects. It was through his great assistance that I managed to come in second. Prior to that course I had taken three previous government courses. The first in the U.S. and the second and third in Canada. I had also graduated as the Honor Student from a specialized USAF AACS school and based upon this, and work experience with the Western Electric Company as an engineer, was *offered* a high paying job as a civilian doing the acceptance inspection for the USAF nuclear missile sites, *which I declined*.

Over the past many years I have built 24 shelters ranging in capacity from one person to 500. These have been of almost every design conceivable, and I have also consulted on a great many others. I have also written a widely distributed booklet entitled, [You Will Survive Doomsday](#), which is available to you FREE for the downloading.

In fact, I probably became the most *notorious* shelter builder in the world. Several major newspapers, in both the United States and Canada, have done multiple page articles about me. There was an article and picture on the front page of the Canadian national newspaper, and there have been articles about me in the national magazine. As recently as March 2002 I was featured on the front cover of a national construction magazine. Over the years there have been dozens of other newspaper and magazine articles, plus lengthy TV shows, and I have spoken on more radio shows than I can count, often being interviewed by phone from thousands of miles away.

I taught a college course on survival and have been the guest speaker at other college's survival courses and numerous conferences on survival. All told, millions of people have heard me or heard about me, including thousands on a face to face basis in various presentations and shelter tours. I have even been the subject of a post-doctoral dissertation by two Ph.Ds from the University of California who referred to me as the "dean" of American survivalists.

You probably cannot *imagine* the number or variety of survivalist groups that I have met with and heard their ideas. I have also, at one time or another, talked with most of the survivalist leaders in North America and have read many, many volumes of ideas and thoughts on the subject. At this point I am surprised if I hear anything new.

Interest in this subject has come in waves. The Berlin Wall crises, the Falkland Island crises, the Gulf War crises, some particular movie or some other event. Presently, interest is growing again because of activities in the Middle East and as the reality is sinking in that the nuclear threat has never been greater since the time of the Cuban Missile Crisis.

Over the last many years, my wife and I have distributed *free* well over one hundred thousand booklets to try to prepare people for a nuclear holocaust. We have *never* charged a dime for doing this. My position is that I cannot play God, deciding who I will help, so I cannot put up the barrier of money in refusing to help someone, therefore I offer the help freely to everyone.

This has already seemed like a lot of breeze but if you would like to know still something more about me personally, and my other interests, then you can

MENU: [HOME](#) » [SURVIVAL](#) » [Index of States](#)

Life in the Ark Two Community

The Ark Two Survival Community is NOT a Commune. Nor is it based upon any particular religious or political concept. It is a pluralistic community that welcomes members from any religious, racial or cultural background.

Except in times of CATASTROPHE the community remains loosely knit. Members of the community can live at a distance, (although this is not recommended) and come to the facility if they feel that a catastrophe is imminent.

For information about the Ark Two Programs

[click here](#)

No one lives in the facility, although several families live nearby. The community tries to develop TEAM leaders with different types of expertise, and the Team leaders generally live within the vicinity.

For information about the Ark Two T.E.A.M.s

[click here](#)

Ideally, new members of the community would purchase or rent their primary home, (or a secondary home such as a resort cottage) within 20 miles of the facility. This, however, is not a requirement. The reasoning behind their having such a home location within the area, however, is that they would be near to the facility, should an emergency occur, and that they would have a base from which to re-establish their lives, during the reconstruction period after an emergency. We are located 90 miles northwest of Toronto, and Canadian Law changed in 1998, so that U.S. residents can purchase property in Canada, without tax penalty, and can reside here, only having to cross back over the border once every six months.

Use of the facility is anticipated in the worse case (an all out nuclear war) to be short term. By this we mean a period of from 3 weeks to six months. The facility would continue to be used as a resource for such functions as community administration, communication, and the ongoing work of agricultural recovery. It would also still be available as a refuge for any other emergencies, such as temporary social disturbances and so forth. Under the nuclear scenario, it is possible that children may need a longer period of sheltering for their sleep periods, than would adults.

Under other scenarios, such as Earth Changes, there would be other uses of the facility. One basic

scenario would be as a refuge from social disturbance and a base for the restoration of agriculture. In this latter regard the facility has fenced off, with a five foot fence a separate protected area for agriculture. The headwaters of the Pine River run through the facility as a water resource, and there are large ponds available.

Key to agricultural recovery is the necessary expertise. Member families of the survival community have farmed on this same land since before the beginning of the last century. It is anticipated that a situation may require labor intensive farming, of the gardening type, that members of the survival community presently maintain. There is sufficient land to provide new members their individual gardening plots, or to let them participate in joint community efforts at food production.

More central to agricultural recovery, is that the whole surrounding area is a well established agricultural community that has been VERY productive over many decades. Nevertheless, in anticipation of EXTREME conditions, preparations have been made for hydroponic seed germination and other such approaches.

For those concerned about Earth Change scenarios, it should be noted that the survival facility is located on the highest level of land in Ontario, far above any possible flood plain. That it is built upon an area of solid pre-cambrian rock, which has suffered no historical earthquake damage, and that the shelter itself, being underground, provides complete protection from any form of radiation, solar or otherwise. Any other personal concerns in this area will be addressed upon request.

During a Catastrophe the shelter operates much like a ship or submarine. There is a shelter commander and crew to maintain its operation. During the state of immediate emergency the shelter is NOT operated as a democracy. In order to protect the maximum number of people, the occupants are separated by age and sex. This admittedly concerns some people, but it must be remembered the facility is a Life Boat, not a Luxury Cruise Liner.

During an emergency, the adults have duties and are only permitted 8 hours per day of bunk time. They will be very busy the rest of the time. Young children and infants, are encouraged to sleep 12 hours a day, so as to reduce activity in the shelter. Nevertheless, in order to accommodate the maximum number of persons, that Canadian Government regulations permit in a shelter this size, it is necessary that all the bunks be assigned for shifts of a fixed number of hours per day, and that on alternate shifts someone else will have to use the bunk. This is the reason the sleeping arrangements have to be assigned by sex and age.

Community organization, aside from the time of emergency, will have to be determined by the community and the circumstances. In a scenario that is not too severe, individuals in the survival community, may simply return to their previous homes and something approximating their previous life style. In a more severe scenario, the members of the survival community may simply merge into the larger surrounding community and whatever response that community makes. In a very severe scenario, the members of the survival community may have to organize themselves into some sort of longer term

continuing entity. All of these responses are hypothetical and there is no need to overly speculate upon them until such time as one sees what the circumstances dictate.

The key to a successful experience in the survival community, is your participation ahead of time. Participation in the TEAM activities, of preparing for contingencies ahead of time. Becoming acquainted with the TEAM leaders and community members, so that you know them, and that they know you. The basis of this community is built upon a Spirit of Service. Those with that spirit will find that they fit right in and that their participation will be greatly appreciated.

If you want to know more particulars about this community, you can contact any of the [TEAM](#) leaders or [The Community Coordinator](#).

If for some reason you feel that this Survival Community is not the one for you, then you should find another more suitable community. To assist you in that we used to have a [list](#) of hundreds of survival groups and communities in North America. However, circumstances have changed and it is now much more difficult to find and make contact with other communities. Whatever you choose to do, we HIGHLY recommend that you join SOME community, if you believe there is an imminent danger, because your chances of survival are greatly enhanced by being in a community rather than being on your own.

The Ark Two Community Nuclear Holocaust Recovery Programs

<p style="text-align: center;">*</p> <p style="text-align: center;"><u>Introduction to Ark Two & Overall Purpose</u></p>	<p style="text-align: center;"><u>Free Shelter Consultation & Nuclear Survival Info</u></p>
<p style="text-align: center;">**</p> <p style="text-align: center;"><u>Agricultural Recovery</u></p>	<p style="text-align: center;"><u>Radiological Monitoring Equipment</u></p>
<p style="text-align: center;">***</p> <p style="text-align: center;"><u>Economic Recovery</u></p>	<p style="text-align: center;"><u>KI Information and Support</u></p>
<p style="text-align: center;">****</p> <p style="text-align: center;"><u>Refuge and Recovery Maps by State</u></p>	<p style="text-align: center;"><u>Family Finding</u></p>
<p style="text-align: center;">*****</p> <p style="text-align: center;"><u>Information Broadcast</u></p>	<p style="text-align: center;"><u>Social Restoration</u></p>

Purpose: Anyone is welcome to join the Ark Two Survival Community (located in Ontario,

Canada) - so long as they do so before the catastrophe occurs. There is no charge for membership nor any restriction other than one be tolerant of the other members. However, it is only practical to be a member if one makes arrangement to live within about 20 miles because it would not otherwise likely be possible to get to the Ark ([see pictures](#)) at the time of catastrophe.

The purpose of the Ark Two Survival Community is to ameliorate the effects of a Nuclear War and to help reorganize society afterwards. The community founder believes that a nuclear war is inevitable and therefore in 1980 built the first phase of the Ark Two Refuge and has since expanded it and established the following programs.

The project has not been favorably received by the local and provincial governments. By 1990, when I stopped counting, it had been subject to over 30 court and commission appearances and the number has greatly increased in the last few years. Legal costs have mounted to hundreds of thousands of dollars. In 1999 there was a raid without warrants involving 7 police vehicles, 4 fire units and over 40 personnel and a K-9 unit, coincidentally caught on video tape by the CBC. Subsequently the facility was hounded with repeated government inspections. Some of the inspectors candidly admitted that it was just harassment, but because of wanting to keep their jobs they of course were not going to put that into writing. It is for this reason that one might refer to the facility as Waco North. A kinder, gentler Canadian version in that The Ark doesn't have any weapons and in that so far no one has been killed by the raiders.

The general public views the project as being operated by an eccentric (in the most favorable terms) or by a nut-case in what is the more usual expressed attitude. For the forty years in which I have built over two dozen shelters and have consulted on many dozens of others, the general ridicule has been extensive, to say the least. "Why do it then?", I have often been asked. Why not get a life, enjoy life and quit worrying about doomsday? The answer is that I don't see the purpose of life, nor happiness in life measured in how many rounds of golf I might play, but rather in service to my fellowman. While I don't have any "visions" or hear any "voices" this appears to me to be the service to which I have been called.

It is my hope that the programs described below will save tens of thousands of lives and will be useful in restoring society and making people's lives better after the nuclear holocaust.

Click here to return to the
[Table of Contents](#)

Survival Education: For over 40 years the Ark Two Community founder has run a large variety of nuclear survival education programs. This has involved the printing and distribution of over 100,000 printed copies of [FREE books and booklets](#). Now, with the Internet, some of these are available right at this web site to untold numbers of more people for free downloading.

He also provides FREE [consultation](#) on shelter building.

In the process of trying to educate the public he has appeared on dozens of TV programs, dozens of radio shows, and has been written about in a great many magazine and newspaper articles. Many millions of persons have heard about his efforts.

The Ark Two Community has a librarian who has done a magnificent job of compiling on CD ROM, Microfilm, and in other media, thousands of volumes of practical and semi-technical descriptions of technology that we hope will be useful after a nuclear holocaust. We hope to be able to widely disseminate this information after the holocaust.

We have also assembled survival guidance material to handout at the door of the shelter to people for whom we have insufficient room in the shelter to accomodate. In December 2001 we completed a series of 4 videos, on such subjects as building an expedient shelter, which we hope to be able to show to the same group of people.

Click [here](#) to return to the
[Table of Contents](#)

Radiological Monitoring: As a Radiological Scientific Officer I try to provide useful information to people about [Radiation Detection Equipment](#). I have assisted many hundreds of people in obtaining thousands of pieces of equipment and in the past have given away hundreds of pieces. I simply no longer have the time to do that but we have stockpiled, tested and labeled hundreds of radiation detection devices (currently worth tens of thousands of dollars) that we will give away to those people that we have to turn away from the door of the shelter.

The plan is to train Radiological Instructors while in the shelter so that they can go out afterwards and train monitoring teams. Equipment has also been stockpiled for these teams.

Click [here](#) to return to the
[Table of Contents](#)

KI Information and Support: A significant radiological defense is in the use of Potassium Iodide (KI) or one of its derivatives. For this purpose we store in our survival community many tens of thousands of dosages to provide for thousands of people in the month following a nuclear event. These we also plan to provide free to persons that we have to turn away from the shelter.

For those persons interested in making provision for their own families we recommend their contacting [KI4U](#).

Click here to return to the
[Table of Contents](#)

Agricultural Recovery: Key to the survival of society and humanity will be the restoration of Agriculture. This is one of the ***MOST IMPORTANT*** types of information that we provide and I highly recommend that you look at [our webpages on agricultural recovery](#).

Among our shelter supplies we are storing multiple copies of [proven plans](#) for converting tractors to operate on wood combustion. With practically no farm horses or horse drawn implements remaining, and with there probably being low availability of petroleum fuels, knowledge of these and similar techniques could be very valuable. The plan would be to train mechanics locally who would then be dispersed to other agricultural locales to supervise local mechanics in the procedures.

We have also prepared a dozen radiological testing kits, for testing for radiation in food and water. We plan to send these to centralized locations, perhaps in each of the Canadian Provinces. Today it would cost over \$5,000 each to replace these and in the future they may be invaluable.

We have also made a point of storing seeds for our own facility, in sufficient quantity to supply a sizable community around us.

Click here to return to the
[Table of Contents](#)

Economic Recovery: One of the most challenging issues will be the re-establishment of a functioning economy with monetary exchange. It is to this subject that we have been able to concentrate our particular skills in so much as I was trained as, and served as professor of Institutional Economics. Extensive study, although not known to the general public, was put into the subject by the US Government. Their summary conclusion was that the best bet was what we call LETS (Local Economy Trading Systems) although they did not go further and develop the concept in detail. That I have done, and have published the methodology for [LETS Entitlement](#) here on the web.

Our plan is after the holocaust to first establish a demonstration system and then train individuals in how

to go to other communities and show them how to replicate it. As the local systems progress we would like to then facilitate exchange between them.

Click here to return to the
[Table of Contents](#)

Refuge and Recovery Maps: For a number of years we maintained for each state of the United States, and for Provinces of Canada, lists of Intentional and Survival Communities, however, it became necessary as of the Oct. 2002 revision to discontinue the list in face of growing governmental and social opposition. For each of the states, we still show [maps with potential targets](#) as listed by FEMA.

It is our hope that after a nuclear holocaust we will be able to replace the current maps with maps showing the actual locations of destruction, information about the extensiveness of the destruction, and the pathways around those areas, as the pathways are developed. We would also hope to include information about surviving resources in the areas and that these maps will then be linked into our Family Finding Registry program.

Click here to return to the
[Table of Contents](#)

Information Broadcast: From the outset it was planned that Ark Two would be a broadcast facility, and for this purpose it was built upon the highest point in Ontario. Originally it was equipped with four transmitters that the radio engineers said had the capability to reach both of the coasts and as far south as Florida. Over the years the transmitters deteriorated and a couple of years ago we scrapped them and they have yet to be replaced.

The idea would be to gather information by short-wave and other means and to then broadcast on a band that could be received by AM receivers in automobiles. Specific broadcast times would be established for times relevant to specific localities.

The content would consist of news, shared recovery experience and expertise, agricultural and medical advice, and survivor lists for various locales at specified times. To what degree we will be able to implement this plan will have to be determined at the time. In the meantime we have upgraded the generator for the transmitter and are making additional steps to continue this program.

Click here to return to the
[Table of Contents](#)

Family Finding: One of the most difficult and yet desirable objectives of individuals will be the finding of missing members of their families. It is for this reason that we hope to establish ***THE REGISTRY*** using the above mentioned [state \(and provincial\) maps](#) with a hierarchial arrangement of T.E.A.M. Leaders to be established in each locality for this purpose. It was found that after the limited atomic blasts in Japan that families that were separated at the time of the blasts often had to go in different directions, and having no central known point to return to, often never found each other again, although there were occasionally happy reunifications decades later.

Using the maps, information gathering systems, and the facilities described under other topics, it is our hope to facilitate family finding. For this purpose our web pages were moved closer to the Internet Backbone (3 hops from the US Backbone whereas we were originally 14 hops) and on a fibre optic network with an ISP that has our own survival philosophy. The Internet was originally designed for nuclear survivability and depending upon how well it fulfills that purpose, or how rapidly it can be restored, then we hope to provide an information network where survivors can register for each of their localities, and seekers will be able to systematically look for family members.

Click here to return to the
[Table of Contents](#)

Social Restoration: The humanitarian motivation behind Ark Two has universal bounds. What the future holds, none of us can know in detail, but the Ark Two founder is one of great optimism. Hopefully mankind will learn from its mistakes and will develop an attitude of universal charity and concern towards all of mankind, regardless of race, religion, culture, or other coincidental distinguishing feature. In this regards there are published here two series of web pages on two subjects that the founder considers to be very germane to establishing peace in the world. One series of pages is on [The New World Order](#) and the other series is on a [Universal Auxiliary Language](#).

Join the MOST CAPABLE Preparedness Community in North America

Our goal is to have the largest and most CAPABLE
Preparedness Community in North America.

Towards this goal,
we assign our members to T.E.A.M.s.
Together **E**veryone **A**ccomplishes **M**ore
At the moment we have **12** TEAM Leaders.
We would like to start some other Specialist TEAMs
when we can find suitable TEAM leaders.
Perhaps you are a person with those qualifications.

If you would like to explore the possibility of joining our Community
you might like to contact one of the following TEAM leaders
LISTED ALPHABETICALLY
regarding the possibility of their acting as your mentor
in joining our community.
or contact directly

The Community Coordinator

Bruce Beach at:

survival@webpal.org

Ours is a very open and tolerant community. Mainly we look for new members who are tolerant, and have a Spirit of Service, and for TEAM Leaders we look for exceptional skills.

Ours is a very diverse community. Represented in it are three different Major Religions, and several denominations of Christians. There are also different nationalities, and a wide spectrum of educational backgrounds. The thing that we have in common is EARNED mutual trust and confidence. The community, as such, espouses no particular philosophy, political, or otherwise.

The TEAM leaders, in alphabetic order, are as follows:

Microbiotics Team Leader.

Aina (aina@bmts.com) has a Masters Degree in Micro-biology. She has been associated with our Preparedness Community for over 15 years. Aina has done special research in the area of the effect of radiation on plants and food. You may see her letter [Radiation in Food](#) and her paper [Contamination of Food Problem After Nuclear War](#). Aina has gathered together a file drawer of folders filled with research papers on the subject of Radiation in Food, and she is in the process of updating her research in the light of published research resulting from the Chernobyle disaster. Coincidentally, Aina is also an expert on the plants and fauna in our area and will work closely with the Agriculture TEAM leader, in this regards.

Medical Emergency Response TEAM Leader.

Bonnar (bonnarbeach@hotmail.com) has a Bachelor's Degree from Wilfred Laurier, and has completed the Emergency Medical Technician course at Humber College. He has been associated with our Preparedness Community for over twenty years, and has been active in both the building and equipping phase.

Radiological Defense TEAM Leader.

Bruce (survival@webpal.org) has a Masters Degree in Economics and has completed four government courses in Radiological Defense to the highest level of Radiological Scientific Officer and is a certified trainer in Radiological Defense. Bruce is also both a St. John Ambulance and Red Cross First Aid Instructor. A member of Bruce's TEAM is Ron, probably the most experienced designer and manufacturer of nuclear radiation test equipment in Canada, if not in North America. (He has checked, and sometimes designed and manufactured all of our radiation detection equipment.) Bruce has written a well received booklet on the subject of Nuclear Survival that is available **FREE** at: [You Will Survive doomsday](#).

Carpentry Maintenance TEAM Leader.

Dave (eldner@interhop.net) is an experienced Habitat for Humanity builder and is an experienced craftsman, having his own business for many years. He is now associated full-time with an area hospital. Over the years he has worked on many of our shelter projects. He has had on his team, for several years, a licensed plumber.

Administrative TEAM Leader.

Frank (dominion_group2@hotmail.com) Frank has his degree in business

administration from a Toronto college. He is the coordinator of the Canadian Preparedness Network, and the TEAM designation was his original concept for this group. Assisting Frank on his Team are Wilf and Bahia, two other experienced administrators. Frank has not been as active with us for the last couple of years but I got an email for this March 2000 update and he says that he is still there so until I get a phone call or notification otherwise he is still listed.

Agricultural Acquisition TEAM Leader.

Gary (gseaborne@stn.net) has been involved in the wholesale operation of agricultural products for the last fifteen years and has become very familiar with local agricultural resources. During those years he has also given us valuable volunteer assistance in the building of the Ark.

Mechanical Systems TEAM Leader.

John (jsipple@easyfocus.com) is a Wheelwright and has been associated with our Preparedness Community for several years. He works full time, and has many years experience, in large plants as the shift supervisor for mechanical and electrical maintenance. John also ends up with the brunt of moving things for the shelter with his truck and trailer, and we have moved many dozens of loads with his trailer in the last years.

Construction Team Leader.

Percy (percy@heaven.God) in MEMORIAM.

Percy passed on from a heart attack, but we still wish to acknowledge his GREAT contribution to our Preparedness Community. Percy over-saw the construction of our 500 person shelter. We will ever be appreciative of his many years of service. In recent years, many man months of labor have gone into the shelter by Bill, who was Percy's assistant foreman, and who is now assisted by Paul. Down through the years many craftsmen have dedicatedly worked on the shelter including John, who with his able crew, dug our well.

Supply Team Leader.

Peter (P_Corlett@yahoo.com) has been associated with our Preparedness Community for over 10 years. He has been greatly dedicated to identifying a variety of necessary equipment and supplies. He is a full-time professional videographer, and our liason to the barter community. Peter has made a professional video of our survival complex. He will will send you a copy for \$10 copying and handling charges, if you wish.

Medical Team Leader.

Ray (Ray@-----) has been a member of our Preparedness Community for over 15 years. Ray is an M.D. and he will be glad to correspond with

any other physicians who are seriously considering becoming a member of our community. If you are a licensed physician send Bruce your email address and he will pass it on to Ray. We also have two other physicians plus two nurses who are "acquainted" with, and not non-supportive of our activities, that may become active if conditions deteriorate. In the next few weeks we are expecting another doctor to join us from Florida and I have asked him for his permission to add his name here.

Communications Team Leader.

Velda (vhardman@sympatico.ca) Member of the Preparedness Community for over 20 years. Ham Operator (call VE3 LIB) and all that. Probably best to make an appointment by email if you want to talk

Personnel Team Leader.

Warren (wsearch@triad-graphics.com)

works full time as a Graphics Artist and makes the daily commute back and forth to the city. In 2000 he took over as the TEAM Leader for Community Personnel and will be the one making assignments to the various TEAMS.

You - A Team of Your Choice

If you are a person who lives in the Greater Toronto Area or within a couple of hundred kilometers North West of Toronto (our shelter is 90 k.m. N.W. of Toronto City Hall, on the protected side of Caledon Mountain) we would like to invite you to investigate our Preparedness Community.

Although not listed here, we have a number of people who live in the vicinity that have some real talent and skills and that have been quite supportive of our efforts. Should the need arise they will be participating in the shelter and they have been tentatively assigned to the appropriate TEAMS.

If you have a skill that we need, we would like for you to become a TEAM leader. The TEAM leader positions that we are most needing to fill are:

- **Community Health Expert**
- **Telephony and Electronics Repair**
- **Chemist (particularly in regards to pharmaceuticals and plastics)**
- **Petroleum Engineer**
- **Dietician and Food Preparation**
- **Automotive Repair**
- **Security**

- **Agricultural**

Although for the latter we have team members with a combined total of over 100 years of agricultural experience in the area, and potential TEAM members with much more.

If you reside in the U.S. as a U.S. citizen, (and have NO criminal record) you may legally purchase for residence a cottage or farm in the Shelter Vicinity. The only requirement is that you must return to the U.S. for a few hours (minutes?) once every six months.

The members of our Preparedness Community have very diverse views about the future. Some are motivated by millennial concerns, some expect a nuclear holocaust, others anticipate earth changes, and still others social disruptions.

Whatever YOUR particular view or motivation you will most likely find a number of other members of our Preparedness Community with similar viewpoints, and you will find the efforts of ALL the members of our community compatible with your concerns. All persons worthy of trust and confidence, who have a Spirit of Service, will find a Haven in which they can have confidence.

If the above describes you as an individual then please contact RIGHT NOW,

FREE Books on Nuclear Survival

There are many books and pamphlets throughout this web site. Here are a few that deal directly with the subject of survival from nuclear fallout. Elsewhere are others on the subject of recovery and reorganization.

Some of the material is in HTML, other in .pdf, a few in both. Some elsewhere are marked LOCKED because for those we have as yet to obtain copyright permission. The key to open the locked files won't be provided until after a nuclear war but they have been archived so that they will be available..

The material comes from a variety of sources but the bulk of it has been converted to web format, (sometimes HTML and sometimes .pdf and occasionally both), by our Ark Two Librarian. For the last several years it has been an intensive labor of love on his part requiring immense effort and dedication.

Some of the material he maintains in duplicate at another site:

http://groups.yahoo.com/group/Self_Sufficiency/files

The materials, here and elsewhere on this website, that are presently available and unlocked are copyrighted but you are free to:

- link to them
- print them off and distribute them free
 - so long as you do so in their entirety - giving the authors credit
- quote from them - so long as you do so accurately and give credit

Nuclear Weapons and Fallout Defense
in order of importance to read

HTML
[You Will Survive Doomsday](#)

This is an easy to read booklet by a Radiological Scientific Officer that gives an

overall theoretical view of nuclear survival by refuting 23 myths often associated with the subject. It is meant to be read well ahead of time.

.pdf

[You Will Survive Doomsday](#)

This is the 2003 KB .pdf format of the above 24 page booklet.

HTML

[11 Steps To Survival](#)

This is a Canadian Government publication that lays out steps to nuclear survival, and should be the first priority to read in face of an immediate threat.

.pdf

[11 Steps To Survival](#)

This is the 930 KB of 25 pages in .pdf format of the above 47 page booklet.

.pdf

[Your Basement Fallout Shelter](#)

This 1111 KB 31 page booklet explains how to build a basement fallout shelter

.pdf

[Fallout On The Farm](#)

This 790 KB 14 page booklet by the Canadian Government explains basic defenses for use on the farm.

.pdf

[Nuclear Weapons Defense Manual](#)

This 1113 KB 95 page course manual was issued in the Canadian Radiological Defense Officers Course.

.pdf

[Nuclear Weapons Defense Manual - Tables](#)

This 951 KB 34 page manual of tables was issued in the Canadian Radiological

Defense Officers Course.

.pdf

[Nuclear Weapons Effects - Radiological Scientific Officers Handbook](#)

This 2540 KB 124 page handbook was issued in the Canadian Radiological Scientific Officers Course.

[Nuclear War Survival Skills](#)

This is the lengthy and comprehensive classic by Cresson Kearny that explains in detail the techniques needed for nuclear survival. Because of the length of this book, it is stored here in Replica Format. Clicking on the execute file will open it for you. If by chance you do not have Replica on your system it will load it for you and take only a moment to do so if you tell it to go ahead. The pictures do not appear.

Fallout Recovery

in order of importance to read

HTML

[Letter on Radiation in Food](#)

This is an introductory letter by the microbiologist Aina Shapley on the subject of Radiation in Food.

HTML

[Contamination_of_Food_After_Nuclear_War](#)

This is the full report by the microbiologist Aina Shapley who was commissioned by Ark Two to examine the overall problem.

.pdf

[Contamination_of_Food_After_Nuclear_War](#)

This 2687 KB 37 page paper in .pdf format of the above paper by the microbiologist Aina Shapley who was commissioned by Ark Two to examine the overall problem.

.pdf LOCKED

[Manual of food quality control - radionuclides in food](#)

This 13048 KB 133 page paper is the official USDA (United States Department of Agriculture) and UN (United Nations) standard and methodology for measuring radiation in food. This is the prime authoritative document on the subject. I obtained the information through its author Edmond J. Baratta, International Expert on Radioactivity with the US Food and Drug Administration at the research facility in Winchester, Massachusetts. The document is published both by the FDA and FAO (Food and Agricultural Organization of the UN). It is both very technical and readable in its detailed description of the methodologies and processes involved. However, since it does carry a copyright, and the government charges hundreds of dollars for a copy, this file is presently sealed until after the nuclear war.

[Removal Of Strontium-89 and Calcium-45 From Milk](#)

How to remove radiation from milk in a processing plant. This is the 61 page masters thesis of David Gene Easterly. I have the author's personal permission to republish it here.

[Radiation Risk and Ethics](#)

There was much scare talk about the effects of peace time radiation. This professional paper gives a much different view. It helps to get things into perspective.

11 Steps to Survival

Canada Emergency Measures Organization

Department of National Defence

Blueprint for Survival No. 4

Make this your handbook for emergencies.

Keep it in a handy place so that you and your family can refer to it quickly should any emergency threaten.

Keep other emergency advice such as first aid and artificial respiration instructions, antidotes for poison, emergency telephone numbers, in the same place.

Introduction

The Canadian Government has joined other peace-minded nations in doing everything possible to reduce world tensions, to assist in the settlement of international disputes by peaceful means and to achieve disarmament with such controls as are necessary to preserve the security of all nations. However, the awesome threat of a major nuclear war involving North America remains a factor in plans for the defence of Canada.

The nature and scale of a possible nuclear attack on North America, and the extent to which Canada would be involved in such an attack, cannot be predicted with accuracy. Our major centres would be at some risk of deliberate attack, random explosions could occur, and there would be the certainty of the danger from widespread, radioactive fallout over most of the Country.

Governments at all levels have made, and are continuing to make, preparations which will reduce the number of casualties, safeguard survivors and contribute to the capacity of this nation to survive and recover from such a tragedy. The purpose of this booklet is to assist individuals and families in making personal survival plans and preparations to guard themselves against the potential dangers of nuclear war.

Many of the precautions which are recommended will serve a double purpose in that they will save lives in peacetime disasters such as flood, tornado, fire, hurricane, blizzard, ice storm or earthquake. Attention has been directed to this important feature throughout the various steps.

All Canadians are urged to read "11 Steps to Survival" with care to act on the advice it contains and to keep it handy for emergencies.

Although protected by Crown Copyright, the contents may be reproduced in whole or in part provided proper acknowledgment of the source is made.

The Queen's Printer
Ottawa, 1969
Cat. No. Id 83-1/4

The Eleven Steps to Survival

Governments and communities at all levels are planning for the survival of our Nation in the event of a nuclear war. But the survival of individuals also will depend upon the preparation that each person makes. Persons ready to take the right action before and following an attack will increase their chances of survival.

This pamphlet describes what YOU can do before and following a nuclear attack. You can greatly increase your family's and your own protection by taking the Eleven Steps to Survival:

- [Step 1](#): Know the effects of nuclear explosions.
- [Step 2](#): Know the facts about radioactive fallout.
- [Step 3](#): Know the warning signal and have a battery-powered radio.
- [Step 4](#): Know how to take shelter.
- [Step 5](#): Have fourteen days emergency supplies.
- [Step 6](#): Know how to prevent and fight fires.
- [Step 7](#): Know first aid and home nursing.
- [Step 8](#): Know emergency cleanliness.
- [Step 9](#): Know how to get rid of radioactive dust.
- [Step 10](#): Know your municipal plans.
- [Step 11](#): Have a plan for your family and yourself.

Step 1: Know the Effects of Nuclear Explosions

A nuclear explosion releases vast amounts of energy in three forms:

1. [Light and heat](#)
2. [Blast](#)
3. [Radiation](#)

The amount of energy released depends upon the size and design of the weapon. A wide range of weapons and delivery systems are available to an aggressor and we have no way of knowing what size of explosions might take place in Canada. For illustration purposes, we describe in this pamphlet the effects of a 5-megaton H-bomb equal to the explosive force of five million tons of TNT. Such a bomb could substantially damage the largest Canadian city.

The effects depend upon whether the weapon is exploded high in the air, or on, or near the ground. An air burst usually produces more fire and blast-damage than a ground burst which results in a big crater and more radioactive fallout. The effects described below are approximate for a 5-megaton explosion and can only be approximate since effects depend upon a number of conditions such as weather, terrain, etc.

Light and Heat

A blaze of light brighter than the sun is produced by a nuclear explosion. It lasts for about 15 seconds. Temporary blindness and eye injury can result from the glare if eyes are not shielded.

The heat rays from the explosion travel at the speed of light or about 186,000 miles per second. It can start fires up to 20 miles away. Many fires are caused when the heat pulse comes through a window to set fire to curtains, paper, clothing and furniture. The heat flash also can set fire to the outside of wooden buildings.

The following are some examples of the predictable effects on unprotected skin of the heat flash of a 5-megaton weapon exploded on a clear day:

- Skin is badly burned up to 15 miles from the explosion.
- Skin is blistered up to 18 miles from the explosion.
- Sunburn types of burns up to 23 miles from the explosion.

Nuclear explosions in the air rather than on the ground are more likely to produce a greater number of serious burns through the heat flash. Clothing will give some protection. A shield between you and the light will give protection against burns from the heat flash.

Blast

The blast wave travels more slowly than the heat flash. Several seconds may pass after you have seen the light or felt the heat before the blast wave reaches you, depending on the distance you are from the explosion. It is like the time between seeing the flash of lightning and hearing the sound of thunder. For example, at ten miles from the centre of an explosion, it would take about 35 seconds for the blast wave to reach you. If caught in the open during a nuclear explosion, this time can be used to find some protection from the blast wave.

You might be injured by being thrown about by the blast; therefore, keep low. The greatest danger is from flying glass, bricks and other debris. The blast from a 5-megaton explosion could injure people as far away as 15 miles.

The kinds of damage that the blast can do to buildings are:

- Complete destruction of all buildings three miles from the centre of the explosion.
- Damage beyond repair to buildings three to five miles distant. They would have to be torn down.
- Major repairs required to buildings five to 10 miles distant before they could be occupied.
- Light to moderate damage to buildings 10 to 15 miles distant. They could be occupied during repairs.

A 20-megaton bomb increases the approximate ranges of damage described above to five, eight, sixteen and twenty-four miles.

These are approximate distances as the strength of buildings is not uniform. For example, reinforced concrete buildings are more blast resistant than wood frame structures. In some areas four miles away from the explosion,

concrete buildings might be repairable, while wood frame buildings would be completely destroyed. Windows, of course, are very vulnerable and are apt to be blown in as far away as 25 miles from the explosion.

Radiation

A nuclear explosion causes both immediate radiation and residual radiation.

Immediate radiation is given off at the time of the explosion. It is dangerous only within two or three miles. If you were near the explosion without adequate protection and managed to survive the effects of blast and fire, you could still be seriously affected by immediate radiation.

Residual radiation is given off by the radioactive particles left as "fallout" after the explosion. The danger from fallout would be so great and widespread that it is discussed separately, in [Step 2](#).

Protection against Heat, Blast and Immediate Radiation

The illustrations below show some of the most probable situations in which you might find yourself at the time of a nuclear attack, and what you should do:

Step 2: Know the Facts About Radioactive Fallout

If a nuclear weapon is exploded on, or near, the ground, danger from radioactive fallout is greatest. The force of the explosion may make a crater up to a mile wide and to a depth of one hundred feet. Millions of tons of pulverized earth, stones, buildings and other materials are drawn up into the fireball and become radioactive. Some of the heavier particles spill out around the point of explosion. The rest are sucked up into the mushroom cloud.

This radioactive material is then carried by winds until it settles to earth. This is called "Fallout". Under some circumstances you may see the fallout; under others you may not.

The radioactivity it gives off cannot be seen. You can't feel it. You can't smell it.

But fallout doesn't come out of the sky like a gas and seep into everything. It can best be described as a fine to coarse sand carried by the winds. Because the wind direction varies at different heights above the ground, it is not possible to judge from the ground where the fallout will settle. It can settle in irregular patterns hundreds of miles from the explosion.

The fallout from a 5-megaton explosion could affect seriously an area of 7,000 square miles. If nothing were done to gain protection during the period of high radioactivity, there would be a grave danger to life in that area.

Because fallout is carried so far and covers such a large area, it could be the greatest danger to the largest number of Canadians in a nuclear war. If Canada was not hit by nuclear bombs, those exploding in the United States close to our border could result in serious fallout in many parts of Canada.

There are four things which determine the amount of radiation reaching your body from fallout:

1. The [time](#) that has passed since the explosion.
2. The length of [time](#) you are exposed to fallout.
3. The [distance](#) you are from the fallout.
4. The [shielding](#) between you and the fallout.

Time

The radioactivity in fallout weakens rapidly in the first hours after an explosion. This weakening is called "decay". After seven hours, fallout has lost about 90% of the strength it had one hour after the explosion. After two days it has lost 99%; in two weeks 99.9% of its strength is gone. Nevertheless, if the radiation at the beginning were high enough, the remaining 0.1% could be dangerous.

Radiation must be measured by special instruments handled by people trained to use them. But, if you stay in a shelter during the first days following an explosion, you escape the strongest radiation. *You should stay in the shelter until radiation has been measured and you have been told over the radio that it is safe to come out.*

1 HOUR

7 HOURS

RADIATION DECAY TIME

48 HOURS

2 WEEKS

Distance

The strength of radiation reaching your body is reduced the farther you are from the fallout. Here are some illustrations of the safest place to be when you are in various kinds of buildings.

Shielding

The most effective protection is to place some heavy material between yourself and the fallout. The heavier the material the better the protection. Many common materials give excellent protection. The materials and design of the fallout shelter recommended in **Blueprint for Survival No. 1** will stop penetration of 99% of outside radiation.

These thicknesses of material will stop 99% of radiation:

- 16 inches of solid brick
- 16 inches of hollow concrete blocks filled with mortar or sand
- 2 feet of packed earth $\ddot{\text{A}}$ 3 feet if loose
- 5 inches of steel
- 3 inches of lead
- 3 feet of water

A fallout shelter is the best way to protect your family and yourself against radiation because:

- It keeps the radiation at a distance.
- It shields you from radiation.
- The time spent there is the period when radiation is most intense.

By providing your family and yourself with a fallout shelter, you are unlikely to suffer serious effects from radioactive fallout.

Personal Danger from Fallout

Radioactive particles in contact with your skin for a few hours may produce burns. Follow [Step 9](#) to prevent this danger.

Radioactive particles swallowed in food or water might be harmful. Follow [Step 9](#) to prevent this danger.

Radioactivity from an area of fallout may produce illness in the unprotected individual after a few days. Follow [Step 4](#) to prevent this danger.

Radiation illness develops slowly. It cannot be spread to other people. Except for temporary nausea shortly after exposure, evidence of serious effects from radiation may only appear after an interval of from a few days to three weeks. A combination of loss of hair, loss of appetite, increasing paleness, weakness, diarrhoea, sore throat, bleeding gums and easy bruising indicate that the individual requires medical attention. *Nausea and vomiting may be caused by fright, worry, food poisoning, pregnancy and other common conditions.*

Step 3: Know the Warning Signal and have a Battery-Powered Radio

All Canadian communities where there is a likely need are provided, or will be provided, with sirens. Other areas should have warning arrangements based on local systems such as telephones, horns, bells or factory whistles.

Warning devices are only attention-getters. Dependent on the size of your municipality, the sirens, bells, telephones, etc., will sound the Attack Warning.

There is one type of siren warning signal in Canada:

The ATTACK WARNING Signal

The ATTACK WARNING Signal: A wailing (undulating) tone on the sirens of three to five minutes duration or short blasts on horns or other devices repeated as necessary means:

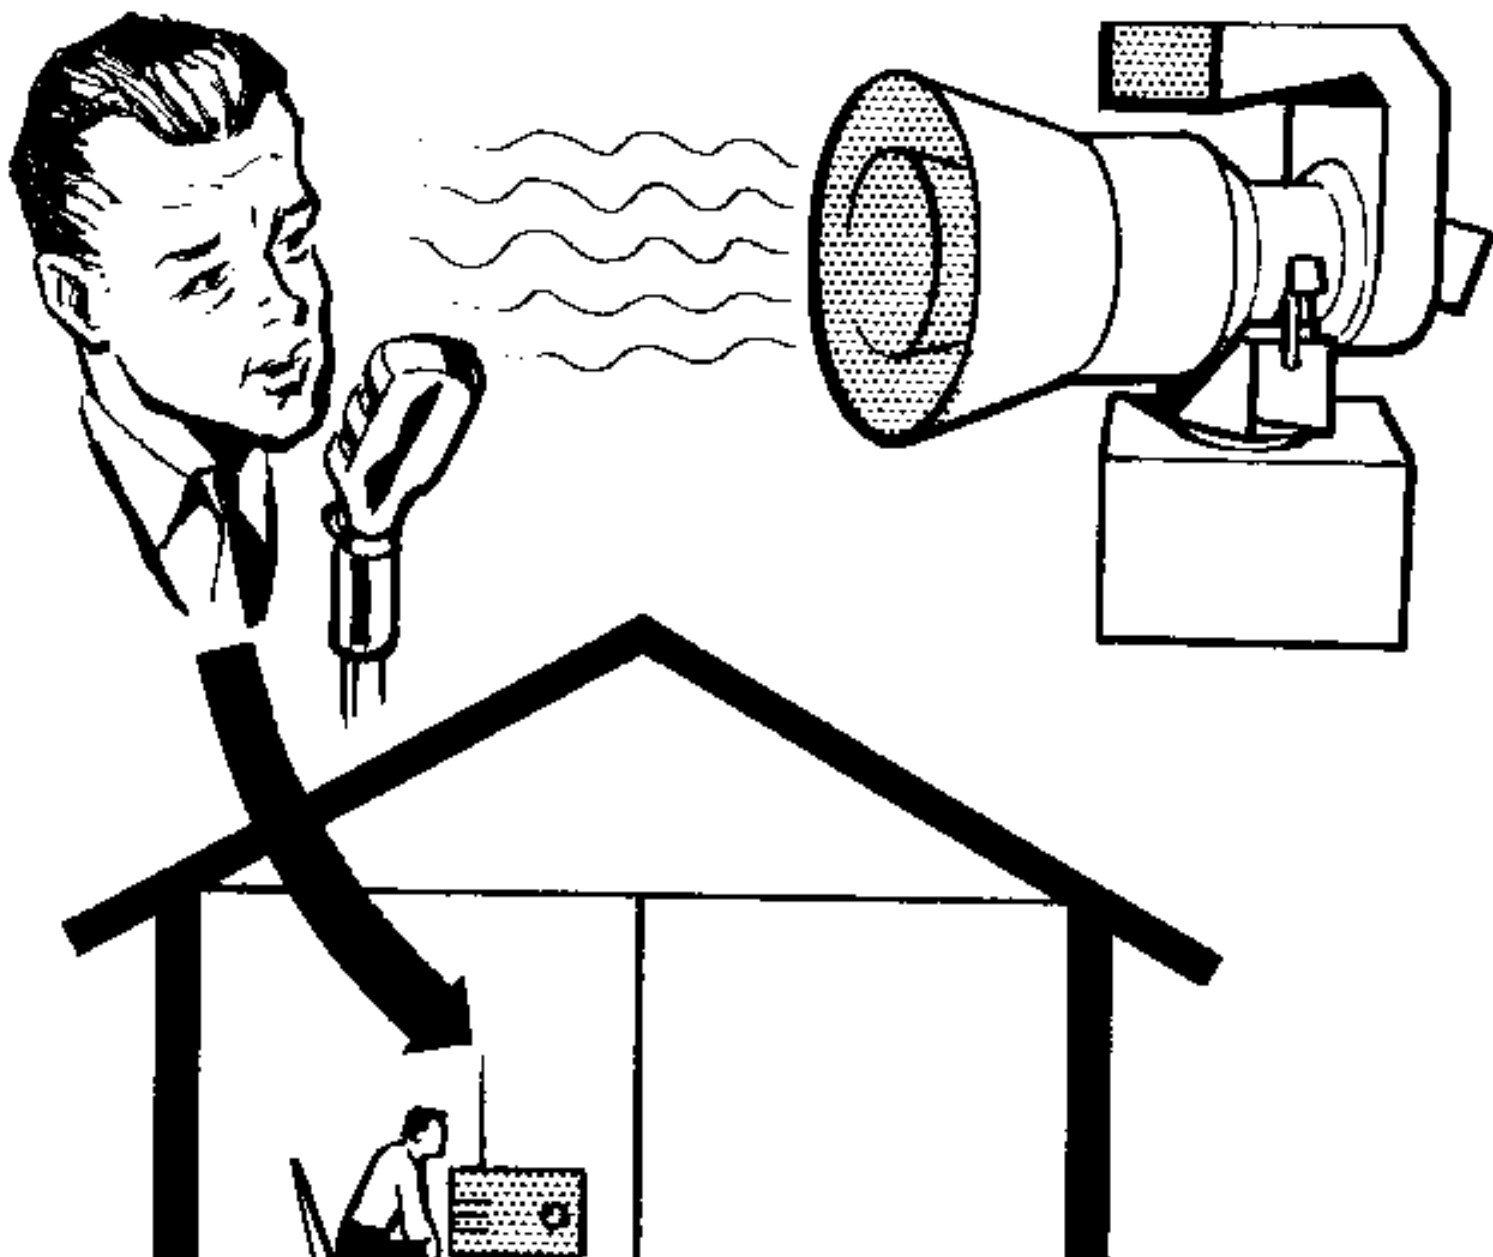

- An attack on North America has been detected;
- Warning of fallout.

WHEN YOU HEAR THE WARNING SIGNAL, YOU SHOULD TAKE PROTECTIVE ACTION AND LISTEN TO THE RADIO FOR INSTRUCTIONS.

A Radio is Essential

When the Attack Warning sounds, you must take protective action. Take a battery-powered radio with you. Broadcast advice and instruction may help to save your life. If you don't have a portable radio, turn up the volume of your house radio so that it can be heard in your shelter. If away from home you are forced to take emergency shelter and are near a radio-equipped vehicle, turn up the volume and open all the vehicle's doors or windows.

The Canadian Emergency Broadcasting System, a network of all Canadian radio and television stations which will be formed when a nuclear attack on Canada has been detected, will tell you when and how to take emergency protective action against possible attack and shelter against fallout if an attack occurs.

Before Attack

If sirens or warning systems signal impending attack, regardless of where you are or what you are doing, you must take the best available cover against the blast, heat and light effects of nuclear explosions.

Emergency broadcast instructions will include the following advice:

- If you are at home go to the basement or strongest part of your house or building which offers the best protection. If material is handy, improvise blast protection. See Step 4.
- Take your battery radio with you, or turn up the house radio so that you can hear it while under cover.
- Stay away from windows.
- Lie down and protect yourself from flying glass and falling debris.
- Shield your eyes from the flash of an explosion.
- If you are away from home take protective cover immediately.
- If you are travelling, stop and take protective cover immediately, or if you are only a few minutes from a safe destination, proceed and take protective cover immediately.
- Listen to your radio for further instructions.

After Attack

If sirens or warning systems sound following nuclear attacks, the warning may mean another attack or that radioactive fallout is approaching your area. **You will be advised over the radio.** If the advice concerns fallout, you must take cover against the fallout effects. (See [Step 4](#)).

Radio broadcasts will identify areas which will be affected by the fallout and give instructions and advice. These might include:

- Location of nuclear explosions causing local fallout.
- Information about the parts of the country to be affected by fallout.
- Length of time before fallout is likely to reach specific communities or areas.
- Ways to increase fallout protection.
- Supplies to take to your fallout shelter.

- Whether it is safer to stay in your community or area, or to go to other areas.
- Advice as to which areas are free of danger.
- Advice on when to leave shelters and for how long as danger from radioactive contamination diminishes.
- Requests for help in rescue operations, such as rescue, firefighting and medical assistance.
- Advice on conservation of food, water and fuel.
- How to keep warm when power is off and the weather is cold.

Don't Use The Telephone

When the sirens sound don't use the telephone. Listen to a radio or television for information. In the event of an Attack Warning telephone lines will be required for official use.

Step 4: Know How to Take Shelter

It is important to provide your family and yourself with a shelter. But what kind of shelter? This is a decision you must make yourself after studying the problem.

Study your shelter requirements in the same way that you would study accident or fire insurance. Decide upon the degree of protection you want for your family and yourself. Shelter is your insurance against something you hope will not happen, but if it does, will give you protection.

Shelters of the type commonly used in Europe during the Second World War would not provide protection against the blast of a nuclear explosion. They were designed to withstand short shock pressures lasting something like 1/100th of a second. Shelters designed to withstand the pressures created by a nuclear explosion must be able to stand up to pressures lasting as long as 6 seconds. In addition, they must be capable of giving the occupants protection against fires outside the shelter as well as against radiation.

The fallout shelter is designed to give protection against radioactive fallout only. Because most people in Canada probably would not be affected by the blast and heat effects of nuclear explosions, protection against fallout is all that is required by them.

The type of shelter for good protection depends upon the distance it will be from the explosion. Unfortunately, it is not possible to know this in advance. That is why each individual must make his own decision when selecting the type of shelter he wishes to have.

Blueprint for Survival No. 1 gives details of a fallout shelter for the home in which you now live. If you rent the home, the decision to construct a shelter must be taken jointly with your landlord.

Blueprint for Survival No. 2 gives details of a fallout shelter for the new home you may be planning to build.

Blueprint for Survival No. 6 gives details of blast shelters which may be built outside the home.

These pamphlets are available from your local Emergency Measures or Civil Defence Organization.

Improvised Protection Against Blast

One of the simplest ways to improvise some anti-blast protection is to build a lean-to (bed springs or boards) against a work bench or heavy table, preferably in the basement, and pile mattresses on it and at the ends. If the material is readily available it could be built in a matter of minutes after the ATTACK WARNING is sounded and could protect you from loose bricks, flying glass, etc.

If you are in the open and there is a ditch or culvert within easy, quick reach, lie face down in it and cover your face with your arms. Make sure this shelter is not too close to buildings which could collapse into it.

"After" the blast and heat of the explosion, you would have to find other protection against fallout which will come down later. (Don't forget your battery-powered radio).

None of these improvisations is as good as a properly equipped blast shelter, but any single one of them could mean the difference between life and death.

Improvised Protection Against Fallout

You may not have a fallout shelter when warning of approaching fallout is broadcast. Here are some tips on how to increase your protection in a basement. The amount of protection you can build will depend on how much time you have available until fallout arrives.

- You can improvise a small emergency shelter by using furniture, doors, dressers, work-bench and other materials.
- Select a corner of your basement, if possible away from windows, in which to build your shelter. Remove inside house doors from hinges to use as a shelter roof over supports. Supports for the improvised roof can be cabinets, chests of drawers, work-bench, or anything which will bear a heavy load. Use the house doors as a roof surface to provide a base for the heavy material you will have to place on it. Bricks, concrete blocks, sand-filled drawers or boxes, books or other dense items on the roof will help reduce radiation penetration. Around the sides and front of your shelter build walls of dense materials to provide vertical shielding. A small cabinet or dirt-filled box as may be used as a crawl-in entrance which can be closed behind you.
- Remember, the heavier or more dense the material around you, the greater the protection.
- Block basement windows with earth, bricks, concrete blocks, books or even bundles of newspaper. In winter, use packed snow.
- On the floor above the corner of the you select as your shelter area, pile any heavy objects you may have available, such as furniture, trunks filled with clothes, dirt-filled boxes, books, newspapers, or earth from outside.
- Outside, against above ground walls of the basement around your shelter area heap earth, sand, bricks,

concrete blocks or packed snow.

If your home has no basement or crawl space, build your emergency shelter in that part of the house (centre hall or clothes closet) farthest away from outside walls and the roof. Build it as described for houses with basements. On the floor immediately above your shelter area, and against surrounding walls, pile up furniture, trunks, dressers, dirtfilled boxes or other heavy material which will reduce radio-active penetration into your emergency shelter.

Step 5: Have 14 Days Emergency Supplies

Nuclear attacks on centres of production, and fallout conditions, may curtail the distribution of available food stocks for several days or even weeks following these attacks. Persons who had taken shelter against fallout might be advised to stay in their shelters for as long as 14 days. Those who had chosen to evacuate larger cities would be dependent largely on the resources available in reception towns. Because of these possibilities, it is recommended that every person should have emergency supplies. These supplies should include food, water, battery-powered radio, first aid kit, and where necessary, medical supplies as recommended in [Step 7](#). Heavy clothing would be necessary in winter. Extra changes of clothing should be considered particularly stockings and underclothing.

For those who may choose to evacuate major centres, supplies must be selected carefully because of space limitation in the family car. Supplies should be packaged beforehand so that they can quickly be put into the car. See the pamphlet "Your Emergency Pack" available from your local Emergency Measures or Civil Defence Organization.

Many of the recommended items are already in your home.

Whether you choose to evacuate or take shelter locally, you should have a road map with you. You could then relate the information about areas under fallout, which you would hear about on the radio, to your actual location. Toys, games, books for your children would help to occupy their time if they had to remain in shelter from fallout. Your battery-powered radio will keep you in contact with the outside world.

The following is a suggested list of items from which your two weeks' supplies should be developed to be in your shelter or handy to it.

Equipment

- Beds (bunks or folding)
- Bedding
- Toilet
- Polyethylene bags for toilet
- Table (folding or other)
- Stools (folding)
- Cups and plates (disposable)
- Knives, forks, spoons
- Can opener
- Cooking utensils
- Kerosene cooker (*Do **not** use a pressurized stove in the confines of your shelter.*)
- Kerosene lamp
- Kerosene (sufficient for 14 days)
- Candles
- Safety matches
- Hand basin
- Calendar
- Paper towels
- Garbage can (two if no waste water runoff is possible)
- Garbage bags
- Shovel
- Broom
- Battery radio and spare batteries
- Electric lamp and spare bulbs
- Clock
- Flashlight and spare batteries
- Fire extinguisher
- Hand tools
- Pocket knife
- Axe
- String
- Light rope

Recreational

- Books
- Paper
- Pencils
- Playing cards
- Chess, checkers, other games
- Crosswords, other puzzles
- Knitting, sewing, etc.

- Hobby materials
- Plasticine

Toiletries

- Soap
- Toothpaste
- Toothbrushes
- Detergent
- Nail brush
- Razor, blades and soap
- Women's basic cosmetics
- Tissues (face and toilet)
- Face cloth
- Towels
- Brush and comb

Clothing and Personal Items

Coveralls, rubber boots, rubber gloves for adults. To be used in venturing outside even after instructions have been given that this is safe for short periods.

- Bedding (blankets preferable)
- Warm sweaters and socks
- Change of underclothing and socks
- Personal hygiene items for women
- Baby clothes
- Baby feeding equipment
- Disposable diapers (two-week supply)
- Legal papers
- Plastic sheeting

Medical

(See [Step 7](#))

Food

These are suggested items and amounts for each adult for 14 days in shelter. Check off the items as you stock them in the shelter and mark the purchase date on them. Food stored for emergency use should be used and replaced at least once a year.

- Milk: 14 cans (6-oz) or 6 cans (15-oz) evaporated milk or 1-lb dried skim milk
- Vegetables: 6 cans (15 or 20-oz) - beans, peas, tomatoes, corn
- Fruits: 6 cans (15 or 20-oz) Ä peaches, pears, apple sauce
- Juices: 6 cans (20-oz) Ä apple, grapefruit, lemon, orange and tomato

- Cereals: 14 individual packages (sealed in wax bags inside or outside)
- Biscuits:
 - 2 packages of crackers (1-lb. each)
 - 2 packages of cookies or graham wafers
- Main Dish Items:
 - 2 cans meat (12-oz) - corned beef, luncheon meats
 - 2 cans beef and gravy
 - 2 cans baked beans (15 or 20-oz)
 - 2 jars cheese
 - 2 cans fish (8-oz)
- Canned and Dehydrated Soups: 2 cans (10-oz) - bean, pea, tomato, vegetable

Other Foods:

- 1 large jar or can honey, syrup, jam or marmalade
- 2 lbs. hard candy
- 1 jar or can peanut butter
- 1 package tea bags or instant tea
- 1 jar sugar
- 1 jar instant coffee
- Salt and pepper
- Instant chocolate powder
- Chewing gum

Special Requirements for Children

- For each infant include 14 cans evaporated milk (15 oz) and infant food for 14 days.
- For each child up to 3 years, include 8 extra cans of milk.
- Decrease amounts of other foods according to appetite.
- Food for older children can be the same as for adults; adjust amounts according to appetite.

Water

- Requirements: 7-14 gallons for each adult member of family; more for younger children (some water may be replaced by canned beverages).
- Containers: Store in well-cleaned, covered containers such as large thermos jugs, new fuel cans, large bottles, or plastic containers.
- Change: Change stored water at least once a month.

Step 6: Know How To Prevent And Fight Fires

Misinformation about the fire danger from nuclear explosions is widespread and common. For example, some persons believe that the fire-ball would completely incinerate a city. This is not true.

The heat from the fire-ball lasts about 15 seconds and would create fires which are no different from the fires you see in peacetime. They can be put out with water and extinguishers, and if each survivor were able to put out a small fire quickly, mass fires would not take place.

The heat flash from the fire-ball entering through windows and doors could set fire to curtains, clothes, furniture and paper. Other fires could break out in attics, in backyard trash, on wooden shingles and on the outside of houses built of wood particularly if they are unpainted or weathered.

Knowing how to prevent and fight fires at home and at work reduces the number of peacetime fires. The same knowledge will also reduce the number of fires caused by a nuclear explosion.

But how can you fight fires in the presence of fallout? From 5 to 15 miles from the centre of the explosion, there will be many survivors. Fallout will not start coming down for about 30 minutes. During this half hour, survivors should inspect their houses and put out all the small fires they can. They must not rely on the fire department to extinguish these fires.

You should have in your home and place of work, fire extinguishers, or in an emergency, create a water supply for fire fighting in pails, bathtubs, washtubs, etc. Don't rely on being able to use the established water supply system.

Even those who live in areas not attacked may find their fire departments will have to fight major fires elsewhere.

Every householder should learn how to carry out fire prevention and know how to fight small fires. It may prove of value in peacetime!

Your local fire authorities are always anxious to advise you on how to fight fires. Attend any emergency fire fighting classes held in your area.

Here are some tips for an emergency:

- Prepare for emergency by preventing accumulations of trash and rubbish in and around the home. This would include dry leaves and grass, lumber, boxes, cardboard cartons, old unused furniture, bales of newspapers, etc. Keep waste and garbage in covered containers.
- The shaking and twisting of buildings and homes due to blast waves in wartime or earthquakes and explosions in peacetime, may break utility inlets at the point they enter the structure. This may allow gas or fuel oil to flow into basements creating a severe hazard. Do not smoke, strike a match, or a lighter, to light your way into a darkened basement. Gas or oil vapours may be present and a violent explosion and fire may result.
- To lessen the danger of fires and explosions follow local instructions about shutting off utility services when the ATTACK WARNING sounds.
- If you have a coal-burning furnace, or a wood-stove, extinguish it or at least be sure to close all fuel and draft doors.
- Close curtains shutters or venetian blinds on all windows and remove furniture from window areas.

TO FIGHT AN ORDINARY FIRE:

- **Take away its fuel.** Get the burning material out of your home.
- **Take away its air.** Smother it with a blanket, wet if possible, or a rug.
- **Cool it** with water, earth, sand or fire extinguisher.

GAS, OIL, ELECTRICAL FIRES REQUIRE SPECIAL METHODS:

- **Gas fire:** Make sure the gas is shut off and then try to extinguish anything still burning.
- **Oil fires:** Make sure the supply is shut off then smother the fire with earth, sand, rugs or other heavy materials. Don't use water.
- **Electrical fires:** Make sure the electricity is shut off then put out the fire. Don't use water if the power is still on.

PROMPT ACTION TO PUT OUT SMALL FIRES IMMEDIATELY FOLLOWING A NUCLEAR ATTACK WILL SAVE LIVES.

Step 7: Know First Aid And Home Nursing

The acquisition of First Aid and Home Nursing skills prepares individuals to serve effectively in a national emergency. If such an emergency occurs, the care of many thousands of injured or seriously ill persons becomes a tremendous task for the organized health services. Doctors and nurses may not be readily available to assist you. Thus the importance of First Aid and Home Nursing skills takes on a new dimension. The survival of the injured or sick members of your family may become your responsibility.

The main objectives of training individuals in first aid and home nursing are:

1. To preserve life
2. To minimize the effects of injury or illness
3. To relieve suffering or distress
4. To provide continuing care and assist in rehabilitation.

Therefore you must:

- Know and practice life-saving first aid.
- Know and practice simple home nursing measures.

First Aid Supplies

A simple first aid box kept in your shelter or in your evacuation kit should contain:

- 1 bottle mild antiseptic solution (use to clean cuts)

- 5 yards 2-inch gauze bandage
- 2 triangular bandages (use for slings)
- 12 4" x 4" sterile pads (use to cover cuts, wounds and burns)
- 12 assorted individual adhesive dressings (use for minor cuts)
- 2 large dressing pads (shell dressing type) 8" x 8" (Available at minimal cost from St. John Ambulance Association)
- 5 yards 1/2 inch adhesive tape
- 9 assorted safety pins
- 1 small bottle toothache drops (for temporary treatment of toothache)
- 1 tube of petroleum jelly
- 1 small bottle aspirin tablets
- 1 thermometer
- 1 small scissors (blunt ended)
- 1 medicine glass
- 1 pair tweezers
- 4 oz baking soda and 8 oz table salt (make a drinking solution by adding 1 tsp salt and 1/2 tsp baking soda to 1 qt. of water)
- 1 First Aid Manual (St. John Ambulance Association)
- 1 Home Nursing Textbook (St. John Ambulance Association and/or Canadian Red Cross Society)
- 1 packet paper tissues

NOTE: individuals requiring special medication such as insulin should maintain at least 100-days supplies.

First Aid Hints

General Rules:

- Keep calm.
- Keep the injured person lying down in a comfortable position, his head level with his body until you determine whether his injuries are serious.
- Examine for stoppage of breathing, serious bleeding or broken bones. These must be treated immediately before any attempt is made to move the injured person. Do not be hurried into this unless you are in a situation of extreme danger.
- Keep him comfortably warm with blankets or other coverings, under and above the patient.
- Never attempt to give a semi-conscious or unconscious person anything to drink.

Unconsciousness:

An unconscious patient lying on his back may be strangled by his own tongue which will tend to fall back and obstruct the airway. All unconscious persons should be placed lying half over on their faces, (three-quarter-prone position).

If the patient is breathing quietly and easily and his lips are pink and have no froth on them, breathing is not obstructed.

If the patient is breathing noisily and with difficulty, if his lips are blue and frothing, or if his chest is sucked inwards when he breathes in, his airway is obstructed and needs immediate attention.

Keep the airway clear by:

Placing the casualty on his back; supporting his shoulders on a pad of any suitable material available; tilting the head back with one hand on the forehead, the other lifting the neck.

If his breathing stops you can breathe for the patient by blowing air into his lungs. Take a deep breath. Pinch the casualty's nostrils. Place mouth to mouth tightly. Blow into the casualty's lungs strongly enough to cause his chest to rise. The cycle should be repeated every 3 to 5 seconds for an adult and a little more frequently for a child. Blow more gently for a child or a baby, but strongly enough to make the chest rise.

Wounds:

You Must:

- Stop bleeding (haemorrhage)
- Keep out germs (infection)

Cover the wound with a clean dressing to keep out dirt and germs. Bandage it on firmly to stop the bleeding. If a wound is bleeding profusely, hold it firmly with your hand until you can secure an emergency dressing. Any thick pad of clean, soft, compressible material large enough to cover the wound will make a good dressing. Clean handkerchiefs, towels, sanitary pads, tissue handkerchiefs or sheets make good emergency dressings.

Burns:

Cover the burned area with large, thick, dry dressing and bandage it on firmly.

Encourage the casualty to drink plenty of fluids. A solution of salt and soda is useful to give to casualties with burns and to those who have suffered from serious bleeding.

Broken bones (fractures):

If a limb is very painful and cannot be used, appears to be bent in the wrong place or the casualty says he heard or felt the bone snap, it is likely that a bone is broken.

Sharp ends of a broken bone may damage important structures such as blood vessels and nerves. A broken limb should be steadied and supported to prevent movement of the broken ends before attempting to move the patient.

If a person's back or neck is so severely injured that he is afraid to move because of pain, or cannot move or feel his limbs, you should assume that he has a broken back. He should be moved on a hard, firm stretcher taking great care not to "jack-knife" him by picking up his feet and shoulders. Improvised stretchers can be made from a door, wide board, window shutter, etc. Fill in the natural hollows of the track and neck with padding and support the head on both sides to prevent movement.

DO NOT:

- Put strong antiseptics into a wound.
- Use a tourniquet.
- Remove clothing which is stuck to a burn.
- Break any blisters or apply creams or grease to a large burn.
- Give anything by mouth to a semi-conscious patient, or to a patient with internal abdominal wounds.

HOME NURSING HINTS

Before medical or nursing help becomes available you may also encounter infant care problems, emotional problems and persons suffering from radiation sickness. What to observe, and what to do for these latter cases, is outlined below.

Infant Care

Breast feeding is preferable but, if not possible, then a formula using powdered or evaporated milk should be prepared under clean conditions.

If vomiting or diarrhoea occurs infants and children become dehydrated very quickly. To avoid this happening give frequent sips of boiled water.

If a rash or fever develops, keep others away from the sick child.

Emotional Problems

Persons who become emotionally disturbed following a disaster should be treated calmly but firmly. They should be kept in small groups, preferably with persons whom they know and encouraged to "talk out" their problem. If they are not otherwise injured they should be given something to do. It may be necessary to enlist the aid of one other calm person to help subdue the overexcited patient. If a stunned or dazed reaction persists over 6 to 8 hours this should be reported to a doctor or nurse immediately one becomes available.

Radiation Sickness

The signs and symptoms of this illness are described in [Step 2](#).

Treatment includes rest, the provision of whatever nutritional food and drink is available and personal encouragement to get well. Swab the mouth gently with mild, warm salt and water if it becomes sore. As these patients are susceptible to infection, keep wounds clean and covered with a sterile dressing. Separate these patients from persons with colds, rash or fever.

Improvised Equipment

The following suggestions may help you care for your patient when proper equipment is not available.

- Bed: A couch, mattress or any well padded, firm surface; if too low raise on bricks, boxes or wooden blocks.
- Bedding Protection: Old crib pads cut into a convenient size and placed over a waterproof sheeting; or several layers of newspaper and heavy brown paper covered with old soft cotton. (Never use thin plastic if patient is a child.)
- Backrest: A straight-backed chair turned upside down at head of bed and securely tied to bed; a triangular bolster or cushions from a chair or chesterfield.
- Bed Cradle: A light wooden box or firm cardboard carton approximately 10 x 12 x 24 inches, with two sides removed; or a hoop sawn in half and the two pieces joined together in the centre.
- Pressure Pads: Soft cushion or foam or sponge rubber pads will protect heels, elbows, back of head or any other body pressure point.
- Bedpan or Urinal: For bedpan use a padded dish or pan; for urinal any wide-necked bottle or jar.
- Hot Water Bottle: A heated brick wrapped in several layers of newspaper.

START TRAINING NOW!

ONE PERSON IN EVERY FAMILY SHOULD BE TRAINED IN FIRST AID AND/OR HOME NURSING.

Courses in these skills are available in most municipalities from your local St. John Ambulance Association or Canadian Red Cross Society.

REGISTER NOW!

Step 8: Know Emergency Cleanliness

Your limited supply of water will have to be rationed and used only for essential purposes. If you have enough warning time before the arrival of fallout, fill your bathtub, all available buckets and pans with water. And remember that there is an emergency supply in your hot water tank. (Don't forget this if in peacetime your water supply has been temporarily disrupted).

The problems of garbage and human waste disposal can be solved even if fallout keeps you in the shelter. Put all your garbage in tightly covered garbage pails. After using your emergency toilet, you should tie human waste in waterproof plastic (polyethylene) bags and place them in the garbage pail. Store a 14-day supply of the plastic bags. After the second day in the shelter, you may risk leaving it for a few minutes for essential tasks. Therefore, when your garbage container is filled, move it out of the shelter.

Keep a soft broom in the shelter for tidying it up.

Remember, personal cleanliness in crowded shelter conditions is important to you and your family.

If your area is free of fallout but is without sewage services, bury human waste and garbage in the ground. Dig the pit deep enough so that the waste will be covered by at least two feet of earth.

Step 9: Know How To Get Rid Of Radioactive Dust

In [Step 2](#), fallout was described as "sand". To remove the danger, remove the sand. If you suspect that your clothes have fallout on them, remove your outer clothing before you come inside your home and leave it outside. Don't shake these clothes inside the house or shelter. You would only scatter the fallout grit and create unnecessary danger to others. If you have water, wash thoroughly, particularly exposed skin and hair. But do not scrub your skin as this might rub in the radioactive particles.

Exposure to fallout does not make you radioactive.

Even if you are stricken with radiation sickness, *this sickness cannot be passed on to others.*

Fallout on your clothing or body would expose you and those close to you to radiation. If you suspect you have been exposed to fallout, you will not be a danger to others if you carefully get rid of your outer clothing outside the shelter and wash.

Food and Water

Since most of your food will be in tightly covered containers (cans, bottles, plastic, boxes), it will all be safe to eat or drink if you dust the containers. Food, if it is unspoiled and free of grit or dust, may be eaten during the emergency period.

Be sure to wash fruit and vegetables and peel carefully.

Water will be safe if it is in covered containers, or if it has come from covered wells, or from undamaged water systems.

Step 10: Know Your Municipal Plan

It is important that your local municipality have a plan for a war emergency. And it is just as important that you know that plan.

Over the past several years, provincial and municipal governments, with the assistance of federal authorities, have been steadily developing plans for the protection of the population and the continuity of essential government services in wartime. Most municipalities in Canada have emergency plans to deal with both peacetime disasters and a nuclear attack situation. These include the details of how welfare, health, police, public utilities, fire and other emergency services will operate.

Some larger communities have developed plans to assist in the evacuation of those who would choose to leave before

an attack or who might have to be evacuated as survivors or casualties following an attack. These plans include traffic arrangements to reception centres and medical facilities in nearby communities.

It would be unwise to try and prepare your own family survival plan without first checking to see how it fits in with municipal plans. This would be true whether you plan to go to a safer area before attack or remain at home. It is particularly important that you know and understand the arrangements to instruct the public about staying in shelter and coming out of shelter when it is safe. Fallout is a health hazard which will require countermeasures for personal and family protection including assessment of radiation and advice and instructions to those in shelter.

There must be close understanding and cooperation between the public and municipal authorities responsible for their protection.

Find out about your municipal emergency plans now and keep well informed about them as they are further developed.

Step 11: Have A Plan For Your Family And Yourself

If you know what is contained in the first nine steps, and you know your municipal plan for a war emergency, you should now make your personal and family survival plan. The success of your plan will depend on how many of the suggested recommendations you carry out. Your chances of survival increase as you carry out each recommendation.

Thinking about the problems with which you would be faced should nuclear attack be launched against North America is the first important step. Blast, light, heat and radioactive fallout are the problems. A workable survival plan will include all of the preparations you can make in advance to meet those problems.

In making that plan, there are certain things you must know:

When to take protective action

When the sirens or other warning devices sound and your local broadcast station confirms that an attack on North America has been detected it means that you must take protective action immediately. Would you and your family

- Recognize the Attack Warning signal ?
- Turn on the radio or television and listen for instructions?

Where to take shelter

Deciding where you will take initial protective action and where you and your family will seek shelter from fallout are two basic points which you must consider in making your survival plan. Can you answer the following questions

about seeking immediate protection and shelter:

- Have you decided where you will take shelter if you're not at home when the Attack Warning sounds?
- Will you try to get home?
- Will your family know what to do if you are not at home?
- Is there a shelter plan for your children at school?
- Do you want them to try to get home?
- Does everybody in your family know your survival plan?

In thinking about what you will do or where you would go, you might consider leaving your home to find shelter elsewhere. Before you decide to plan on evacuation, consider the following questions:

- Will protection there be better than in your home?
- Are there sufficient supplies there?
- Can you carry emergency supplies for 14 days?
- Do you know how to get there quickly?

How to take shelter

If you don't have a fallout shelter built in your home, study the guide given in [Step 4](#). It shows how you can improvise emergency home protection. Bearing in mind that density and distance between you and the fallout is necessary, try to estimate if there is enough material and furniture to build an emergency shelter in your basement or the central part of your house.

- Can you move it to where it will be needed quickly?
- Will you have the help you require?

Based on the lists of emergency supplies suggested in Steps [5](#), [6](#), [7](#) and [8](#), try to answer the following questions:

- Do you have them at home?
- Can you collect and move them to the shelter area quickly?
- Does your emergency cooker, lamp, flashlight, radio work?
- Have you containers for water, garbage, hygiene?
- **DO YOU HAVE A BATTERY RADIO AND SPARE BATTERIES?**

There are many other points which you and your family must resolve for a workable survival plan. This booklet provides most of the essential information on which to base your plans. Read the Steps again, and, as you review each Step, try to answer the questions which apply to your surroundings, your home, your family. Here are a few more which may help:

- Do I know the recommended fire precautions?
- Does anyone in my family know how to fight small fires?
- Can an emergency supply of water be obtained quickly - for fire fighting? for personal use?
- Are first aid supplies and special medicines readily available?
- Does anyone in my family know how to render first aid?
- Can materials for personal hygiene and cleanliness be gathered near the shelter area quickly?
- Do I know what I must do about radioactive dust?
- Do I know the emergency plans of my municipality - for public shelters? for planned evacuation routes? for schools, hospitals, welfare centres? other special instructions?

REMEMBER! YOU MUST PLAN FOR:

- **PROTECTIVE ACTION WHEN WARNED OF ATTACK and**
- **PROVISION OF SHELTER AGAINST THE EFFECTS OF FALLOUT**

On the basis of what you've read and the questions and answers you've thought about, you should now make your survival plan and start making whatever arrangements you can. **BUT MAKE SURE THAT ALL MEMBERS OF YOUR FAMILY KNOW YOUR PLAN AND WHAT TO DO WHEN THE TIME COMES.**

The best way to arrive at a workable plan which will be remembered by your family is to practice it. If you plan on building an emergency shelter, try it now to find out if you have enough material, how much help you'll need, if your proposed area is large enough, and how long it will take to build. Locate and practice moving essential supplies, water, clothing, bedding, etc. Practice the essential things you would have to do.

If you plan to move to what you consider a safer location, make a practice run to make sure you know the quickest and safest route, that protection is available when you get there, and that you can carry all the supplies you think you'll need.

A GOOD SURVIVAL PLAN IS A PLAN WHICH YOU KNOW YOU CAN CARRY OUT.

WRITE DOWN THE IMPORTANT PARTS OF YOUR PLAN.

List for quick reference the important things to be done in the event of warning. As examples, note when and where all members of your family will take shelter at all times; where essential items of food, shelter and other supplies will be obtained; how shelter will be improvised; what windows must be blocked; if you plan on going to what you consider a safer area, details of the route and supplies you will need at your destination.

FOREWORD

In announcing the policy of the Government concerning shelters for civil defence purposes, I stated that substantial protection against radioactive fallout could be achieved by family shelters built at home at a modest cost. I said a pamphlet would be issued giving detailed suggestions for those wishing to provide such protection for their families. This is it. Another will be issued shortly with suggestions for shelters that can be built in a backyard.

Although Canada will persist in its efforts to avoid war, and to settle international disputes by peaceful means, there still remains some risk of nuclear war. Should a nuclear war occur, the risk of radioactive fallout will be very widespread, and will endanger many of us in our homes, even though a long way from the bomb explosion. The best and simplest way to safeguard against fallout is by household shelters which will provide protection.

The shelter described in this booklet, although not affording protection against the blast of a nuclear explosion or the fires that may result, will provide good protection against the more widespread radiation danger. These shelters will be a practical and reasonable means of insuring one's family against this risk that would arise should a war occur.

Each householder can and should decide whether or not to have this form of family protection. I recommend it.

A large, stylized handwritten signature in black ink, appearing to read "Diefenbaker". The signature is written over a horizontal line that spans the width of the signature area.

Rt. Hon. JOHN G. DIEFENBAKER
Prime Minister

NOTE

"The Associate Committee on the National Building Code of the National Research Council considers this design of household fallout shelter to be structurally acceptable for its intended use for installation in the basements of dwellings, for emergency use only.

The Associate Committee makes this statement since the provisions of the National Building Code are intended for use with building for normal conditions of occupancy and not for emergency use."

Produced by the Emergency Measures Organization of the Privy Council Office by Authority of the Prime Minister of Canada, The Right Honourable John G. Diefenbaker.

1 WHY A FALLOUT SHELTER

If nuclear war comes, the greatest danger to the greatest number of Canadians is likely to come from radioactive fallout. Fortunately, this danger can be averted or considerably reduced by the use of comparatively simple measures.

To understand how you can protect yourself against fallout, you must know something of its nature.

When a nuclear bomb explodes so that its fireball touches the ground, a considerable amount of earth and other pulverized material is drawn up into the cloud, becoming radioactive in the process. This dust is carried downwind and may be deposited over thousands of square miles of territory. After it has fallen onto the ground, or buildings, it still continues to emit radiation which cannot be detected by the human senses but is harmful to the human body.

For people outside the immediate blast area, one of the greatest dangers may be this radioactive dust. So we should keep such dust away from us.

Study of radiation has shown us how to protect ourselves against it. We know, for example, that the further one is from any source of radiation, the less one is affected by it. Then, while

radiation can pass through walls and other solids, we know that the denser the obstacles it encounters the more its intensity is reduced. That is to say, a solid brick, or stone, or concrete wall will reduce radiation effects more than wooden walls. So, by placing some type of heavy construction between ourselves and the sources of radiation, we can achieve a considerable amount of protection.

Finally, fallout radiation decreases with time; its strength is reduced day by day. So one method of survival open to us is to stay in some form of protected accommodation until the radiation intensity has dropped to the point where it is safe for us to resume a more normal pattern of living.

You would be wise to follow to the letter the procedures recommended here. The fallout shelter has been designed to make maximum use, at minimum cost, of the protective measures already known to be effective. Some choice has been left to the householder—for example: selection of the shelter size and equipment. But unless something is clearly indicated to you as a matter of choice, in your own interest you should consult your local civil defence authority or the Emergency Measures Organization at the address given on Page 32 before you deviate from the pamphlet's recommendations.

The shelter design will allow you to live without fear of radiation or harmful fumes generated within the shelter. In spite of a possible loss of electrical power and normal facilities, there will be enough heat in the shelter, even in our Canadian winters—if you wear warm clothes—to safeguard you from the worst effects of exposure to cold. A prolonged stay in the shelter will almost certainly prove uncomfortable at times, but it should not be unbearable.

Danger from radioactive fallout may occur in any part of Canada, if a nuclear war occurs, and will be greatest in the southern parts of the country. It would be just as great in rural areas as in towns, and in small communities as well as large. It may come from bombs dropped on defence bases or on large centres or ports selected as targets, from bombs going off in aircraft shot down in battle, or from missiles that miss their targets. Consequently, it is prudent for all Canadians to consider protection against this risk in their own homes.

It's not a blast shelter

You should not take refuge in a fallout shelter as a protection against the blast of an exploding weapon. There is a greater danger in the shelter than elsewhere because it may collapse as well as the house, and it may be more difficult to escape from the shelter if the house catches fire. It is better to seek protection elsewhere against the blast—in the basement lying down near a wall, under a heavy table, close to some exit in case of fire. The fallout shelter is for *after* the explosion, if you're in an area that has not been

devastated by blast and fire but is in the path of the fallout. Warnings of fallout will be broadcast by radio.

Until you build your shelter

If an attack should come before you have time to finish your shelter and your area is subjected to fallout, you should take refuge in a basement, in a corner, if possible under a heavy table, or other support on which should be piled as much heavy material as possible—bricks, books, piles of newspapers, lumber, etc. You should lie there for forty-eight hours, or until notified you can come out. It is much better in such circumstances to suffer from hunger, cold, thirst or other hardships than to run the risk of death or serious injury from radiation poisoning.

Other shelters in target areas

Those living in possible target areas, such as the larger cities, may prefer to build household shelters that will protect them and their family against blast and fire as well as fallout, in case a weapon explodes a few miles away. These are more difficult and expensive to build, costing several times as much as fallout shelters. Detailed suggestions for building such antiblast shelters are being prepared. Those living in or near potential target areas who do not feel prepared to go to the expense of building stronger shelters, can and should protect their families against the fallout danger.

Even an ordinary house provides some protection against radioactive fallout. The safest place inside is a corner of a basement. However, even in this part of the house there will not be, in most cases, sufficient protection to ensure the survival of the householder and his family. It is therefore necessary to add to the protection afforded, and this can best be done by building a basement fallout shelter. The shelter described in this pamphlet will provide the additional protection that is required.

Selection of site

Because the protection already available is highest in a corner of the basement, one of these should be chosen. That corner of the basement with the highest outside ground level will give the best protection and will simplify construction of the shelter. If, however, the ground is level with the basement floor or varies only slightly, then you should place the shelter below a room which contains a considerable amount of heavy equipment, such as a kitchen. In this way you increase overhead protection, and you can improve this further, after a fallout warning has been received, with more furniture, books, magazines, etc.

The corner you select should not have any basement windows inside the shelter. If it does, however, the windows and wood frame must be removed and the opening filled with brick or solid concrete blocks at least eight inches thick. (See Diagram 7(a) on the enclosed chart).

The nature of the shelter

The basement fallout shelter described here has been designed as a "do-it-yourself" project. An able-bodied person should be able to build it by following the instructions in this booklet and the plans on the enclosed chart.

The shelter is a small, protected room built on the concrete basement floor. The walls are made of heavy concrete blocks, except against that part of the cellar wall which is below the level of the ground outside. Here there is no danger from radiation and the wall of the shelter is simply a framework of lumber to hold the concrete blocks above it. The roof of the shelter consists of two layers of loose concrete blocks, laid on planks which are supported by strong wooden joists resting on the two sides of the shelter. The entrance is a short passageway built of concrete blocks to prevent direct radiation coming in the doorway.

Diagram 1 on the enclosed chart shows an outline plan of such a shelter located in the corner of a house basement.

Size

This shelter has been designed to a minimum width of 6 feet 8 inches inside its walls. This width is recommended because it provides for a full-length bed along the end wall furthest from the shelter entrance.

Most houses have a maximum distance of about 10 feet in the clear between the external wall and the beam supporting the floor joists. Thus the shelter will fit into most houses without interfering with the existing structural framework. The height from the underside of floor joists to the basement floor in an average Canadian home is approximately 7 feet 3 inches. This should

still give adequate headroom in the shelter after its roof has been put in place. If the height of your basement is less, the height of the shelter must be reduced by using a method described later in this section.

Diagram 1 on the enclosed chart shows the dimensions of a typical shelter required to accommodate five persons, using a width of 6 feet 8 inches between the inside walls. The size of the shelter should not, if possible, be reduced for families with fewer than five persons because a smaller size shelter is likely to be much less comfortable and may create ventilation problems. Changes in length required to accommodate additional persons are as follows:

<i>No. of People</i>	<i>Clear Inside Width</i>	<i>Clear Inside Length</i>	<i>Overall Length</i>
5	6'8"	9'4"	14'0"
6	6'8"	10'8"	15'4"
7	6'8"	13'4"	18'0"
8	6'8"	14'8"	19'4"

Diagrams 2, 3 and 4 on the chart show various construction details. The materials required to construct the shelter include concrete blocks of several sizes for the walls and roof (solid blocks are suggested but you may use hollow blocks *provided* their hollows are completely filled with sand or mortar as work proceeds); heavy lumber to support the roof and construct the framework against the basement walls; hydrated lime, cement and sand to make mortar; nails, lag screws, bars and washers to be used as described below. The detailed amounts required for the four sizes of shelters noted above are listed on Page 33. Tools required for the project include:

- Mortar Mixing Board
- Shovel and Pail
- Bricklayer's Trowel
- Level and Bricklayer's Line
- Long Straightedge
- Saw
- Hammer
- Drill with masonry bit
- Spanner or Wrench

How to make mortar and lay up masonry

The mortar mix recommended for shelter construction is one part of cementing material to three parts of clean sand. The cementing material may be masonry cement, or Portland cement plus hydrated lime in equal proportions, or Portland cement alone. The usual cement used in construction, called Portland cement, will not give as easy a mix to work with when used alone as will masonry cement. Prehydrated lime, purchased in bags, gives a workable mix when added to Portland cement, but means that an extra ingredient must be purchased.

A ready mortar mix in bags containing both cement and sand, and requiring only mixing with water, is available in some localities.

Mix the cementing materials and sand while dry, then add water and mix again thoroughly. Do your mixing in a shallow box, on a metal or plywood sheet or on a board platform. You may even use the basement floor for mixing, if you do not object

FIGURE 1

to its discoloration by the cement, but a box or plywood sheet will be more convenient. Mortar sets quickly, so mix only as much material at once as you can use conveniently in fifteen or twenty minutes.

Lay it on the line

Having decided the size of shelter you need for your family, the first step is to mark out "guide lines" on the basement floor as illustrated in Figure 1 on Page 8.

Start on the level

After marking out your "guide lines", check to see if the floor is level. If it is not level, then the procedure illustrated in Diagram 9 on the enclosed chart should be followed. This is to construct a shallow form in which are placed guide blocks to indicate the level to which the concrete is to be finished. The mortar is placed inside this form and finished level with the tops of the guide blocks. After it has set, the form and guide blocks can be removed and the spaces left by them filled in with the aid of an elementary form as shown in Figure 2 below.

FIGURE 2

Plan your work

Now that you have a level base, plan so that the walls come out straight and true (See Diagram 11) and to the exact height desired at each stage. Measure carefully the dimensions of the block you have available and remember to add $\frac{1}{2}$ inch to the block height for the thickness of the mortar joint when calculating the heights at any given course.

At corners the blocks must alternate and be fitted together, so you must keep the corresponding mortar joints at the same heights on all walls. Make use of a long, wooden straightedge, a level and a bricklayer's line in checking your work. Do not forget that the cores of hollow blocks *MUST* be filled as work progresses in order to give the desired degree of protection.

Consider carefully how many rows of whole blocks you can get into the height of your wall. The top row of blocks must not be closer than 16 inches to the existing floor joists or you won't have room for your roof. You may not be able to use the nine rows of blocks needed to give you the six feet of clearance within the shelter. (The shelter described in this pamphlet is, of necessity, calculated on the basis that the average Canadian house has 7 feet 3 inches of clearance between floor joists and basement floor).

However, you will want to make use of every inch of headroom your basement offers. If a wall of nine courses, or rows, of blocks is too high and one of eight courses not high enough, the difference can be made up by increasing the height of the level footing you make for the wall and, if necessary, by combining this with a top course of 4-inch blocks on the wall.

The following table will show you how to do this:

<i>If your basement headroom is:</i>	<i>You will need this number of 8-inch courses of blocks</i>	<i>and this increase in height to your level wall footing</i>
7'4" and over	9	Nil
7'3"	8½*	3"
7'2"	8½*	2"
7'1"	8½*	1"
7'0"	8½*	Nil
6'11"	8	3"
6'10"	8	2"
6'9"	8	1"
6'8"	8	Nil

*The half course consists of 4-inch blocks.

If the basement headroom is less than 6 feet 8 inches, which means a shelter headroom of 5 feet 4 inches, you should build the next larger size of shelter in order to ensure having the correct volume of air space inside.

Framing

The blocks which are built against the existing basement walls of the house, above the ground level, rest on 2-inch by 8-inch timber framing, which itself must be supported on a course of cement blocks or concrete at least 3 inches thick (See Diagram 10 on the enclosed chart). The framing reduces the number of concrete blocks required and provides storage space.

Below outside ground level and immediately adjacent to the shelter, the existing concrete wall of the house and the existing ground will provide adequate protection. Therefore, the height of the framing and the number of courses of blocks on top will depend on the level of the ground outside the basement wall. As an example, if it is 4 feet 6 inches from ground level to basement floor, then the top 2-inch by 8-inch board on which blocks are laid must not be more than 4 feet 6 inches from the floor. If the grade outside is lower, so must be the height of the framing. If the ground level is higher than the top side of the shelter roof, then concrete blocks would not be required on these walls. But timber framing must be built on these walls to support the ends of the roof joists. The timber framing must be properly braced

with diagonal pieces and all pieces well “spiked” together, using 4-inch nails (See Diagrams 2 and 3 on the chart).

The framing must be anchored to the existing basement wall as shown in Diagrams 5 and 8 on the chart.

It is important to remember that the height of your framing and blocks on top of it must always correspond to the height of the rows of blocks on the opposite walls so that your shelter will end up at the same height on all sides.

The surfaces of the framing which are to be placed in contact with concrete or masonry should first be treated with some suitable timber preservative such as copper naphthanate. You just paint it on; you’ll get the necessary instructions on its use when you buy it.

Walls

Having set the timber framing in position, the corner of the shelter on top of the framing is built about four blocks high (using blocks 16 inches long by 8 inches wide by 8 inches deep), and the remainder of the wall then built to the same height (See Diagram 10). Continue building the wall in this way to the required height.

The blocks which form the 90-degree angles at the corners need to be “toothed” together (as shown in Diagram 11 of the chart) in order to achieve proper bonding and rigidity.

These blocks must support the heavy roof of the shelter. For this reason the wall must be anchored to the existing basement walls. This is done by imbedding a metal bar at every other block between the two top courses of blocks and securing it to the basement wall by means of a lag screw (Diagram 8). Don’t forget to drill the holes in the basement wall and secure the bars in place (bent as shown in Diagram 6) before laying the top course.

The first row, or base course, of blocks which form the other walls is set in about $\frac{3}{4}$ of an inch of wet mortar along the guide lines you have drawn on the floor. You then move to the corner

nearest the centre of the basement, build that corner about four blocks high and continue with the remaining walls in the same manner as described above.

Don’t forget to insert the vent or air-circulating blocks as shown in position in Figure 3 below and Diagram 1 on the chart. Hollow blocks laid on edge will form suitable openings.

FIGURE 3

Block designs differ but most blocks will provide about the same area of opening, 40 square inches per block. Four blocks should be arranged for vents, two at the top and two at the bottom of the shelter, providing up to 80 square inches of opening at each level. You may, if you wish, arrange to provide the equivalent area of opening in some other way, such as by leaving out half a block. (If you plan to use solid blocks in your construction programme, it would be an idea also to buy four hollow blocks for the vents).

Before construction of the outer wall has gone too far, all bulky fittings and furniture such as cots, bunks or tables should be placed inside the shelter. Even when these have been put in

place, the walls should not be built all the way to the basement ceiling since a clear space of at least 16 inches is needed overhead to permit construction of the shelter roof.

The baffle wall protecting the shelter entrance from direct radiation must be the same height as the shelter walls.

The roof

When the mortar in the block wall has dried for a period of at least 48 hours, the roof joists may be installed. As the inside width of the shelter is 6 feet 8 inches, then joists, 2-inches by 6-inches by 7 feet 4 inches, should be set 10 inches apart (on 12-inch centres) and placed across the shelter. Each joist should bear on the block walls for a distance of 4 inches at its end. A 6-inch blocking piece is nailed between each pair of joists flush with the inside face of the shelter walls to hold the joists in place.

The space between the joists where they rest on the wall **MUST** be filled with mortar to maintain the required 8 inches of thickness to the top of the roof. This is done by laying one course of 4-inch thick solid blocks which will butt against the end of the joists and which when completed will form a "box" into which the mortar can be poured. (The "box" is formed by the blocking piece between the joists, the sides of two joists and the 4-inch concrete block).

You should note on Diagram 2 of the chart that the joists carrying the roof over the entranceway are supported on two 4-inch by 4-inch posts and a beam placed there for that purpose.

After the spaces between the 4-inch blocks and the joists on the house foundation wall side of the shelter have been filled with mortar, the laying of the 1-inch roof boards may be started at that side of the shelter. The first one or two boards should be placed in position across the roof joists. These boards are nailed to the joists by reaching up through the open space between the joists. Four-inch thick solid concrete blocks are then passed between the joists and placed on the boards. (There is no need to mortar them together). These roof blocks are in two layers which form a total thickness of 8 inches as shown in Figure 3.

Work on the roof continues in a similar manner until the inside of the opposite wall is reached. Again the space between the joists

where they rest on the wall must be filled with mortar. When this has been done, continue with the remaining course of 8-inch blocks to complete the wall. (Note in Diagrams 2 and 3 of the chart that the wall goes up beyond the rafters and the roof does not cover the walls).

Building sequence

In summary, the steps which you should follow in constructing the shelter are:

- (1) Plan your work well. Use the pamphlet in conjunction with the diagrams on the enclosed chart.
- (2) Mark out guide lines on the basement floor.
- (3) Erect timber framing against the outer basement walls and fasten it to them.
- (4) Build the concrete block wall on top of the framing to the required height and anchor it to the basement walls.
- (5) Build the remaining walls to the required height, remembering to move larger objects inside before the walls have been raised too high.
- (6) Place the joists or rafters into position, inserting the necessary blocking pieces between them and filling the spaces between joists and blocks with mortar.
- (7) Construct the overhead protection by nailing on roof boards and placing 4-inch concrete blocks in position, working from the outside wall of the house inwards towards the centre of the basement.

4 LIFE IN THE SHELTER

Shelter layout

There isn't much space inside the shelter by normal living standards. And as you may have to live in it for a considerable period, it is wise to arrange the accommodation as compactly and neatly as possible. If, for example, a shelter is to accommodate five people, you could save space by using a 3-tier and a 2-tier bunk. (Three tiers are the most you can fit into the available headroom).

The living space will be improved if bunks can be built so that they can also serve as additional seating or table space. Suggestions on how this might be done are shown in Figure 4. A folding table will leave you more floor area between meal times.

You will undoubtedly adapt the shelter to suit yourself. However, such measures as painting the inside walls of the shelter, painting the concrete floor or placing an old carpet on it, putting up shelves and other minor fittings will all go a long way to improving your comfort.

Proper understanding of the recommended shelter facilities, and good planning in laying out and stocking a shelter can reduce discomfort to a minimum.

FIGURE 4 2 TIER BUNK

Dust

Ventilation need not be a problem. The shelter does not have to be made airtight or sealed off from the basement. Radiation does not travel with air movement, and provided the house itself is closed up in the normal way (doors and windows closed) radioactive dust will be kept outside.

It is possible that if you live in an area within 25 miles of a potential target, the windows of your house could be blown in without any other serious damage being caused to the house. In this case, it is possible that a small amount of radioactive dust might be deposited inside the house, but this can be kept out of the basement by arranging to have a door or curtain between the basement and the rest of the house. You should also make provision to block up all basement windows. (See Diagram 7(b) on the chart).

Ventilation

The shelter air supply can be regulated by adjusting the curtain in the doorway. (This curtain should be of some heavy material such as canvas). Adjusting the curtain will also, to some extent,

control the heat within the shelter. When the curtain is closed, the air flow will be restricted to the vents in the wall and the temperature and humidity in the shelter will rise. When the curtain is open, air flow will be at a maximum and the temperature will fall.

When the basement is cold, ventilation should be restricted by closing the curtain tightly and perhaps even by blocking half the vent openings top and bottom in order to maintain a comfortable temperature in the shelter. This can be done quite safely so long as no fuel-burning appliance is operating in the shelter. When a fuel-burning appliance is in use and the basement is cold, the curtain may be kept tightly closed but the vent openings should be kept completely clear. At all other times, when the need for heat is not great, both vents and curtain should be used for ventilation while operating an open, unvented fuel-burning appliance.

Heating and cooking

It is possible that damage outside the area where you live may interrupt the supply of electrical power for long periods. This makes it essential to provide for other than electrical methods of cooking and heating which do not involve your making visits to other parts of the house or basement. However, since power may not be interrupted in all areas, or it may be quickly restored, your shelter design may also include facilities to take advantage, up to 1,500 watts, of the normal electrical supply when this is in operation. Wiring should, of course, be installed by a qualified electrician.

In winter, the shelter will almost certainly need to be heated and this will help to increase the air circulation and reduce humidity which might otherwise become oppressive. For shelter heating, high-quality, kerosene-fuelled appliances, available at hardware stores, etc., seem to offer the most satisfactory features. (**WARNING: DO NOT USE** gasoline and other highly volatile liquids because they are far too hazardous for use in a confined space).

The hot gases produced by an unvented fuel-burning appliance will tend to rise. They may be collected and led out of the shelter by placing the appliance directly under a small hood located at one of the top vents. This procedure is recommended for all times when the heat produced is not needed for heating the shelter.

When an open, unvented, fuel-burning appliance is used to warm the shelter, a problem arises. A top vent hood will not only draw off an appliance's gases, but much of the heat produced and existing warm air in the shelter. Further, the warm air in the shelter will rise, leaving the floor cool. So, for the best heating performance under these conditions, the heating appliance should be placed near the floor. Of course, you would be better off with a small closed stove, fitted with a vent pipe. This would heat without subjecting you to unpleasant odours or dangerous gases.

Don't try to convert a small open fuel burner into a closed stove; there can be real danger if the burner and fuel tank are made to operate at too high a temperature. You should use an open hood above the burner.

The quantities of fuel required are not excessive. Even under winter conditions, one gallon of liquid fuel per day should be adequate for all heating, lighting and cooking purposes within the shelter. About $\frac{1}{3}$ pint per hour will provide adequate heating. If this rate of fuel consumption is not exceeded, the ventilation system will be more than adequate to ensure that no hazard to health occurs from depletion of oxygen or production of carbon dioxide. A hood and vent over cooking or heating appliances is recommended. This will both improve ventilation and remove combustion products.

In summer, the shelter may be uncomfortably hot and you should therefore keep cooking to an absolute minimum.

Lighting

Battery-powered lamps, candles or kerosene lanterns or lamps can be used. At least twelve, No. 6 dry cell batteries would be required to provide one watt of electrical output during waking

hours for a two-week period. During hot weather you should use lighting generated from batteries. There are many types of emergency lighting equipment on the market today.

Sanitation

Inside the shelter, the health of your family will depend to a large degree upon the standards of sanitation and personal hygiene that you adopt. Cleanliness is the keynote.

Your major concern will be the disposal of human waste. It is recommended that you install a sanitary toilet provided with polyethylene bags. Your shelter should be pre-equipped with at least a two-weeks supply of large-size bags. After use they should be tied at the neck and deposited in the garbage can or other suitable metal container until they can be disposed of. For the first 48 hours at least, the toilet and garbage can should be placed in the entrance passageway to the shelter. (See Diagram 1). During this period, you and your family should remain within the shelter, unless otherwise officially advised, so blocking this passageway will not matter. After 48 hours, it may be possible to move both items further out into the basement. You will be advised officially. Families with infants should ensure that at least a two-weeks supply of disposable diapers is stored. These too should be placed in polyethylene bags after use and deposited in the waste container.

Washing, especially of hands, is of great importance. Soap, detergents and water do the job best. But, naturally, the waste water from this—and perhaps cooking—has to be disposed of. So it will be important for you to make use somehow of the basement drainage system which normally exists in most houses. One way is to lead a hose from your basement drain to the shelter entranceway, equip the end with a funnel and get rid of the waste water that way. If this is not possible, waste water will have to be treated in the same way as garbage and an additional receptacle for it placed alongside the garbage can.

For reasons of hygiene, and in order to reduce shelter odour, you should provide a number of changes of underclothing for all occupants of your shelter.

Food and water

Radiation conditions may make it necessary for you to live in the shelter for two to fourteen days. Better make sure, then, that you have enough food and water inside the shelter for at least two days; the balance of your supplies—which can be stored outside but close to the shelter—should be enough for at least twelve days. On Page 31 you will find a list of suitable foodstuffs for a 14-day period. These may be bought and stored over a period of time.

As for water, you should have enough to give at least half a gallon daily to each person; a gallon would be even better. Even if you find that the normal water supply to your house has not been cut off after an attack, you should *NOT* use it until you are told definitely that it is safe to do so. The water could be contaminated without your knowing it. In fact, one of the last things you should do before occupying your shelter is turn off the water at the main shut-off valve. (Make sure you know where it is). You should not open it again until you have been advised to do so by local authorities. Once the valve is closed you may use the water stored in your hot water tank as an additional supply.

Communications

Your only contact with the outside world, once you are in the shelter, will be by radio. It is vital, therefore, that you have a battery-powered radio as part of your shelter equipment. It is important that you check the reception in the shelter when you install it; it is possible that you will require an aerial to ensure adequate reception. The radio will *keep you informed* of any changes in the general situation in your area. Broadcasts will let you know when, and for how long, it is possible for you to leave the shelter. Under NO circumstances should you leave the shelter before being told it is safe to do so.

Equipment

The items of equipment with which your shelter should be stocked are listed, for handy reference, on Page 29. After all

essentials which you need, and for which there is adequate room, have been stored, you should give thought to additional items which might make shelter life more pleasant, and which will not take up too much space.

Daily routine

The degree of comfort in shelter living will be governed by two factors—daily routine, and outside conditions. The first of these you can control by the planning that you put into working out a routine for daily life within the shelter. The second you cannot control. Conditions outside the shelter may or may not permit limited excursions to other parts of the house or even out of doors.

In planning a daily routine you should break up the day into various periods for rest, individual and group activity, cooking and feeding, shelter chores, and so on.

5 HEALTH AND SAFETY

Sanitation and hygiene

Polyethylene bags used for the disposal of human waste, diapers, etc., must be tied at the neck after use and deposited in the garbage can until they can be disposed of by burial or other means.

Water must be rationed according to your supply. Remember, part of the ration will be for washing, especially hands.

Changes of underclothing must be planned according to the supply available.

The main water supply valve must NOT be turned on again until you receive instructions that it is safe to do so.

Ventilation and heating

In winter, the shelter should be heated if at all possible. This will increase air circulation and reduce humidity. Use a kerosene appliance for cooking and heating. Do not burn more than one gallon of fuel per day since this will be adequate for all heating, cooking and lighting purposes. At this rate of consumption there is no problem of fumes.

In summer, the shelter may be too hot and you should aim at reducing the heat generated inside the shelter by keeping cooking to a minimum and using lighting generated by batteries.

Fire precaution

DO NOT use gasoline or other volatile fuels in the shelter. Kerosene is recommended. Consult your local fuel oil company concerning the best grade of kerosene for long-term storage.

DO NOT use dished, reflector-type electric heaters.

Store your fuel in non-leaking containers and make sure that taps, bungs, etc., are out of the reach of children.

See that all sources of ignition such as matches, etc., are in your possession at all times and not accessible to children.

DO NOT locate cooker or heater where a chance fire could block the entrance.

Take great care in refuelling appliances and always use a funnel. It is safer to wait until the appliance has cooled off before refuelling.

Medical supplies

Don't forget to store adequate First Aid supplies, etc., and special medicines if required.

DO NOT leave such supplies within reach of children. A medicine cabinet which can be locked would be a valuable addition to your shelter furnishings.

6 LEAVING THE SHELTER

As the radiation intensity outside the house is reduced, it will be possible for you to come out of your shelter for limited periods of time. When you may do so, for how long and where you may go safely will be the subject of instructions issued at the time by local civil defence authorities. Normally, these instructions would be broadcast; under certain circumstances they may be delivered by word of mouth. By whatever means you receive these instructions it will be, of course, extremely important to follow them carefully, otherwise you may endanger the lives of yourself and your family.

Generally, it is anticipated that you will have to remain within your shelter continuously for 48 hours if you happen to be in an area of high radiation. After that, your excursions from the shelter will be in accordance with instructions given you at the time. Even then you should make a point of using the shelter for all non-productive activity, such as sleeping, eating, resting, and listening-in.

In an area subjected to fallout there are safety zones at your home. Safest place is in your shelter; next safest is in the basement below ground; next is upstairs in the house; least safe is outside the house.

7 BUILD IT NOW

By now you will have realized that there *IS* a great deal you can do to protect yourself and your family from the dangers of radioactive fallout. The shelter described here is based upon the best knowledge available today. However, studies continue and simple means of improving it still further may be found in the future. You should therefore keep in touch with your local civil defence authority.

It is not an expensive shelter, as you will find when you price the list of materials, and if you are prepared to do the work yourself this represents a modest price to pay for your survival. Talk it over with your neighbours and your friends. Perhaps you can all get together and build your shelters as a team—it could be a real community project. You might even consider building the shelter for relatives, friends or neighbours who are not able, for one reason or another, to build their own.

You can accomplish a great deal at little cost, with little effort and a little forethought. What is important, however, is to build the shelter *NOW*. The work cannot be done at the last minute, and it will be too late when the warning is given.

8 ACTION GUIDE

Now You Can:

1. Build your shelter in accordance with the enclosed working drawings.
2. Install the suggested items of equipment. Check them against the list on Page 29. Have you got all the essentials, particularly the shelter radio?
3. Store all the food, water, fuel, batteries, etc., that you will need. Arrange to use and replace at the specified intervals.
4. Plan a family drill for occupying the shelter and practise it. (Remember, *any* adult or adolescent in your home may have to assume command of the situation at the time of an emergency).
5. Plan a daily routine for shelter life.
6. Make preparations so that all basement windows can be quickly and effectively shielded in accordance with instructions.
7. Keep the shelter warm and dry.

If Warning Comes:

1. Turn on your home radio. Wait for instructions. You will be told when to go into your shelter.

2. If there is time—you will be told how much—do as many of the following tasks as you can in this order of priority:

- (a) Shield all basement windows;
- (b) Move clothes and bedding, suitable for the season, into the shelter;
- (c) Move as much furniture, books, magazines, papers, etc., as possible into the room above your shelter;
- (d) Fill up any additional water containers which may be useful later on. These can be left outside the shelter for use when you are told it's safe to venture into the basement;
- (e) Take in any extra reading material, etc., you might need;
- (f) Open an upstairs tap and turn off the water at main shut-off valve.

Go Into The Shelter

1. Last person in places toilet and garbage can in passageway.
2. Turn on the shelter radio. Listen for instructions.
3. Put daily shelter routine into effect.
4. Remain in the shelter until instructed to leave. (In most cases this will come via radio but in some instances civil defence officials may notify you in person).
5. Keep calm. Your family will look to you for leadership.

9 SHELTER SUPPLIES

Equipment

- Beds (Bunks or folding)
- *Table (Folding or other facility)
- *Stools (Fold flat)
- Cooking vessels
- Cups and Plates (disposable)
- Knives, forks, spoons
- Can openers
- Paper towels
- Kerosene cooker
- Kerosene Lamp
- Electric Lamp and Batteries, spare bulbs
- Flashlight
- 10 Gallons Kerosene (2 gals. in shelter; remainder in basement)
- Matches
- Garbage can (2 if no waste water run-off is possible)
- Garbage bags

- Toilet
- Polyethylene bags for toilet (two-week supply)
- Shovel
- Crowbar
- Axe
- Pocket knife
- Whistle
- *Saw
- *Screwdriver
- *Hammer
- *Screws
- *Nails
- Pliers
- Fire Extinguisher (non-carbon tetrachloride)
- * $\frac{1}{2}$ -inch Rope
- String
- Battery Radio
- Clock
- Spare Radio batteries
- Hand basin

Recreational

- *Calendar
- *Books
- Paper
- Pencils
- *Playing cards
- *Chess, checkers, other games
- *Crossword, other puzzles
- *Knitting, sewing, etc.
- *Hobby materials

Toiletries

Soap, toothpaste, tooth-brushes
Detergent
Nail brush
Razor, blades and soap

Personal

Bedding (blankets preferable)
Warm sweaters and socks
Change of underclothing and socks
Personal hygiene items for women

Medical

First Aid dressings and drugs (commercial First Aid kit)
*Aspirins
*Bicarbonate of soda
*Cough drops
*Nose drops

Protective clothing

Coveralls, rubber boots, rubber gloves for adults.
To be used in venturing outside even after instructions have been given that this is safe for short periods.

*Desirable but not essential.

*Women's basic cosmetics
Tissues (face and toilet)
Face cloth
Towels
Brush and comb

Baby clothes
Baby feeding equipment
Disposable diapers (two-week supply)
Plastic sheeting

Specific medicines such as insulin, heart medicines, etc. as required (100-day supply)
Disinfectant
Scissors

10 FOOD AND WATER

Food

These are the requirements *per person* for 14 days. Canned foodstuffs should be used and replaced once every six months. Check off the items as you stock them in the shelter.

Milk: 4 cans milk (1 lb. cans, evaporated or dried skim milk)

Vegetables: 6 cans (15 oz. or 20 oz. cans—beans, peas, tomatoes)

Fruits: 6 cans (15 oz. or 20 oz. cans—peaches, pears)

Juices: 6 cans citrus juice (20 oz. cans—apple, grapefruit, lemon, orange, tomato)

Cereals: 14 individual packages (sealed in wax bags inside or outside)

Biscuits: 2 packages crackers (1 lb.)
2 packages cookies

Main Dish Items:

2 cans meat (12 oz.—corned beef, luncheon meats)

2 cans beef and gravy

2 cans beans (15 oz. or 20 oz. cans—baked beans, pork and beans)

2 jars cheese

2 cans fish (8 oz.)

Canned and Dehydrated Soups: 2 cans (10 oz.—bean, pea, tomato, vegetable)

Infant Foods: Meat and vegetable soup, precooked baby cereal, assorted strained fruits.

Other Foods:

1 can honey

2 lbs. hard candy

1 jar or can peanut butter

1 package tea bags

1 jar sugar

1 jar instant coffee

Salt and pepper

Jam, syrup, molasses, jelly

Chocolate powder

Chewing gum

Water

Requirement: 7-14 gallons for each member of the family.

Containers: Store in clean, tightly covered containers such as large thermos jug, new fuel cans, large vinegar bottles, etc.

Change: Change the stored water at least once a month.

11 ADDITIONAL SERVICES AVAILABLE

If you have difficulty in adapting the design to your basement, you may obtain advice on possible modifications by writing to the Emergency Measures Organization, Privy Council Office, East Block, Ottawa, Ontario.

Extra copies of the pamphlet may be obtained from your local or provincial civil defence or emergency measures coordinator.

12 BUILDING MATERIALS

Item	Size	Amount in shelter for:			
		5 people	6 people	7 people	8 people
<i>Concrete Blocks</i> (preferably solid but can be hollow (a))					
Walls	8"×8"×16"	220	240	260	300
	8"×8"×8"	20	20	20	20
Roof	4"×8"×16"	210	250	300	340
Inner Layer Shielding (b)	8"×8"×16" – allow for each course	13	14	16	17
	4"×8"×16" one course only	7	8	10	11

(a) If solid blocks are used, add 4 hollow blocks to the list for ventilation purposes.
(b) Height depends upon height of shelter above ground level.

Item	Size	Amount in shelter for:			
		5 people	6 people	7 people	8 people
<i>Mortar</i>					
Hydrated Lime		200 lbs.	250 lbs.	300 lbs.	350 lbs.
Cement		18 bags	21 bags	27 bags	31 bags
Mortar Sand		3 cu. yd.	3½ cu. yd.	4 cu. yd.	4½ cu. yd.
<i>Lumber (c)</i>					
Posts and Beam	4"×4"×10'0"	2 pcs	2 pcs	2 pcs	2 pcs
Stud wall					
Plates (short)	2"×8"×8'0"	3	3	3	3
Stud wall					
Plates (long)	2"×8"×10'0"	3	—	—	—
	2"×8"×12'0"	—	3	—	—
	2"×8"×14'0"	—	—	3	—
	2"×8"×16'0"	—	—	—	3
Studs	2"×8"× (d)				
Rafters	2"×6"×8'0"	14	16	19	20
Blocking pieces	2"×6"×10'0"	3	4	4	4
Curtain frame	2"×4"×8'0"	2	2	2	2
Roof boards	1"×6"×14'0"	14	—	—	—
	1"×6"×16'0"	—	14	—	—
	1"×6"×18'0"	—	—	14	—
	1"×6"×20'0"	—	—	—	14
Shelving	1"×8"×10'0"	4	5	6	7

(c) Commercial lengths are listed. See diagram dimensions for lengths you cut.

(d) Length depends upon height of shelter above ground level.

Item	Size	Amount in shelter for:			
		5 people	6 people	7 people	8 people
<i>Hardware</i>					
Nails	6 inch	1 lb	1 lb	1 lb	1 lb
	4 inch	6 lbs	7 lbs	8 lbs	9 lbs
	2 inch	3 lbs	3½ lbs	4 lbs	4½ lbs
Copper Naphthanate		As Required			
<i>Framing Anchor</i>					
Lag screws & plugs	3/8"	4	4	4	4
Washers		4	4	4	4
Lumber	2"×4"×8"	2	2	2	2
<i>Wall Anchor</i>					
Lag screws & plugs	1/4"	5	5	6	7
½" Bar	12" long*	5	5	6	7
Washers		5	5	6	7

*Bent as in Diagram 6 on the wall chart.

Timber framing & blocks adjacent to outside walls would be in position at this stage (see diagram 10) but have been omitted for clarity.

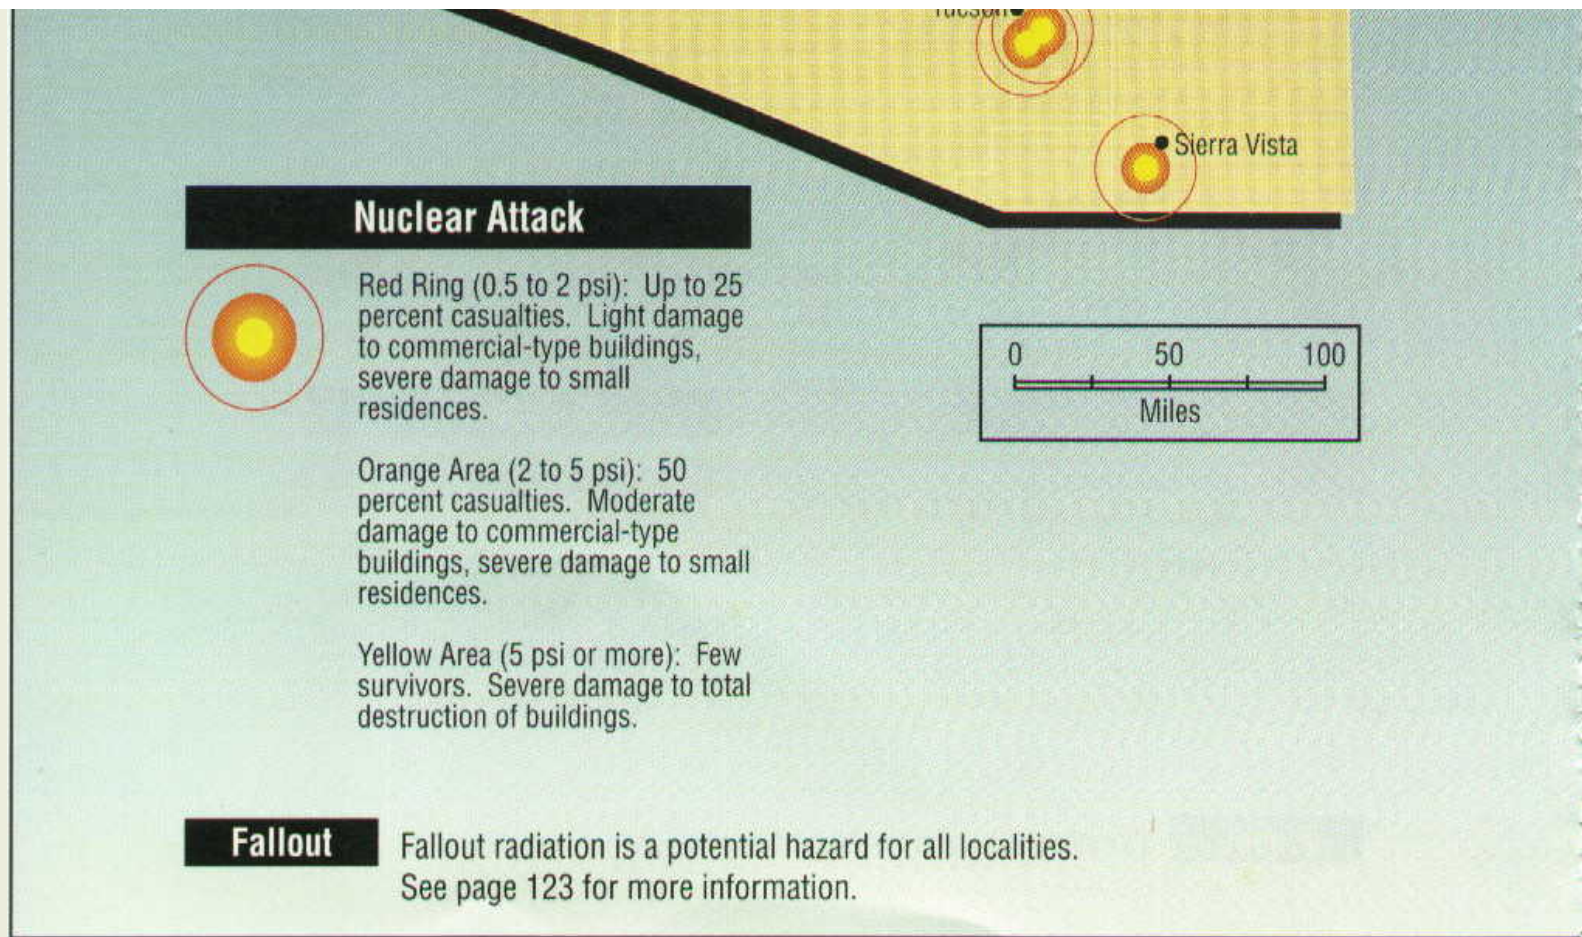

Nuclear Survival in **Arizona**

This is the nuclear target map for Arizona, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Arizona](#) that follows it.

This link will take you back to the [Index of all the States](#)

Nuclear Weapon Target Map for Arizona (FEMA-196/September 1990)

[UPDATE to Target Information!!!](#)

Information for Arizona

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to Arizona.

1. Look at the [State Map](#) above to see the target nuclear areas in Arizona.
2. Look at the [general expected fallout map](#) to see where Arizona (according to the **prevailing wind pattern**) gets fallout from other states.
3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of](#)

STATES for

- Montana
- North Dakota
- South Dakota
- Nebraska
- Missouri
- Colorado

These six states contain what is called DENSE PACK which I explain on each of those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "prevailing" wind pattern.

4. Bookmark the present URL or make a copy of this present address so that you can come back to it after going to

[Blast Mapper](#).

This mapper is on someone else's web site so that you will need to save this address in order to return here if your back button doesn't work. However, you want to be sure to go the mapper site and calculate the damage to probable targets (cities) around you.

5. Memorize the THREE top rules for survival. They are:

- Number One - **Get out of the cities!**
- Number Two - **Get out of the cities!**
- Number Three - **Get out of the cities!**

6. The follow-on rules are:

- a. Have a shelter
- b. Work with a group (you are going to need the manpower, brainpower, and skillpower).

- c. Stock supplies.

7. My [Main Survival Page](#) contains links to lots of other information such as free books to download about nuclear survival, links to plans for building shelters, and even free consultation about building a shelter.

8. If you are SUPER concerned about nuclear survival you might consider moving within 20 miles of the

[Ark Two Community](#)
(in Canada)

Nuclear Survival in **Colorado**

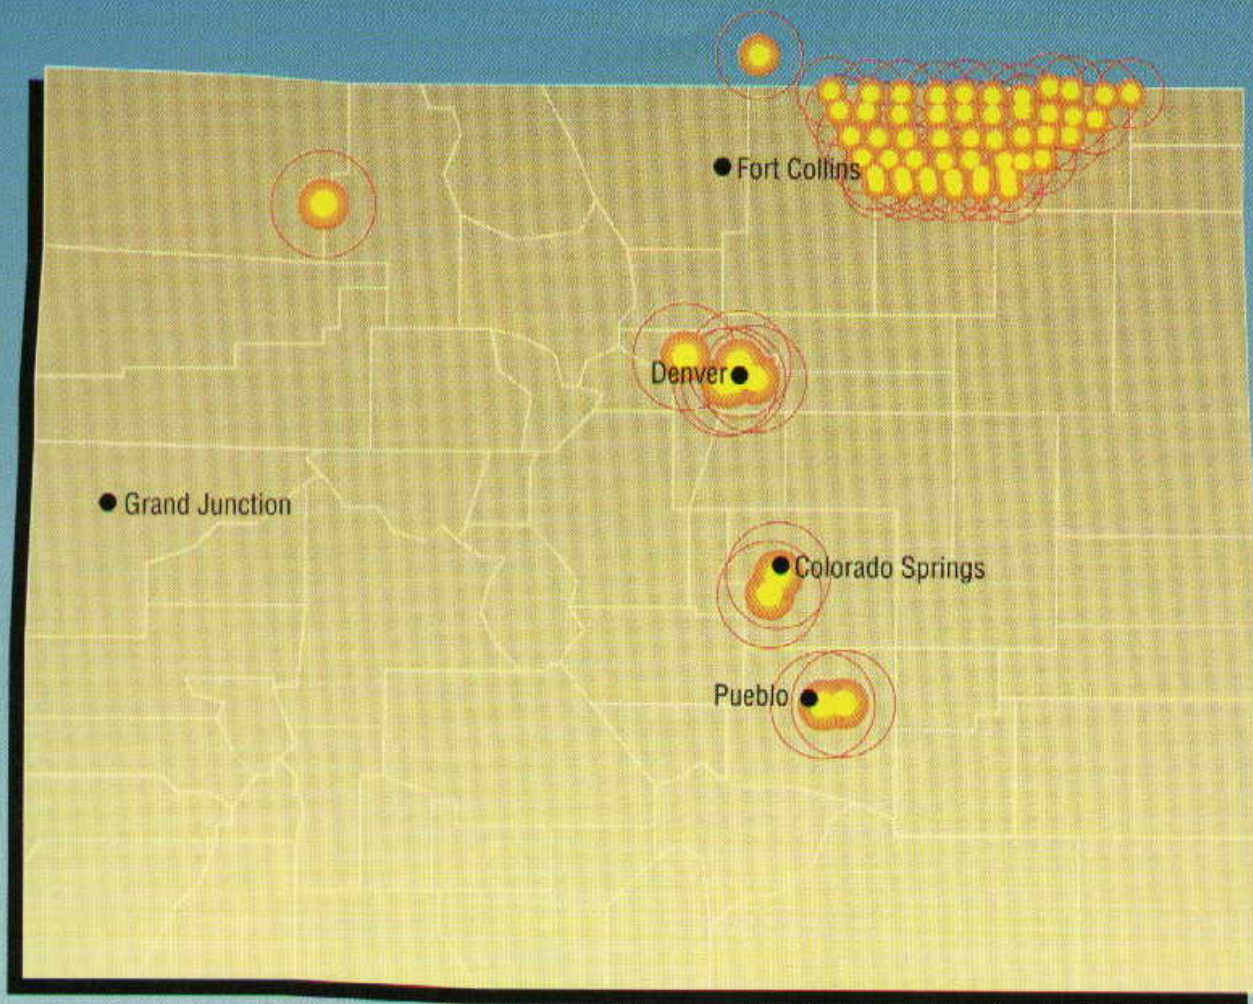

This is the nuclear target map for Colorado, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Colorado](#) that follows it.

This link will take you back to the [Index of all the States](#)

***DENSE PACK** - Look at all those target sites. So close Together! It serves a purpose. It is missiles protecting missiles, and this is how it is done. These are "hardened" sites. Meaning it takes a direct ground explosion to dig them out. An air burst will not do it. When you have a ground explosion it throws many tons of dust and sand up into the air. High into the air. This is what will later become fallout carried by the winds hundreds, sometimes thousands, of miles away. But right over that site that has just been hit the sand and grit in the air is very thick for quite a while. Another high speed missile (ICBM) trying to come through it will have its skin torn off just like by sand blasting and it will be destroyed. So the other missile sites nearby are safe. On the other hand, because missiles take off much slower than the speeds they eventually reach, the missiles in the undamaged silos can still be launched and will pass through the dust cloud without be harmed. Neat, eh? See there is a purpose in putting so many in one place. Now the only way that you can dig them out is with what is called a slow walk. Hit a target. Move on further and hit another target where the dust from the first won't hurt you. Come back thirty or forty-five minutes later and hit a second target near where you hit the first, after the cloud has had time to blow away. A slow process. Some silos will already have launched and you will waste the shot. Others can still wait to launch later because you can only get one at a time. This could go on for days. Neat. The military missiles protecting missiles. But they don't protect you, because if you are downwind you will get the fallout. Fatal if you are not in a*

shelter. They call it Defense but it is only Destruction. Nothing here defends or protects you, if they are used.

Nuclear Weapon Target Map for Colorado (FEMA-196/September 1990)

Nuclear Attack

Red Ring (0.5 to 2 psi): Up to 25 percent casualties. Light damage to commercial-type buildings, severe damage to small residences.

Orange Area (2 to 5 psi): 50 percent casualties. Moderate damage to commercial-type buildings, severe damage to small residences.

buildings, severe damage to small residences.

Yellow Area (5 psi or more): Few survivors. Severe damage to total destruction of buildings.

Fallout

Fallout radiation is a potential hazard for all localities. See page 123 for more information.

[UPDATE to Target Information!!!](#)

Information for Colorado

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to Colorado.

1. Look at the [State Map](#) above to see the target nuclear areas in Colorado.
2. Look at the [general expected fallout map](#) to see where Colorado (according to the **prevailing wind pattern**) gets fallout from other states.
3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of STATES](#) for

- **Montana**
- **North Dakota**
- **South Dakota**
- **Nebraska**
- **Missouri**
- **Colorado**

These six states contain what is called DENSE PACK which I explain on each of

those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "prevailing" wind pattern.

4. Bookmark the present URL or make a copy of this present address so that you can come back to it after going to

[Blast Mapper](#).

This mapper is on someone else's web site so that you will need to save this address in order to return here if your back button doesn't work. However, you want to be sure to go the mapper site and calculate the damage to probable targets (cities) around you.

5. Memorize the **THREE** top rules for survival. They are:

- Number One - **Get out of the cities!**
- Number Two - **Get out of the cities!**
- Number Three - **Get out of the cities!**

6. The follow-on rules are:

- a. Have a shelter
- b. Work with a group (you are going to need the manpower, brainpower, and skillpower).
- c. Stock supplies.

7. My [Main Survival Page](#) contains links to lots of other information such as free books to download about nuclear survival, links to plans for building shelters, and even free consultation about building a shelter.

Nuclear Survival in

Kansas

This is the nuclear target map for Kansas, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Kansas](#) that follows it.

This link will take you back to the [Index of all the States](#)

Nuclear Weapon Target Map for Kansas (FEMA-196/September 1990)

Red Ring (0.5 to 2 psi): Up to 25 percent casualties. Light damage to commercial-type buildings, severe damage to small residences.

Orange Area (2 to 5 psi): 50 percent casualties. Moderate damage to commercial-type buildings, severe damage to small residences.

Yellow Area (5 psi or more): Few survivors. Severe damage to total destruction of buildings.

Fallout

Fallout radiation is a potential hazard for all localities. See page 123 for more information.

[UPDATE to Target Information!!!](#)

Information for Kansas

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to Kansas.

1. Look at the [State Map](#) above to see the target nuclear areas in Kansas.
2. Look at the [general expected fallout map](#) to see where Kansas (according to the **prevailing wind pattern**) gets fallout from other states.
3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of](#)

STATES for

- Montana
- North Dakota
- South Dakota
- Nebraska
- Missouri
- Colorado

These six states contain what is called DENSE PACK which I explain on each of those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "prevailing" wind pattern.

4. Bookmark the present URL or make a copy of this present address so that you can come back to it after going to

[Blast Mapper.](#)

This mapper is on someone else's web site so that you will need to save this address in order to return here if your back button doesn't work. However, you want to be sure to go the mapper site and calculate the damage to probable targets (cities) around you.

5. Memorize the THREE top rules for survival. They are:

- Number One - **Get out of the cities!**
- Number Two - **Get out of the cities!**
- Number Three - **Get out of the cities!**

6. The follow-on rules are:

- a. Have a shelter
- b. Work with a group (you are going to need the manpower, brainpower, and skillpower).

- c. Stock supplies.

7. My [Main Survival Page](#) contains links to lots of other information such as free books to download about nuclear survival, links to plans for building shelters, and even free consultation about building a shelter.

Nuclear Survival in **Missouri**

This is the nuclear target map for Missouri, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Missouri](#) that follows it.

This link will take you back to the [Index of all the States](#)

***DENSE PACK** - Look at all those target sites. So close Together! It serves a purpose. It is missiles protecting missiles, and this is how it is done. These are "hardened" sites. Meaning it takes a direct ground explosion to dig them out. An air burst will not do it. When you have a ground explosion it throws many tons of dust and sand up into the air. High into the air. This is what will later become fallout carried by the winds hundreds, sometimes thousands, of miles away. But right over that site that has just been hit the sand and grit in the air is very thick for quite a while. Another high speed missile (ICBM) trying to come through it will have its skin torn off just like by sand blasting and it will be destroyed. So the other missile sites nearby are safe. On the other hand, because missiles take off much slower than the speeds they eventually reach, the missiles in the undamaged silos can still be launched and will pass through the dust cloud without be harmed. Neat, eh? See there is a purpose in putting so many in one place. Now the only way that you can dig them out is with what is called a slow walk. Hit a target. Move on further and hit another target where the dust from the first won't hurt you. Come back thirty or forty-five minutes later and hit a second target near where you hit the first, after the cloud has had time to blow away. A slow process. Some silos will already have launched and you will waste the shot. Others can still wait to launch later because you can only get one at a time. This could go on for days. Neat. The military missiles protecting missiles. But they don't protect you, because if you are downwind you will get the fallout. Fatal if you are not in a*

shelter. They call it Defense but it is only Destruction. Nothing here defends or protects you, if they are used.

Nuclear Weapon Target Map for Missouri (FEMA-196/September 1990)

Nuclear Survival in

Montana

This is the nuclear target map for Montana, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Montana](#) that follows it.

This link will take you back to the [Index of all the States](#)

***DENSE PACK** - Look at all those target sites. So close Together! It serves a purpose. It is missiles protecting missiles, and this is how it is done. These are "hardened" sites. Meaning it takes a direct ground explosion to dig them out. An air burst will not do it. When you have a ground explosion it throws many tons of dust and sand up into the air. High into the air. This is what will later become fallout carried by the winds hundreds, sometimes thousands, of miles away. But right over that site that has just been hit the sand and grit in the air is very thick for quite a while. Another high speed missile (ICBM) trying to come through it will have its skin torn off just like by sand blasting and it will be destroyed. So the other missile sites nearby are safe. On the other hand, because missiles take off much slower than the speeds they eventually reach, the missiles in the undamaged silos can still be launched and will pass through the dust cloud without be harmed. Neat, eh? See there is a purpose in putting so many in one place. Now the only way that you can dig them out is with what is called a slow walk. Hit a target. Move on further and hit another target where the dust from the first won't hurt you. Come back thirty or forty-five minutes later and hit a second target near where you hit the first, after the cloud has had time to blow away. A slow process. Some silos will already have launched and you will waste the shot. Others can still wait to launch later because you can only get one at a time. This could go on for days. Neat. The military missiles protecting missiles. But they don't protect you, because if you are downwind you will get the fallout. Fatal if you are not in a*

shelter. They call it Defense but it is only Destruction. Nothing here defends or protects you, if they are used.

Nuclear Weapon Target Map for Montana (FEMA-196/September 1990)

Nuclear Attack

Red Ring (0.5 to 2 psi): Up to 25 percent casualties. Light damage to commercial-type buildings, severe damage to small residences.

Orange Area (2 to 5 psi): 50 percent casualties. Moderate damage to commercial-type buildings, severe damage to small residences.

Yellow Area (5 psi or more): Few survivors. Severe damage to total destruction of buildings.

Fallout

Fallout radiation is a potential hazard for all localities.
See page 123 for more information.

[UPDATE to Target Information!!!](#)

Information for Montana

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to Montana.

1. Look at the [State Map](#) above to see the target nuclear areas in Montana.
2. Look at the [general expected fallout map](#) to see where Montana (according to the **prevailing wind pattern**) gets fallout from other states.
3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of STATES](#) for

- **Montana**
- **North Dakota**
- **South Dakota**
 - **Nebraska**
 - **Missouri**
 - **Colorado**

These six states contain what is called DENSE PACK which I explain on each of

those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "prevailing" wind pattern.

Nuclear Survival in

North Dakota

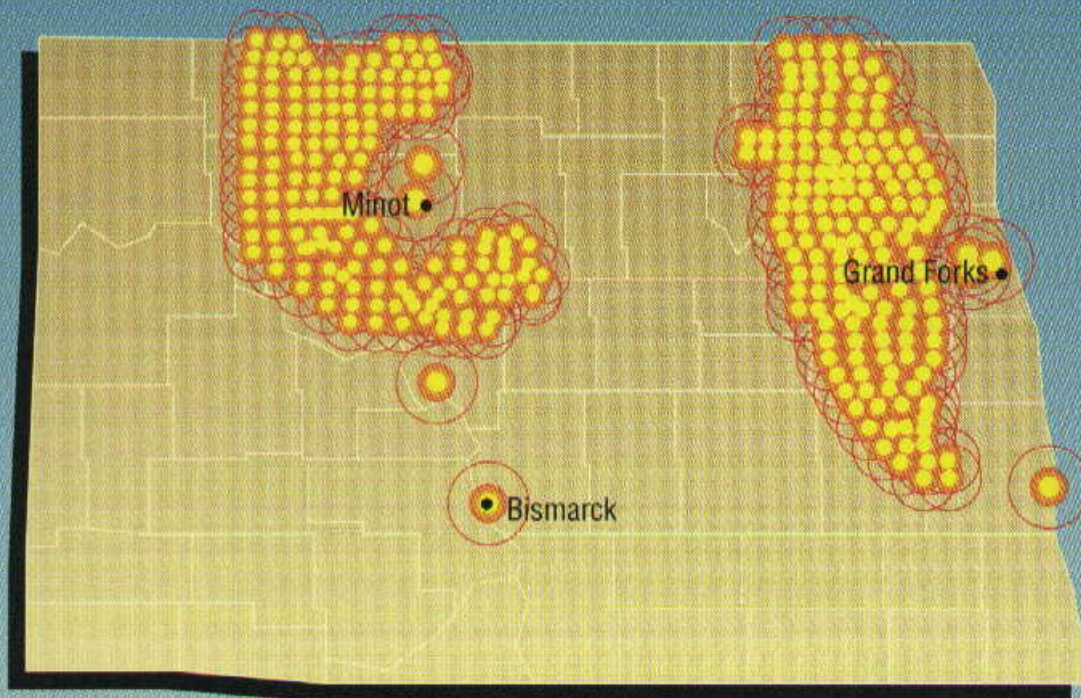

This is the nuclear target map for North Dakota, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for North Dakota](#) that follows it.

This link will take you back to the [Index of all the States](#)

***DENSE PACK** - Look at all those target sites. So close Together! It serves a purpose. It is missiles protecting missiles, and this is how it is done. These are "hardened" sites. Meaning it takes a direct ground explosion to dig them out. An air burst will not do it. When you have a ground explosion it throws many tons of dust and sand up into the air. High into the air. This is what will later become fallout carried by the winds hundreds, sometimes thousands, of miles away. But right over that site that has just been hit the sand and grit in the air is very thick for quite a while. Another high speed missile (ICBM) trying to come through it will have its skin torn off just like by sand blasting and it will be destroyed. So the other missile sites nearby are safe. On the other hand, because missiles take off much slower than the speeds they eventually reach, the missiles in the undamaged silos can still be launched and will pass through the dust cloud without be harmed. Neat, eh? See there is a purpose in putting so many in one place. Now the only way that you can dig them out is with what is called a slow walk. Hit a target. Move on further and hit another target where the dust from the first won't hurt you. Come back thirty or forty-five minutes later and hit a second target near where you hit the first, after the cloud has had time to blow away. A slow process. Some silos will already have launched and you will waste the shot. Others can still wait to launch later because you can only get one at a time. This could go on for days. Neat. The military missiles protecting missiles. But they don't protect you, because if you are downwind you will get the fallout. Fatal if you are not in a*

shelter. They call it Defense but it is only Destruction. Nothing here defends or protects you, if they are used.

Nuclear Weapon Target Map for North Dakota (FEMA-196/September 1990)

Nuclear Attack

Red Ring (0.5 to 2 psi): Up to 25 percent casualties. Light damage to commercial-type buildings, severe damage to small residences.

Orange Area (2 to 5 psi): 50 percent casualties. Moderate damage to commercial-type buildings, severe damage to small residences.

Yellow Area (5 psi or more): Few survivors. Severe damage to total destruction of buildings.

Fallout

Fallout radiation is a potential hazard for all localities.
See page 123 for more information.

[UPDATE to Target Information!!!](#)

Information for North Dakota

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to North Dakota.

1. Look at the [State Map](#) above to see the target nuclear areas in North Dakota.
2. Look at the [general expected fallout map](#) to see where North Dakota (according to the **prevailing wind pattern**) gets fallout from other states.
3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of STATES](#) for

- **Montana**
- **North Dakota**
- **South Dakota**
 - **Nebraska**
 - **Missouri**
 - **Colorado**

These six states contain what is called DENSE PACK which I explain on each of

those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "prevailing" wind pattern.

4. Bookmark the present URL or make a copy of this present address so that you can come back to it after going to

[Blast Mapper](#).

This mapper is on someone else's web site so that you will need to save this address in order to return here if your back button doesn't work. However, you want to be sure to go the mapper site and calculate the damage to probable targets (cities) around you.

5. Memorize the **THREE** top rules for survival. They are:

- Number One - **Get out of the cities!**
- Number Two - **Get out of the cities!**
- Number Three - **Get out of the cities!**

6. The follow-on rules are:

- a. Have a shelter
- b. Work with a group (you are going to need the manpower, brainpower, and skillpower).
- c. Stock supplies.

7. My [Main Survival Page](#) contains links to lots of other information such as free books to download about nuclear survival, links to plans for building shelters, and even free consultation about building a shelter.

8. If you are **SUPER** concerned about nuclear survival you might consider moving within 20 miles of the

[Ark Two Community](#)

(in Canada)

Nuclear Survival in

South Dakota

This is the nuclear target map for South Dakota, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for South Dakota](#) that follows it.

***DENSE PACK** - Look at all those target sites. So close Together! It serves a purpose. It is missiles protecting missiles, and this is how it is done. These are "hardened" sites. Meaning it takes a direct ground explosion to dig them out. An air burst will not do it. When you have a ground explosion it throws many tons of dust and sand up into the air. High into the air. This is what will later become fallout carried by the winds hundreds, sometimes thousands, of miles away. But right over that site that has just been hit the sand and grit in the air is very thick for quite a while. Another high speed missile (ICBM) trying to come through it will have its skin torn off just like by sand blasting and it will be destroyed. So the other missile sites nearby are safe. On the other hand, because missiles take off much slower than the speeds they eventually reach, the missiles in the undamaged silos can still be launched and will pass through the dust cloud without be harmed. Neat, eh? See there is a purpose in putting so many in one place. Now the only way that you can dig them out is with what is called a slow walk. Hit a target. Move on further and hit another target where the dust from the first won't hurt you. Come back thirty or forty-five minutes later and hit a second target near where you hit the first, after the cloud has had time to blow away. A slow process. Some silos will already have launched and you will waste the shot. Others can still wait to launch later because you can only get one at a time. This could go on for days. Neat. The military missiles protecting missiles. But they don't protect you, because if you are downwind you will get the fallout. Fatal if you are not in a shelter. They call it Defense but it is only Destruction. Nothing here defends or protects you, if they are used.*

Nuclear Survival in

Utah

This is the nuclear target map for Utah, but remember, fallout can go anywhere or everywhere (and probably will). After you have looked at this map look at the [Information for Utah](#) that follows it.

This link will take you back to the [Index of all the States](#)

Nuclear Weapon Target Map for Utah (FEMA-196/September 1990)

[UPDATE to Target Information!!!](#)

Information for Utah

This link will take you back to the [Index of all the States](#)

It is recommended that you go through the following 10 steps in studying about the nuclear threat to Utah.

1. Look at the [State Map](#) above to see the target nuclear areas in Utah.
2. Look at the [general expected fallout map](#) to see where Utah (according to the **prevailing wind pattern**) gets fallout from other states.
3. If the state that you live in is anywhere EAST of any of the following 6 states in the **prevailing wind pattern** then look at the states in **RED** on the [INDEX of](#)

STATES for

- Montana
- North Dakota
- South Dakota
- Nebraska
- Missouri
- Colorado

These six states contain what is called DENSE PACK which I explain on each of those states pages. **UNDERSTAND** that the wind pattern **COULD** at that time be something other than the "prevailing" wind pattern.

4. Bookmark the present URL or make a copy of this present address so that you can come back to it after going to

[Blast Mapper](#).

This mapper is on someone else's web site so that you will need to save this address in order to return here if your back button doesn't work. However, you want to be sure to go the mapper site and calculate the damage to probable targets (cities) around you.

5. Memorize the THREE top rules for survival. They are:

- Number One - **Get out of the cities!**
- Number Two - **Get out of the cities!**
- Number Three - **Get out of the cities!**

6. The follow-on rules are:

Bruce Beach

Greetings, my name is Bruce Beach and I am adding this page so that anyone desiring to do so may get to know me more personally. I am the coordinator, founder and initial vision holder of the [World Language Process](#). I am a former professor of computer science and have been a student of the world language problem for over thirty years.

I now live in a little village of 200 people, called Horning's Mills, that is about 90 miles northwest of Toronto, Ontario, Canada. My wife was born in this village (and her mother also, in the 19th century). We have many relations that live in the village and I have a son and daughter and grandchildren nearby.

I was born in Winfield, Kansas and raised mostly in Wellington, Kansas where a number of my offspring (children, grandchildren, and great grandchild) still live. I moved to Canada in 1970 to teach in the Northern College System (in Sault Ste. Marie, Kirkland Lake and Kapuskasing) after having previously taught in black colleges in the U.S. (Morgan State and Jarvis Christian College in Hawkins Texas).

Years ago I spent a year in the Arctic as a control tower operator, courtesy of the U.S. Air Force. I have made a couple of trips to China and have travelled somewhat extensively in South America and less so to Europe and elsewhere. I have a total of over 20 children, grandchildren, and a great grandchild, several of which live in Taiwan and the rest in the U.S. and Canada. Below is a picture of myself with some of my grandchildren.

At one time I owned a very large research ship called **Canada's Tomorrow** and one third of the company that built the robotic arm that recovered the space shuttle Challenger. One of the company's robotic arms is in the Smithsonian. I have also written a number of books in the computer sciences, the latest being on the programming language 'C'.

My strongest interests, outside of the [World Language Process](#), lie in the areas

of religion, astronomy and the social sciences. I have no musical or sports talents but was once upon a time an exceptional speed reader, reading as many as five books a day. Now I read only about that many a month. I used to play a little [chess](#) and hold patents on a chess teaching machine that was manufactured some years ago and sold in several countries.

I am somewhat notorious as a survivalist having built two dozen [shelters](#) for myself and others, and I have consulted on many dozens more. I maintain a web page on this subject also, and you can click on the link in the unlikely case that this is something that interests you.

I am an optimist about the long term future of mankind but a pessimist about the immediate future, particularly at this millennialist point. As I have said, I am greatly interested in religion, being a class taught student of Christian Science and a persistent student of the writings of Emannuel Swedenborg for almost forty years. At one time I termed myself a Zen Buddhist and have read many translations of both the Bhagavad Gita and the Koran. I have also thoroughly studied the Mormon religion (I did some practice teaching at BYU) and the Jehovah's Witness religion. I truly appreciate them all and have been a Baha'i for thirty-five years. You can link to my [essays](#) if you are interested to know where

my understanding of the Baha'i Writings has led me. I met my wife at the Baha'i Temple in Wilmette, Illinois which is just outside Chicago. She was guiding at the front door.

My reading interest, in addition to Swedenborg, Computer Magazines, Sky and Telescope and the Bulletin of the Atomic Scientists, is completely eclectic. My favorite books of all time, aside from religious books, have been "Zen and the Art of Motorcycle Maintenance", "The Flatland", "Godel, Escher and Bach", "Varieties of Religious Experience", and many works by J.S. Mills. I have also in the past read gobs in psychology and economics (having a master's degree in the latter). There are times in my life when I have been a science fiction and movie hound but my greatest pleasure now is my children and grandchildren.

This should be about enough to bore you about any one person. I lead a very active life working fourteen to sixteen hours a day. A stroke some years ago blinded me in one eye but I have since reprogrammed myself to type on a Dvorak keyboard. I have loving children who look after me and a wife that everyone,

including myself, says is a saint. I am truly a happy and joyful person, a claim that I wish that more people could make in this technologically illustrious and spiritually dark age.

I can be reached personally at:

language@webpal.org

My hope, of course, is that we can find a mutual interest in furthering the

[World Language Process,](#)

which you can click on and link to if you have come to this page by a different path.

Regards,

Bruce M. Beach

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [Survival](#)

Reconstruction of Society

[Holocaust: Immediate Steps to Social Restoration after Holocaust](#)

This a link to another page that presents solutions for the first early problems of social restoration. Anarchy and Martial Law / Mass Death and Body Disposal / Refugees and Emergency Shelter / and many other issues.

The other entries immediately below will fit in - in the longer term.

[REGISTRY: Family LOCATING and relocating](#)

After a holocaust one of the major concerns that people will have, will be that of locating missing family members and finding a place where they can settle. The pages linked here will be intended to help provide that information at that time. At the moment they show potential nuclear targets but in the future the intention is to reformat them to show the actual disaster areas, paths around them and a link to the REGISTRY of survivors for each area.

[LETS: Reconstruction of the Economic System](#)

There is good reason to believe that much of the conflict, that led to the nuclear war, grew out of the greed, power and conflict of the world's economic systems. As large and powerful as they were there were many people in the world who were without economic opportunity to improve themselves. There is recommended here an alternative economic approach that will help great numbers of people to rapidly recover economically.

[Pencil: The Making of a Pencil](#)

This is an essay that explains why people cannot live independently of others. It shows why the economic system has to be reconstructed. To reconstruct something does not mean to necessarily put it back as it was. Indeed, it is a chance for improvement and to remove what experience has shown were faults in the previous design.

[Carnegie: Management of Large Scale Enterprises](#)

Because large scale enterprises offer economies of scale they are often the most efficient and most productive systems. In connection with the subject of entitlement covered in the previous section this section uses the insights of Andrew Carnegie who was one of America's foremost capitalists and its leading philanthropist to explain what he called "The Gospel of Wealth". The subject is really the integrity, morality, and motives that should be required of the managers of large economic concerns.

[NWO: The New World Order-an introduction](#)

There are many ideas about the New World Order. It was international anarchy that brought about the nuclear war and there will surely be a willingness, indeed an eagerness, to implement a system of international order that will eliminate the scourge of war. Here, there is presented the very varied thinking on the subject of many notables from over a century.

[Angel Tongue: World Language Process](#)

A premier project of this author is the World Language Process. The main activity, until now, of the program has been the research into the requirements of a universal auxiliary language. As a part of the reconstruction of society it will be necessary that some world body will eventually select such a language. The purpose of the World Language Process will then be the further development and promotion of that language. An experimental language candidate, called the Angel Tongue, is presented here.

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [Survival](#)

Immediate Steps to Social Restoration

The immediate aftermath of a world-wide nuclear war will most likely result in anarchy, total confusion and disaster in almost every local community no matter how far it is located from the blast and firestorm effects of the nuclear weapons themselves. Most likely there will be no distributed electrical power, extremely limited and not immediately irreplaceable supplies of food and fuel, and very limited means of communication.

In these circumstances there will most often be looting of the few remaining supplies from stores. Medical and other services will be impossible to maintain. For a more graphic illustration of what may be expected you may be interested in reading the author's

["You Will Survive Doomsday"](#) (Myth #01).

The first order of the day will be the

Restoration of Security

Moving masses of refugees, semi-organized mobs such as motorcycle gangs or groups who are able to mutually identify on some racial or other basis, along with mass escapes from penal institutions, will add to confusion and hazard for personal safety.

The first order of business, of any entities who wish to establish a system of justice and order, will be that of security. There is the possibility that previous police and military units may simply go renegade but if they can be called upon to provide service their identity will be helpful in gaining respect for their enforcement. You will probably be very fortunate if you have any security - even martial law.

[Martial Law: Domestic Support Operations](#)

This is the full 1993 Field Manual in .pdf format from the Headquarters of the Department of the Army and the US Marine Corps. Of particular interest may be Chapter 9-5 in regards to operation *Garden Plot*. In our off-line library we maintain a number of other manuals dealing with lines of authorization and other such matters.

The essential requirement is always security and this is why it is necessary to extend the social perimeters as far as possible. Live and let live, will not work - if the other fellow does not agree. No matter how well armed and organized an individual family or small collective might be - they cannot withstand unending repeated assaults nor the attack of a significantly larger force. This is just a fact of

life.

The three choices are to conquer, cooperate, collaborate - or die in the effort. The preferred choice is cooperate. If one or a community is attacked by a vicious renegade gang that has no inclination to cooperate and which offers no benefits in collaboration (such as protection) then the only choice is between conquering or dying in the effort, where otherwise they will be pillaged, raped and murdered anyway.

Martial Law: Reconstruction of Social Order

This is the Table of Contents in HTML format of the 2001 Field Manual from the Headquarters of the Department of the Army on Military Police Internment and Resettlement Operations. There are links here for downloading the entire manual from the official government site.

Humanitarian Services

The second order of business, after security, will be that of shelter, especially in the winter time. Such public and private buildings that can be commanded will need to be utilized. Food and fuel will then become the nagging problems. Any significant stocks must be immediately commanded and protected. Those who are able to provide for these essentials, perhaps by some collective effort, can then begin to widen their horizons as to providing for the largest collective good.

Martial Law: Internment and Resettlement Operations

This is the full .pdf version of the above 2001 Field Manual from the Headquarters of the Department of the Army on Military Police Internment and Resettlement Operations.

Camps: Standards for Building Refugee Camps

This UN paper is based upon experience and gives considerations that should be taken into account wherever possible. After a nuclear holocaust, a compounding problem for many areas will be a shortage of supplies and no outside source for them.

Health: Field Hygiene and Sanitation

This is the 2000 Marine Corps Field Manual. Health and hygiene from a community perspective, rather than the individual perspective. Everything from maintaining community kitchens to showers, toilets, and so forth. Refugee handling centers, camps and facilities along with emergency medical facilities may find some application of principles listed here.

Toilets: Unsewered Toilets

As a sub-issue to public health this is a 40 page booklet from the Ontario Ministry of the Environment which we have placed in a 1599KB .pdf file.

Salvaging Operations

The size of marauding renegade, or not so renegade, forces that may be allied against initially forming cooperative and collective communities - may be very great and may increase overtime. Once again, the best solution is to increase through cooperation the size and perimeters of the collective community. If given the opportunity to submit to the authority of some entity that already has in place or has achieved a superior degree of organization, along with the resources to maintain it, then that is the most reasonable and rapid choice - providing that entity is sufficiently altruistic towards one's essential values.

One of the first potential resources will be that of salvaging and protecting the assets that remain. Initially, this particularly applies to food, fuel, and medicines. However, any controlling entity will do well to as quickly as possible establish protocols for dealing with looters and vandals. Regarding the latter, there will arise a destructive mindset that must be controlled immediately in order to prevent detrimental destruction that can thus be avoided. On the other hand, salvaging needs to be quickly legitimately authorized, organized, coordinated, controlled, collected and cataloged. This will be an excellent use of what would be otherwise unemployed manpower and a redirection of energies that could otherwise be put to detrimental purposes. The old saying - "the devil finds work for idle hands".

[Rescue: Basic Rescue Skills](#)

This 831 KB in 22 .pdf pages of this 43 page booklet covers basic rescue skills, which may be a continuing necessity for some period of time.

[Death: Mass body disposal](#)

This is a link to another page where I deal with problems of mass body disposal.

[Medical: Emergency Medical Facilities](#)

This is a link to another page where I deal with establishing emergency medical facilities.

Reestablishment of Infrastructure

An inventory of resources needs to be compiled. Not just physical objects but what is called human capital so that recovery and reconstruction coordinators can best utilize both materials and skills. The primary concerns will be [Individual Agricultural Recovery](#), communication, fuel, transportation, and manufacture.

Communications may have to be as simple as establishing runners or a localized postal system. On the other hand there may be the capability of charging batteries for battery powered radios and even HAM radio for more distant communication. If a local transmitter can be brought back on the air this would provide one way communication to battery powered car radios, the batteries for which could be charged by a variety of methods. Local phone lines may be undamaged and it again becomes a matter of charging the system. As with any system it may be necessary to restrict or ration usage to those points with the highest social priority.

Alternate fuel sources are described in [Individual Agricultural Recovery after Nuclear Holocaust](#). Some of these may be as primitive as salvaging and distributing wood for heating and cooking. Combustible fuels for internal combustion engines will be a high priority.

Transportation is highly necessary for security, fire defense, salvaging, distribution and getting the labor force where it is needed. A busing system may have high priority in this latter regard.

The reestablishment of manufacture is an important goal. Support and incentive should be given to those trying to do so. Large scale manufacture may come considerably later but what should be done first is to identify the immediate needs and what methods there are of fulfilling them. Two lists, one of priorities, the other of resources and capabilities, can be drawn up. High priority items have a first call upon resources. Lower priority items that can be easily fulfilled without detriment to high priority items can also be readily met. The challenge will be in allocating resources to priorities in the middle range which are not so essential but are not so easily met either.

The very largest scales of manufacture require large functioning reconstructed communities. To support the reconstruction of a refinery, for instance, with its requirements for energy, raw material, transportation of product, expert operators, and so forth would very likely require a functioning surrounding community of tens, if not hundreds, of thousands. Once again a reason for extending the perimeters of the supporting communities. While such reestablishment may be a considerable time coming in many areas, nevertheless all such resources should be protected, as much as possible, for the future. In the meantime, all presently usable resources should be utilized to the maximum. This particularly applies to the human capital.

A traumatized society will probably collectively go through the seven stages of grief. Intense, purposeful and meaningful activity is probably the best therapy available, both individually and collectively. The reestablishment of social institutions for security, justice, health, education, all depend upon the functioning political / economic system. Whoever or whatever controls the economic, production, distribution system will also control the security and other systems. This writer's preference is for that which he describes in conjunction with the [LETS](#) system, but most any functioning system will be better than none.

PREFACE

PURPOSE

This manual provides the capstone doctrine for US Army and US Marine Corps domestic support operations. It also provides general information to civilian authorities at federal, state, and local levels involved in planning for and conducting such operations. It identifies linkages and defines relationships with federal, state, and local organizations and with other services that have roles and responsibilities in domestic support operations.

SCOPE AND APPLICABILITY

This doctrine applies to all Army and Marine Corps commanders and staff tasked with planning, preparing for, and conducting domestic support operations. For overseas theaters, this doctrine applies to US unilateral operations only, subject to applicable host nation laws and agreements.

USER INFORMATION

This publication was developed by the Army Doctrine Directorate at Headquarters, Training and Doctrine Command (HQ TRADOC) with the participation of the Doctrine Division (C42) at Marine Corps Combat Development Command (MCCDC). HQ TRADOC, with MCCDC, will review and update this publication as necessary. Send comments and recommendations directly to—

Commander

Unless this publication states otherwise, masculine nouns and pronouns do not refer exclusively to men.

INTRODUCTION

Domestic support operations are not new. They had their beginning with settlement of the new world and organization of the colonial militia. With the establishment of the United States and a federal military, the Army routinely provided support to state and territorial governors as the nation expanded westward. In some instances, it actually administered governmental affairs until the fledgling local government became a viable entity.

Congress has determined and the National Command Authorities have directed that the military should become more engaged in supporting domestic needs. In addition, the National Security Strategy “Domestic Imperative” affirmed that national security must be viewed in the context of the nation’s well-being.

Acknowledging the inherent capabilities the Army possesses for supporting federal, state, and local governments, the Congress has passed numerous laws providing for domestic military support. These laws recognize that the National Guard, while in state status, has primary responsibility for providing initial support when military assistance is required. They also institutionalize interdepartmental and interagency coordination/planning, linking it to the national strategy.

Commanders should anticipate requirements to provide emergency assistance and use domestic support opportunities to enhance unit and individual wartime skills. The Army, particularly the National Guard and Army Reserve, with its extensive combat support and combat service support (CS/CSS) structure, is ideally equipped to assist civil authorities in a wide variety of missions that fall into four general categories: disaster assistance, environmental assistance, law enforcement support, and community assistance.

Although the frequency of domestic support operations may increase, they are not in lieu of wartime operational requirements. The Army’s primary mission remains to defend the United States and its interests. It is the Army’s combat readiness that enables it to accomplish domestic support operations.

This manual provides specific guidelines and operational principles in the conduct of domestic support operations. It emphasizes the utilization of the Army’s core combat competencies and values to enhance combat readiness and the overall well-being of the nation.

CHAPTER 1

CONCEPT AND PRINCIPLES

This chapter presents a brief historical perspective and concept of Army domestic support operations, the principles of operations other than war that apply to these operations, and a description of the Army's role. The Army consists of the active component (AC), the Army National Guard (ARNG), the US Army Reserve (USAR), and Department of Army (DA) civilians. The National Guard (NG), in a state or territorial status, has primary responsibility for providing military assistance to state and local civil authorities.

HISTORY AND CATEGORIES OF DOMESTIC SUPPORT

A domestic support operation is the authorized use of Army physical and human resources to support domestic requirements.

Since the Army's inception, its mission has been to fight and win the nation's wars. At the same time, the Army has provided general military support to the

nation, including participation in a wide variety of activities to assist civilian authorities. The Army has enforced laws, quelled domestic violence and insurrection, combatted terrorism, participated in public works and environmental projects, and assisted in recovery operations following disasters.

The dramatic end of the Cold War caused significant changes in the nation's domestic and foreign priorities. During the Cold War, national attention was directed to the external threat and related issues. Today, along with a shift from a forward deployed to a force projection strategy is a new awareness of the benefits of military assistance to improve the nation's physical and social infrastructure. The Army's focus on and continuing involvement in all aspects of domestic support operations identified the need for published doctrine.

The Army's roles and responsibilities in domestic support operations divide into four primary categories: disaster assistance, environmental assistance, law enforcement support, and community assistance, as depicted in Figure 1-1.

DISASTER ASSISTANCE.

From the earliest years of the republic, the Army has provided assistance to the country in times of disaster. During the final year of the Civil War, Army officers provided disaster relief through the Freedman's Bureau. The Army also played a direct role in many disaster relief operations in the late nineteenth century, including the great Chicago fire, the Johnstown flood, and the Charleston earthquake.

In recent years, Presidential and Congressionally mandated federal disaster assistance programs have evolved. The Army actively participates with federal and

state agencies in disaster assistance planning, exercises, and operations in response to both natural and man-made disasters.

Disaster assistance includes those humanitarian and civil defense activities, functions, and missions in which the Army has legal authority to act. The Army provides disaster assistance to states, the District of Columbia, territories, and possessions. Civil authorities must request assistance, usually as a result of disasters such as hurricanes, typhoons, earthquakes, or massive explosions.

ENVIRONMENTAL ASSISTANCE

Environmental assistance has been evolving since the 1960s. The Army has provided a variety of resources to meet environmental challenges that have emerged as a result of increased public concern and demands for the restoration, conservation, and protection

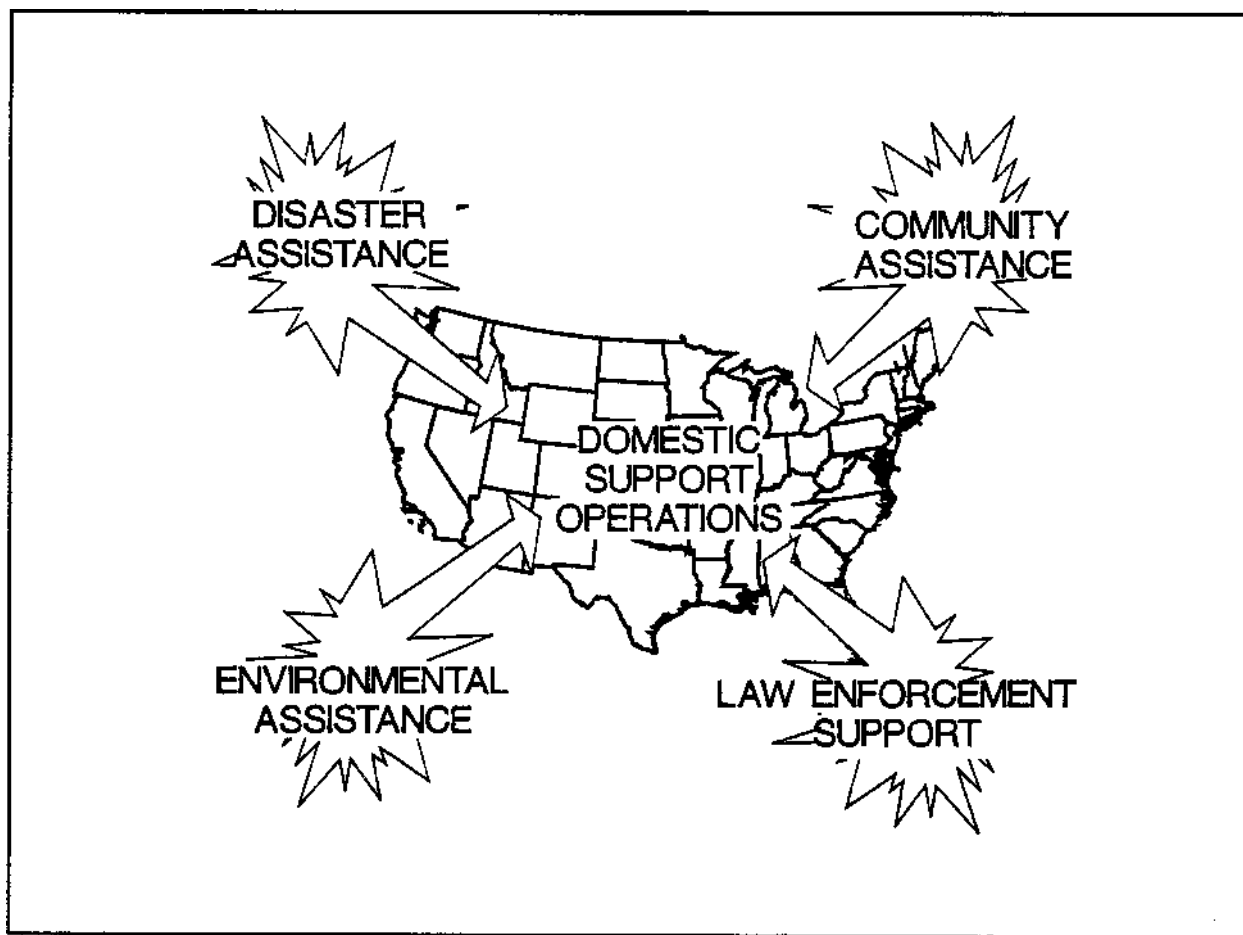

Figure 1-1. Domestic Support

of the environment. Typical missions are responding to hazardous material releases, restoring contaminated land and water, and conserving the nation's natural and cultural resources. With the passage of *The Comprehensive Environmental Response, Compensation, and Liability Act of 1980* and the later development of The National Oil and Hazardous Substances Contingency Plan, the Army became a member of the national and regional response teams that plan for and respond to hazardous substance spills.

The Army is inextricably linked to environmental stewardship. Its environmental assistance operations aid civil authorities in preserving, protecting, and enhancing the environment. Its strategy rests on the four pillars of compliance, restoration, prevention, and conservation.

- Compliance is responding to small-scale hazardous material spills and regulating support to other government agencies.
- Restoration is cleaning up contamination from past operations.
- Prevention is developing and sharing new technologies that reduce pollution generation.
- Conservation focuses on the preservation of natural and cultural resources such as wetlands and wildlands.

Army support in these areas may be initiated under disaster assistance or executed under separate authority.

LAW ENFORCEMENT

The Posse Comitatus Act of 1878 severely restricts the use of federal forces to enforce public law. However, acting under Constitutional provisions, the Army has on many occasions been used to quell civil disturbances and restore order. Use of military force has ranged from the Whiskey Rebellion in 1794 to the urban riots of the 1960s and the Los Angeles riot of 1992.

In 1981, Congress passed The Military Cooperation with Civilian Law Enforcement Agencies Act to allow military collaboration with civilian law enforcement agencies. This act dramatically expanded the Army's participation in counterdrug efforts. Alliance and North Star are two examples of operations that use active and reserve component forces to halt the flow of contraband across United States borders.

Operations in support of law enforcement include assistance in counterdrug operations, assistance for civil disturbances, special security operations, combatting terrorism, explosive ordnance disposal (EOD), and similar activities. Some, by their nature, may become international in scope due to a linkage between domestic and international operations. Constitutional and statutory restrictions and corresponding directives and regulations limit the type of support provided in this area.

COMMUNITY ASSISTANCE

Throughout its history, the Army has been involved in community projects and operations, applying its skills, capabilities, and resources to the needs and interests of American communities. Efforts at the national level focus on contributions to the nation and generate public support for the Army. State and local efforts foster an open, mutually satisfactory, cooperative relationship among installations, units, and the local community.

The most frequently conducted domestic support operations involve community assistance. Army resources may be used to support civilian organizations to promote the community's general welfare. These missions and operations include public works, education, and training. Other examples include participation in minor construction projects and providing color guards for local events. In compliance with existing regulations and directives, the Army and local communities may establish mutual support agreements concerning medical, police, and emergency services.

CONCEPT

The Secretary of the Army is the DOD's executive agent for most domestic support operations.

The National Command Authorities (NCA) direct the Army to conduct domestic and international operations. The Secretary of Defense has designated the Secretary of the Army as the executive agent for most domestic support operations. During these operations, military support supplements, rather than replaces, civil agency responsibilities.

The Army provides domestic support through Army posts, camps, installations, armories, and stations as members of the communities in which they are located. Commanders should maintain close liaison with local elected and appointed officials.

Domestic support ranges from disaster assistance to more frequently conducted community assistance activities. All domestic support operations share the common characteristic of using Army human and physical resources to enhance national security, thus contributing to the nation's overall well-being. These operations, which usually draw extensive media attention, must consider public affairs implications.

Environmental missions and operations are directed at the physical infrastructure of the nation. National and local efforts may be supported by Army organizations, activities, and units.

Law enforcement support helps civil law enforcement authorities maintain law and order. Laws, directives, and regulations restrict the Army from assuming the civil law enforcement mission.

Community assistance operations help meet national, state, or local community objectives. Intended to fill needs not met, they should avoid duplication or competition with the civilian sector.

The Army offers assistance, such as providing equipment or personnel to accomplish a specific task, to other federal, state, or local agencies. The Army's goal is to use its assets prudently for domestic support

operations while providing a significant benefit to the nation.

Civilian emergency management is almost universally organized on the "unmet needs" philosophy. Local jurisdictions, responsible for the security and welfare of their citizens, request assistance only when their resources are insufficient to meet requirements. Most states conform to the general outlines of this emergency management concept, as do their constituent county and local jurisdictions. Normally the state directs large-scale efforts, and commanders should establish liaison at that level. Disaster or emergency declarations are associated with legal and funding requirements.

A final facet of this concept is that Army commanders should be aware that exercising Army core competencies and demonstrating Army values are vital aspects of providing domestic support. Basic soldier skills in logistical support, engineering, medical care, and communications are but a few examples of competencies that can be exercised in both wartime and peacetime operations. Commanders should, when possible, use domestic support requirements to exercise basic soldier competencies, thereby enhancing individual and unit wartime capabilities. Additionally, domestic support operations provide excellent opportunities for soldiers to interface with the civilian community and demonstrate traditional Army values such as teamwork, success-oriented attitude, and patriotism. These demonstrations provide positive examples of values that can benefit the community and also promote a favorable view of the Army to the civilian population.

PRINCIPLES OF OPERATIONS OTHER THAN WAR

Domestic support operations occur under various scenarios and conditions. Regardless, the six principles for the conduct of operations other than war—objective, unity of effort, legitimacy, perseverance, restraint, and security—apply. A discussion of each follows.

- Objective - *Direct every military operation toward a clearly defined, decisive, and attainable objective.* All commanders and soldiers must understand the objective and integrate their efforts with those of the supported civil

authorities to achieve it. The concepts of mission, enemy, troops, terrain, and time available (METT-T) determine intermediate or subordinate objectives that must be accomplished to achieve the primary objective.

- *Unity of effort - Seek unity of effort toward every objective.* Commanders must seek, establish, and maintain unity of effort. In most crisis situations, they will be in support and under the general direction of civil authorities. They must coordinate closely with these authorities and clearly understand the lines of authority and control. Unity of effort also requires coordination and cooperation among the other federal agencies involved. Almost all domestic support operations will be conducted in a joint and interagency environment. Although unity of command may not be possible since command structures vary, the requirement for unity of effort remains.
- *Legitimacy - Sustain the people's willing acceptance of the right of the government to govern or of a group or agency to make and carry out decisions.* Legitimacy derives from the perception that using military force is a legal, effective, and appropriate means of exercising authority for reasonable purposes. However, the issue of legitimacy demands caution and critical judgment. The Army must be aware of the legitimate interests, prerogatives, and authority of the various levels of civil government involved and act accordingly. If the Army aids in the solution of a domestic problem but detracts from the legitimacy of the national or state governments by so doing, its actions will be detrimental to the federal government's long-term strategic objectives.
- *Perseverance - Prepare for the measured, protracted application of military capabilities in support of strategic aims.* Domestic support operations may require years to achieve desired effects. They may not have a clear beginning or end decisively. For example, the Army's involvement in counterdrug operations, which began in 1981, remains active.
- *Restraint - Apply appropriate military capability prudently.* Specific rules of engagement govern

the disciplined application of force. In operations other than war, these rules will be more restrictive, detailed, and sensitive to political concerns and may change frequently during operations. Restraints on weaponry, tactics, and levels of force characterize domestic support operations.

- *Security - Never permit hostile forces to acquire an unexpected advantage.* The Army must never be lulled into believing that the nonhostile intent of a mission involves little or no risk. Individuals or groups may wish to take advantage of a crisis situation for personal gain or to make a political statement. Commanders must be ready to counter activity that could bring harm to their units or jeopardize their mission. Disaster assistance operations focus on alleviating human suffering, but as Army forces involved in 1992 Hurricane Andrew relief discovered, prevention of looting and protection of supplies are also necessary.

THE ARMY'S ROLE

The National Guard in a nonfederal status has the primary responsibility for providing military assistance to state and local governments.

In domestic support operations, the Army recognizes that National Guard forces, acting under the command of their respective governors in a state (nonfederal) status, have the primary responsibility for providing military assistance to state, territorial, and local governments. When state and National Guard resources need supplementation and the governor requests it, the Army will, at the direction of the NCA, assist civil authorities.

During massive flooding of the Mississippi River and its tributaries in the summer of 1993, more than 7000 National Guardsmen from the states of Arkansas, Illinois, Iowa, Kansas, Missouri, and Wisconsin were called to state active duty to provide relief to flood victims. Their duties included providing fresh water, security, evacuation, reconnaissance and traffic control, plus sandbagging, hauling, and dike reinforcement support for the duration of the emergency.

The Army provides this support at federal, state, and local levels. For example, it may help a state or local community by providing disaster relief or it may provide medical personnel and transportation for a state's firefighting effort. Another example is aiding governmental agencies in cleaning up the environment. The Army may also be designated a lead agent for a

specific operation, such as urban search and rescue (US&R) under the Federal Response Plan (FRP), the document that directs federal response to natural disasters such as earthquakes, hurricanes, typhoons, tornadoes, and volcanic eruptions; technological emergencies involving radiological or hazardous material releases; and other incidents requiring federal assistance as prescribed by law. The FRP provides standing mission assignments to selected governmental and nongovernmental organizations to carry out specific emergency support functions (ESFs). Each type of assistance may require an extensive commitment of resources, depending on the nature and scope of the operation, and close coordination with federal, state, or local officials.

Army commanders will frequently coordinate with civilian emergency managers, both professional and volunteer. They are often referred to as the "coordinators of emergency services" or similar titles and, in smaller jurisdictions, may be the fire chief, police chief, or other official. The Army will—

- Establish achievable objectives.
- Establish clear termination standards.
- Tailor forces to the mission.

SUMMARY

The Army, composed of the AC, ARNG, USAR, and DA civilians, has a long and proud tradition of providing domestic support to the nation. It ranges from less demanding operations such as community activities to high-intensity crisis situations. Principles of operations other than war provide the Army a conceptual foundation on which to conduct domestic support operations. Although the National Guard has primary responsibility for developing plans and providing support to state and local governments, the national shift from a forward deployed to a force projection strategy has brought a new awareness of the benefits the Army can provide to America.

CHAPTER 2

ROLES AND RESPONSIBILITIES

Army support to federal, state, and local agencies covers a broad range of activities, events, and occurrences. The type of domestic support may vary from a static display at a local fair to a large deployment of troops, material, and supplies in response to a natural disaster. The scope may vary from involvement at the local community to massive operations covering a multistate or international arena. Depending on the type and scope of required support, the civil authorities and organizations that Army commanders assist will also vary greatly. These organizations are addressed in this chapter in terms of their roles and responsibilities in disaster assistance, environmental assistance, law enforcement, and community assistance operations. Also addressed are the Department of Defense agencies and commands that have significant responsibilities for providing domestic support.

THE PRESIDENT

The Army will conduct domestic support operations in a joint and interagency environment.

The President, as the Chief Executive Officer of the US Government and Commander-in-Chief of all US

military forces, authorizes the use of federal resources for domestic support operations. During disasters or other periods of national emergency, the President provides guidance and direction to federal departments, agencies, activities, and other organizations. The President does this by declaring, usually at the request of a governor, a disaster or emergency and appointing a federal coordinating officer (FCO) to coordinate federal-level assistance.

The President also provides leadership and direction in other areas that may generate Army support, for example, drug abuse, the social and physical

2-1 infrastructure, and environmental pollution. The President may further assist in resolving these issues by committing federal resources or by proposing new programs.

FEDERAL AGENCIES OTHER THAN DOD

Although not all-inclusive, the following list includes those organizations that have significant responsibilities in the categories of assistance addressed in this manual.

DEPARTMENT OF AGRICULTURE (USDA)

As the lead agency for food and firefighting under the FRP, the USDA has significant responsibilities in disaster assistance operations. The US Forest Service (USFS), an agency under the USDA, is responsible for leading firefighting efforts as well as protecting forest and watershed land from fire. Jointly with the Department of Interior (DOI), the USFS controls the National Interagency Fire Center (NIFC) in Boise, Idaho. The NIFC, in turn, provides national coordination and logistical support for federal fire control.

The USDA is scientifically and technically capable of measuring, evaluating, and monitoring situations where hazardous substances have impacted natural resources. In that regard, the USDA can also support environmental assistance operations involving cleanup of hazardous substances.

THE AMERICAN RED CROSS (ARC)

The ARC, under charter from Congress, is America's official volunteer disaster relief agency. In that capacity, it has a major role in disaster assistance operations, having been designated the lead agency for mass care under the FRP. Due to the general nature of its charter, it can provide support in environmental assistance, law enforcement, and selected community assistance operations.

DEPARTMENT OF COMMERCE (DOC)

The DOC provides fire and weather forecasting as needed from the NIFC or from a nearby weather forecasting facility. Through the National Oceanic and Atmospheric Administration, it provides scientific support for response and contingency planning in coastal

and marine areas. Support includes hazard assessments, trajectory modeling, and information on the preparedness and sensitivity of coastal environments to hazardous substances. Based on its responsibilities and capabilities, DOC can provide support in both disaster and environmental assistance operations.

DEPARTMENT OF EDUCATION (DOEd)

The DOEd establishes policy for, administers, and coordinates most federal assistance to education. It supports information and planning for disaster and environmental assistance operations. The DOEd may also become involved in selected Army community assistance programs that address education and training.

DEPARTMENT OF ENERGY (DOE)

As the FRP's lead agency for energy, the DOE provides the framework for a comprehensive and balanced national energy plan through the coordination and administration of the federal government's energy functions. The DOE—

- Provides nuclear technical assistance and executive national coordination with the oil, gas, electric power, and solid fuels industries.
- Coordinates international emergency responses with the International Energy Agency and with the International Atomic Energy Agency.
- Coordinates supporting resources for the energy industries involved with catastrophic disaster response and recovery.
- Plays a supporting role in disaster and environmental assistance operations.

ENVIRONMENTAL PROTECTION AGENCY (EPA)

As the lead agency for hazardous material response under the FRP, the EPA has a significant role and responsibilities in both disaster and environmental assistance operations. It provides for a coordinated response by federal departments and agencies, state and local agencies, and private parties to control oil and hazardous substance discharges or substantial threats of discharges. In selected operations, it coordinates closely with the US Coast Guard (USCG), which is responsible for conducting hazardous material operations over coastal and inland waterways.

FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA)

The FEMA is the federal government’s executive agent for implementing federal assistance to a state and its local governments. In most cases, it implements assistance in accordance with the FRP. Organized into ten federal regions that provide support on a national basis, FEMA may be involved in either disaster or environmental assistance operations. Figure 2-1 depicts those regions.

GENERAL SERVICES ADMINISTRATION (GSA)

The GSA is the lead agency for resource support under the FRP. Having extensive expertise both in

contracting and providing services, GSA is an invaluable player in both disaster and environmental assistance operations.

DEPARTMENT OF HEALTH AND HUMAN SERVICES (DHHS)

The DHHS is the lead agency for health and medical services under the FRP. The Public Health Service (PHS), an agency under the DHHS, leads this effort by directing the activation of the National Disaster Medical System (NDMS). The DHHS is also responsible for assisting with the assessment of health hazards at a response site and the protection of both response workers and the general public. Agencies

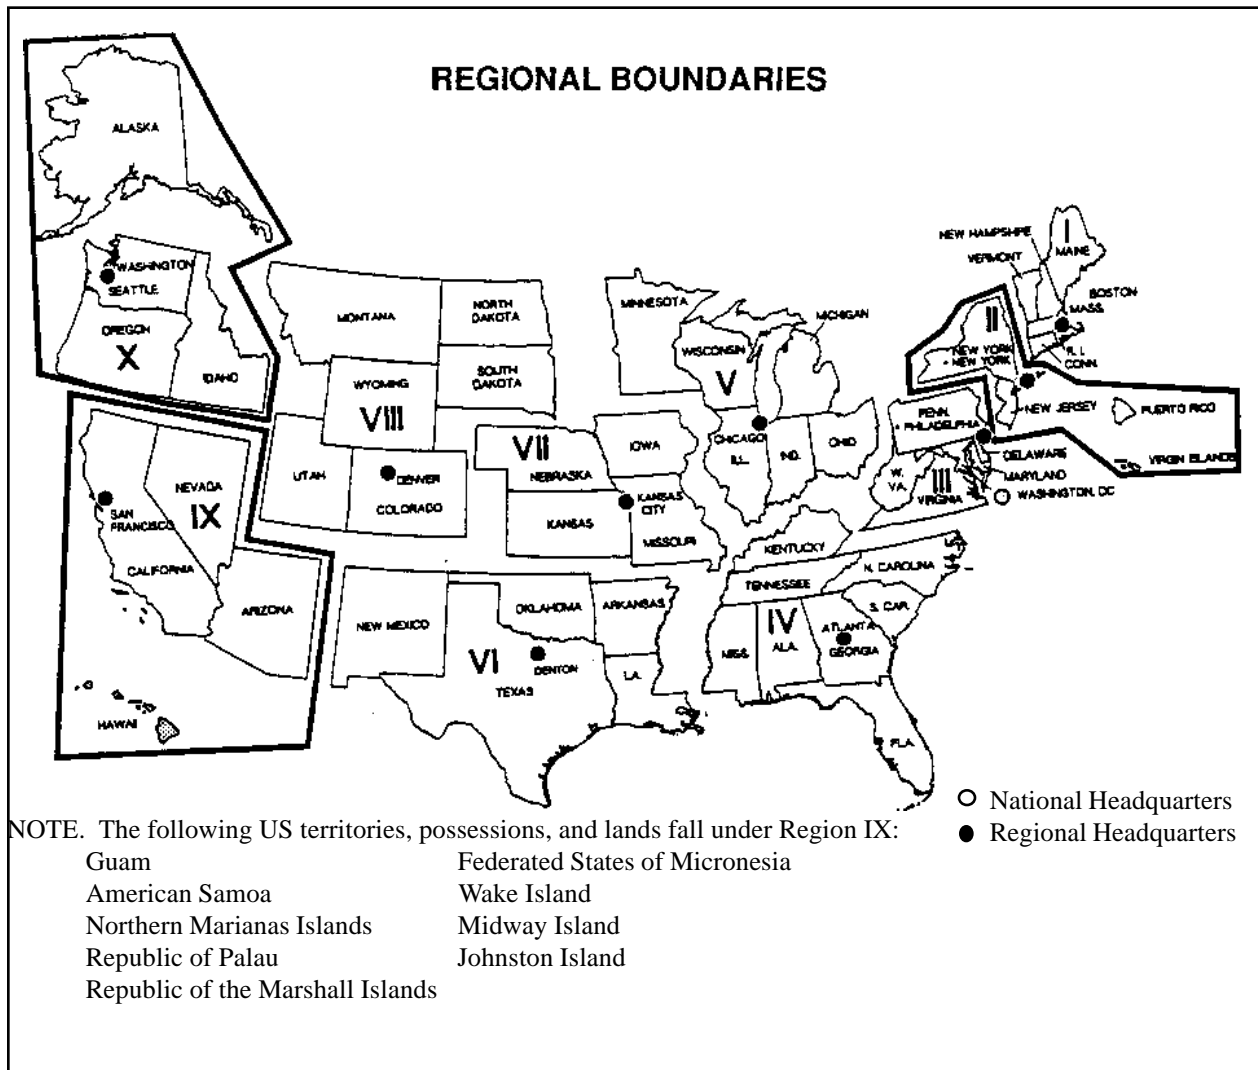

Figure 2-1. Federal Emergency Management Agency

within DHHS that have relevant responsibilities, capabilities, and expertise are the Agency for Toxic Substances and Disease Registry and the National Institute for Environmental Health Sciences. The DHHS provides support for both disaster and environmental assistance operations and may also become involved in selective Army community assistance operations that provide medical support to disadvantaged communities.

DEPARTMENT OF INTERIOR

As a support agency under the FRP, the DOI provides support for disaster and environmental assistance operations. It also has major responsibility for American Indian reservations and for people who live in island territories under United States administration. Operating the NIFC jointly with the Department of Agriculture, the DOI has expertise on, and jurisdiction over, a wide variety of natural resources and federal lands and waters.

DEPARTMENT OF JUSTICE (DOJ)

The DOJ plays a significant role in law enforcement and counterdrug operations. The Drug Enforcement Administration (DEA) is DOJ's lead agency for counterdrug operations. As the government's representative in legal matters, the DOJ may become involved in law enforcement operations, community assistance operations, and disaster and environmental assistance operations, providing legal advice on questions arising from oil and hazardous substance spills. The Attorney General supervises and directs US attorneys and US marshals in the various judicial districts. The DOJ has oversight authority for the Immigration and Naturalization Service (INS) and serves as the lead agency for operations involving illegal mass immigration. The Federal Bureau of Investigation (FBI) is an arm of DOJ.

DEPARTMENT OF LABOR (DOL)

The DOL, through the Occupational Safety and Health Administration, conducts safety and health inspections of hazardous waste sites and responds to emergencies. It must assure that employees are being protected and determine if the site is in compliance with safety and health standards and regulations. The DOL can thus become a support agency for disaster and environmental assistance operations.

NATIONAL COMMUNICATIONS SYSTEM (NCS)

As the lead agency for communications under the FRP, the NCS consists of representatives of 23 federal agencies and operates under the authority of the General Services Administration. The NCS provides communications support to federal, state, and local response efforts and is charged with carrying out the National Telecommunications Support Plan to ensure adequate communications following a disaster. It also provides technical communications support for federal fire control. Administratively structured, the NCS consists of an executive agent, a manager, a committee of principles, and the telecommunications assets.

NUCLEAR REGULATORY COMMISSION (NRC)

Responsible for the Federal Radiological Emergency Response Plan (FRERP), the NRC responds to the release of radioactive materials by its licensees. It provides advice in identifying the source and character of other hazardous substance releases when the commission has licensing authority for activities using radioactive materials. The NRC may serve in a support role in disaster and environmental assistance operations.

DEPARTMENT OF STATE (DOS)

The DOS advises the President in the formulation and execution of foreign policy. Its primary mission in the conduct of foreign relations is to promote the interests of the United States overseas. In this capacity, the DOS manages the US Agency for International Development and the US Information Agency. The DOS also has a support role in disaster or environmental assistance events or domestic counterdrug operations having international implications.

DEPARTMENT OF TRANSPORTATION (DOT)

As the lead agency for transportation under the FRP, the DOT coordinates federal transportation in support of federal agencies, volunteer agencies, and state and local governmental entities. It has support roles in ten other ESFs of the FRP. A subordinate agency of the DOT during peacetime, the US Coast Guard conducts counterdrug operations and, in conjunction with the EPA, hazardous material operations. The DOT and the USCG have major roles in disaster and environmental assistance operations. The DOT provides expertise regarding transportation of oil or hazardous substances by all modes of transportation.

DEPARTMENT OF TREASURY

The Department of Treasury, through its agency, the US Customs Service (USCS), regulates goods, people, and vehicles entering or leaving the United States and its territories. The USCS assesses and collects duties on imports and controls merchandise to prevent smuggling of contraband, including narcotics. As one of the primary federal agencies involved in support of law enforcement, the USCS plays a support role in planning for disaster or environmental assistance operations. Through the US Secret Service (USSS), the Department of Treasury is responsible for providing security for the President, the Vice-President, and visiting heads of state. The USSS can request the aid of the military—in particular, military police, military working dogs, and explosive ordnance disposal and signal personnel—in the conduct of security and protection missions.

NATIONAL WEATHER SERVICE (NWS)

The NWS predicts, tracks, and warns of severe weather and floods. It plays a support role in disaster or environmental assistance operations.

DEPARTMENT OF DEFENSE

The DOD is the lead agency for public works and engineering, as well as urban search and rescue under the FRP. It has support roles in the 10 other ESFs, frequently becoming involved in disaster or environmental assistance operations. If directed by the President, DOD may provide support to law enforcement operations and selected community assistance initiatives. A diagram of DOD is at Figure 2-2.

SECRETARY OF DEFENSE (SECDEF)

The SECDEF has designated the Secretary of the Army (SA) as the DOD executive agent for providing DOD domestic support operations. These responsibilities are outlined in existing policies, procedures, and directives.

SECRETARY OF ARMY

As the DOD executive agent for domestic support operations, the SA develops necessary planning guidance, plans, and procedures. The SA has authority to task DOD

components to plan for and to commit DOD resources in response to requests for military support from civil authorities. Any commitment of military forces of the unified and specified commands must be coordinated in advance with the Chairman, Joint Chiefs of Staff (CJCS). The SA uses the inherent authority of his office to direct Army assistance to domestic support operations. A diagram of the Department of the Army is at Figure 2-3.

DIRECTOR OF MILITARY SUPPORT (DOMS)

The DOMS, a general officer appointed by the SA, is the DOD primary contact for all federal departments and agencies during periods of domestic civil emergencies or disaster response. On behalf of the DOD, the DOMS and his supporting staff, serving as a joint staff, ensure the planning, coordination, and execution of many domestic support operations.

UNIFIED COMMANDS

Selected commanders-in-chief (CINCs) have domestic support responsibilities, some of which are addressed below. More specific CINC responsibilities for civil assistance missions are identified in appropriate DOD directives, guidelines, and operational plans.

Commander-in-Chief, Forces Command (CINCFOR)

The CINCFOR serves as the DOD principal planning and operating agent for military support to civil authorities for all DOD components in the 48 contiguous states and the District of Columbia.

Commander-in-Chief, Atlantic Command (CINCLANT)

The CINCLANT serves as the DOD principal planning and operating agent for military support to civil authorities for all DOD components within the Atlantic command area of operations (AO).

Commander-in-Chief, Pacific Command (CINCPAC)

The CINCPAC serves as the DOD principal planning and operating agent for military support to civil authorities for all DOD components within the Pacific command AO.

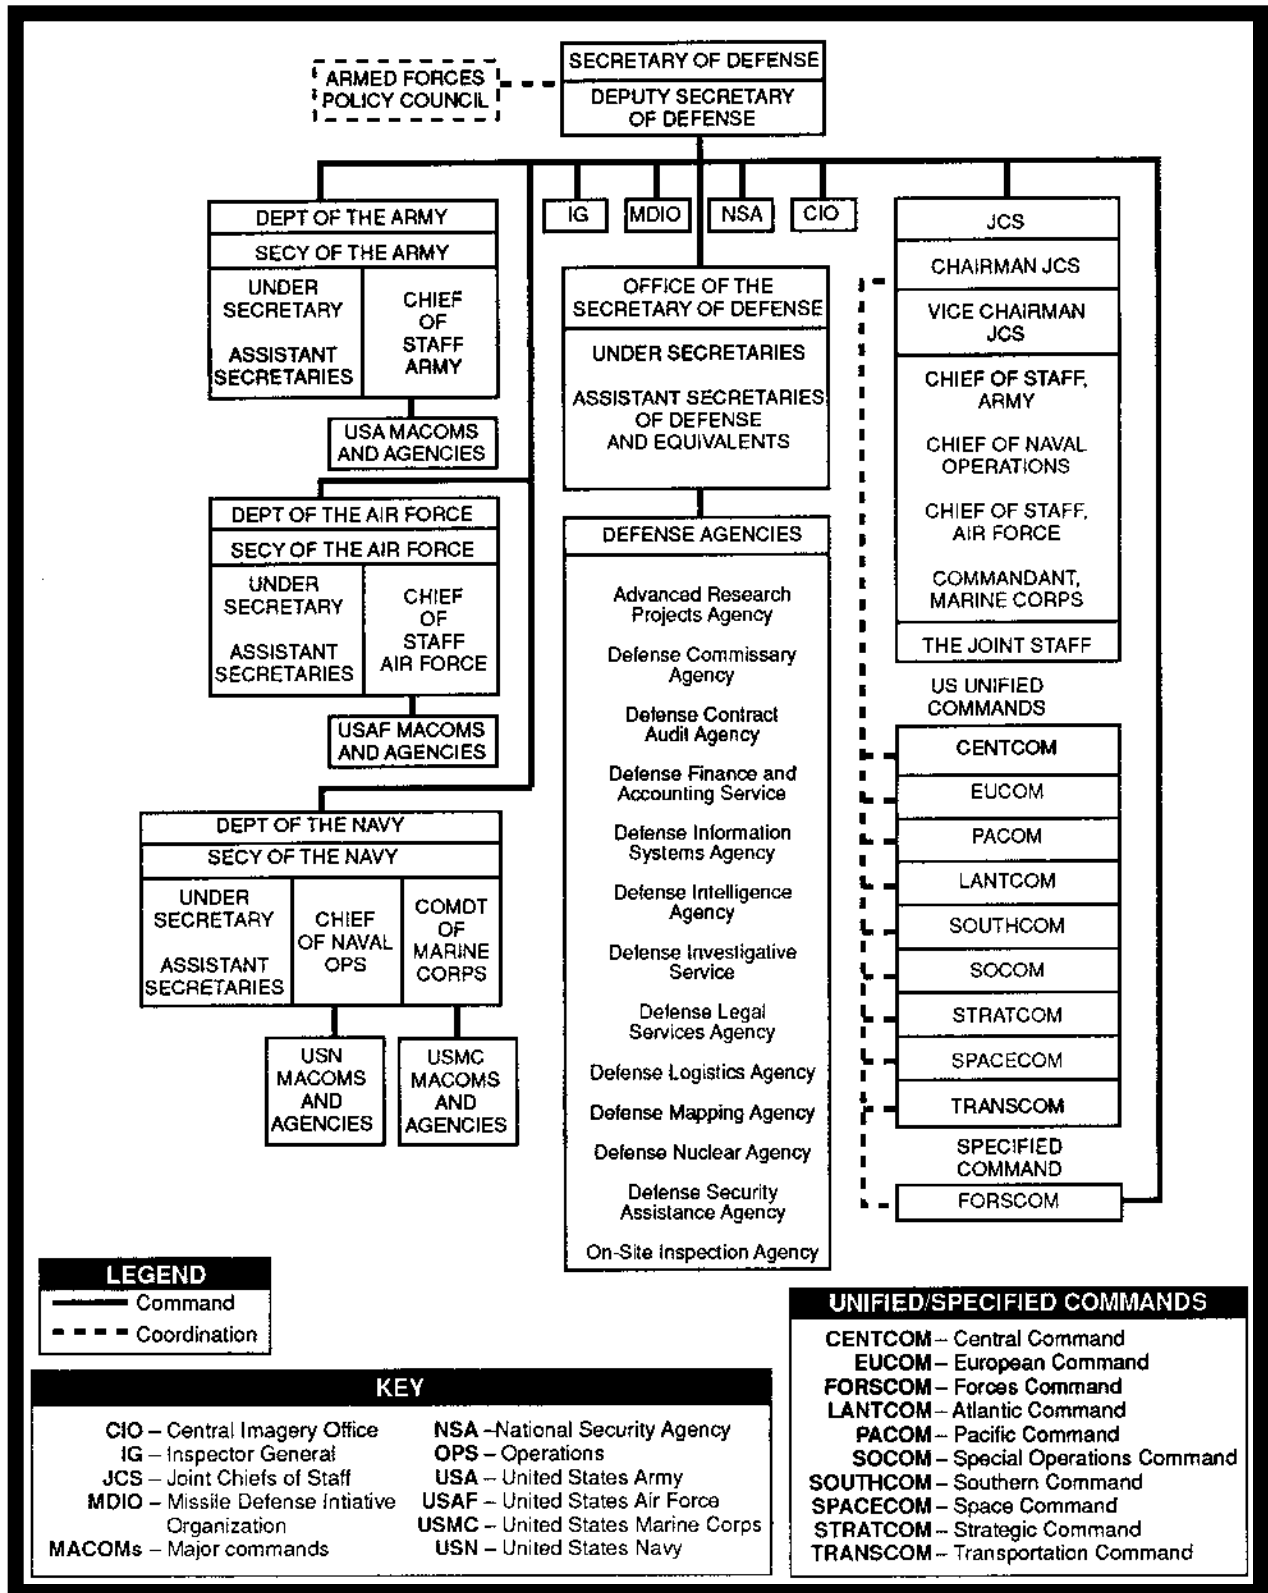

Figure 2-2. Department of Defense

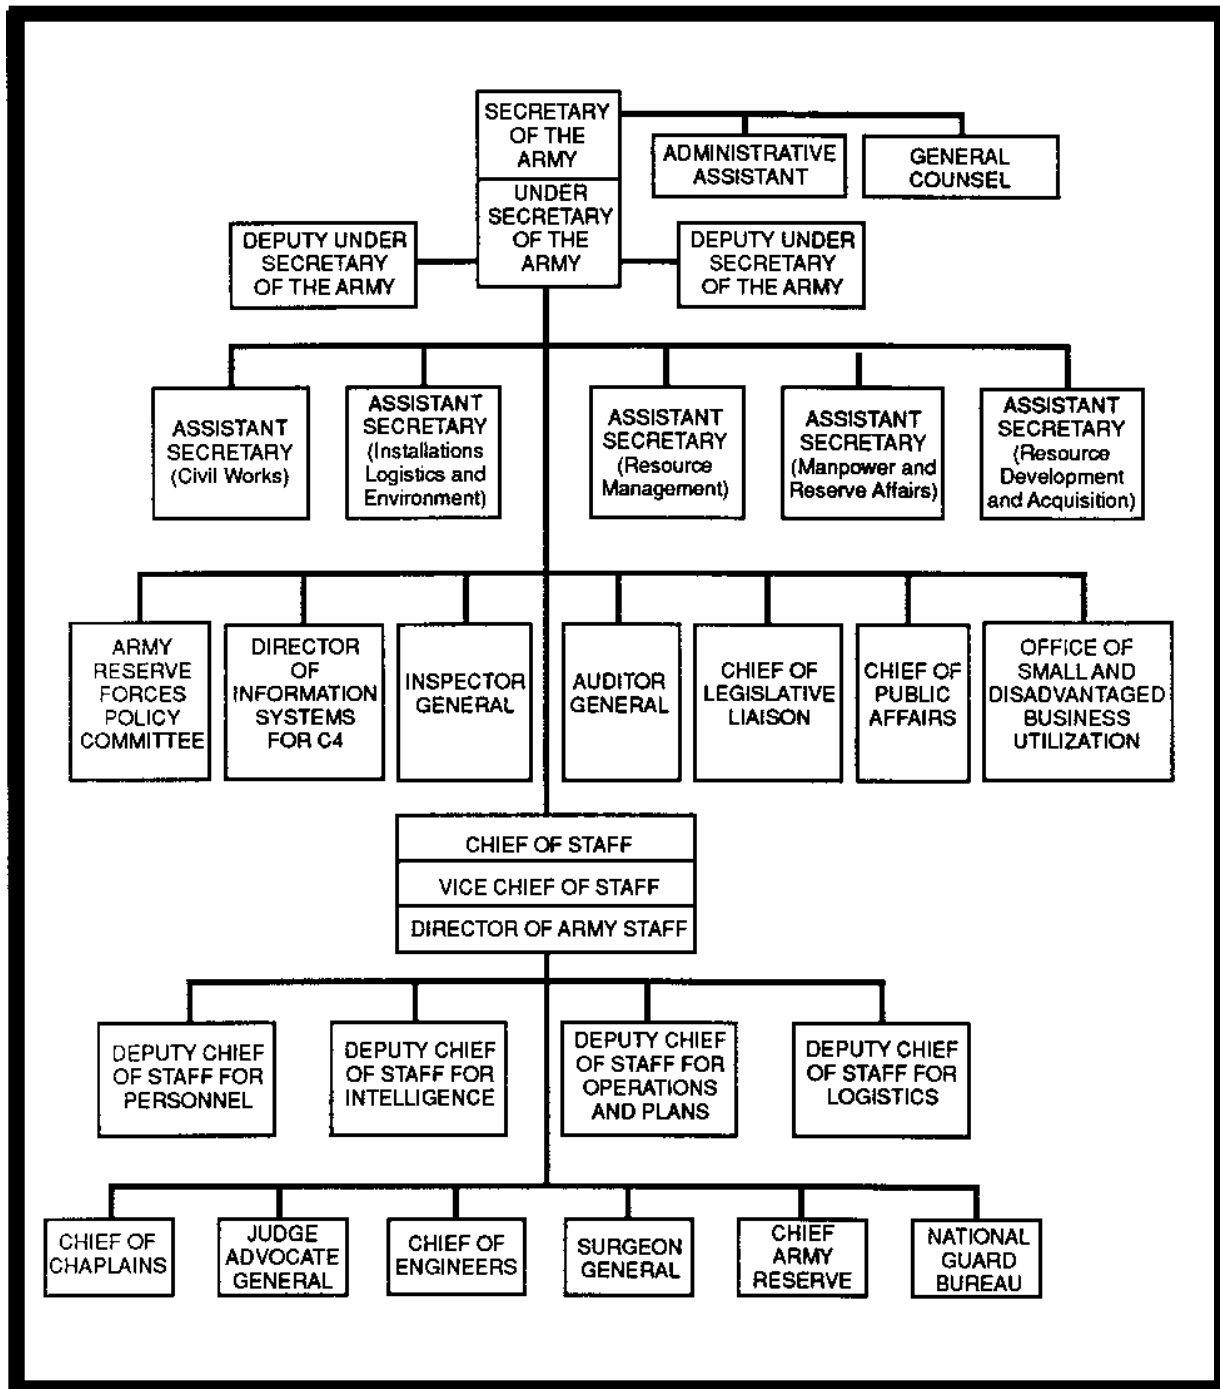

Figure 2-3. Department of Army

Commander-in-Chief, Transportation Command (CINTRANS)

The CINTRANS serves as the DOD single manager for transportation, providing air, land, and sea transportation to meet national security objectives. The CINTRANS has combatant command (COCOM) of the Military Traffic Management Command, Air Mobility Command, and Military Sealift Command, collectively known as the transportation component commands.

Defense Logistics Agency (DLA)

The DLA supports civil disturbance operations under the provisions of OPLAN GARDEN PLOT, the National Civil Disturbance Plan, with wholesale logistics support for military assistance in disasters.

DEFENSE COORDINATING OFFICER (DCO)

A CINC appoints the DCO to serve as the DOD single point of contact to the federal coordinating officer for providing DOD resources during disaster assistance. The DCO should collocate with the FCO and coordinates all FEMA mission assignments for military support. The DCO usually has operational control of all DOD forces deployed to support the federal effort. A defense coordinating element (DCE) will be organized to provide support staff for the DCO in the disaster area. The size and composition of the DCE is situation-dependent.

NATIONAL GUARD

National Guard Bureau (NGB)

The NGB is the federal coordination, administrative, policy, and logistical center for the Army and the Air National Guard (ANG). It serves as the legal channel of communication among the United States Army, the United States Air Force, and the National Guard in the 54 states and territories. The Chief, National Guard Bureau, has executive agent responsibility for planning and coordinating the execution of military support operations. The Director, Army National Guard (DARNG), in coordination with the Director, ANG, is responsible to the Chief, NGB. NG commanders are responsible for planning and training their forces for both their federal and state missions.

State Area Command (STARC)

The STARC is a mobilization entity in each state and territory. It organizes, trains, plans, and coordinates the mobilization of NG units and elements for state and federal missions. The STARC is responsible for emergency planning and response using all NG resources within its jurisdiction. It directs the deployment and employment of ARNG units and elements for domestic support operations, including military support to civil authorities. As with active duty forces, emergency response may be automatic or deliberate. When the NG is in a nonfederal status, the governor serves as commander-in-chief of the NG in his state or territory and exercises command through the state adjutant general (TAG). While serving in state status, the NG provides military support to civil authorities, including law enforcement, in accordance with state law. Federal equipment assigned to the NG may be used for emergency support on an incremental cost-reimbursement basis.

US Property and Fiscal Officers (USPFOs)

USPFOs are Title 10 officers assigned to the NGB and detailed for duty at each state or territory. They are accountable for all federal resources (equipment, dollars, and real estate) provided to the NG of each state. The USPFO staff provides supply, transportation, internal review, data processing, contracting, and financial support for the state's NG. When required, the USPFO can operate as a support installation for active component or USAR forces on a reimbursable basis.

Emergency Preparedness Liaison Officers (EPLOs)

Representatives from the services are EPLOs to each state NG. As service planning agents' representatives to TAGs and STARCs, they plan and coordinate the execution of national security emergency preparedness (NSEP) plans, performing duty with the STARCs. EPLOs are Army, Navy, and Air Force Reservists who have been specifically trained in disaster preparedness and military support matters. Each reports to an active duty program manager or planning agent in his or her respective service who has responsibility and authority to provide (or seek further approval of) military support to the state. EPLOs must have a comprehensive knowledge of their respective service facilities. They must also monitor and update their portion of the DOD Resource Data

Base (DODRDB). Upon appointment of the DCO, EPLOs may be ordered to active duty to serve as liaison representatives to the STARCs and their respective services.

US ARMY RESERVE

The USAR is capable of extensive domestic support operations. This assistance and support may include the use of equipment and other resources, including units and individuals. USAR personnel may be activated in a volunteer status when ordered to active duty in lieu of annual training or after the President has declared a national emergency.

MAJOR COMMANDS (MACOMs)

MACOM commanders may provide domestic support operations in accordance with authorized agreements they have reached with civil authorities in their surrounding communities or as directed by higher headquarters. Specifically, they may provide resources for disaster relief upon request, generally placing these resources under the operational control of the military commander in charge of relief operations.

US Army Health Services Command (HSC)

The HSC, as requested by the supported CINC, provides health service support (HSS) resources, including clinical personnel under the Professional Officer Filler System (PROFIS), for all categories of domestic support operations. These resources are normally attached to, or placed under the operational control of, a supported CINC HSS unit for the duration of the operation.

Continental US Army (CONUSA) Commanders

CONUSA commanders provide regional military support to civil authorities by planning for and conducting disaster relief operations within their areas of responsibility. They also establish and maintain disaster relief liaison with appropriate federal, state, and local authorities, agencies, and organizations.

US Army Corps of Engineers (USACE)

The USACE is organized into geographically dispersed (CONUS and OCONUS) division and district subordinate commands. The USACE commander also serves as the chief of engineer soldier forces and in that

capacity guides the Army staff in their utilization. The USACE's mission is to provide quality, responsive engineering service to the nation. The command applies substantial expertise to the areas of operation and maintenance of the national waterway infrastructure, environmental restoration and remediation, project planning and management, coordination of complex interagency or regional technical issues, and disaster planning and response. The USACE serves as DOD's lead agent, in direct support of FEMA, for public works and engineering in the FRP. Figure 2-4 depicts USACE division and district regulatory boundaries.

US Army Materiel Command (USAMC)

The USAMC may organize and deploy a logistics support element for domestic support operations. It provides supply, maintenance, technical assistance, and other services to the units. In addition, the logistics support element may organize a humanitarian depot to receive, store, and distribute relief supplies. The USAMC is the Army's executive agent for chemical and nuclear accidents and incidents.

STATE AND LOCAL GOVERNMENT

This section addresses general state and local government responsibilities for responding to disaster assistance operations. Responsibilities for environmental assistance, support of law enforcement, and community assistance are discussed in chapters specifically addressing those operations. State and local government officials, operating under authority granted by state constitutions and local charters, are responsible for most of the daily safety and security issues that impact on their citizens' quality of life. State and local officials have primary responsibility for emergency preparedness planning and responding to emergencies.

Historically, NG units, under control of state governors and TAGs, have been the primary military responders in emergencies. Using federal military forces to support state and local governments is the exception rather than the norm. Federal forces are normally used only after state resources have been exhausted.

STATE RESPONSIBILITIES

Governor

A state governor is empowered by the US Constitution and each respective state constitution to execute the laws of the state and to command the state's NG when it is serving in state status. Governors are also responsible for issuing Executive Orders declaring "states of emergency" and ensuring that state agencies plan for actions in the event of a disaster.

Once a disaster occurs, the governor assesses its extent and determines if local government requests for assistance should be honored. If appropriate, the governor declares a state of emergency, activates the state response plan, and may call up the NG. The governor gives the NG its mission and determines when Guard forces can be withdrawn. In the event a disaster exhausts state resources, the governor may petition the President for federal assistance.

Figure 2-4. Corps of Engineers Division and District Regulatory Boundaries

Office of Emergency Services (OES)

All states have a specific agency that coordinates emergency preparedness planning, conducts emergency preparedness training and exercises, and serves as the governor's coordinating agency in an emergency. The titles of these offices vary from state to state, for example, Division of Emergency Government, Emergency Management Agency, Department of Public Safety, or Office of Emergency Preparedness. This manual refers to this office using the generic term Office of Emergency Services. A diagram depicting a typical structure for state and local operational emergency services organizations and their linkages with equivalent federal organizations is at Figure 2-5.

Generally, the OES is either organized as a stand-alone office under the governor or aligned under TAG or the state police. It operates the state emergency operations center during a disaster or emergency and coordinates with federal officials for support if required. A diagram depicting typical organizations involved in state and local emergency response is at Figure 2-6.

The Adjutant General. The state NG is the governor's primary response force in an emergency. The TAG, through the STARC (specifically the Plans, Operations and Military Support Officer (POMSO)) coordinates emergency response plans for

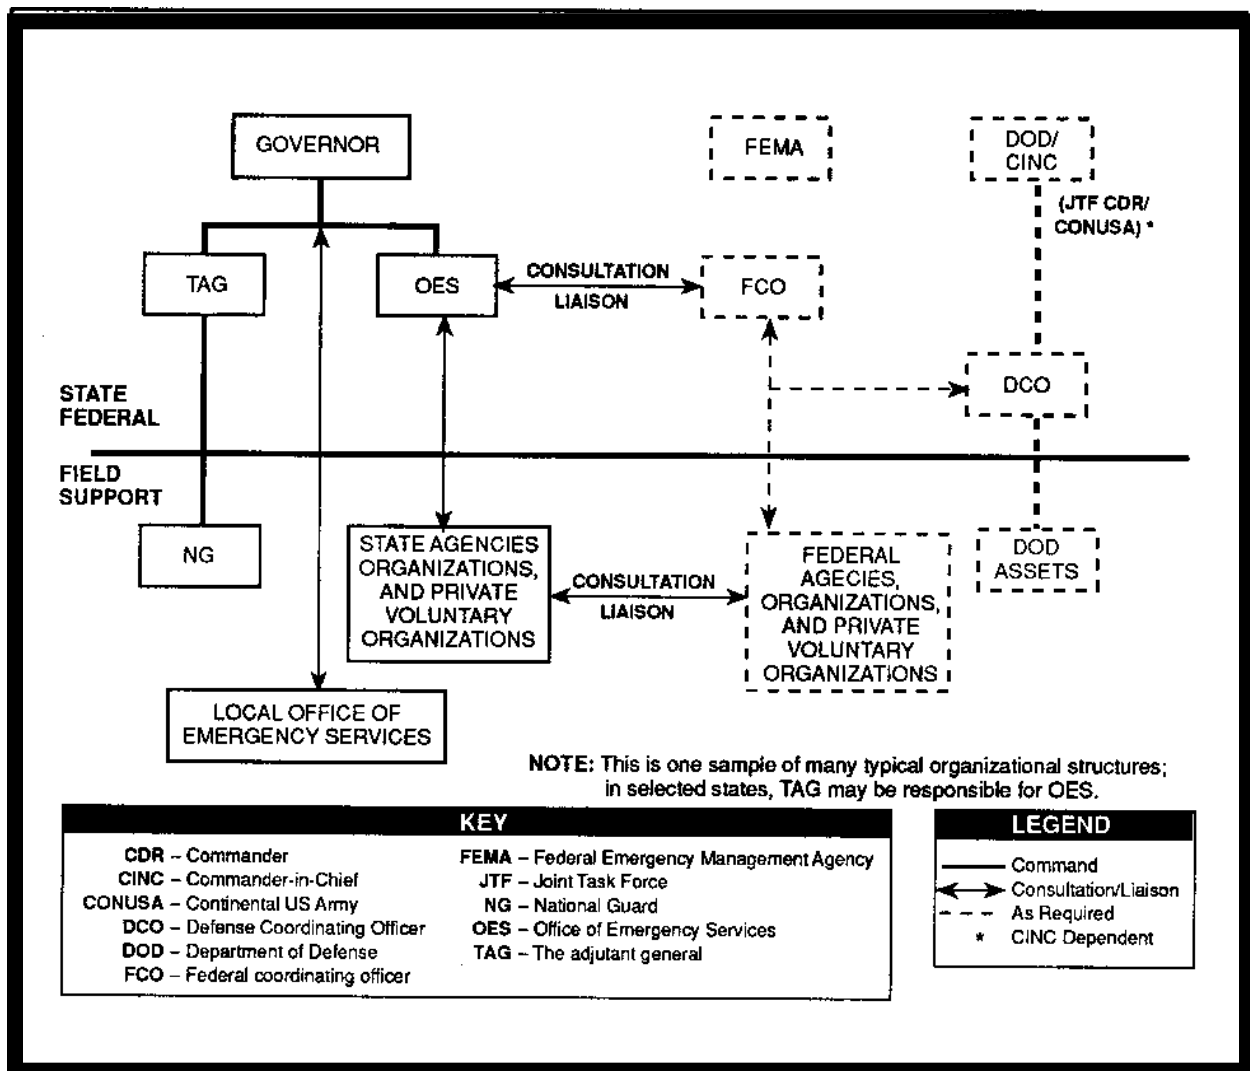

Figure 2-5. State/Local Operation Emergency Services Organization

Figure 2-6. State and Local Emergency Response

disasters and emergencies. TAG is in command of state NG forces called to state active duty.

Plans, Operations, and Military Support Officer

The POMSO plans for disaster response and recovery operations within the full spectrum of military support missions. Within each state, the POMSO coordinates training plans and exercises between the state NG and federal, state, and local emergency management agencies. The POMSO will serve as the NG point of contact with DOD officials during a federal emergency or disaster.

State Government Agencies

State government departments and agencies prepare emergency response plans for their areas of specialization. They also participate in emergency preparedness exercises and respond according to plan.

LOCAL RESPONSIBILITIES

Within their respective communities, mayors, city managers, local police and fire protection officials, county executives, sheriffs, prosecuting attorneys, and public health officials are some of the people responsible for law enforcement, safety, health, and fire protection on a daily basis. They are responsible for developing appropriate emergency response plans and responding to emergencies within their jurisdictions. Most local jurisdictions have an OES to plan and coordinate actions in an emergency. In many cases, local jurisdictions have mutual aid agreements with other jurisdictions that allow for firefighter and police assistance. Once local officials determine that an emergency is beyond the scope of their resources or ability to respond, the senior local official is responsible for requesting additional assistance from the state governor.

SUMMARY

The Army may support or coordinate with many federal, state, and local governmental departments and agencies as it conducts domestic support operations. Although the Army is seldom the lead agency in disaster assistance operations, it is a support agency for all the FRP's emergency support functions. Almost all Army domestic support operations will be conducted in a joint or interagency environment. Throughout our history, the Army has provided community support at the national level and support to its surrounding communities. The Army also has a long history of providing domestic support and will continue to provide that assistance in the future.

CHAPTER 3

LEGAL CONSIDERATIONS AND CONSTRAINTS

The Constitution, laws, regulations, policies, and other legal issues limit the use of federal military personnel in domestic support operations. This chapter presents an overview of those considerations and constraints.

CIVILIAN CONTROL OF THE MILITARY

**Commanders should discuss plans,
policies, programs, exercises,
funding, and operations with their**

legal advisors.

Under the Constitution of the United States, Congress has the authority to raise and support an army, provide and maintain a navy, and make rules for governing and regulating the land and naval forces. The Constitution places the military under civilian control and designates the President as commander-in-chief. Statutes provide for civilian leadership in the form of a secretary of defense, service secretaries, and various other civilian authorities.

The unique capabilities of the military enable it to support federal, state, or local civilian agencies. In most circumstances, the DOD is one of many federal agencies reacting to a domestic emergency or crisis, playing a subordinate, supporting role to a lead, civilian agency.

THE ROLE OF THE ARMY

Traditionally, nations have raised and maintained armies to provide for the national defense. Today, the United States calls upon its Army to perform various other functions as well, for example, controlling civil disturbances, assisting with disasters, and providing essential services.

- During the civil disturbances of the late 1960s and early 1970s, civilian authorities called upon the Army to help restore order.
- Soldiers provided assistance during times of natural disaster, such as the Hurricane Andrew cleanup in Florida in 1992. Civil authorities can call upon the Army to render assistance if a

major accident occurs at a nuclear power plant. The Army can also help prevent a major environmental disaster by assisting in the cleanup of petroleum or chemical spills.

- During the postal strike of 1970, the federal government called upon the Army to help operate post offices in several cities. Army air traffic controllers manned control towers during the 1981 air traffic controller walkout.

THE LAW

Within the United States, civilian agencies, not the military, provide for the needs of citizens. Civilian, federal, state, and local government and law enforcement agencies execute US laws. Laws governing use of the military in domestic operations are complex, subtle, and ever-changing. For this reason, commanders should discuss plans, policies, programs, exercises, funding, and operations with their legal advisors. They should scrutinize each request for aid, whether it be for equipment or training, to ensure that it conforms with statutory requirements.

SUPPORT TO CIVILIAN LAW

ENFORCEMENT: *The Posse Comitatus Act*

Generally, federal military forces may not give law enforcement assistance to civil authorities without running afoul of *The Posse Comitatus Act*. However, Constitutional and statutory exceptions to this prohibition do exist. The recent emphasis on drug interdiction has led to an increase in those exceptions.

The Judiciary Act of 1789 allowed United States marshals to call upon the military as a *posse comitatus*. This continued until after the Civil War, when the federal government used the Army to execute Reconstruction Era policies. The southern states regarded the use of the military for this purpose as abusive and repressive, and in 1878 President Rutherford B. Hayes signed the original bill ending the practice. The current wording contained in 18 USC 1385 is:

Whoever, except in cases and under circumstances expressly authorized by the Constitution or act of Congress, willfully uses any part of the Army or the Air Force as a posse comitatus or otherwise to execute the laws shall be fined not more than \$10,000 or imprisoned not more than two years, or both.

The *Posse Comitatus Act* prescribes criminal penalties for use of the US Army or Air Force to execute the laws of or to perform civilian law enforcement functions within the US. DOD policy extends this prohibition to the US Navy and Marine Corps. Prohibiting the military from executing the laws means that military personnel may not participate directly—

- In arrest, search and seizure, stop and frisk, or interdiction of vessels, aircraft, or vehicles.
- In surveillance or pursuit.
- As informants, undercover agents, or investigators in civilian legal cases or in any other civilian law enforcement activity.

The *Posse Comitatus Act* does not apply to—

- Members of the National Guard when not in federal service.
- Members of a reserve component when not on active duty or active duty for training.
- DOD civilians, unless under the direct command and control of an active duty officer.
- A soldier when off duty and acting only in a private capacity.
- Soldiers taking action for the primary purpose of furthering a military or foreign affairs function of the US, for example, enforcing military justice, maintaining law and order on military installations, protecting classified materials.

There are specific actions in which military personnel may not participate.

Constitutional Exceptions

Under its inherent authority, the United States Government is responsible for preserving public order and carrying out governmental operations within its territorial limits, by force, if necessary. Under the Constitution, two exceptions allow the use of the military to execute or enforce the law: when necessary to protect civilian property and functions and when necessary to protect federal property and functions.

When Necessary to Protect Civilian Property and Functions. A sudden and unexpected civil disturbance, disaster, or calamity may seriously endanger life and property and disrupt normal governmental functions to such an extent that local authorities cannot control the situation. At such times, the federal government may use military force to prevent loss of life or wanton destruction of property and to restore government functions and public order. This exception has rarely been used.

When Necessary to Protect Federal Property and Functions. The federal government may use military force to protect federal property and federal government functions when local authorities cannot or decline to provide adequate protection.

The President may order the armed forces to aid state civil authorities who are suffering from an insurrection or civil disturbance—

- At the request of a state.
- To enforce federal authority.
- To protect federal property.
- To protect the Constitutional rights of citizens within any state.

The President must act personally by first issuing a proclamation calling upon insurgents to disperse and retire peaceably within a limited time (10 USC 331-333; 10 USC 3500; 10 USC 8500). Note: Not one of these authorities, in and of itself, provides sufficient legal basis to order the reserve components to active federal service.

Statutory Exceptions

Other statutory exceptions (10 USC 371-380) allow military personnel to provide limited support to civilian law enforcement agencies (LEAs) indirectly. Under these laws, the military may share certain information and provide equipment, facilities, and other services to LEAs. The annual DOD Authorization Act also contains exceptions concerning military support to civilian authorities fighting illegal drugs. DOD policies for providing support to civilian LEAs, including personnel and equipment, are contained in DOD Directive 5525.5. AR 500-51 contains related US

Army policies. Examples of support that does not violate *The Posse Comitatus Act* follow:

- Loan of equipment and training to operate or repair the equipment. Certain customs and other laws—*The Controlled Substances Act*, *The Immigration and Nationality Act*—permit direct operation of this equipment.
- Civilian LEAs' use of installation research facilities.
- Transfer of information acquired during normal military operations.

DOMESTIC DISASTER RELIEF:

The Robert T. Stafford Disaster Relief Act

The Stafford Act, 42 USC 5121, et seq, as amended, is the statutory authority for federal domestic disaster assistance. It empowers the President to establish a program for disaster preparedness and response, which the President has delegated to FEMA. The Stafford Act provides procedures for declaring an emergency or major disaster, as well as the type and amount of federal assistance available. The Act authorizes the President to provide DOD assets for relief once he formally declares an emergency or a major disaster. He may also provide DOD assets for emergency work on a limited basis prior to the declaration. DOD policy for providing domestic disaster assistance is contained in DOD Directive 3025.1, Military Support to Civil Authorities. Army policy is found in AR 500-60, Disaster Relief.

Emergencies and Major Disasters

The difference between an emergency and a major disaster is one of duration, severity, and the extent of assistance required. Examples are hurricanes, floods, tornadoes, storms, tidal waves, earthquakes, volcanic eruptions, landslides, droughts, explosions, or other natural or man-made catastrophes. Emergencies are less severe than major disasters, requiring a shorter time to recover and to provide adequate relief. Both may require federal assistance to augment state and local resources and relief agencies. From a DOD perspective, an emergency and a major disaster may require the same type of work, that is, removal of debris, preservation of health and safety, and restoration of essential services.

The difference between an emergency and a major disaster is one of duration, degree of damage, and extent of assistance needed.

The Federal Response Plan

Once a state requests aid, the President may declare an emergency or a major disaster, enabling the FEMA to act under the FRP. The FRP is a memorandum of understanding (MOU) between the FEMA and other federal agencies, including the DOD, to provide domestic disaster assistance. Under the FRP, a single federal agency is assigned primary responsibility for each of twelve ESFs. The FEMA orchestrates disaster relief through these ESFs. Each primary agency orchestrates the federal effort within its sphere of responsibility and may, if authorized by the FEMA, task other agencies for support.

The DOD has primary responsibility for ESF 3, Public Works, and ESF 9, Urban Search and Rescue, and is a supporting agency for the remaining ten. The FEMA reimburses the DOD for the incremental costs of providing the tasked assistance. Without specific FEMA tasking, DOD units lack authority to provide domestic disaster assistance and, if provided, risk not being reimbursed for its cost. If in doubt, commanders should seek clarification from the FEMA through the defense coordinating officer.

Emergency Work

To save lives or to preserve property, the President may commit DOD resources to perform emergency work on public or private lands prior to his official declaration of an emergency or major disaster. Emergency work is defined as clearance and removal of debris and wreckage and temporary restoration of essential public facilities and services. Such work may not last more than 10 days.

CIRCUMSTANCES CONCERNING ELECTIONS

US law (18 USC 592) prescribes criminal penalties for US troops being at or near polling places.

Commanders should determine if elections are scheduled during disaster assistance operations. For example, during JTF Andrew operations, the FEMA asked the DOD, at the request of Florida election officials, to erect 66 tents, with generators and light sets, to serve as temporary polling sites during a general election. They further tasked DOD to maintain the equipment. Several other polling sites were located near DOD personnel performing disaster relief duties. The Department of Justice opined that so long as DOD personnel did all they could to respect the integrity of the sites, they would not violate 18 USC 592. This was true as they provided tasked support and as they continued relief operations in their vicinity.

Hurricane Iniki left the Hawaiian island of Kauai devastated; one result was inoperative county polling places. Soldiers from the Hawaii Army National Guard (serving on state active duty) helped a state primary election take place as scheduled by providing tents and transportation assets to Kauai County polling officials.

COMBATting TERRORISM, AIRCRAFT PIRACY, AND OTHER OPERATIONS

COMBATting TERRORISM

Various DOD directives outline the policies for maintaining security and combatting terrorism. Because the DOD retains responsibility for protecting its resources, DOD domestic actions to combat terrorism do not always fall within the category of providing assistance to civilian authorities. OPLAN GARDEN PLOT contains DOD procedures for assisting the FBI in combatting terrorism on and off of US military installations.

The FBI's Responsibility

The FBI has overall jurisdiction at the scene of a terrorist incident wherever it occurs, including military

installations. The President has directed federal departments and agencies to cooperate to thwart terrorist incidents.

The DOD's Responsibility

Commanders are responsible for the maintenance of law and order on their installations. They must take all actions to respond to and terminate any terrorist incident occurring on the installation and to protect the installation's personnel and equipment from attack. Installation commanders should coordinate protective measures with appropriate civilian LEAs.

**Commanders who
perform disaster assistance
missions not tasked by
FEMA risk the Army's not being
reimbursed for its cost.**

DOD components are authorized to respond to reasonable requests from the FBI for military resources for use in combatting acts of terrorism. Assistance may include material, facilities, and technical personnel in an advisory capacity. Without Presidential approval, military personnel may not be used in a law enforcement role outside of a military installation. With that approval, soldiers may perform missions designated by the FBI pursuant to its responsibilities during a terrorist incident. However, command and control of the soldiers always remain with their military chain of command.

DOD resources may be provided only upon request of the Director, FBI, or the senior FBI official at the scene of a terrorist incident. Commanders may accept the judgment of the requesting official if the official's determination is consistent with available facts. Commanders must forward requests for resources not based upon an actual or imminent terrorist incident—for example, requests for training or longterm equipment loans—to the DOD for processing in accordance with OPLAN GARDEN PLOT.

AIRCRAFT PIRACY

The Federal Aviation Administration (FAA) has exclusive responsibility for directing law enforcement activity affecting the safety of persons on board in-flight aircraft involved in aircraft piracy. The DOD is required, upon request of the Administrator, FAA, to provide necessary assistance to carry out the air piracy laws. The DOT and the DOD have a memorandum of understanding concerning aircraft piracy that covers DOD aircraft, regardless of location, and any non-DOD aircraft on DOD installations.

OTHER OPERATIONS

DOD support to civilian agencies for other emergencies, such as hazardous substance cleanup, radiological threats, emergency evacuation, and flood control, may be under specific authority, for example, The Flood Control Act. Such support may also be executed in conjunction with other laws, policies, procedures, or regulations. It is not possible to discuss all situations within the constraints of this publication. For example, Army Corps of Engineers civil engineering projects exceed the scope of this discussion. Applicable references are listed at the back of this manual.

10 USC 672(b), The 15-Day Rule.

The secretary concerned may order reserve component units—and personnel not assigned to units—to active duty for a period not to exceed 15 days per year. Activating NG units and personnel requires the governor's consent. USAR units and ARNG units performing annual training outside the US and its territories, however, use such orders as authority for their annual training period. If a reserve component unit ordered to active duty under this authority uses it to perform annual training, the authority is no longer available for that unit until the next fiscal year.

10 USC 672(d), Volunteers

The secretary concerned may order to active duty reserve component personnel who volunteer. The governor must consent to activating NG personnel. Normally, as a matter of policy, USAR personnel are ordered to active duty for a period of more than 30 days

Ordinarily, no USAR or NG personnel will be ordered to active duty as volunteers unless active duty and state ARNG personnel cannot perform the duty and the appropriate CINC validates the requirement.

USE OF PERSONNEL, MATERIEL, AND EQUIPMENT

USE OF MILITARY INTELLIGENCE (MI) PERSONNEL

Use of MI personnel during domestic support operations is restricted as a direct result of lessons learned from their improper use in the 1960s. Consequently, LEA requests for MI personnel or material for counterdrug support must be approved by the Secretary of the Army General Counsel and coordinated through the Department of the Army Office of the Deputy Chief of Staff for Intelligence.

During disaster assistance operations, MI personnel may be used for liaison as well as other MI support activities. However, a specific MI mission statement, coordinated through proper authorities, must authorize MI personnel to collect, analyze, and disseminate information. When so authorized, MI personnel may

- Acquire information that may threaten the physical security of DOD employees, installations, operations, or official visitors, or that may be needed to protect the safety of any person, that is, force protection.
- Analyze and disseminate information to disaster relief personnel and emergency operations centers (EOCs).
- Support EOC operations using intelligence preparation-of-the-battlefield (IPB) skills.

Information that MI personnel gather without using or retaining it is considered not to have been collected. Commanders and MI personnel will ensure that all such material is handed over to appropriate authorities before departing the disaster area.

When OPLAN GARDEN PLOT is executed in response to civil disturbance operations, MI activities

fall under the jurisdiction of law enforcement policies and regulations. Commanders must ensure that MI support missions, other than normal liaison with LEAs for force protection, have been coordinated with and approved by appropriate authorities.

USE OF RESERVE COMPONENT PERSONNEL

Several statutes permit the President, the SECDEF, or the service secretaries to use portions of the reserve components. For domestic disaster assistance, generally only two apply: 10 USC 672(b) and 10 USC 672(d).

USE OF MATERIEL AND EQUIPMENT

AR 700-131 provides HQDA guidance for the loan or lease of US Army materiel. The SA must approve the loan of arms, ammunition, combat vehicles, vessels, and aircraft. Ordinarily, when the DOD loans equipment, the borrowing agency must reimburse them for all DOD costs incident to its delivery, return, and repair. In addition, the borrower must reimburse the full purchase price for consumable or nondurable items, such as batteries, and for depreciation if it is significant.

DOD directives tightly regulate use of reserve component equipment. The MACOM commander approves temporary loans for 90 days or less. The Secretary or Deputy Secretary of Defense approves withdrawals of equipment for more than 90 days. Replacement plans must accompany requests for withdrawals.

REIMBURSEMENT

In addition to the authorities mentioned above, The Economy Act (31 USC 1535) permits federal agencies to provide goods and services to other federal agencies on a reimbursable basis. The Stafford Disaster Relief Act requires reimbursement to the DOD for the incremental costs of providing support. Approval authority and reporting requirements vary depending upon the duration and type of support requested. OPLAN GARDEN PLOT contains procedures for reimbursing DOD for assistance during civil disturbances. Reimbursement for use of NG personnel and assets to assist state counterdrug operations and programs is authorized by 32 USC 112.

Other statutes permit federal agencies to seek waiver of reimbursement. For example, federal law enforcement agencies are not required to reimburse DOD if support—

- Is provided in the normal course of military training or operations.

- Results in a benefit to DOD that is substantially equivalent to that which would otherwise result from military training (10 USC 377). Ordinarily, the DOD makes this determination.

SUMMARY

Domestic support operations raise many legal issues. The Constitution, statutes, and regulations strictly govern the relationship of the military to civilian authorities. The basic rule is that the military plays a subordinate and supporting role to civilian authority, which is different from the wartime role they would have in a foreign theater of operations. Questions of posse comitatus, use of force, disaster assistance, and federalization of troops raise issues that require timely legal advice. Commanders must be aware of the legal implications of domestic support operations, ensure that they are appropriately advised by competent legal counsel, and act accordingly.

CHAPTER 4

LOGISTICS AND SUPPORT OPERATIONS

Most domestic support operations are logistical in nature. Support is based on actual requests or requirements, rather than on standard support packages. In planning for support of national objectives amid growing complexities, military planners face ambiguities about how to prepare for and predict types of contingencies our forces will confront. However, certain support functions always apply, whether for combat forces or civil authorities. To avoid duplication, support planners must consider military and civil requirements and capabilities concurrently. This chapter addresses support common to all domestic operations, as well as specifics for tailoring a support force for particular purposes.

PLANNING

Most domestic support operations are logistical in nature.

In most crises, ARNG units under the control of the respective state governments will be the first military units to provide support. Although the military commander retains command and control of Army forces, a federal, state, or local official may control the overall operation. Detailed planning and familiarization

with the various levels of federal, state, and local government will help synchronize assistance efforts. Coordination and synchronization will avoid confusion and duplication of effort. A knowledge of other agencies' capabilities will help to avert adversarial situations.

Logistics assessment personnel should carefully identify requirements before US Army support assets are deployed. Before deployment, logistics commanders can form emergency response teams to react immediately to emergency situations. These teams would arrive on the scene early to assess the impact and severity of a crisis before commitment of operational forces.

Commanders must ensure that support to troops and to civil authorities is planned for and executed simultaneously. They must also ensure that—

- Logistics command and control cells arrive early.
- Deploying units have access to assured communications and to all Standard Automated Management Information Systems (STAMISs) directly at the support base (local installation).
- Support and supplies flow smoothly and continuously.
- Termination standards (end states) for all types of support are established early in the operation.
- Resource management is fully integrated into all phases of the operation.

SOURCES OF SUPPORT

The four primary sources of logistical support are contracting, negotiated support, military support, and support from other federal agencies. See Figure 4-1.

CONTRACTING

Contracting—purchasing, renting, or leasing supplies or services from nonfederal sources—is a highly effective and efficient way to provide rapid support in a crisis. Included are all classes of supply, labor, mortuary affairs, laundry, showers, food service, sanitation, billeting, transportation, maintenance and repair, access to communications networks, temporary real property leasing, and limited minor construction.

Contracting can augment organic military unit support capabilities and provide new sources of critically required supplies, services, and real estate. It can also bridge gaps that may occur before the deployment of sufficient Army support. Contracting should always be the preferred method of support, beginning as soon as requirements are known.

Decentralized contracting provides a means to respond rapidly to immediate demands. As operations stabilize, centralized contracting becomes more important, allowing Army units to gradually diminish support, to transfer functions to civil agencies, and to disengage and redeploy.

Warranted contracting officers will be needed early in domestic support operations.

During the initial stages of a crisis operation, warranted contracting officers will be needed immediately to procure validated emergency supplies and services. Contracting officers may be brought in with federal forces or they may be provided by the ARNG from its property and fiscal offices, by the designated support installation, the USACE, or by a civil agency.

NEGOTIATED SUPPORT

In some cases, civil authorities may have enough logistical resources to support not only themselves but also the Army personnel providing assistance. For example, civil authorities may provide housing, food, and fuel to troops assisting in a counterdrug or firefighting operation. Such support is negotiated on a case-by-case basis with the appropriate civil authorities.

MILITARY SUPPORT

Whenever possible, installations will continue habitual support to units tasked to conduct domestic support operations. Installations may also have to support personnel with whom they have no established support relationship. These personnel may include civil authorities, elements from other services, and Army elements from other stations.

If an installation or one of the other sources discussed below cannot provide required support directly, planners will tailor a support force for that purpose. Most considerations for tailoring a support force are the same as they are for any operation: requirements, available resources, estimated length of the operation, and so on.

SUPPORT FROM OTHER FEDERAL AGENCIES

The GSA also provides support to civil authorities. GSA provides general supplies and services that are

common to more than one department of the federal government. GSA can provide an extensive amount of support to DOD for such commonly used items as office furniture and supplies, machine and hand tools, photo supplies and other items. Other federal agencies and organizations may be able to provide assistance depending on the nature, scope, and duration of the operation.

LOGISTICS COMMAND AND CONTROL CELLS

Logistics command and control cells are critical to successful support operations. A materiel management center (MMC) can operate in a split-based mode. This concept provides for part of the MMC to remain in a secure location (out of harm's way), while a force projection MMC element deploys with the force it is supporting. The forward deployed MMC element would

provide a conduit for the electronic transmission of logistics data, messages, and voice communications traffic, resulting in inventory asset visibility. Such visibility is vital to logistics support operations.

Logistics command and control cells must arrive early in domestic disaster operations.

Combat service support units must continue to support units awaiting redeployment. Resource accountability remains critical during this phase to prevent waste, fraud, and abuse. At or near the

Figure 4-1. Source of Support

completion of domestic operations, redeployment will be phased to allow for continued and uninterrupted support to civil authorities. Military support should not be curtailed before civil authorities assume the function. When state-activated ARNG units remain on site, special efforts should be undertaken to assist them. Transportation must be arranged through the appropriate movement control organization in accordance with established priorities.

In the past three years (1989-92), US military forces have responded to three hurricanes and two typhoons that struck densely populated areas. After the most recent storms, Hurricane Andrew in Florida and Louisiana and Hurricane Iniki in Hawaii, Army soldiers provided relief services, prepared meals, cleared and hauled debris, produced and distributed water, restored power, and constructed life support centers. These missions provided important lessons in preparedness, leadership, organization, equipment, and safety.

RESOURCE MANAGEMENT

The commander is responsible for maintaining the readiness of the command to execute missions and operations. Any unprogrammed requirement may result in spending resources intended for other use. To request reimbursement for lost resources, the commander must be able to account for them. Equipment and supplies misused, improperly maintained, damaged, lost, or issued to others will adversely affect future readiness and timely deployment.

Judicious management and accountability should be an early and constant focus. When possible, resource management analysis should precede key operational and logistics decisions and actions. Army resource managers should seek early guidance as to reimbursement. For example, will the operation be reimbursable from civilian

sources, should specific Army accounting codes be used for the operation, and so forth. Project codes for use in accumulating costs should be requested at the onset of a disaster relief effort. Designating logistics organizations, for example, US Army Materiel Command corps support command (COSCOM), divisional support command (DISCOM), to receive, store, issue, and account for DOD material must also be considered.

Judicious management and accountability should be an early and constant focus.

State, local, or federal agencies; DOD; or other military services will normally reimburse the Army for assistance. The reimbursement process requires accurate billing for legitimate costs. Discrepancies must be resolved with the supported and/or reimbursing agency. Supported agencies should keep records of services and support received from the Army. To distinguish costs from those related to training or normal operating expenses, Army resource managers must maintain accountability throughout an operation for costs of equipment and supplies dedicated to operational support.

Commanders and managers should fully integrate resource management into all phases of the operation. Establishment of a resource management element to review procedures and advise the commander is also required. Positive resource management calls for planning to account for the expenditure of all resources supporting an operation with the expectation of being audited. By requesting early on-site involvement and advice from external functional experts, for example, Army Audit Agency (AAA) and General Accounting Office (GAO), resource managers can head off major accounting problems that could occur later in the support operations.

SUPPLIES AND FIELD SERVICES

Supplies and services are critical to the life-threatening needs of some types of civil emergencies and to the sustainment of operations in others. Basic guidelines for support are to tailor the package for the

mission, to contract for services early on, and to utilize local resources when possible.

DEFENSE LOGISTICS AGENCY

The DLA may provide common supplies and services used by the military services when supporting domestic operations. The agency's mission is to provide effective logistics support to the operating forces of all military services and to federal civil agencies as assigned. DLA provides support at the lowest feasible cost to the taxpayer. It provides contract administration services in support of the military departments, other DOD components, and other government agencies upon request. The DLA

organization is shown in Figure 4-2. Its defense distribution depots are shown in Figure 4-3.

QUARTERMASTER (QM) UNITS

QM supply and field service units, which should be among the first logistics elements deployed, will satisfy immediate needs and establish receipt, storage, and distribution of incoming supplies. QM units can make food, water, clothing, and shelter available and coordinate required contractual services. The Army's field service companies provide personal hygiene services such as showers, laundry, and, if required, delousing.

The Army has various options for feeding people, even though no unit is specifically designed for mass

Figure 4-2. Defense Logistics Agency

feeding. Options range from distributing meals, ready-to-eat (MRE) to preparing and providing hot meals in a climate-controlled dining facility. Under certain conditions, contract feeding may be a viable means of support. However, local circumstances will dictate the method chosen to feed both supporting military personnel and the supported civilian population. To the extent available, QM units should use established structures suitable for feeding.

MORTUARY AFFAIRS UNITS

Because disasters usually occur without warning, they create considerable confusion, as well as a shortage of personnel to handle the sensitive, unpleasant task of caring for the dead—a job that must be done quickly and efficiently. At such times, Army mortuary affairs forces can provide valuable assistance. When the requirement for such services exceeds

a community’s capabilities, Army mortuary affairs units can provide search, recovery, evacuation, and identification services.

FORCE PROVIDER UNIT

The Army’s Force Provider Unit is specifically designed to provide logistical support in a consolidated location. It is also ideally suited for supporting disaster and humanitarian aid operations. This system, which can provide support for 3300 people, is designed in modules. Each module is capable of independent operations. The unit includes billeting facilities with heating/cooling, kitchens, latrines, showers, laundries, power generation, and water purification. It also includes facilities and equipment and material for religious support as well as morale, welfare, and recreation (MWR). Figure 4-4 shows a 550-person Force Provider module.

Figure 4-3. Defense Distribution Depots

OTHER SUPPORT

Depending on the magnitude of need and the flow of supplies, Army units may require an extensive storage complex.

In emergencies, large quantities of goods are routinely contributed to the affected populace. Normally, civil agencies handle these donated goods; however, they may request that Army forces do the job. Commanders must recognize the requirement for supply accountability and reimbursement for goods and services in accordance with applicable Army regulations. Likewise, they must honor their responsibility to provide designated common supplies to other services in accordance with regulatory guidance. Such efforts apply equally to US civil authorities and traditional military operations.

Real Property

Civil emergency service organizations and the NG should jointly coordinate the use of real property. Facilities should be selected based on their potential for support and the anticipated scale of assistance operations. Vacant warehouses, parking lots, potential staging areas, and other facilities that could be used for

supply activities should be acquired to enable receipt, storage, and distribution operations.

Facilities must be identified to accommodate the receipt, storage, and transshipment of supplies to an impacted area.

Equipment

The nature of the emergency and prevailing conditions will determine the proper mix of equipment needed. In many cases, military equipment is well-suited for domestic support operations. However, additional equipment may be required, either temporary loans from other units or civilian equipment. When civilian equipment is needed, the commander must convey the requirement to higher headquarters. The supporting contracting element (SCE) determines

Figure 4-4. 550-Soldier Force Provider Module

market availability and processes local purchases or hires. In some cases, unit commanders will have the authority to commit funds.

Army equipment may be loaned between active and reserve units, to other services, or to federal government and law enforcement agencies to supplement their capabilities. With proper authorization, loans may be made to nonfederal agencies; state, county, local civil authorities; or private agencies. Normally, consumable supplies and repair parts are not loaned.

As a result of Hurricane Andrew, the 16th Field Supply Co (FSC), 240th QM battalion, was deployed to provide support. The 16th FSC mission provided laundry, bath, and light textile renovation support to disaster victims and deployed forces. Overall, the 16th FSC processed 5000 bundles of laundry and provided showers for more than 22,000 soldiers and civilians.

The borrower must sign a statement assuming liability for equipment during the period of the loan, to include care, custody, security and safeguarding, proper use and maintenance, and responsibility for all incremental costs accrued to the Army. Prior to issue, the Army should clearly define condition standards for return.

Requests from nonfederal agencies must state that a commercial source for an item is not reasonably available. Loan of firearms, weapons, combat or tactical vehicles, water vessels, and aircraft must be approved by the Assistant Secretary of the Army.

MAINTENANCE

The number and type of maintenance units deployed will depend on the operational requirements of the crisis. Military maintenance personnel will remain under military command and control throughout the assistance operation. Whenever possible, the normal planning and execution chain of command should remain in place.

Maintenance commanders should identify supporting vendors; organize maintenance elements; and organize assets from other agencies, contractors, and local maintenance resources. Commanders must consider not only support of their own equipment but support of diverse civilian equipment such as buses, trucks, ambulances, power generation equipment, and so forth.

Commanders must plan on maintenance being performed under field conditions. Disaster relief vehicles such as ambulances, firefighting equipment, buses, power generation and construction equipment will receive priority. As facilities are reactivated following a disaster, maintenance of local infrastructure equipment might be conducted in fixed facilities on an ever-increasing scale.

The types and quantities of Class III and Class IX supplies to be carried or constructed for support of local infrastructure equipment will depend largely on the type of disaster and the equipment being supported. Standard prescribed load lists (PLLs) and authorized stockage lists (ASLs) should be adequate for unit military type equipment committed to domestic support operations. However, this may need to be tailored to support equipment for units in attached or under operational control (OPCON) status.

A priority consideration is the early reestablishment of the local government's infrastructure. Maintenance units are particularly adept at providing this support, whether repairing the local television and radio stations or emergency vehicles. Emergency or quick-fix type repairs similar to the Army's Battle Damage Assessment and Repair (BDAR) System may be required in the early stages of disaster relief, allowing time for repair parts procurement and establishment of a maintenance program.

TRANSPORTATION

Early assessment of transportation requirements is essential. Transportation support will be tailored to both the deployed military force and civil authorities under centralized control. The Army can provide numerous capabilities depending upon the mission. Transportation planners should be deployed early as part of the logistical assessment element.

Movement control units plan, schedule, and control Army movements into, within, and out of an area of

operations. They also support joint force movement control requirements and coordinate support with civil authorities. In this capacity, an Army movement control unit can provide the nucleus of a joint movement center (JMC) and effectively meet all requirements. The JMC is a proven concept and can be tailored to meet the operational transportation requirements. A notional JMC is depicted in Figure 4-5.

The JMC is a proven concept and can be tailored to meet operational requirements.

Transportation units may be organized under a multifunctional or pure transportation headquarters depending upon the tailored support package. Truck companies can distribute large quantities of essential cargoes over terrain normally impassable to most civilian trucking. Cargo transfer companies prepare cargo for transshipment at distribution centers. Terminal service companies operate water ports, load and offload ships, or assist civilian port operators. Watercraft companies move units, supplies, and equipment along intracoastal or inland waterways.

Asked to provide a JMC during Hurricane Andrew, the US Army Transportation Center deployed a JMC nucleus to the JTF headquarters. With augmentation, the JMC succeeded in providing a combination of air, land, and sea transportation to DOD forces, disaster victims, and relief workers.

DEPLOYMENT

Deployment to the area of operations will normally be under the centralized control of the US Transportation Command (USTRANSCOM) and will often be conducted under crisis action procedures. Units will deploy according to port-call instructions using

military and commercial transportation. Deploying units or teams follow existing policies, procedures, and regulations. When deployment control is not centralized under USTRANSCOM, the servicing installation arranges transportation to final destination.

CONVOYS

Military convoys are coordinated between the deploying unit's installation and the defense movement coordinators (DMCs) in states where the convoys originate. The DMC coordinates military movements with his state transportation, civil defense, and law enforcement officials. During domestic support operations, the DMC should provide liaison to the senior movement control organization in the joint force.

REDEPLOYMENT

Redeployment will be centrally controlled to provide for orderly movement out of the area in compliance with approved termination standards. The deployed force must be prepared to redeploy on commercial transportation since redeployment normally carries a lower priority for military lift than does deployment. The servicing installation transportation office (ITO) in the area of operations will procure the commercial transportation, prepare and issue shipping documentation, and monitor carrier performance. If an ITO is unavailable to service the area, a joint transportation office (JTO) must be organized to provide this support.

AVIATION

Army aviation support to domestic operations includes air movement support of logistics and transportation operations; command and control support to federal, state, and local authorities; and reconnaissance and surveillance support of law enforcement operations. Active duty and National Guard aviation units provide support to civil authorities for counterdrug programs, civil disturbances, and border surveillance operations.

Unmanned aerial vehicles (UAVs) have tremendous potential in surveillance and reconnaissance operations of US border areas. Army aviation's inherent flexibility and responsiveness are ideally suited to support military and civil authorities.

Aviation support during disaster assistance operations will concentrate on air movement,

aeromedical evacuation, and command and control. Disasters may temporarily close ground lines of communication due to debris or higher priority traffic. Large metropolitan areas will experience traffic gridlock. Aviation units should include medium lift assets in the initial response to enhance distribution of critical personnel, supplies, and equipment over these obstacles. Early aerial reconnaissance of the disaster area by federal, state, and local authorities will help to assess relief priorities.

Aviation operations in a particular area will include various DOD aviation assets and many civilian and public aircraft. Coordination with the FAA and DOD representatives is imperative to delineate disaster area airspace procedures, management, and safety. Recent aviation operations in support of civil authorities point out the critical need to form airspace management cells and an aviation liaison cell within the first 24 hours.

Relationships among military services and the FAA air traffic services (ATS) must be succinctly addressed. The development of an aviation procedure guide (APG) will assist airspace management. These guidelines must extend to all prospective airspace users. Planners should provide guidance on flying civilians (law enforcement and government officials, Red Cross, news media, and non-DOD relief workers) and allocating critical aviation assets at the very beginning of the operation.

ENGINEER

Engineer assistance to civil authorities will vary with each type of operation. Engineers may become involved in these operations as individuals, teams, or complete units. Individuals may technically assist in assessing damage or estimating engineer work. They

Figure 4-5. Typical Joint Movement Center Organization

may provide specialized support such as power supply and distribution or utilities repair and reconstruction.

The USACE provides expertise through its engineer districts and divisions. Support can include damage survey and assessment teams, contracting support, and technical advice. The US Army Engineering and Housing Support Center (USAEHSC), a field operating agency of USACE, provides prime power teams and equipment. These power teams restore temporary electrical power to key locations. Planners must resolve funding issues with USACE early in the assistance process.

Army engineer units provide a wide variety of skills and capabilities, including limited construction, structure repair, clearing and hauling debris, limited temporary electrical and plumbing facilities, and construction of life support centers. Engineer units possess heavy construction equipment, exterior lighting capability, and generators for temporary electrical power. Soldiers in engineer units are skilled in a variety of tasks useful during the response to and the recovery from natural disasters.

MAPS AND CHARTS

In domestic support operations, map coverage is critical to provide a common frame of reference for all military and civil agencies. Paper maps, image-based substitute products, Geographic Information System (GIS) data bases, or a combination that provides total coverage is acceptable. Common maps and GIS data bases should be provided to all agencies and headquarters that are operationally involved. All controlling headquarters should operate from the same geographic frame of reference to coordinate support.

When locally produced products are available on a larger scale, they should be used. Maps or charts at a scale of 1:10,000 or 1:5,000 are extremely useful in assisting civil authorities. Products at these scales are better able to portray street names, local landmarks, and other commonly used reference points that are not usually portrayed on Defense Mapping Agency (DMA) or US Geological Survey (USGS) maps at smaller scales. Local planning agencies, realtor associations, travel agencies, or utility company records may be able

to provide such detailed map coverage. US Army topographic engineer units, federal mapping agencies, or local activities may be able to reproduce these products as required.

If map coverage does not exist over the area of operations, agencies can request image-based products, which can be produced in a relatively short time using unique imagery capabilities. US Army Engineer channels handle requests for such products.

INTELLIGENCE

The importance of timely, focused information cannot be overstated. Military intelligence offers a disciplined and trained cadre of specialists who can quickly collect, integrate, analyze, and disseminate information that decision makers need to respond immediately to a situation. The first step is to sensitize military planners and operators to crucial needs of civilian authorities. Concurrently, they must keep in mind the distinction between the employment of military intelligence assets outside the US and the application of legal guidelines within the US. The best use of intelligence capabilities is through the skills and techniques employed in the IPB and liaison with law enforcement agencies.

MILITARY POLICE

Military police have special expertise in counterdrug, terrorism, and civil disturbance operations. They are highly mobile and capable of providing search, rescue, and evacuation support; physical and area security; and traffic circulation control. Due to their decentralized operations and density of communications equipment, they are also valuable for notification and area damage control.

MILITARY HEALTH SERVICE SUPPORT

Commanders may use medical forces and resources in domestic support operations when directed by the NCA. They may provide medical personnel and resources to support interregional military medical plan (IRMMP) missions before any NCA allocation

decisions. Commanders may withdraw this support, which is temporary, to meet higher priority military missions if they occur. The health services' goal in disaster operations is to assist the local and state health services organization return to normal. Figure 4-6 depicts levels of effort.

Medical support can range from local domestic support to a full-scale regional disaster. Guidance for DOD medical support for domestic operations will normally be based on priorities established by the DHHS at both regional and national levels.

TASK-ORGANIZED MEDICAL TEAMS

When civilian authorities are unable to provide or are required to request medical support, the NCA can direct the deployment of medical teams. These task-organized teams will enter the affected area to assess the medical situation, determine treatment and evacuation requirements, establish treatment elements, and facilitate evacuation.

In situations where civil medical services are not available, for example in isolated areas, assistance includes, but is not limited to, personal hygiene, immunizations, chemical prophylaxis, pest management, nutritional programs, and epidemiological surveys. HSS encompasses several functional areas that call for immediate and sustained assessment of the public health status and local medical infrastructure.

KEY PLANNING GUIDANCE

After the initial response, a mission analysis is conducted so that the HSS response can be tailored to meet the needs of the community in both the short and long term. Domestic emergency experience has shown that the senior US Army medical commander must locate his headquarters near the FCO's offices. Coordination between these two organizations is essential to unity of effort. Both should also centralize the location of HSS specific supply items from multiple sources (private and government). A medical logistics unit can provide assistance to non-DOD federal and civilian agencies in dispensing materiel.

NATIONAL DISASTER MEDICAL SYSTEM

The NDMS was jointly developed by the DOD, the FEMA, the DHHS, and the VA to serve as a backup for the VA/DOD Contingency Hospital System for military casualties. NDMS is also the primary recipient of

casualties in the event of a catastrophic national disaster.

Depending upon the magnitude of the disaster, the local civilian hospitalization system and resources may become saturated, and NDMS may be activated. DHHS is responsible for ensuring sufficient available hospitalization capability. It considers a number of options to meet this requirement. First, the Army could deploy hospital resources such as a combat support hospital (CSH) or a mobile army surgical hospital (MASH) to the immediate disaster area. Second, the Army could coordinate the evacuation of patients to Army Medical Department Activities (MEDDACs) community hospitals or medical centers throughout the US. Third, Army medical units can use hospitalization resources from the other services.

During domestic national emergencies, the NDMS also depends on existing resources that will remain under the control of parent agencies. One of these is a nationwide network of more than 100,000 standby nonfederal acute care hospital beds. The NDMS depends on other in-place resources, including communication networks, transportation, and medical regulation systems to evacuate casualties to receiving hospitals. The national medical mutual aid response network provides patient clearing and staging services. It uses disaster medical assistance teams (DMATs), available military medical units, and supplementary medical supplies and equipment to carry out its functional support.

SYSTEM ACTIVATION

The system may be activated in two ways. In the event of a domestic disaster, the governor of the affected state may request federal assistance under the authority of The Disaster Relief Act of 1974. This may result in the activation of NDMS. A state health officer may request that the Secretary of Health and Human Services (HHS) activate the NDMS in situations where the President has not declared a disaster.

In a civil emergency, the principal interface will be through FEMA and HHS regional coordinators to the state disaster medical and health coordinator. If the system is activated, the lead agency will be the DHHS; in a national security emergency, the lead agency will be the DOD. Each agency will be responsible for managing its own resources in accordance with general policy.

PERSONNEL SERVICES

Personnel units and soldiers will primarily be used to support soldiers conducting the domestic support operation. While this personnel support is provided during any operation, a domestic support operation may require additional planning and preparation. For example, maintaining accurate strength accountability may be more demanding due to unusual tailoring of units to fit the particular mission. In addition, personnel soldiers may support military and family members who are victims or are otherwise affected by the operation.

Personnel units and soldiers may be brought into an operation to assist civil authorities in accomplishing their

mission using civilian agency systems. Assistance in personnel identification, classification, and accounting may be needed. Personnel soldiers may also assist in receiving and interviewing civilians to collect information and identify unique skills. They may account for casualties. Military personnel services units also assist civil personnel in recognizing outstanding contributions from members of the supported population. Assistance is provided to the US Postal Service if it is not able to conduct essential mail operations. Morale, welfare, and recreation services are provided in limited scope or as part of a force provider package.

Figure 4-6. Military Medical Relief Support

FINANCE

The finance mission is to sustain operations by providing timely commercial vendor and contractual payments, various pay and disbursing services, and all essential accounting. Organizational support is provided to organization units as required. It includes payment for local procurement of supplies and services, legal claims, and so forth. Finance units must provide accurate cost descriptions for initial input into the accounting system for all transactions.

Procurement support, the most critical finance mission, covers two areas. Contracting support involves the payment of commercial accounts for goods and services obtained through formal contracting procedures. Finance units can disburse currency and checks, which can alleviate shortages and delays in the procurement of various supplies and services. Commercial vendor services (CVS) meet immediate needs that cannot reasonably be met by normal logistics. Imprest fund cashiers, finance support teams (FST), and Class A agents may pay CVS in cash. Units must appoint Class A agent officers to make cash payments when they will be delayed.

The 312th Army reserve Band from Lawrence, Kansas, developed a counterdrug program for school kids. During their summer 1992 annual training (AT), band members designed a mixed program of music, dance, and testimonials that told the children, in terms they could understand, that drug use is wrong and leads nowhere. The band expanded its AT effort and now regularly visits local schools, playing for and talking to young students.

BAND

The Army also provides band support. Bands contribute effectively to commanders' community relations programs. Patriotic and popular music instill feelings of well-being and pride and provide respite from worries and problems. The band stationed nearest

the involved area should be the one tasked to support civil authorities with musical programs.

LEGAL

Judge advocates provide advice and assistance in the functional areas of the law, including administrative, contract, international, and operational law, as well as claims, legal assistance, and military justice. Historically during military operations, the duties of the judge advocate have concentrated on the military justice system. During support operations to US civilian authorities, this military justice mission may take a secondary role to the mission of providing advice on the laws dealing with military and civilian relationships. Questions concerning the scope and source of the commander's authority, liability of soldiers, and contingency contracting may come to the forefront. For example, after-action reports from Hurricane Andrew identified a greater need for judge advocate support for claims and contingency contracting.

CHAPLAINCY

When federal units are called in, a high probability exists that a significant amount of devastation and trauma will be associated with the emergency. Early deployment of unit ministry teams (UMTs), which consist of one chaplain and one chaplain's assistant, will put care givers on the scene to deal with trauma.

Particularly at risk are soldiers who are confronted with the emotional impact of the disaster as they arrive on the scene. The chaplain's key role is to provide spiritual care and perspective to enable the soldiers to deal with the situation as they find it.

Early deployment is particularly critical when civilian care givers, such as pastors and social workers, are themselves traumatized victims of the disaster. During the initial response phase, these people will be extremely limited in their ability to provide care. Although the UMTs may not provide direct care to affected people, they can identify those in need of care and refer them to those who can help. Through consultation with local civilian religious leaders, faith groups, and organizations, the senior chaplain of the response force will assess physical and spiritual needs and determine ways to meet both.

During the aftermath of Hurricane Andrew, UMTs provided religious support to military personnel who were providing food, water, shelter, and medical care

to civilian victims. They also talked with victims, distributed food, counseled children, picked up debris alongside other relief workers, and visited the elderly. As they met civilians in the affected area, UMTs provided religious support. They also coordinated with civilian clergy to provide religious services for civilians remaining in the life support centers. UMTs became key coordinators with local religious organizations.

PUBLIC AFFAIRS (PA)

Public affairs is a critical consideration in Army domestic support operations, where commanders must operate in an environment of complex information demands. Domestic support operations impart a lasting impression relative to the commitment of the civil-military teams. Ultimately, the impression of the assistance effort depends to a great extent on the media. The public's perception will also be influenced by the cooperation and coordination between commanders and civilian leaders and the efforts of the public affairs personnel.

Commanders must be prepared to operate in an environment of complex information demands.

The news media will have unrestricted access to domestic support operations. Army public affairs officers (PAOs) must operate under any constraints imposed by the government agency that has jurisdiction. The lead agency will have release authority. The Army must coordinate all PA activities with the lead agency and comply with public affairs guidance. Public affairs officers must establish an Army information bureau to work with the Joint Information Center (JIC).

The PAO advises the commander on the information demands that he can anticipate, the information strategies available, and the effect of the communication effort. It is sometimes necessary to create an *ad hoc* PA organization to support the operation. Regardless of how Army units provide PA support, it is critical that leaders involve their PA

personnel in planning and decision making.

Commanders should be prepared to provide timely and pertinent information to the media on developing issues and changing perceptions. They must be prepared to appear on camera, answer questions, and provide explanations in order to tell the story as completely, accurately, honestly, and openly as possible.

Commanders must also fill the information needs of their soldiers. Providing effective command information is a critical element in maintaining soldier morale and unit esprit. Soldiers need information about the environment in which they are operating. They need to know that their work is valid, moral, and supported by the American people.

SPECIAL OPERATIONS FORCES (SOF)

Army special operations forces are particularly suited to domestic support missions. They are trained and experienced in operating in austere environments. Many are cross-trained in various disciplines. Three types of SOF units are especially well-suited to domestic support missions: civil affairs (CA), psychological operations (PSYOP), and special forces (SF).

CIVIL AFFAIRS

CA units are specifically organized to use the civil sector functions and skills and to provide support to various levels of government in 20 specific functional areas. This working knowledge is especially useful in disasters. The units will tailor their capabilities to particular situations. CA units should be employed to advise the military commander on the impact of military activities on the civil sector. They assess damage to the civil infrastructure, assist in the operation of temporary shelters, and manage a civil-military operations center (CMOC). CA units may also serve as liaison between the military and the various civil organizations.

PSYCHOLOGICAL OPERATIONS

The rapid production and dissemination of accurate information to the population in crisis situations are important. This information may include safety and health messages, location of water or food distribution

points, and designation of restricted areas and temporary shelters. Since the normal civilian facilities may be disrupted, these units may have to employ alternative methods. Equipment assets of PSYOP units (portable printing presses, loudspeakers, and radio broadcasting stations) have often been needed in disaster operations. PSYOP personnel can provide a commander with real-time analysis of the perceptions and attitudes of the civilian population and the effectiveness of the information being disseminated.

SPECIAL FORCES

The SF team's organization, training, capability, and adaptability allow them to operate effectively in remote and urban areas isolated by disaster events. They may be able to provide detailed reports and assessments on conditions in the area. The teams are rapidly deployable, have excellent radio communications capabilities, and are suited to working with culturally dissimilar ethnic groups.

SIGNAL

Forces deployed in domestic support operations must carefully plan their communications packages. Communications objectives must be determined, responsibilities defined, and types of support identified. The level of information mission area (IMA) support required depends on the nature of the assigned mission. In all likelihood, a combination of military and commercial communications support will be required. A major concern for the signal planner will be the interface between military and commercial communications and information systems and networks.

If the commercial communication infrastructure is incapable of supporting civil and military communication requirements, the Army signal planner must coordinate with his civilian counterpart to determine what communication capabilities are required. This information is essential to tailoring the signal support package.

Most civil and military communications systems are incompatible for various reasons, for example, equipment, frequency allocation, and usage. Though possible, it is highly unlikely that either element will have sufficient assets on hand to equip both with compatible communications equipment. For these reasons, military and civil communication planners must exchange knowledgeable communication support personnel and compatible equipment to ensure connectivity is maintained between military and civilian operation centers. This exchange of personnel and equipment can occur at any level and should be implemented and modified as the situation dictates.

CHEMICAL CORPS

Army chemical units are trained and equipped to provide support in many technological accident or incident situations. Although the current focus is on chemical or nuclear accidents or incidents, the present technologies and doctrine allow for greater flexibility in responding to any mission associated with the FRP. Chemical units can support domestic support operations as individuals, teams, or units.

Chemical units can support domestic support operations as individuals, teams, or units.

The Army Technical Escort Unit (TEU), as a DOD executive agent, has the primary mission of responding to incidents that include hazardous and toxic substances. TEU and associated explosive ordnance disposal, security, and command and control elements routinely deploy to support the movement and demilitarization of toxic chemical munitions and substances. Nuclear accident/incident (NAI) and chemical accident/incident (CAI) during domestic support operations require coordinated efforts through

DOD, and with the DOE, EPA, and LEAs. DOD and FEMA have established joint policy for a coordinated response to a nuclear material accident. Army policy and the Federal Radiological Emergency Response Plan describe duties of these agencies and organizations.

A chemical battalion headquarters can provide command, control, and communications resources, as well as training support, for any technological and consultative operation involving nuclear, biological, and chemical (NBC) defense and operations. Chemical reconnaissance units are equipped to conduct surveys and determine the type and extent of toxic contamination with mobile spectral analysis. Chemical decontamination units can deploy with high-mobility vehicles allowing off-road employment of a wide range of equipment and capabilities. Both reconnaissance and decontamination unit capabilities allow for chemical and nuclear hazard surveying, detection, identification, monitoring, and personnel and equipment decontamination. Additional capabilities provide local security, vector control, and limited water transfer, spray, and storage, allowing a limited personnel shower and a firefighting capacity. Chemical smoke units also possess high-mobility capabilities as well as equipment for the employment of smoke and obscurants.

Technical support available to other agencies includes surveying radiological and hazardous material, monitoring, determining downwind contamination hazards, and assessing vulnerability and area damage as may be required for environmental missions or for disaster assistance operations. Training and consultation in NBC defense and operations, including the use of defoliants, the employment of riot control agents, and the construction and employment of flame field expedient devices, are also available for civil preparedness. Chemical units are capable of providing NBC defense training in law enforcement and counterdrug operations.

If chemical units deploy as self-sustaining entities, they are capable of at least 72 hours of operations without additional support. Follow-on support requires coordination for resupply of chemical defense equipment and material and life support. Military, federal, or contracted logistics support can provide the required resources.

SAFETY

Installation or unit safety professionals may be required to provide safety services to a community in support of assistance operations. Whereas military support is intended to provide aid and comfort, the potential for a catastrophic accident is greatly increased if equipment designed for combat is used for disaster assistance. If, due to expediency, soldiers are tasked to perform services in which they have little or no formal training, for example, civil disturbances, flood control, or firefighting, the result could be the loss of soldiers or military equipment and additional damage to the community the soldiers are trying to support. Army safety services must be focused toward both the Army unit providing the support and the civilian community receiving it.

The Army commander's primary responsibility is to accomplish the assigned mission and to provide for force protection. He accomplishes this through the systematic use of risk management techniques and the total integration of safety throughout all aspects of the operation. He must use the same philosophy and techniques to ensure that Army services provided to the civilian community are free of unnecessary risk. The safety (risk management) staff officer advises the commander and his staff on all applications of the risk management process and recommends how to integrate the safety function. He also maintains liaison with, and provides assistance to, other Army, joint, or combined elements as required or directed by the commander.

SUMMARY

Most domestic support operations are logistical in nature. Leaders and managers must understand the basic considerations and concerns necessary to accomplish those missions. Basic guidelines are to make a careful assessment of the mission, tailor the force for the mission, maintain accountability for resources expended, contract for support at the earliest opportunity, and transition support operations to local authorities as soon as possible. Force protection is a primary consideration and is implemented by identifying and eliminating unnecessary risks to the force and public.

CHAPTER 5

DISASTERS AND DOMESTIC EMERGENCIES

The American people have come to expect Army support during times of critical need. Combat readiness, combined with organizational mobility, permits the Army to respond rapidly to crisis situations. This chapter describes how the Army provides support to federal, state, and local civil authorities during disasters and domestic emergencies.

THE ROLE OF THE ARMY

The National Guard has primary responsibility for providing military assistance to its state.

A fundamental principle for employing military resources is recognizing that civil authorities have the primary authority and responsibility for disaster assistance. The National Guard, in state active duty status, has primary responsibility for providing military disaster assistance in its state. The Army, as part of DOD, plays a supporting role to lead civil agencies during domestic emergencies.

As the DOD executive agent, the Secretary of the Army—through his Army Staff agent, the Director of Military Support—has both the responsibility and the authority to task the services, defense agencies, and the CINCs to support other federal, state, or local agencies. The SA will coordinate the commitment of unified and specified command forces with the CJCS. The chain of command is depicted at Figure 5-1.

DISASTERS

A federal disaster is any event, either natural or man-made, whose severity or magnitude overwhelms the capabilities of local and state authorities to respond. Examples of natural disasters are hurricanes, earthquakes, floods, and fires. Hazardous chemical spills, radiological accidents, and massive electrical power disruptions are typical man-made disasters.

Each state has a plan and an Office of Emergency Services, or similar agency, that is responsible to the governor for coordinating its disaster response efforts. Local emergency organizations will be the first to provide disaster relief assistance; next are state organizations, including the state NG.

Prior to or immediately following a disaster, the state will activate an Emergency Operations Center to gather information, assess damage, and advise the governor. The state OES, through its EOC, coordinates the local and state disaster response operations. The state's adjutant general and NG also play key roles in disaster assistance.

**RESPONSE FOLLOWING
A PRESIDENTIAL DECLARATION**

When the severity of a situation exceeds local and state capabilities, the governor can request that the President declare a disaster, leading to the commitment of federal resources. At that time, the FEMA takes the lead in coordinating federal assistance. The FEMA coordinates the federal government's response to state

and local authorities for disasters and civil emergencies under the authority and provisions of The Robert T. Stafford Disaster Relief and Emergency Assistance Act. While the FEMA is the lead federal agency in most disasters, the DOE has the lead for civil radiological emergencies, and the EPA and the USCG share responsibility for chemical contaminations.

Regardless of the disaster scenario, DOD can expect to support the lead federal agency. The SA will issue an Execute Order, coordinated with the Chairman of the Joint Chiefs and the Joint Staff, through the DOMS to the appropriate CINCs, services, and agencies. The Execute Order will designate a supported CINC and specify the supporting CINCs, services, and agencies as well as the command relationships. The Army has designated CINCFOR as the DOD operating agent and the supported CINC for CONUS disaster assistance operations. CINCLANT and CINCPAC are operating agents and supported CINCs for US states, territories, and possessions within their respective areas of operations.

Figure 5-1. Chain of Command

The CINC will appoint a defense coordinating officer to coordinate all requests for military assistance.

After declaring an emergency or disaster, the President will appoint an FCO to manage the federal assistance efforts under provisions of the FRP. The FRP addresses disaster or emergency situations in which federal response assistance is needed under the authority of The Stafford Act. The plan describes basic

mechanisms and structures by which the federal government mobilizes resources and conducts activities to augment state and local response efforts. The defense coordinating officer, appointed by the supported CINC, serves as the principal DOD point of contact for military support. The decision sequence for disaster support is illustrated at Figure 5-2.

RESPONSE PRIOR TO A PRESIDENTIAL DECLARATION

Military commanders may act before a Presidential declaration when an immediate life-threatening situation develops. When a disaster or emergency is imminent and awaiting instructions from higher authority—military or civil—would preclude responding effectively, military commanders may act. They

Figure 5-2. Decision Sequence for Disaster Support

may do what is required to save lives, alleviate human suffering, and mitigate major property damage within the proximity of their installations.

Military commanders may act before a Presidential declaration when an immediate life-threatening situation develops.

Commanders may use immediate response authority to assist in the rescue, evacuation, and emergency treatment of casualties; to restore emergency medical capabilities; and to safeguard public health. They may also provide essential public services and utilities. This list is not inclusive. Commanders use their assessment of mission requirements and the capabilities of their commands to judge the extent of immediate assistance they choose to provide.

Immediate response is a short-term emergency supplement to government authorities. It does not supplant established Army plans for supporting civil authorities, nor does it take precedence over a primary mission. Commanders notify their senior commanders and seek guidance for continuing assistance whenever Army resources are committed under immediate response circumstances. Immediate assistance is given with the understanding that its costs will be reimbursed; however, it should not be delayed or denied when the requestor is unable to make a commitment to reimburse.

When the President determines federal assistance will be provided in response to a natural or man-made disaster, the military commander will continue to provide immediate response assistance. He will adjust operations to conform with the tasks assigned by his higher headquarters, within the FRP.

PREPARING FOR DISASTER ASSISTANCE SUPPORT

Commanders can best prepare for disaster assistance operations by understanding the appropriate laws, policies, and directives that govern the military in these emergencies. The military's role is well-defined and by law is limited in scope and duration. Military resources

temporarily support and augment—they do not replace—the local, state, and federal civilian agencies that have primary authority and responsibility for domestic disaster assistance.

The military does not stockpile resources solely for domestic disaster assistance. Disaster planning and coordination must occur between the appropriate agencies at the appropriate levels, for example, between DOMS and FEMA, between CINCs and CONUSA, between the federal, state, and regional agencies.

The Army's structure and training in command and control, deployability, and sustainment operations offer ready and robust capabilities for disaster assistance support. Those same skills that soldiers and leaders use day to day often translate to the types of tasks required during disasters.

Domestic disaster operations are normally conducted in stages: response, recovery, and restoration. The role of the military is most intense in the response stage, decreasing steadily as the operation moves into the recovery and restoration stages.

Response operations focus on those life-sustaining functions required by the population in the disaster area. Recovery operations begin the process of returning the community infrastructure and services (both municipal and commercial) to a status that satisfies the needs of the population. Restoration is a long-term process that returns the community to pre-disaster normalcy. While the military has an important role in the relief and recovery stages, restoration is primarily a civilian responsibility. Military forces will redeploy as operations transition from the response and recovery stage to the restoration stage. The overlap of military support and effort during the three stages is depicted in Figure 5-3.

Assessment

Assessment is a fundamental task for providing effective disaster assistance. The assessment process requires the integration and analysis of information from many different sources. This process is not exclusively a DOD responsibility. It is first and foremost a local and state agency task. Federal agencies, including DOD, assist and cooperate in the information-gathering and assessment process.

Laws limit the types and ways military agencies can gather information in domestic situations. Commanders must ensure that all requests for information, both

before and during a domestic emergency, comply with the applicable laws and are handled in the appropriate military channels.

Responsibility for assessments is shared by federal, state, local, and military agencies. When a disaster occurs the damage and the anticipated military support requirements must be assessed before resources are committed. This ensures that the committed resources and forces will be appropriate for the mission and that they will be used efficiently.

The earliest information needed for the assessment process is the impact on the population, available critical infrastructure facilities, and any serious environmental hazards. Because saving lives is an immediate priority within the first 72 hours, especially in US&R operations, collapsed or badly damaged buildings that may contain trapped people must be identified. Mobile home communities, if not evacuated prior to the disaster, are especially vulnerable and likely to contain injured people. The status of the road

and rail systems, airports, and seaports must be determined. Identifying major fires, hazardous chemical spills, ruptured petroleum and natural gas pipelines, and downed electrical power lines—especially in populated areas—is a priority. Also essential is determining the status of local emergency services; police, firefighters, and health service providers.

As the federal relief effort escalates, including the deployment and employment of federal military resources in the disaster area, critical relief facilities must be made operational and accessible. These facilities include municipal offices, hospitals, water treatment plants, ice manufacturing and storage plants, electrical power stations or lines, and telecommunications nodes. Sites for the emergency shelter, feeding, and medical treatment of displaced civilians must be identified and prepared. These life support centers will be required within the first few days after a disaster. Sites for the reception, storage, and distribution of supplies in the affected area must be identified.

Figure 5-3. Military Stages and Levels of Effort

Terminating Support

The military's role in disaster assistance must end as soon as practical. The ultimate task of the federal disaster response effort is to assist the local community in returning to a normal, predisaster status. Consequently, the military should expect to be heavily committed during the response phase of the operation, and progressively less during the recovery phase. As a principle, the military does not compete with civilian commercial enterprises. As a commercial enterprise becomes more available in the community, the military's provision of support and services can diminish.

The military's role in disaster assistance operations must be transferred to civilian organizations as soon as practical.

Disaster assistance operations require that end states or conditions be established to mark the completion of disaster assistance missions. Conditions must be definable and attainable. End states must be developed from the highest (national) perspective to the lowest county and municipal levels. They must provide a road map that can be followed by all government and nongovernment agencies involved. The affected population must know when military operations will cease and local support organizations are to continue the mission. Mission success will be tied directly to the military's ability to accomplish specific end-state objectives.

In conjunction with federal, state, and local officials, commanders at all levels must understand the desired community objectives or goals. They will affect the termination standards for the military as well as other federal agencies. The return to normalcy requires a progressive downsizing of the military's role.

Termination standards, which are established in coordination with the FCO and state and local

authorities, must be clearly stated and understood by all. They can usually be expressed in terms of percentage of predisaster capability by specific function, for example, 70 percent of electrical power restored. In an operation such as disaster assistance, redeployment of forces becomes a sensitive issue since it can create misperceptions and anxiety in the population with respect to sustained support needed and the ability of local government and contractors to handle the support as federal forces are withdrawn.

The criteria for mission success and completion must be defined, articulated, and disseminated as soon as possible. Civil authorities and Army personnel should know when the operation has reached completion or when Army assets will be withdrawn. It is important to understand that the mission may not be fully complete from the civilian authorities' perspective. Army support may have to be replaced by civilian assets and local support organizations, which will continue the restoration mission. Mission success should be directly proportional to the military's ability to accomplish specific milestones. Planners need to identify these milestones in their functional areas and use them, when accomplished, to reduce further military support requirements. These norms should be coordinated and validated for each of the possible missions, operations, and activities.

THE FEDERAL RESPONSE PLAN

The Army and the DOD most often provide disaster assistance to other agencies in accordance with the FRP. This plan describes how the federal government responds to a declared disaster. When the plan is fully implemented, DOD and 26 other federal agencies provide support. The FRP groups disaster assistance into 12 functional areas called emergency support functions. During disaster response operations, some or all of these ESFs may be activated. The FRP assigns responsibility for each of the ESFs to a lead agency based on that agency's authority or capability. Each ESF will also have assigned supporting agencies. DOD has been designated the lead federal agency for ESF 3, Public Works and Engineering, and ESF 9, Urban Search and Rescue; a supporting agency in the remaining ten. Consequently, the Army may have resources committed in all 12 ESFs. The FRP emergency support assignment matrix is at Figure 5-4.

LEGEND

P – Primary agency responsible for management of the ESF.
S – Support agency responsible for supporting the primary agency.

ESF – Emergency support function.
ORG – Organization.

Figure 5-4. Emergency Support Assignment Matrix

Public Works and Engineering

Public works and engineering support includes technical advice and evaluations, engineering services, potable water, construction management and inspection, emergency contracting, emergency repair of waste water and solid waste facilities, and real estate support. Activities within the scope of this ESF include emergency clearance of debris, temporary construction of emergency access routes, emergency restoration of critical public services and facilities, emergency demolition or stabilization of damaged structures and facilities, technical assistance and damage assessment, and support to other ESFs. The USACE is DOD's operating agent for planning, preparedness, and response operations for this ESF.

Urban Search and Rescue

US&R activities include locating, extricating, and providing for the immediate medical treatment of victims trapped in collapsed structures. Designated operating agents for US&R in their respective areas of operation are the CINCFOR, the CINCLANT, and the CINCPAC. The DOMS will designate the appropriate operating agent as supported CINC.

The supported CINC will coordinate federal US&R operations and employ one or more task forces to conduct "light" (wood frame-type structures) US&R. The supported CINC will also manage military support for civilian US&R task forces. FEMA-sponsored teams provide the necessary expertise and equipment for "heavy" (masonry/concrete and steel, multistory structures) US&R. The USACE has structural specialists trained to assist in US&R. Transportation, medical, billeting, and maintenance are the types of support that civilian US&R teams may require.

Support to Other ESFs

DOD support to other ESFs may come from one of two sources. First, when the primary agency for an ESF determines that it requires support or resources from outside its own agency, that agency may coordinate its requirements with the FEMA through its regional and national headquarters. The FEMA will then determine how to provide the required support or resources from any nationwide source. DOD, a designated supporting agency, may be tasked. Second, an FCO may task DOD to provide the required support or resources from military assets already within the disaster area or available through DOD channels. The FCO gets this

support through coordination with the defense coordinating officer.

RESPONSIBILITIES

FEDERAL COORDINATING OFFICER

An affected state or area will receive federal assistance through the management of FEMA and the overall coordination of an FCO, usually the FEMA regional director. The FCO is the on-scene commander for all federal resources supporting local and state authorities in the assistance effort.

DEFENSE COORDINATING OFFICER

In the field, the DCO, appointed by the supported CINC, is the central point of contact to the FCO and ESF managers for all requests for military support. At the discretion of the CINC, the DCO may assume control of all federal military units involved in a disaster. The DCO's expertise and constant liaison with the FCO, local officials, and other ESF managers are critical to the effective coordination and integration of the federal and state disaster assistance efforts. Traditionally, CINCFOR has tasked the CONUSAs to plan for disasters and domestic emergencies and to appoint DCOs following a disaster declaration. The DCO supervises the DCE, a staff that can support both the administrative and the ESF functional areas for all coordination and decisions.

STATE COORDINATING OFFICER (SCO)

As the governor's representative, the SCO is responsible for emergency management, disaster response, and recovery activities. The SCO is the primary point of contact for the FCO in facilitating disaster assistance. The STARC has developed disaster emergency plans in coordination with other state and local agencies. The STARC and the DCO will establish liaison so that local, state, and federal activities can be coordinated and managed effectively. The STARC can assist the federal forces with contracting support as well as logistical support from Guard resources not otherwise committed.

JOINT TASK FORCE (JTF)

Military support to civil authorities in disasters and domestic emergencies is a DOD, not a service component responsibility. The supported CINC may decide that the severity and scope of a disaster require a joint

response. In disaster assistance, as in operational level warfighting, the CINC uses the different and complementary capabilities of each service to accomplish the mission. Such use requires knowledge of both the capability and the availability of all service component assets, to include their agencies and installations.

The CINC may establish a joint task force to provide comprehensive military support.

Establishing a JTF may provide the best DOD response in a disaster. The DOD's response to Hurricanes Andrew and Iniki in 1992 demonstrated that a JTF is effective in providing the comprehensive support needed in most catastrophic situations. A JTF is established to execute a specific mission limited in scope and duration. The JTF's objective in a disaster is to deploy forces to the disaster area rapidly, to assist immediately in saving lives and safeguarding property, and to continue providing assistance required by the FRP and the particular situation.

The CINC has the authority to determine the command relationship between the DCO and JTF commander. The DCO serves as the DOD's central point of contact for all requests from the FCO and ESF managers for military support. If the size of the JTF expands and the CINC decides to designate another, more senior officer as the JTF commander, the DCO becomes a special staff officer for the JTF commander.

The JTF is configured for each specific mission. In disasters, the JTF may require a greater proportion of combat service-support-type units and capabilities than in typical warfighting deployments. The JTF must be able to provide emergency assistance across all lines of support. All classes of supply and all types of services may be required. Because DOD has a supporting responsibility in all ESFs, close cooperation between the JTF and all other ESF agencies is required through the FCO, DCO, and state emergency structure. Command relationships between these authorities and organizations are illustrated at Figure 5-5.

When Typhoon Omar struck the American territory of Guam in August 1992, the CINCPAC appointed the Commander, Naval Forces Marianas (COMNAVMAR), as the DCO and the JTF commander. In response to Hawaii's Hurricane Iniki less than one month later, the CINCPAC appointed the Commander, US Army, Pacific (USARPAC), as Commander, JTF Hawaii and the DCO.

The military has been involved in such diverse disaster relief activities as the preparation and distribution of food, removal of debris and garbage, restoration of electrical power and water systems, management of donated goods and services, and establishment of life support centers that provide shelter, security, medical care, counseling, bath and laundry, and recreation activities. The JTF commander may establish joint cells to manage specific functional or technical areas, such as a joint movement center.

DOMESTIC EMERGENCIES

CIVIL DEFENSE EMERGENCIES

Civil defense emergencies result from the devastation following an enemy attack, although they may be proclaimed by appropriate authority in anticipation of an enemy attack. Specific plans and orders at the appropriate command levels provide general guidance for responding to an enemy attack. Local Army commanders are authorized to respond to civil defense emergencies under immediate response and to deal with immediate emergency conditions that would be created by such attacks or disasters.

In the event of an attack on the US, the scope of military support to the civil authorities in each affected area would depend on the requirements of military operations, the extent of damage sustained in the civilian community, and the status and reconstitution priorities of the active and reserve component forces. The Army National Guard STARC, when ordered to federal service, will become the DOD's focal point for providing military assistance at the state and local

levels. CONUSA commanders must coordinate the response to these civil emergencies with the STARCs.

ENVIRONMENTAL DISASTERS

DOD may be called on to support other federal agencies during major environmental disasters. For example, the DOE has responsibility for civil radiological emergencies and the EPA and USCG

share responsibility for chemical contamination accidents, such as major oil spills. The FEMA may also be involved in a complementary role, managing federal relief operations associated with a disaster. Regardless of the disaster scenario, the Army and DOD should expect to provide military support appropriate to the nature of the disaster and the needs of the people affected.

Figure 5-5. Command Relationships

MASS IMMIGRATION EMERGENCY SUPPORT OPERATIONS

The DOD may be called on to provide support to the DOJ and its INS. The DOJ is the lead federal agency; INS is its action agency. In the event of an immigration emergency, the SA is the DOD executive agent, DOMS the action agent. The DOD may be tasked to assist in the reception, processing, transportation, and detention of the immigrants. DOD installations and facilities may be required to house immigrants for extended periods of time. These installations may have to provide a full range of services, either by DOD or by contracted agencies. Even on DOD installations and facilities, however, the DOJ and INS have the primary responsibility for the legal processing, custody, and eventual deportation or resettlement of the immigrants.

During Operation Provide Refuge in February 1993, a task force from the 25th Infantry Division provided security and humanitarian assistance to 535 Chinese nationals who attempted to illegally enter the United States. The Chinese were fed, clothed, and housed in a US facility on Kwajalein Atoll, Republic of the Marshall Islands, until the People's Republic of China agreed to their repatriation.

OTHER DIRECTED MISSIONS

The DOD receives many diverse missions requiring military assistance to civil authorities. They include planning to use DOD personnel in the event of a large disruption to US mail service and air traffic control assistance in the event of a federal air traffic controller strike. The type and level of military support will be as diverse as the missions. The general concepts, principles, and guidelines for disasters, emergencies, and other assistance operations may be useful to Army commanders located OCONUS, but are subject to applicable CINC guidelines and host nation laws and agreements.

Guardsman in Alabama, Georgia, Kansas, Kentucky, Maine, New York, North Carolina, Ohio, South Carolina, Virginia, and Wisconsin were called up in Operation Haylift to deliver relief to farmers throughout the southeast during the drought of 1987.

SUMMARY

The Army and the Department of Defense provide military support to civil authorities, especially in disaster assistance operations. DOD is a supporting agency, providing military support to other lead federal agencies. The SA is DOD's executive agent, and the DOMS is the SA's agent for disaster assistance support. In most cases, the Army will participate in disaster assistance operations as part of a DOD effort managed by the DOMS serving as a joint staff and commanded by a supported CINC. The Army is committed to providing timely and effective disaster assistance support to other federal agencies and the American people.

CHAPTER 6

ENVIRONMENTAL MISSIONS

The Army has developed and fielded an integrated environmental program that employs a variety of resources to assist US civil authorities in environmental activities. The Army's environmental strategy rests on the pillars of compliance, restoration, prevention, and conservation. The pillars rest on a bedrock of shared national values that support the essential foundation of people, resources, communication, and organization. They also support the vision and ethic of environmental stewardship that underlies the Army program. Figure 6-1 depicts this strategy.

PLANNING AND EXECUTION

The ethic of environmental stewardship underlies the Army's environmental strategy.

If consistent with the unit's mission, commanders can allocate people and resources for the planning, technical assistance, oversight, and execution of environmental assistance missions.

- Planning focuses on environmental resource management and contingencies for incidents that adversely affect human health or the environment. It includes preassistance efforts such as developing local agreements and memorandums of understanding and integrating mutually supporting plans.
- Technical assistance covers a broad array of activities. The Army can help develop off-the-shelf plans and scopes of work, conduct on-site assessments, provide procurement advice, and augment local staffs with technical personnel.
- Oversight focuses on support roles such as administering contracts and providing staff support for operations.

- Execution employs US Army manpower and equipment to perform a mission.

A CH-54 "Skycrane" from Company D, 113th Aviation Battalion, Nevada National Guard, carried a slingload of construction materials from Mount Rushmore. The material had been on the mountain since 1941. The 113th removed the materials during Golden Coyote '92 in the Black Hills of South Dakota.

CHARACTERISTICS

Environmental support missions are characterized by the time required to accomplish them:

- Short-term or immediate-response missions require 30 days or less. They include oil and hazardous materials spills, removal of materials that contain military specific chemicals, and support in fighting wildland fires.
- Mid-term missions require 30 to 180 days. They include environmental compliance-related matters and responses requiring longer-term assistance.
- Long-term missions require more than 180 days. They include remediation or research and development support that requires contracted effort.

Figure 6-1. Pillars of Army Environmental Strategy

CLASSIFICATIONS

The Army classifies environmental support as compliance, restoration, prevention, and conservation. These four classifications correspond to the pillars of the Army environmental strategy, which provide direction for attaining and sustaining environmental resources stewardship.

COMPLIANCE

As an environmental leader, the Army works with regulators and citizens' groups, a cooperative approach that is necessary for successful relations with the local community and other government agencies. Army assistance responds to immediate needs or is provided as a general service.

Response includes support to correct oil and hazardous material spills under the National Contingency Plan (NCP) and control of chemical incidents. General services include support to improve compliance with environmental laws and regulations. The primary compliance missions are listed in Figure 6-2.

Figure 6-2. Compliance Missions

OIL AND HAZARDOUS MATERIAL SPILLS

Oil and hazardous material spills are common occurrences. Any release of a reportable quantity of oil or hazardous material requires an immediate response. Larger-scale, catastrophic releases may occur as a result of man-made or natural disasters. Under the NCP for response to oil and hazardous material spills, the Army provides representatives to the national response team and the 10 regional response teams for both planning and response.

On 5 January 1993, potentially volatile World War I-era liquid-filled munitions were unearthed in a residential area of Washington, DC. The location had been a chemical research site between 1917 and 1919. With support from the 101st Chemical Company, Fort Bragg, NC, the Army Environmental Hygiene Agency, the Army Armament, Munitions, and Chemical Command, the Corps of Engineers, and other local, state, and federal agencies, the cleanup began. By the last day of excavation, a total of 141 munitions had been safely unearthed.

The director of military support coordinates Army response for large-scale spills based on requests from the EPA/USCG on-scene coordinator (OSC). Small-scale releases are more common. The Army can respond directly to small-scale releases when the spill is beyond the capability of civilian response assets or the Army has jurisdiction over the spill area.

The Army can respond to oil and hazardous material spills under

established procedures.

An installation commander may assist in identifying, surveying, containing, and cleaning up small-scale releases of oil and hazardous materials. The commander’s installation spill response group typically consists of trained personnel from the fire department or environmental staff. When the Army employs chemical units, it does so under the Nuclear and Chemical Accident and Incident Response and Assistance (NAIRA and CAIRA) Program.

Under the NAIRA and CAIRA Program, the Army can provide an immediate or planned response to a crisis or situation involving radiological or hazardous materials. Nuclear or chemical accident or incident control (NAIC/CAIC) emergency response elements organized as an initial response force (IRF) can respond immediately to the spill site to save lives, preserve health and safety, and prevent further damage to the environment.

If further action is needed, the service response force (SRF), a DA-level emergency response force, will deploy to the site. The SRF continues response operations, provides command and control of all military forces, and coordinates the activities of federal, state, and local response agencies. The Army SRF commander, executing the role of the federal OSC, executes coordinating duties per Army policy and the NCP.

PERMIT APPLICATIONS AND PLANS

Some government facilities may not be sufficiently staffed to address all applicable compliance requirements. Army personnel can assist these facilities in successfully completing and submitting applications and plans for permits. Depending on the size and mission of the environmental staff, a local commander can support short-term local missions. The USACE can best handle more extensive efforts on a cost-reimbursable basis. Typical compliance support projects include:

- Preparing Resource Conservation and Recovery Act (RCRA) Part B permit applications, closure plans, waste analysis plans, and underground storage tank site assessments.
- Preparing spill prevention, control, and countermeasures and spill contingency plans.
- Preparing National Pollutant Discharge Elimination System (NPDES) permit applications.

- Preparing air quality permit applications.

ENVIRONMENTAL COMPLIANCE ASSESSMENTS (AUDITS)

The Army can assist other government facilities in attaining and sustaining compliance with environmental laws and regulations. USACE districts provide comprehensive environmental compliance assessments that identify deficiencies and requirements for corrective action.

The Army developed the Geographic Resource Analysis Support System (GRASS) that allows Army environmental and land managers to analyze, store, update, model, and display data quickly and easily. Analysis and display can be created for an entire geographic region. More than 100 Army installations, the National Park Service, and the Soil Conservation Service are currently using GRASS.

RESEARCH AND DEVELOPMENT

The Army emphasizes joint technology development and use with the EPA, the DOI, and other government agencies. This transfer of information improves compliance throughout the nation. The Army conducts an extensive environmental research and development program that focuses on developing methods and equipment to meet the growing compliance requirements of new laws and regulations. The Army has developed technical products independently and transferred them to other government agencies. The Army has also developed them jointly with other federal agencies. Within the Army, most environmental research and development occurs through the USAEC and USACE laboratories.

WETLANDS

The USACE administers the National Wetlands Protection Program for the federal government. In this capacity, the Army serves as a regulator and oversees the

restoration and mitigation of wetlands within the US.

In Illinois, an Army National Guard engineer battalion detonated 5600 pounds of explosives as part of its training and built a home for ducks at the same time. The explosions were intentionally set off near a lake to create a series of duck ponds.

RESTORATION

Environmental restoration missions include correcting contamination problems resulting from past operations. Environmental investigations and remediation conducted by the Army mitigate adverse impacts to human health and the environment. Restoration efforts maximize the amount of property available for reuse and redevelopment.

Restoration missions fall into three categories: facility restoration, real property transfers, and general support. The USAEC and USACE can provide assistance in these areas. The USACE can provide longer-term assistance on a cost-reimbursable basis, while USAEC may provide short-term assistance. The primary restoration missions are depicted in Figure 6-3.

The Army conducts environmental investigations and remediation to protect human health and the

Figure 6-3. Restoration Missions

environment.

FACILITY RESTORATION

The Army has extensive expertise in investigating and restoring sites under their control. In the Installation Restoration Program (IRP), the Army investigates sources of contamination, extent of contamination, exposure pathways to potentially impacted people and ecosystems, and potential health and ecological risks. Activities routinely conducted at Army sites include:

- Assessing current site conditions, identifying past operations contributing to current site contamination, and determining whether further investigations are needed.
- Developing and implementing public involvement and public relations programs.
- Characterizing the nature and extent of contamination at suspected sites.
- Quantifying the risk to human health and the environment from contaminated sites and

- determining appropriate cleanup levels.
- Developing and evaluating alternatives for site remediation.
- Designing and implementing appropriate cleanup actions.

On request, USACE provides technical support to other federal agencies in the Work-for-Others Program. In this program, the other federal agency retains control and responsibility for the action but uses the technical capabilities of the Corps to accomplish the task.

REAL PROPERTY TRANSFERS

The storage, release, and disposal of hazardous materials and wastes directly affect the transfer of real property. The Army has gained considerable experience in mitigating these issues for unexploded ordnance (UXO), lead base paints, radon, asbestos, and polychlorinated biphenyls (PCBs). The Army assists local committees in developing reuse options that fully consider all appropriate environmental issues, identifying clean parcels, and remediating contaminated parcels. The Army can provide this support in any real estate transfer that other government agencies may consider.

GENERAL SUPPORT

The Army supports both state and federal agencies through specifically negotiated agreements. It provides direct support to the EPA in implementing The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980. The Army supports state regulatory agencies through the Defense and State Memorandum of Agreement/Cooperative Agreement (DSMOA/CA) Program. It conducts cooperative efforts in developing innovative technologies with other government agencies.

EPA Support

The Army has entered into an interagency agreement with the EPA to provide assistance in executing CERCLA, also known as the Superfund. Under this agreement, USACE serves as the program manager for execution activities assigned by EPA. These assignments include—

- Providing technical assistance during the EPA's remedial investigations feasibility studies.
- Acting as the contracting officer for federal lead remedial design and remedial action activities.
- Providing technical assistance during the EPA's

enforcement activities.

- Providing technical assistance and oversight of the EPA's alternative remedial contracting strategy (ARCS) contractors.
- Assisting in real estate and other support activities.

Defense and State Memorandum of Agreement/Cooperative Agreement Program

The DSMOA/CA Program was established to facilitate state and US territory involvement in cleanup activities conducted under the Defense Environmental Restoration Program. DSMOAs/CAs provide a mechanism to involve states in installation restoration activities by establishing the terms and conditions by which they are reimbursed for the cost of providing technical support.

Research and Development

As a part of its environmental research and development program, the Army pursues cost-effective restoration technologies that can be transferred to any user. The US Army Environmental Center can provide consultations in such areas as analytical chemistry and industrial hygiene. The USAEC and USACE laboratories can provide assistance in applying technology.

The Army demonstrated an innovative idea for recovering heat lost at boiler plants at the Louisiana Army Ammunition Plant. The teflon-covered heat exchangers will pay back the investment in 5.2 years. This process saved the plant \$13,000 in FY 88 and has potential for widespread application in military and civilian boiler plants.

PREVENTION

Prevention assistance missions focus primarily on participating in pollution prevention programs with other agencies. The Army also shares information and technologies that reduce the discharge of pollutants into the environment. Pollution prevention is an ethic that must be learned at all levels of an organization. As a result of implementing its own pollution prevention

program, the Army has gained considerable experience from recycling solid waste to manufacturing process changes.

The Army has gained valuable experience in preventing pollution.

Installation commanders can help local communities develop community recycling programs and support them. The local commander can work with local, county, or regional solid waste management organizations to integrate recycling efforts. Possible prevention missions are shown in Figure 6-4.

Figure 6-4. Prevention Missions

Pollution prevention is another driving force in the Army's environmental research and development program. Its efforts focus on changing or replacing existing processes to reduce and ultimately stop pollutant discharges. Examples of these technical innovations are the new generation of metal-plating procedures and advances in solid waste recycling.

Once again, the Army may develop these technologies in concert with other government agencies or alone, then share their findings with other agencies.

CONSERVATION

Conservation assistance missions address the preservation and protection of America's natural and cultural resources for future generations. The Army works to conserve and protect natural and cultural resources on a daily basis. Typical Army conservation missions are listed at Figure 6-5.

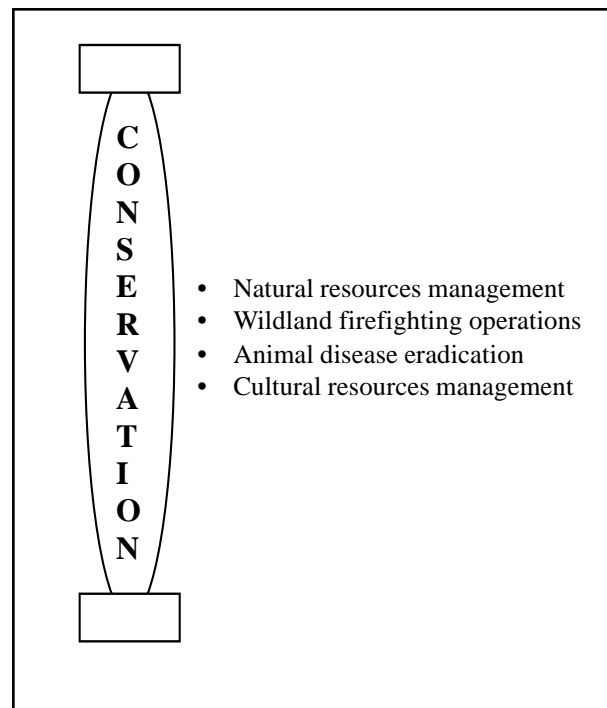

Figure 6-5. Conservation Missions

NATURAL RESOURCES MANAGEMENT

With vast acreages, the Army conducts intensive military training while providing many sanctuaries for a wide variety of plants and animals. In so doing, the Army has gained experience in the proper care, repair, restoration, and management of these resources.

The Army often works with state and federal agencies in managing soils, vegetation, fish, wildlife, and water resources. The Army and the public both benefit from this cooperative effort because the

protection of natural resources enhances the mission and preserves the environment for all.

The Army has vast experience in advanced land management techniques.

Approximately 300 breeding pairs of the red Cockade woodpecker and other endangered bird species were on Fort Bragg, NC. To save them, the Army closed off areas to vehicles, marked bird colony nesting boundaries, taught soldiers to recognize and observe training restrictions, built beams to absorb rifle fire on ranges, and set up artificial nests to attract more birds.

WILDLAND FIREFIGHTING

The Army may provide manpower and equipment to assist the NIFC in suppressing wildland fires. Initially, the NIFC contacts DOMS and requests military assistance. The DOMS tasks the appropriate CINC to appoint a DCO to confirm military support requirements. Once the DCO is appointed, the NIFC passes all resource requests to him. The Army may provide aviation, engineer, and communications support in addition to firefighters. The federal land manager trains soldiers before they are employed to fight fires. The NIFC provides the needed firefighting equipment and reimburses DOD from either the USDA or the USDOJ. The wildland firefighting tasking and resourcing channels are depicted at Figure 6-6.

ANIMAL DISEASE ERADICATION

In the event of an emergency arising from an actual or imminent outbreak of a foreign plant or animal disease, the DOD provides assistance to the USDA's

Administrator for Animal and Plant Health Inspection Service (APHIS). The Secretary of the Army, as DOD's executive agent, designates the Commander-in-Chief, Forces Command, as the operating agent supported CINC for DOD support to the USDA.

CINCFOR, as directed by the director of military support, provides personnel, equipment, supplies, and services to support the Regional Emergency Animal Disease Eradication Organization (READEO) task force. The READEO is the USDA organization responsible for completing all containment and eradication missions.

Included in CINCFOR's support is designating the base support installations (BSIs); tasking supporting CINCs, services, and agencies; developing contingency plans; and participating in exercises. Upon direction of CINCFOR, the BSI commanders provide personnel and logistics to the task force. USDA reimburses DOD for actual costs, less pay and allowances.

The BSIs may be outside FORSCOM and the Army. Resources provided by the BSIs can include technically qualified personnel to assist the USDA; the LSO; minimum essential TOE, TDA, and individual equipment; and procurement support.

The two key liaison officers are the veterinary support officer (VSO) and the LSO. The VSO, who is designated by Health Services Command, serves as the military point of contact with the READEO task force for veterinary support requirements. The LSO coordinates with the READEO task force director and determines the personnel, administrative, and logistical support requirements in the area of operations. The LSO provides the support requirements to the BSI and oversees the employment of DOD personnel and equipment. Figure 6-7 depicts command relationships for animal disease eradication operations.

CULTURAL RESOURCES MANAGEMENT

The Army works to preserve cultural resources for present and future generations. The Army may provide experts in the field of historic preservation from the USAEC, USACE, and the local installations. Many communities are involved or are interested in preservation of historic buildings and similar properties but may lack expertise. This is especially true in many rural areas.

Installations or other Army activities may provide some assistance to local communities at no charge. Army experts may assist in developing local historic

preservation committees and ordinances, identifying historic properties, and providing technical advice on the proper treatment of historic properties. For more involved projects, USACE districts and laboratories can provide assistance on a cost-reimbursable basis.

ARMY RESOURCES

Upon request, the Army can provide national-level resources for state and local environmental problems.

The Army offers a breadth of experience and the ability to provide solutions from regions throughout the United States to local environmental managers.

DEPARTMENT OF THE ARMY

At the DA level, the Director of Environmental Programs is responsible for policy guidance and program oversight. His primary source of technical expertise is the US Army Environmental Center, a field operating agency of the DA staff.

Figure 6-6. Wildland Firefighting and Resourcing Channels

TECHNICAL SUPPORT ORGANIZATIONS

A network of Army organizations provides a wide variety of technical support to installations. These organizations include the MACOM staffs; the USACE laboratories, districts, and divisions; and field operating agencies (FOAs) such as the US Army Environmental Hygiene Agency and the US Army Engineering and Housing Support Center.

MACOM staffs can execute many environment-related missions. The USACE organizations can provide specific technical services and contracting capabilities on a cost-reimbursable basis. Army FOAs

can provide technical experts in environmental engineering or science.

INSTALLATIONS AND STATE AREA COMMANDS

At this level, commanders can commit manpower and equipment to assist civil authorities in protecting, restoring, and preserving the environment. Environmental professionals at installations and STARCs focus on daily operations. These staffs are generally small. They concentrate on managing environmental resources and meeting regulatory requirements imposed

Figure 6-7. Animal Disease Eradication Command Relationships

by federal, state, and local regulations. In addition to addressing daily requirements, they develop contingency plans for potential hazardous material spills or similar incidents or accidents. The various internal Army environmental agencies and their relationships are shown in Figure 6-8.

COMMANDERS

Commanders tailor forces to meet specific environmental support time requirements. Commanders may augment their forces with other related environmental professionals, including attorneys, public affairs specialists, safety specialists, and others who understand

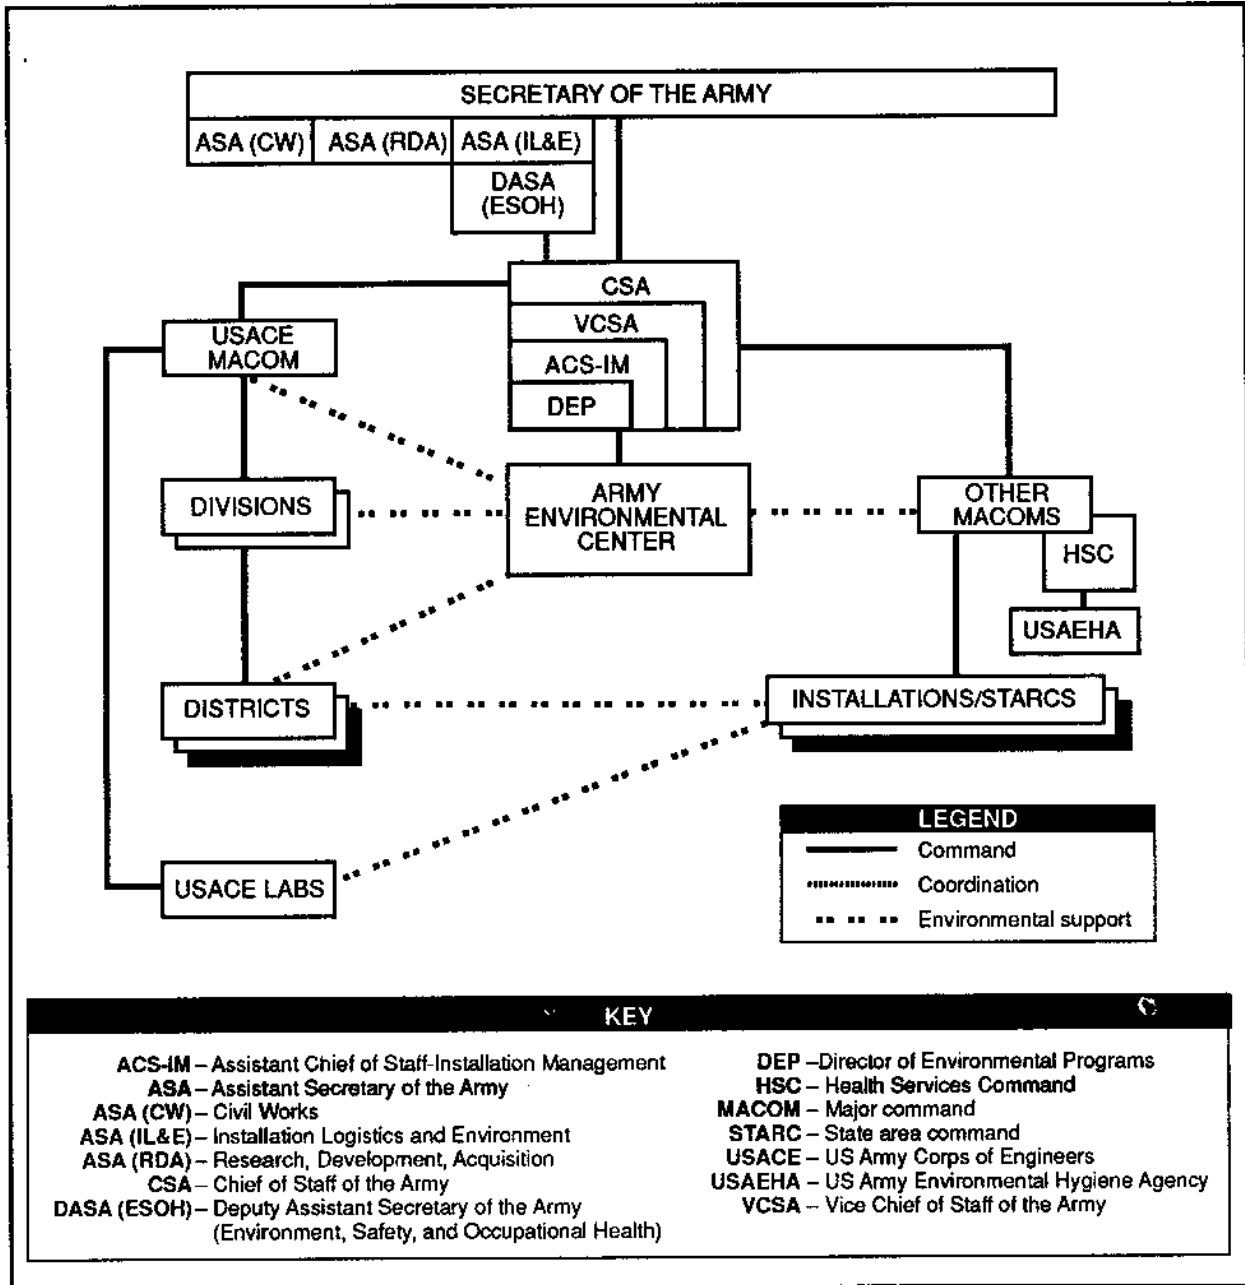

Figure 6-8. Internal Army Environmental Support Relationships

and work daily with environmental issues. Short-, mid- and the long-term missions on the local and regional levels

and the recommended organizations that may provide assistance are shown in Figure 6-9.

Figure 6-9. Recommended Actions for Commanders Providing Environment Assistance to US Civilian Authorities

SUMMARY

The Army may support or coordinate with many federal, state, and local governmental departments and agencies as it conducts domestic support operations. Although the Army is seldom the lead agency in disaster assistance operations, it is a support agency for all the FRP's emergency support functions. Almost all Army domestic support operations will be conducted in a joint or interagency environment. Throughout our history, the Army has provided community support at the national level and support to its surrounding communities. The Army also has a long history of providing domestic support and will continue to provide that assistance in the future.

CHAPTER 7

MISSIONS IN SUPPORT OF LAW ENFORCEMENT

Army forces may conduct missions in direct support of US federal, state, or local law enforcement agencies. Counterdrug, civil disturbance, and terrorism operations are missions that typically require such support. This chapter addresses the tasks necessary to plan for and provide this support.

COUNTERDRUG OPERATIONS

Army support to the counterdrug effort requires the sustained commitment of trained and equipped soldiers.

Directives from the President, Congress, and the DOD have resulted in an expanded role for military forces in attacking illegal drugs in every phase of their flow: at the source, in transit, and in the US.

While this manual focuses on Army domestic counterdrug support and operations, a major portion of the DOD and Army counterdrug effort is conducted OCONUS, particularly in Central America and South

America under the supervision of the CINC US Southern Command (USSOUTHCOM). The Department of State has primary oversight responsibilities for all support provided OCONUS. The CONUS Drug Law Enforcement System is depicted at Figure 7-1.

ROLES

Military support to the national counterdrug effort requires sustained deployment of appropriately trained and equipped members of the armed forces. The effort also requires continuing cooperation and coordination among the military and federal, state, and local drug law enforcement agencies (DLEAs).

The DOD counterdrug support organization that receives and validates requests from LEAs and considers the actual resources to support those requests is illustrated at Figure 7-2.

The Army's counterdrug support program includes operational support provided by active and reserve component forces and nonoperational support such as

Figure 7-1. CONUS Drug Law Enforcement System

the provision (loan or transfer) of military equipment and facilities and training in formal schools.

The Army also plans and executes programs to reduce demand for illegal drugs. The Army executes its counterdrug missions with the same dedication, skill, and professionalism that it applies to all national security missions. The Army's organization for counterdrug support is illustrated in Figure 7-3.

CATEGORIES OF SUPPORT

The Army conducts counterdrug support operations that generally fall within 11 DOD counterdrug mission categories. A critical factor in the program is that the Army provides support, rather than taking a lead role or directly participating in civil law enforcement activities such as performing searches or seizures or making arrests. The DOD counterdrug mission categories are illustrated in Figure 7-4.

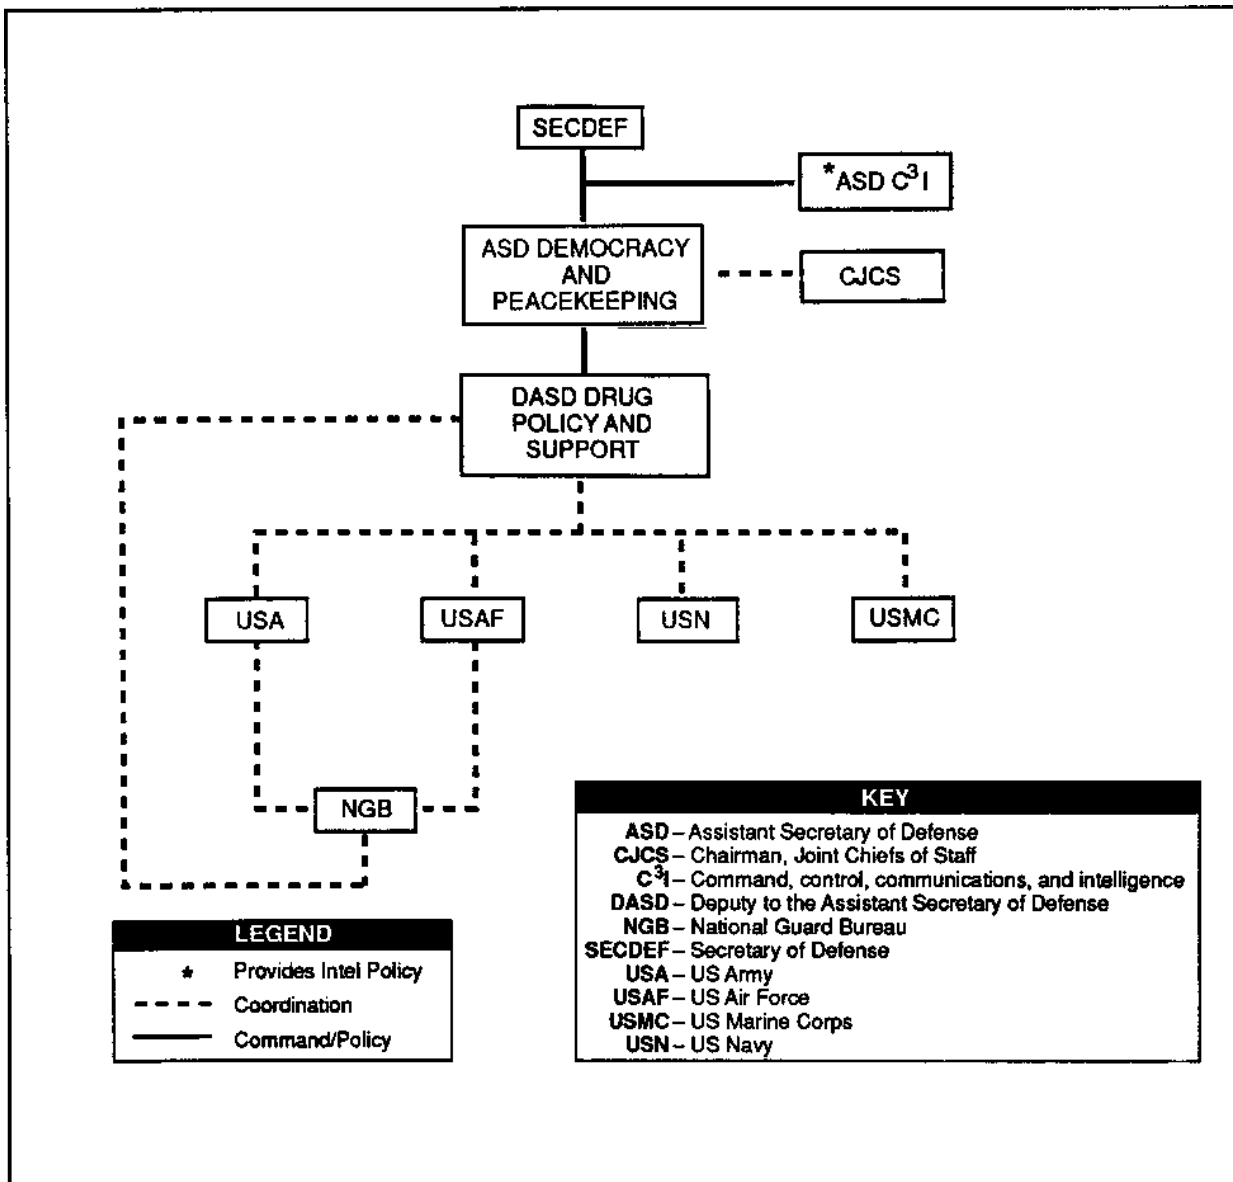

Figure 7-2. Present DOD Counterdrug Support Organization

Figure 7-3. Army Organization For Counterdrug Support

Detection and Monitoring

DOD is the lead agency for the detection and monitoring of the air, sea, and ground transit of illegal drugs bound for the US. The Army supports these missions with ocean-based aerostats, land-based aerostats, land-based radars (such as air defense radars), and OCONUS reconnaissance and surveillance activities. Responsibility for the subsequent interdiction (arrest and seizure) of suspects and contraband remains with LEAs.

On 20 May 1991, a California National Guard counterdrug task force in Oakland, CA, was assisting the US Customs Service in inspecting warehouse cargo. While examining plastic produce bags from Taiwan, a task force member noticed inconsistencies in packaging and weight. A thorough examination of the complete shipment uncovered high-grade Southeast Asian heroin. The nearly 1100 pounds, the largest seizure in US history, reportedly had a wholesale value of more than \$2 billion.

Command, Control, Communication, and Computers

Army personnel and equipment may assist LEAs in designing, implementing, and integrating C4 systems. Army personnel support national and departmental drug operations and LEA analytical centers. In addition, the Army provides liaison to LEAs to facilitate the smooth and successful integration of military support.

Intelligence

The DA Deputy Chief of Staff for Intelligence (DCSINT), establishes policy for use of Army intelligence personnel or material. The DCSINT receives approval of policy statements and guidelines from the Secretary of the Army General Counsel. Commanders should ensure all use of Army intelligence personnel or material is in accordance with established policy and guidelines coordinated through the DCSINT and

approved by the Secretary of the Army General Counsel.

Army personnel can provide multidiscipline support to joint task force intelligence organizations or to individual drug enforcement agencies. Types of support normally provided are basic and advanced techniques used in the intelligence-preparation-of-the-battlefield process; linguists to translate counterdrug materials; and imagery collection, processing, and analysis. Also, the Army provides and participates in LEA intelligence training to facilitate an understanding of the military capabilities and support relationships.

Commanders must ensure that Army personnel are aware of and comply with legal and policy restrictions. Military personnel performing domestic counterdrug support duties are generally prohibited from collecting information on specific individuals. The supported LEA must retain data processed by intelligence augmenters. Army personnel will not maintain or store gathered counterdrug information files on specific individuals in military facilities or data bases. Additionally, Army intelligence personnel can provide assistance to LEAs by providing operations security (OPSEC) evaluations and training.

Commanders and analysts must ensure that Army personnel comply with legal and policy restrictions.

Planning

Planning support consists of planning and coordinating counterdrug operations, determining resource requirements, and gathering information for operations financial support. Planning support can range from assisting a multiagency task force with developing long-range strategy, to facilitating campaign planning between LEA jurisdictions, to helping to write an operations order (OPORD) for a specific operation or mission.

Early planning is critical prior to missions using military operational support. Many LEAs are unfamiliar with military capabilities and limitations. Therefore, early coordination and liaison are vital to ensure maximum effectiveness of joint military-LEA

efforts. Because military and law enforcement communications systems are often incompatible, extensive communications planning is usually required prior to conducting joint military-civilian operations.

Logistics

Logistics support includes loaning equipment; providing engineering, air, and surface transportation; providing maintenance; and providing facilities. Loans and transfers of equipment are arranged through the four DOD regional logistics support offices (RLSOs). Army personnel may be tasked to provide MOS-related maintenance support on LEA equipment. Engineer operations can include construction of roads or structures, repairs, or terrain denial operations.

Transportation

Military vehicles and aircraft can be used, with some legal constraints, to transport personnel, cargo, or equipment. If evidence, seized property, or contraband is transported, a law enforcement officer must be present at all times to maintain the chain of custody. Precautions must be taken to ensure that Army aircraft and personnel are not placed in positions where they are likely to be fired upon.

Training

Army personnel may be tasked to train LEAs. This will often involve the use of mobile training teams (MTTs). As their title suggests, MTTs provide military trainers to instruct LEAs on-site. Subjects trained may include common soldier skills (especially field craft), planning, analysis, maintenance, languages, and physical security. For example, military police can provide training in counterdrug, civil disturbance, terrorism, and mass immigration operations.

In fiscal year 1991, DOD trained 1471 military personnel and 253 police personnel, primarily in riverine operations, operational missions planning, intelligence management, communications planning and support, and civic action.

DOD continues to be the government leader in drug testing. The department certifies the operations of nine DOD and two civilian drug-testing labs.

10. Demand Reduction
11. Land Reconnaissance

Figure 7-4. DOD Counterdrug Mission Categories

Commanders may support LEAs by providing soldiers to conduct military-specific tasks that would otherwise require civilian law enforcement personnel. Law enforcement officers freed from this requirement can devote their efforts to arresting growers or collecting evidence.

Soldiers may also provide clerical and administrative support. National Guard personnel in state status may be used to assist the US Customs Service with inspections of cargo, vehicles, vessels, aircraft, baggage, and/or mail at ports of entry.

On 28 October 1991, combat divers from the 3d Battalion, 20th Special Forces Group, conducting ship-bottom inspections in support of the US Customs in Florida, discovered an unusual package behind an intake grate of a 600-foot banana freighter from Turbo, Colombia. The divers ascertained that the package and grate were not booby-trapped and assisted customs agents in its recovery. Customs inspection revealed 75 pounds of cocaine packaged in an exceptionally waterproofed container.

Army personnel may also provide military skills such as diver, EOD, linguist, dog team, and chemical support. Divers may visually inspect subsurface hulls of vessels but may not enter, search, or alter them. EOD teams can be called on to disarm explosive booby traps placed to protect contraband or equipment. Linguists may be used to translate documents or taped conversations. They may not conduct real-time translations of wire or oral intercepts.

Army forces may provide military dog teams to assist LEAs in detecting illegal drugs and contraband. Chemical liaison teams can advise on the use of

defoliants and identification of drug-producing hazardous chemicals.

Research, Development, and Acquisition

The Army Counterdrug RDA Office provides technical liaison between the Army development community and the counterdrug community. The purpose of the office is to define technical requirements and facilitate technical transfer within the counterdrug community. The efforts of the Army counterdrug RDA office help to provide LEAs access to new and emerging technologies and equipment. This office may also assist LEAs with contracting and procurement.

Demand Reduction

Prevention or reduction of drug abuse requires a combination of education, deterrence, and treatment or rehabilitation. Drug abuse awareness education includes programs for all the DOD schools and DOD civilian personnel. Also, to the maximum extent possible, the DOD provides drug education assistance programs to local community organizations. Drug deterrence for DOD personnel is provided through scheduled and random urinalysis testing. The DOD treatment and rehabilitation program is designed to diagnose, treat, and return to full productivity as many people as possible.

Land Reconnaissance

While reconnaissance is an essential aspect of the DOD detection and monitoring mission, land reconnaissance refers specifically to support provided to US LEAs inside the US. This distinction is made due to legal and policy restrictions concerning the use of the military within our borders.

Army forces may execute a variety of aerial-based and land-based counterdrug reconnaissance missions. These can include the use of fixed wing aircraft, rotary wing aircraft, and unmanned aerial vehicles. Groundbased reconnaissance operations can be accomplished through establishing listening posts and observation posts, on foot or mounted patrols, operation of ground surveillance or air defense radars, and the emplacement and monitoring of remote sensors. Thermal images and other night vision devices may be used to conduct these missions.

US Army, Pacific and Hawaii Army National Guard soldiers combined to provide support to Hawaii and federal DLEAs during Operation Wipeout in the early 1990s. Working together, these forces succeeded in eliminating more than 90 percent of Hawaii's visible marijuana crop, valued at more than \$6 billion.

REQUESTS FOR SUPPORT

Law enforcement agencies may request support through either the state National Guard counterdrug coordinator, the appropriate CONUSA, the FORSCOM counterdrug support cell, the National Guard Bureau counterdrug task force, or the DOD coordinator for drug enforcement policy and support. The preferred method for requesting support is through the state NG counterdrug coordinator. If the NG is unable to provide support, the request will be passed to the appropriate CONUSA. Requests for CONUS military counterdrug operational support are illustrated in Figure 7-5.

Figure 7-5. Requests for Military Domestic Counterdrug Operational Support

PROVISION OF SUPPORT

Within the United States, the National Guard is the primary source of military support to federal, state, and local LEAs. Support is also provided to LEAs by both USAR and active duty units. This Army support to counterdrug operations is another aspect of the Army's traditional role of providing military support to civil authorities. Army National Guard forces execute these missions under control of the governor, while USAR and active duty units operate under the control of a regional joint task force, for example, JTF 6 in the US southwest, or in support of a CONUSA.

Each state or territory has a National Guard counterdrug coordinator to receive LEA requests for support and coordinate the execution of support as directed by the state adjutant general (or commanding general). Army National Guard counterdrug operations are conducted in accordance with state law and applicable National Guard regulations. Drug interdiction and eradication operations are conducted in all 54 states and territories. In fiscal year 1992, the National Guard helped confiscate drugs with a street value of \$69 billion.

The National Guard has categorized its support into 16 missions (approved by SECDEF) that are essentially subdivisions of the eleven DOD categories. These missions are depicted in Figure 7-6. Coordination Requirements

The Joint Staff reviews all DOD operational support requests and the Secretary of Defense or delegatee approves them. The CINCFOR coordinates counterdrug land operations in CONUS. Figure 7-7 illustrates the counterdrug operational support approval process. Nonoperational Support Requests

In accordance with current DOD policy and service regulations, the appropriate regional logistics support office will process LEA requests for equipment, facilities, and formal school training. The Director of Operations, Readiness, and Mobilization, in coordination with the Assistant Secretary of the Army for Installations, Logistics, and Environment, administers such actions for the Department of the Army.

CONSIDERATIONS FOR PLANNING

STAND-ALONE CAPABILITY

Whenever possible, Army support will be packaged to provide a complete stand-alone capability. Units

tasked with providing counterdrug support should perform a mission analysis to ensure the requested forces or capabilities are sufficient to meet requirements.

DECISION-MAKING PROCESS

Planning for a counterdrug support mission entails the same decision-making process as any other military operation. The conduct of counterdrug operations should be consistent with Army doctrine. Unlike combat operations where the massing of firepower is appropriate, however, the guiding principle for Army personnel during counterdrug operations is to avoid contact and use minimum necessary force.

Leaders at the lowest echelons will perform troop-leading procedures and analysis based on the factors of METT-T. Leaders at higher echelons will perform command and staff estimates. To the greatest extent possible, estimates should be coordinated with the supported LEA.

LEGAL AND TACTICAL ASPECTS

In developing a threat estimate, the military counterdrug planner may have to rely heavily upon law enforcement sources for information. IPB should be performed before each mission but must be modified to account for less predictable drug traffickers, rather than for a doctrinally rigid threat. Also, planners must consider legal as well as tactical aspects when developing courses of action.

Legal constraints are a major concern in planning counterdrug missions.

LEGAL CONSTRAINTS

Legal constraints constitute a major concern during counterdrug mission planning. Use of military support may require special procedures to ensure that legal proceedings resulting from joint military-LEA counterdrug operations can be effectively prosecuted in court. Counterdrug plans should be reviewed by a staff judge advocate. The supported LEA is responsible for obtaining any required warrants or determining instances in which warrants are not required.

RULES OF ENGAGEMENT

Rules of engagement (ROE) and use-of-force policies will usually be detailed and restricted by US law. Soldiers conducting counterdrug support missions must be familiar with and completely understand the ROE. Commanders routinely provide a precommitment briefing outlining the mission, legal considerations, and ROE to soldiers engaging in counterdrug operations.

OPERATIONS SECURITY

OPSEC during counterdrug support operations cannot be overemphasized. The mere appearance of military personnel or strangers in an area can cause drug traffickers to alter or delay their activities.

Planners must identify security vulnerabilities and implement measures to protect weaknesses. Commanders must take steps to preserve counterdrug force intentions and capabilities.

COMMAND AND CONTROL

Command and control relationships must be clearly established. The relationship between a military unit providing counterdrug support and the supported LEA is similar to a unit providing direct support (DS) and a supported unit. However, the military chain of command must always be maintained. US soldiers will not be placed under the command of law enforcement officers.

16. Aerial Interdiction

Figure 7-6. National Guard Counterdrug Support Categories

Figure 7-7. Counterdrug Operational Support Approval Process

On 15 December 1992, members of the Oregon National Guard (ORNG) Counterdrug Support Program assisted the DEA, BATF, US marshals, and two IRS criminal investigation divisions in executing a search warrant in Hermiston, Oregon. With the support of the ORNG, the agencies seized a number of fully automatic weapons, 42 other weapons, and more than 3000 rounds of ammunition, including .50-caliber armor-piercing rounds.

LEA arrested four individuals and seized illegal drugs, \$115,000 cash, a 48-foot yacht, eight vehicles, military explosives, grenades, and booby traps.

From 1 to 19 June 1991, the New York National Guard counterdrug program was responsible for seizing \$24,589,110 in illegal drugs and \$3,192,106 worth of cash and travelers checks.

COMMUNICATIONS

Communications plans must be detailed. Since military and civilian systems are often incompatible, military and supported LEA communications planners must coordinate as early as possible.

PUBLIC AFFAIRS

The lead for public affairs rests with the supported LEA. Army public affairs officers will coordinate any release of information with the supported LEA. Commanders should ensure their public affairs officers are included in the planning process for all counterdrug operations. Unwanted disclosure of operations by the media can render a plan ineffective. It can also negate the favorable results of an operation such as arrests and seizures.

A good public affairs plan can minimize these risks by providing the media with only the information the

operational commander wishes to release. A good public affairs plan will serve the public's right to know while minimizing risk through effective security at the source and OPSEC awareness. The identity of soldiers providing counterdrug support will not be released to the media.

THREAT AWARENESS AND RISK ASSESSMENT

Commanders should perform a risk assessment prior to the deployment of troops. Threat awareness and risk assessments are a critical part of counterdrug planning. While soldiers should not be placed in situations where they will likely be fired upon or come into direct contact with suspected drug traffickers, such a possibility always exists. Units and soldiers may face an armed adversary. They should be prepared for actions related to combat, even when conducting training or other noncombat operations. Commanders should also be aware of the chemical hazards associated with drug production.

SUPPORT FOR CIVIL DISTURBANCE OPERATIONS

Civil disturbances may range from unruly demonstrations to widespread rioting with looting and arson. In extreme cases, civil disturbances may include criminal acts of terrorism and violence. Civil disturbances in any form are prejudicial to public law and order. The Army has a role in assisting civil authorities to restore law and order when local and state law enforcement agencies are unable to quell civil disturbances.

ROLES

The National Guard, as a state organization, responds to the governor in accordance with state law for civil disturbance operations. National Guard regulations direct planning and training for the civil disturbance mission. During most civil disturbance situations, the National Guard will be the first military responder and will usually remain in state active duty status throughout the operation. The National Guard can be brought on federal service for civil disturbance operations when so ordered under appropriate federal statute by the President. This will normally be done at the request of the state governor.

The LA riots of 1992 were unquestionably the most costly civil disturbance in US history (\$800 million plus). At 2230 on 29 April 1992, as part of the response to this disorder, the 3d Battalion, 160th Infantry (Mechanized), 40th Infantry Division, California National Guard, was ordered to mobilize. Between 2100 and 2400 the following day, all 3d Battalion companies deployed to their assigned areas. It was the first tactical battalion to be mobilized, the first to deploy to the streets of LA, and the last to redeploy.

The role of federal Army forces is to assist civil authorities in restoring law and order when the magnitude of the disturbance exceeds the capabilities of local and state law enforcement agencies, including the National Guard. Under the provisions of the Constitution and selected federal statutes, the President may order the employment of the federal armed forces to aid local and state civil authorities to protect the Constitutional rights of citizens. Federal military forces may also protect federal facilities and installations in any state, territory, or possession. The Department of the Army civil disturbance plan, nicknamed GARDEN PLOT, provides direction for Army forces directed to quell civil disturbances.

REQUESTS FOR FEDERAL MILITARY ASSISTANCE

Requests for federal military assistance normally originate with the state and are forwarded to the President of the United States. The Attorney General is responsible for coordinating and managing all requests for federal military assistance for civil disturbance operations. The Attorney General advises the President whether and when to commit federal military forces. The President orders the employment of federal military forces in domestic civil disturbance operations.

The Attorney General, as the head of the lead federal agency responsible for law enforcement, will appoint a senior civilian representative of the Attorney General (SCRAG). The SCRAG is responsible for

coordinating federal civil disturbance operations and assisting the state civil authorities.

The SCRAG has the authority to assign missions to federal military forces. The SCRAG exercises this authority in coordination with the commander of the federal military forces committed to civil disturbance operations. Civilian officials remain in charge of civil disturbance operations.

The Secretary of the Army is the DOD executive agent for federal military operations in response to civil disturbances. Within the Department of the Army, the Director of Military Support coordinates the functions of all the military services when federal military assistance for civil disturbances is required. The executive agent, through DOMS, serving as a joint staff, publishes an execute order designating a supported CINC for civil disturbance operations. This execute order also designates the supporting CINCs, services, and agencies (see Figure 7-8).

The CINC will determine the organization and forces required to accomplish the civil disturbance mission. The CINC may establish a joint task force in order to make best use of the forces available for the mission.

CONDUCT OF CIVIL DISTURBANCE OPERATIONS

The JTF commander exercises control of all federal military forces (including National Guard in federal status) committed to assist civil authorities. Federal military forces remain under the military chain of command during civil disturbance operations. Federal forces will not be placed under the command of either civil officials or National Guard commanders in nonfederal status. Civilian authorities retain control of their state and local law enforcement agencies. The JTF commander establishes liaison with the SCRAG and other appropriate federal, state, and local civil authorities.

Federal military forces must be tailored to the specific civil disturbance situation. Sufficient combat support and combat service support units will be required to sustain the force throughout the deployment. Coordination with civil officials may allow the force to draw on resources available from state and local agencies. Close and continuous coordination between the federal military forces and the LEAs will

provide the commander the detailed information required to employ and protect the force effectively.

In supporting OPLAN GARDEN PLOT, intelligence personnel may conduct close and continuous liaison with LEAs and the military police to ensure that their units receive the information needed to allow the commander to adequately protect the force. The JTF commander should staff intelligence support missions with his senior intelligence officer and legal counsel prior to approving the mission.

Federal military forces remain under the military chain of command during civil disturbance operations.

Federal military forces must be employed in tasks or missions appropriate to their organization and training; they must not be employed in ways that violate the legal restrictions in effect. Military forces may be used to disperse unlawful assemblies and to patrol disturbed areas to prevent unlawful acts. They may be used to assist in the distribution of essential goods and the maintenance of essential services. Forces may also establish traffic control points, cordon off areas, release smoke and obscurants, and serve as security or quick-reaction forces. Certain types of missions are always inappropriate for military forces during civil disturbance operations, for example, gathering intelligence on civilians.

Requests for the conduct of specific military missions are typically passed through a single state or federal law enforcement coordinating officer, as approved by the SCRAG. Validated requests are transmitted to the JTF commander and his headquarters

Figure 7-8. Decision Sequence for Law Enforcement Support

for staffing and coordination. Approved missions are assigned through the military chain of command to the appropriate element or unit for execution. Units and soldiers will not accept taskings or missions directly from law enforcement or civilian officials, except in a direct support relationship as approved and ordered through the military chain of command.

Military liaison should be provided to each LEA headquarters generating requests for support. This liaison can assist LEA officials in determining the types and quantities of military support to be requested. The JTF headquarters can facilitate this mission assignment process by providing LEAs with a detailed listing of the types of missions military forces may conduct.

A deployed unit's area of operation should coincide with the jurisdiction or subdivision boundaries of the law enforcement agency it supports. This arrangement facilitates liaison and coordination between law enforcement and military chains of command.

SUPPORT FOR COMBATTING TERRORISM

ANTITERRORISM ASSISTANCE

Antiterrorism is the term encompassing defensive measures, to include limited response and containment of a terrorist incident involving DOD personnel and facilities. Since the FBI has the lead role in most matters concerning terrorism in the US, the Army's function in AT is essentially to reduce the vulnerability of Army personnel and property to terrorist attack.

Selected Army and civilian personnel may attend established AT training courses. Additionally, Army organizations may develop memorandums of understanding with civilian agencies for mutual support in the event of a terrorist incident. Such agreements may include arrangements for firefighting or EOD support, providing assistance in site isolation, security engineering and assisting in hostage negotiation.

COUNTERTERRORISM ASSISTANCE

Counterterrorism includes means taken to prevent, deter, and respond to terrorism. Assistance provided in counterterrorism is essentially a subset of civil disturbance operations. The Federal Bureau of Investigation is the lead law enforcement agency concerning incidents of terrorism in the US. The Secretary of the

Army remains the executive agent for the employment of military support.

TYPES OF SUPPORT

Support provided by Army forces may include material, facilities, and personnel acting in an advisory capacity. Presidential authorization is required before military personnel can perform law enforcement functions outside the military installation. At the request of the director of the FBI or the senior FBI official at the scene of a terrorist incident, the Secretary of the Army and OCONUS CINCs may provide the FBI military resources (barrier materials, smoke and obscurants, body armor, protective masks, clothing, communications equipment, firefighting equipment and operating personnel, and explosive detection dog teams for the purpose of combating terrorism). The Secretary of the Army has delegated this authority down to installation commanders. The approval of the Secretary of the Army or his designated representative is required to authorize the provision of arms, ammunition, combat tactical vehicles, vessels aircraft, and personnel (other than firefighting and EOD personnel).

Explosive Ordnance Disposal

The EOD mission is to assist public safety and law enforcement agencies in developing a capability to deal with the improvised explosive device (IED) threat and, when necessary, to provide EOD service in the interest of public safety. Army EOD personnel will not participate in bomb or IED search operations (except to support the US Secret Service) or assist in the enforcement of civil law. Army EOD personnel will respond to requests when a suspected or actual device has been located and when the responsible agency has no EOD capability or its capability is overextended.

**Army EOD personnel may
support the US Secret
Service or assist local law
enforcement.**

EOD personnel do not normally respond to incidents involving commercial explosives or chemicals but may be authorized to provide technical assistance to preserve life or to prevent severe property

assistance to preserve life or to prevent severe property damage. Army EOD units may not transport, store, or dispose of commercial explosives or chemicals for agencies other than the DOD.

EOD personnel train military personnel, Defense Civil Preparedness Agency personnel, and civil authorities in—

- Explosive ordnance reconnaissance.
- Responding to bombings and sabotage.
- Combatting bombings and sabotage.
- Identification and dangers of ordnance.

**Department of
Defense Key Asset Protection Program (KAPP)**

CINCFOR is designated the DOD executive agent for the DOD Key Asset Protection Program. CINCFOR develops and promotes the security of key assets within the US by providing to the owners or managers of such assets appropriate advice, guidance,

and planning assistance on the application of physical security and emergency preparedness measures. Such assistance is designed to protect key assets from sabotage, espionage, and other hostile or destructive acts and to minimize the effect of attack damage.

USACE provides security engineering advice for government installations. Examples of facilities selected for this program include, but are not limited to, munitions plants, production facilities producing critical national defense items, communication nodes, and power plants.

The DOD will not replace the primary responsibility of others for the physical security of any privately owned assets; federally owned assets under the control of any other federal department, agency, or contractor; or assets owned by any state or political subdivision of any state. The DOD will ensure that actions to protect key assets are included in military contingency plans for CONUS security.

SUMMARY

The US Army can perform many tasks in support of civil law enforcement. Efforts to combat the flow and use of illegal drugs in the US have shown that the Army can provide effective assistance to LEAs. Army personnel and equipment can also help civilian law enforcement authorities quell civil disturbances and terrorist activities. By providing both operational and nonoperational support to law enforcement, the the Army can be a formidable force multiplier for civil authorities.

CHAPTER 8

COMMUNITY ASSISTANCE

Community assistance applies the skills, capabilities, and resources of the Army to the needs and interests of America and local communities. Supporting and participating in events and activities that benefit the Army and the civilian community build on a long tradition of America's Army helping American communities. Community assistance can have a large scale impact because active component, National Guard, and Army Reserve units are located in thousands of towns and cities across the nation. What a command does, or fails to do, for the community will affect the attitudes of the American people, upon whom the Army depends for its support and existence. Every commander should identify opportunities to conduct initiatives that meet specific needs, have specific start points and end states, enhance readiness, and advance the interests of the nation, the Army, and local communities.

PRINCIPLES

America's Army has a long tradition of helping American communities.

Community assistance projects and operations must enhance the Army's image, have a positive impact on

the unit or individual soldier, and contribute to the common good of the nation and local communities. Army commanders must be sure that their initiatives are not competitive with local resources or services, do not benefit any particular interest group, and will not result in monetary or service remuneration in any form. Army commanders located OCONUS may find these principles useful in fostering their established relationships with adjoining host nation commanders. However, they must consider applicable CINC guidelines and host nation laws and agreements before implementing community assistance programs.

COMMAND EMPHASIS

Commanders should take an active interest in their relationships with civilian officials, encouraging appropriate community assistance programs. Establishing long-term, harmonious, productive relationships with national, state, and community officials can significantly benefit both the Army and the nation's civilian communities.

INDIVIDUAL AND UNIT ENHANCEMENT

Community assistance activities increase public awareness and understanding of the Army, inspire patriotism, and enhance the Army's reputation as a good neighbor. They positively influence public opinion toward the Army while also enhancing the combat readiness of the organization. They help build unit morale and esprit de corps. Community assistance activities are an excellent opportunity for soldiers to serve as role models, which not only enhances recruiting but motivates other soldiers. These activities promote their self-esteem and further their sense of service to the nation.

READINESS ENHANCEMENT

Community assistance activities should enhance individual and unit combat readiness. They should make the best use of assets and foster a positive training environment where soldiers can become involved in realistic, hands-on training opportunities. Whenever possible, community assistance projects should exercise individual soldier skills, encourage teamwork, challenge leader planning and coordination skills, and result in measurable, positive accomplishments. Finally, they should enable a unit to use its equipment, providing training opportunities that increase operator proficiency.

COMMUNITY BENEFIT

Community assistance activities should contribute to the health and welfare of the nation and local communities, making the Army an integral partner in progress and development. These activities enhance the ability of the nation and communities to provide the best possible services to the citizenry. They promote a positive, healthy, safe environment, as well as an understanding of the basic principles, values, and ideals upon which America is built. This results in increased awareness of America's history and the Army's role in a continuously changing world.

During the summer of 1992, units from the 89th US Army Reserve Command helped a nonprofit, community action organization in Kansas City, Kansas, lift, transport, and relocate 81 houses from Fort Leavenworth to the Kansas City area to provide housing for elderly, handicapped, and lower income families.

COMMON INTEREST AND BENEFIT

Because the Army belongs to the American people, it should support only events and activities of common interest and benefit. Commanders should avoid providing assistance and support to one sponsor that it cannot also provide to other sponsors. Army assistance should not selectively benefit any person, group, or corporation, whether profit or nonprofit, religious or sectarian, ideological or quasireligious, fraternal, political, or commercial.

NONCOMPETITIVE

Army community assistance projects should not compete with resources and services commercially available in the community. Commanders must not authorize assistance activities when local businesses can provide the same or similar assistance and support.

**Assistance projects
must be noncompetitive
and nonprofit.**

NONPROFIT

Army support for or participation in community assistance activities cannot be provided on a for-monetary-profit basis. Commanders must ensure that no Army person or unit realizes a monetary profit, a gratuity, or a remuneration in any form not provided for by public law or regulation.

TYPES OF COMMUNITY ASSISTANCE

Community assistance activities can be national efforts focused on developing public support for the Army and its contribution to the nation. They can also be state or local community efforts focused on improving the community, its infrastructure, and its ability to serve the local population. Both types improve the lives of American citizens, foster the values and purposes of democracy, and give the American people hope and confidence in a changing world.

NATIONAL EFFORTS

The goal of national efforts is to develop an open, cooperative relationship between the Army and the American people. National efforts take advantage of the technical, vocational, and group skills of military professionals to enhance the lives of American people. They supplement programs available in the civilian sector and through other government agencies, not replace them. They provide opportunities for the Army to contribute to the growth and welfare of the nation, improving its perception of the Army, its capabilities, and its personnel. Army and DOD regulations provide detailed guidance on national effort programs. Examples of national efforts are described in the following paragraphs.

Public Works Maintenance and Management

The Army exercises its federal engineering executive oversight responsibilities through the US Army Corps of Engineers. The USACE manages myriad components of the nation's public works infrastructure. Executed principally, but not solely, through the civil works directorate, this unique Army national assistance program has developed an integrated understanding of complex federal, state, and local regulations and policies governing the national infrastructure, the national waterways, environmental remediation and recovery operations, real estate, disaster recovery operations, and general project management functions. The Army's efforts help maintain and improve the nation's infrastructure. Many federal, state, and local agencies engage the USACE on a reimbursable basis when they lack the expertise to manage the engineering dynamics of a particular project.

Assistance Programs

Army involvement in a wide variety of national assistance programs focuses on economic and social issues having national security implications. Large segments of our society face an unfulfilling lifetime of marginal existence, creating the potential for disorder in our nation. Army participation in programs designed to provide the nation's citizens opportunities to fulfill their potential is effective use of our resources and capabilities. Examples of national assistance programs in place or under consideration are described below.

Civilian Community Corps. This program provides managerial, organizational, and technical skills for disadvantaged Americans seeking the skills they need to succeed. Through this program, the Army helps participants become productive citizens. In exchange, participants perform a wide range of community service activities that improve the foundation of American society. This program encourages intragovernmental cooperation on the federal level. It also encourages partnerships with industry, education, state, federal, and local governments.

Science and Technology Academies Reinforcing Basic Aviation and Space Exploration (STARBASE) Program. This program is an innovative partnership of professional educators, military personnel, and corporate sponsors. It promotes science, mathematics, and technology basics for primary through secondary schools. Using NG resources to spark student interest, the program develops strong self-esteem, provides excellent role models, promotes positive attitudes, and develops goal-setting skills.

Civilian Youth Opportunities Program (Challenge). This is a youth program directed at attaining a high school diploma, providing job training and placement, improving personal and social skills, and providing health and hygiene education and physical training. Soldiers work with civilian leaders to provide a comprehensive support package, ranging from choosing appropriate clothing to attending residential training facilities.

Drug Demand Reduction Programs. These are activities in which soldiers work with community agencies and organizations to reach at-risk individuals. Program activities include presentations on drug

awareness and prevention, sponsorship of drug-free activities and events, leadership camps, fitness programs, and cultural exchange programs. One of the specific programs in this general category is the Drug Abuse Resistance Education (DARE) Program. Military police provide instructor support to law enforcement agencies teaching elementary students how to stay drug-free. This support is provided either on or off military installations based on the requests of local law enforcement agencies.

Youth Physical Fitness Clinic Program. The National Guard encourages fitness and combines academic and athletic achievement by helping schools conduct competitions in selected athletic events. This program also establishes a separate scholar-athlete category for those students with a 3.5 or higher grade point average.

Crews from the 57th Medical Command (Air Ambulance), 1st Corps Support Command, Fort Bragg, provide emergency rescue support to the local community. In March 1993, they responded to a call to assist two 19-year-old canoeists who had been forced to climb a tree after losing their boat in the rampaging waters of the Eno River near Durham, North Carolina, which was swollen as a result of three inches of rain.

Medical Readiness Program. The Medical Readiness Program is an activity in which Army medical unit personnel, together with state medical emergency officials, plan and provide support in the form of diagnosis, treatment, and preventive medical, dental, and veterinary care to citizens in remote areas of the US or its territories. The program is designed to enhance the unit's medical readiness, provide unit training opportunities, and serve the public in locations where medical care is not otherwise available. The

program may not compete with local private medical care that may be available.

Air Ambulance Participation. The Military Assistance to Safety and Traffic (MAST) Program is a proven example of Army support to civil authorities. This program permits the utilization of Army aviation assets to conduct emergency air evacuation and recovery efforts.

National Events

When directed, the Army provides support to national events and activities that promote the image of the country. Examples of such missions include support to national and international supporting events such as the Olympics and the Super Bowl, or political events such as the Presidential inauguration and other national celebrations and commemorations.

Fort Eustis started a pilot program in 1992 called Operation Self-Enhancement to give high-risk middle school students the opportunity to visit the post and focus on careers, teamwork, and self-esteem. The program was so successful that it has become an annual event. Students receive light military training through an array of "testable" tasks and obstacles presented by members of a cadre team. This training helps students build their self-esteem and self confidence and affords them the opportunity to interact with positive role models.

STATE AND LOCAL EFFORTS

The guiding principle behind state and local efforts is that the installation and the community have a common interest in providing the best possible support for each other. A cooperative relationship exists, because soldiers stationed at the installation receive life support from the community while many of the civilians who make up the community receive life

support from the installation. The interdependence of the military installation and the civilian community can involve economics, education, health care, basic services, quality-of-life issues, and many others.

The goal of local commanders should be to develop an open, mutually satisfactory, cooperative relationship between the installation and the community. Good state and local efforts improve the community's perception of the Army, the installation and the soldiers, family members, and civilians who are part of the installation.

Commanders should consider appointing a committee or small agency to act as a clearing house for community assistance requests. This committee might be headed by the garrison commander or Director of Plans, Training, and Mobilization (DPTM). It should include the public affairs officer, the staff judge advocate, the chaplain, and representatives from the Directorate of Resource Management (DRM), the Directorate of Installation Support (DIS), and the Directorate of Personnel and Community Activities (DPCA). Units that play a major role in the activity should be represented. Key community leaders should also be invited to serve on this committee. A diagram depicting a typical flow of community assistance requests through command channels and the assistance committee is at Figure 8-1.

Many community activities and efforts can be established in a more formalized manner. These efforts permit both the installation and local community to expand and enhance their services to their respective residence. Examples of these efforts are explained in the following paragraphs.

Memoranda Of Agreement (MOA) or Memoranda Of Understanding

An installation or organization can enter into an agreement with the local community to provide critical services not available in the community, to augment community services unable to meet demand, or to ensure that emergency services are available in the shortest possible time. Examples include arrangements to provide air ambulance support, search and rescue, firefighting capability, explosive ordnance disposal, emergency or broad-based medical care, wildlife and domestic animal management, assistance in safety and traffic control, emergency snow removal, and temporary supplemental housing for the displaced or disadvantaged.

Speakers Bureaus

Speakers are an especially effective means of developing understanding of the Army and stimulating patriotic spirit. They inform the public about the activities of the installation, its units, and its soldiers. Commanders should establish an installation speakers bureau and encourage soldiers of all ranks to participate in the program.

Community Liaison

Maintaining liaison through informal community relations councils can enhance open communications with community officials and organizations. Councils have a variety of responsibilities, such as developing and promoting new ways for members of the command to participate actively in local community activities and resolving potential and actual areas of conflict. Community liaison can also recognize, with public service awards, private citizens, local community leaders, citizen groups, and organizations for their support of the Army. Commands can further community liaison through membership in civic, business, and professional organizations when the goals and objectives of those organizations are beneficial to the Army and their programs and projects are consistent with Army interests.

Band, Color Guard, and other Ceremonial Unit Participation

Participating in public events and memorials is an excellent way to accomplish community relations objectives. These representatives of the Army serve as ambassadors to the civilian community and promote patriotism, interest in the Army, and awareness of our forces' professionalism.

Elements of the 489th Engineer Battalion, 420th Engineer Brigade (USAR), helped a rural community near Little Rock, Arkansas, plan, develop, and build a local recreational area for the general public.

Exhibits

Exhibits and displays of Army equipment, historical materials, models, devices, and other information can enhance understanding of the Army and the installation. They can also promote patriotism and educate the public. They provide an excellent opportunity for interaction between our soldiers and members of the local community, communicating the professionalism, readiness, and standards of our forces.

Physical Improvements

Community service physical improvements focus on ensuring that the physical infrastructure is as safe as possible and provides the fullest possible range of support to the population. These activities encompass a wide range of programs that do not compete with the services provided by contractors and businesses in the local civilian community. Examples include—

- Construction projects that enhance the recreational, educational, environmental, or cultural facilities of the community, such as building community picnic areas and hiking and biking trails.

- Demolition projects that enhance the safety and appearance of the community, such as the removal of unstable playground equipment.
- Projects that create or enhance a safe, clean environment, such as the removal of debris from a community wildlife area or painting a community recreation center.

SOCIAL IMPROVEMENTS

Community service social improvements, which focus on making the social environment as healthy as possible, provide the widest range of support to the population. They encompass myriad projects, including—

- Support to youth programs, such as scouting, and programs that provide assistance to special need audiences, such as special olympics.
- Involvement in ventures and projects that enhance the educational or cultural climate of the community, such as adult literacy, school reading, or community theater programs.

Figure 8-1. Community Assistance Request Flow

- Participation in special events, such as law enforcement or fire prevention awareness programs, which enhance the welfare of the community.

The Fort Sill Public Affairs Office has worked with the local community college to establish an intern program for students in the communications and journalism programs. The students receive credit for work they do in the installation PAO office, providing the college with a valuable education asset and the students with an opportunity to get real-world experience in their academic fields.

Commanders should consider the contributions that all organizations and personnel associated with their installation can make in community assistance activities. For example, Army Reserve Officers Training Corps (ROTC) cadets may be a valuable resource for participating in or supervising selected community assistance projects. ROTC cadets, particularly those in the final two years of training, can gain valuable leadership experience by participating in community activities. Communities will benefit from the dedication of intelligent, reliable, and energetic future Army leaders in their community efforts.

Another example of Army personnel that can contribute to community assistance activities is Army recruiters who are dispersed throughout the United States. These noncommissioned officers serve as positive role models and leaders who may be called on to assist in DOD-approved community activities as recruiting duties permit. Specific programs executed by Army recruiters include—

- The National Stay-in-School/Stay-Off-Drugs Program. Recruiters, supported by visual and print materials, serve as role models for youth at

risk of dropping out of school or using drugs. Recruiters assist school counselors and community leaders in fighting local drug problems through education and positive encouragement.

- The USAR Scholar-Athlete Program. With more than 13,000 high schools participating, the program honors the top male and female scholar and athlete selected by each school based on guidelines suggested by the Army.
- Planning for Life. This Army initiative, developed in concert with the Committee for Economic Development, recognizes excellent career planning at state and national levels. The Planning for Life award will be presented to the coalition of schools, business, labor, and communities that do an excellent job of preparing students for the work world.

PUBLIC AFFAIRS CONSIDERATIONS

Almost all community assistance activities are conducted in public view. For this reason, PA officers are a valuable resource for commanders involved in community assistance activities. They can provide advice and assistance in determining the propriety, suitability, and appropriate level of support to be provided. They are experienced in working with civilian leaders and organizations and in planning and conducting programs involving the civilian community. They should be part of the commander's community assistance committee.

LEGAL IMPLICATIONS

Army participation in community service activities is limited by law, regulation, and policy. Commanders must consider the objective and purpose of the proposed community assistance. They must consider the limitations under which Army participation in community assistance activities is authorized. They should ensure the SJA is an important element in the consideration and development of any community assistance programs.

SUMMARY

Participation in community assistance activities is an effective method for projecting a positive Army image, making the best use of assets, providing alternative training opportunities, and enhancing the relationship between the Army and the American public. Activities vary widely, ranging from individual soldier involvement to full Army participation. They are characterized by detailed coordination between the military command and community authorities. They fulfill community needs that would not otherwise be met, enhance soldier and unit morale, skills, and readiness, and improve the mutual support between the military and civilian communities.

CHAPTER 9

EDUCATION AND TRAINING

Training for war is the Army's top priority. With the exception of the training required in OPLAN GARDEN PLOT, the Army does not normally do specific training for domestic support missions until after a mission is assigned. Most domestic support missions can be accomplished by a disciplined force, proficient in its warfighting tasks, as described in its mission-essential task list (METL). However, in some cases unique training may be required to successfully complete an assigned domestic support mission. This chapter provides a guide to leaders on training for essentially non-METL-supported missions.

CONCEPT

The basis of the Army's capability to provide domestic support is wartime mission training.

Commanders should be familiar with the requirements and limitations peculiar to domestic support operations. They must ensure that leaders

and staffs are trained in the organization and processes of supporting civilian agencies. Units should be selected to perform specific domestic support missions consistent with known levels of training and military skills. The Army could be tasked to provide domestic support under a variety of missions and circumstances. The Army will seldom be tasked to provide such support independent of other services or civil agencies. All personnel require mission orientation and introduction to civil assistance techniques specific to the mission. Figure 9-1 provides insight into the factors that affect training for assigned domestic support missions.

Training required for domestic support is conducted within the tenets of current Army training doctrine.

Many tasks common to warfighting and domestic support exist at all levels. Senior commanders should make every effort to use domestic support missions as skill enhancers for subordinate units. They accomplish this by assigning domestic support missions to units whose combat skills and capabilities match the mission's requirements. Also, execution of domestic missions should mirror, as closely as possible, the execution of the same or similar tasks in combat. Such assignments will often favor selecting combat support and combat service support units. As an example, medical units may find little difference in the type of medical support required after a natural disaster from that required following a battlefield engagement. Commanders can exploit the relationship between METL and domestic missions to save time and training resources while maintaining combat readiness.

A unit's METL is the focus of the commander's training plan. While using unit METLs to focus training toward combat readiness, a number of factors, as seen in Figure 9-2, impact on readiness.

Commanders able to emphasize the positive aspects of these impacts when training for an assigned domestic support mission are able to improve readiness while supporting domestic needs. In many cases, specialized mission-oriented training will have to be accomplished prior to committing forces. The lead federal, state, or municipal agency may provide training information and requirements to Army forces. Training may be provided through cadre instructional programs or to entire units. The FEMA operates an Emergency Management Institute in Emmitsburg, Maryland. Courses that are of interest to Army planners include Integrated Emergency Management, Multi-hazard Planning, and Hazardous Material Spill

Figure 9-1. Dealing with a Variety of Missions In Domestic Support Operations

Response. The National Guard operates the National Interagency Counterdrug Institute in San Louis Obispo, California. It offers training to federal, state, and local agencies in counterdrug operations and techniques. An example of training provided to entire units is the three-day course in firefighting skills that the US Forest Service provides to units tasked to assist their efforts each summer. Interagency government training may be available in a variety of areas, such as counterdrug operations.

TRAINING TECHNOLOGIES

Unit training is integrated into existing individual and collective events. Many conventional training exercises provide the opportunity to include interaction with federal, state, or municipal agencies. Exercises such as HURRICANE POLLY and RESPONSE 93

were developed and conducted to improve the coordination needed to respond to hurricanes and earthquakes. These exercises were developed by non-DOD agencies, but they can provide an opportunity to improve military capabilities for domestic support with minimal resources. These exercises emphasize interoperability requirements and stress staff coordination. A number of exercises are supported by Army organizations, such as the Louisiana Maneuvers Task Force.

The recent development of distributed simulation provides training technology that permits multiple organizations or agencies to participate in the same simulation exercise without having to be at the same location. It offers the potential for selected leaders to develop effective interagency communication and mutual understanding without having to be physically present at a specific exercise site.

Figure 9-2. Impacts on Training Readiness

The tiny Eskimo village on Diamede Island had not received any supplies for more than four months. Personnel from the 558th QM Company (Aerial Resupply), operating from the Alaskan General Depot, devised hasty rigging procedures. They rigged 25,000 pounds of food and fuel and air-dropped it to villagers in February 1956.

READINESS

Combat readiness is the primary focus of all military forces. Execution of domestic support missions should have minimal impact on unit readiness or mission essential task list proficiency, but it may adversely impact readiness of units given extended domestic support operations. Units committed to long-term domestic support may require significant resources, beyond that which the unit would normally be allocated, to regain warfighting standards after completion of their domestic support mission.

RISK MANAGEMENT

Commanders realize that protecting soldiers and equipment is an implied aspect of any mission. Normal METL training will satisfy most protection requirements. Domestic support missions, however, could require the employment of personnel and equipment in roles other than those for which they were trained or designed. Consequently, leaders at all levels must make risk assessments. Commanders must ask four questions prior to and during any operation:

- Do my soldiers need specialized training for the mission?
- Will my soldiers be required to use their equipment in a manner other than that for which it was designed?
- Are my soldiers and their equipment operating under the conditions they had during training?

- Do my soldiers or their equipment endanger the civilians we are supporting?

Commanders and staffs must do everything possible to protect the force, regardless of the mission. In many cases it may be challenging to do so during some domestic support missions.

Elements of the 391st Engineer Battalion, 120th US Army Reserve Command, assisted in the construction of a new training area for the County Sheriff's Department in Greenville, South Carolina.

PUBLIC AFFAIRS

Personnel in units conducting domestic support operations must become familiar with public affairs principles and procedures. Their activity will be of great interest to the news media. Commanders may capitalize on this interest by assisting the media in telling the Army story.

Commanders must be trained to accomplish their mission under the close scrutiny of the media. They will have to satisfy the media appetite for information. They will have to react rapidly to developing issues and changing perceptions while simultaneously fulfilling the information needs of their soldiers.

Public affairs training should be of a dual nature. PA staff elements must train themselves to identify the information expectations and requirements of internal and external audiences, evaluate the potential impact of information, develop information communication strategies, assess the effectiveness of information communication, and serve as the interface between the military and the media. They must also train commanders, staff, and soldiers to deal with the media. This includes providing information on First Amendment rights of the media to have access to and report news, soldier rights concerning media interviews, and OPSEC considerations.

Assistance to local communities by Army units can provide training opportunities to soldiers of supporting units.

ENVIRONMENTAL ASSISTANCE

Environmental awareness instruction has been developed for inclusion in all leadership courses. The intent is to counter environmental apathy and integrate environmental awareness into operations and training. Training focuses on the four pillars of the Army Environmental Awareness Program, which are compliance, restoration, prevention, and conservation. This training will sensitize leaders to environmental considerations during domestic support operations. It will further enhance the image of the Army's stewardship of the environment.

Training soldiers and civilians to provide environmental assistance to domestic authorities generally requires no special efforts except the training needed to perform their Army jobs.

DISASTER ASSISTANCE OPERATIONS

The Corps of Engineers has DOD-designated responsibilities for disaster assistance operations. It routinely conducts disaster response and recovery missions. Engineers, both military and Army civilian, must be educated and trained to accomplish unique responsibilities directed by the Federal Response Plan. All committed engineer units must be prepared to perform general engineering tasks necessary to establish temporary life-support facilities or to restore basic municipal services.

Commanders may encounter a variety of radiological and chemical hazardous materials (HAZMAT) during the conduct of domestic support operations.

Trained Chemical Corps HAZMAT specialists are available to advise commanders on the identification, avoidance, containment, and neutralization of these substances. Training can be provided by Chemical Corps personnel to emergency response personnel at the federal, state, or local level in several NBC areas. These areas include monitoring, surveying, detecting, identifying, and decontaminating chemical and nuclear hazards. Also, technical expertise is available to provide training to determine the type and extent of toxic contamination, to determine downwind contamination hazard, and to assess vulnerability.

Training for disaster assistance will primarily focus on light urban search and rescue. Selected units may achieve some degree of proficiency while conducting normal METL training. The urgency of response rarely affords commanders the ability to train after the alert notification is issued. Although CS and CSS units will routinely be expected to execute this mission, combat units could also be tasked. In all cases, unit METLs incorporate tasks which prepare personnel to perform this operation. For example, a supply company may have the METL task to receive, store, and distribute supplies. This same task could apply to disaster assistance operations, even though the supplies may be donated food and clothing and not military supplies. Figure 9-3 provides some additional examples of normal METL training that support disaster assistance.

The senior commanders involved must understand the DOD role in the Federal Response Plan. They then ensure subordinate leaders are familiarized with civil and municipal operations. For units to be quickly and smoothly deployed for domestic support they must know the specific rules for their employment. They must know the reporting channels, have a clear understanding of who is in charge, and know how the unit will receive necessary supplies. All leaders receive introductory contracting and ordering procedures training in professional development courses. However, they may require additional or refresher training in order to obtain supplies when operating outside the normal military logistics support arena. Some leaders may need to be trained as contracting and ordering officers.

Mass immigration emergency support is another form of humanitarian assistance. Again, routine

conduct of common skills training will prepare units to execute this operation. Any specialized training requirements will have to be identified by tasked commanders in conjunction with the Department of Justice and the Immigration and Naturalization Service.

LAW ENFORCEMENT SUPPORT OPERATIONS

The three distinct missions grouped under law enforcement support are counterdrug, civil disturbance, and combatting terrorism. Many tasks on which units train to meet wartime mission requirements are directly applicable. In cases where requirements are unrelated to the wartime METL, commanders must employ mission focus to define new training needs. Civilian law enforcement agencies must understand that very specific laws govern the use of the military to support civilian law enforcement activities.

The National Guard conducts a great deal of training and maintains a viable force to support law enforcement in counterdrug, civil disturbance, combatting terrorism, and key asset protection. The National Guard Bureau provides funding to the states to develop key asset security plans and to train leaders in civil disturbance operations. Hurricane Andrew is an excellent example where the Florida National Guard was on the street within hours after passage, providing security support with trained personnel to law enforcement agencies.

Counterdrug missions present unique training opportunities. Units formulate plans to conduct training in high-intensity drug trafficking areas. If appropriate, units will be integrated into federal or state Drug Enforcement Agency operations.

Elements of the 854th Engineer Battalion, 77th US Army Reserve Command, provided the manpower and equipment to clear and grade 20 acres for construction of a new softball and Little League fields in Hyde Park, New York.

Commanders are responsible for civil disturbance operations training. As an exception to most domestic support operations, OPLAN GARDEN PLOT requires that Army units conduct civil disturbance training. Assigned missions and command guidance determine the frequency of training. Specific training for commanders and staffs should address legal and psychological considerations. Training for soldiers should address legal and psychological considerations, rules of engagement, search and seizure, use of special equipment, and crowd control techniques.

Commanders are responsible for civil disturbance operations training.

Combatting terrorism includes defensive measures against terrorist attack. All soldiers must train on the fundamentals necessary to defend installations, units, and individuals against terrorist attack. Combatting terrorism is a force protection measure and the responsibility of commanders at every level. Military police have the capability to conduct specialized training for combatting terrorism for both the Army and civil authorities. The use of explosives and booby traps is a common tool employed by terrorists. EOD personnel can provide training and planning assistance for combatting terrorism operations.

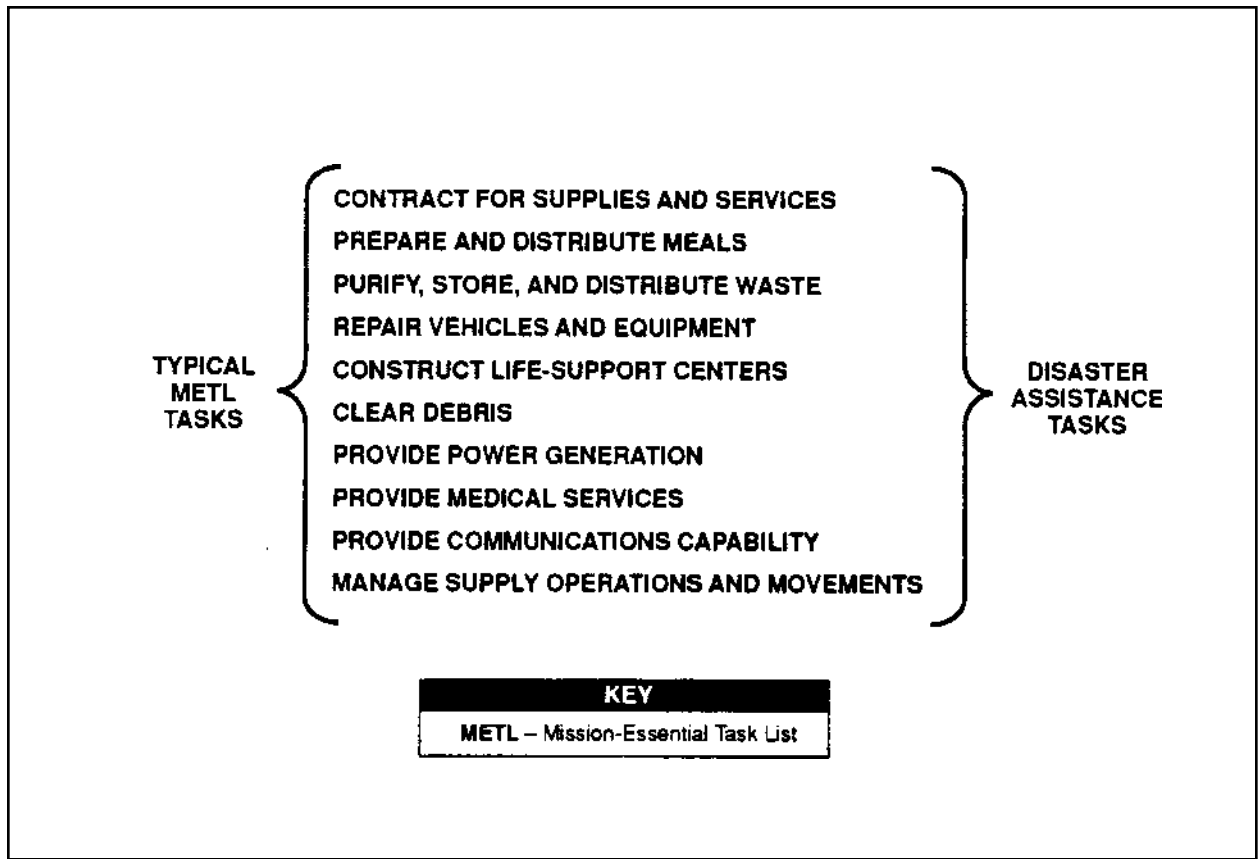

Figure 9-3. Disaster Assistance Supporting Tasks

SUMMARY

Wartime mission training is the basis of the Army’s capability to provide domestic support. Specialized training, when directed by the respective CINC or MACOM commander, will be conducted for selected operations. Leader training for domestic support operations is vital to provide unit responsiveness to the community without reducing proficiency in warfighting tasks.

APPENDIX

ANALYSIS OF THE AREA OF OPERATIONS FOR DISASTER ASSISTANCE

The analysis of the area of operations is a detailed study conducted within time constraints to serve as the basis for developing specific courses of action. It includes an analysis of weather, terrain, and other factors such as the political boundaries, governmental structures, economy, social groups, location, scope, and severity of damage throughout the commander's projected area of operations.

The civil-military operations (CMO) team is responsible for initiating, coordinating, completing and disseminating the final analysis of the area of operations, which represents a coordinated staff effort with federal and state agencies. Considerations for area analysis may also apply to other types of operations. In any event, the assigned mission will dictate what essential elements of information (EEI) are needed.

ESSENTIAL ELEMENTS OF INFORMATION

In most cases, the EEI about the area of operations can be readily determined by consulting several FORSCOM automated systems. One of these is the FORSCOM Automated Intelligence Support System (FAISS), a geographic information system that uses Defense Mapping Agency maps and a variety of data bases to locate and display many of the EEI. A second automated system available at FORSCOM is a DOD resource data base that contains information about military resources and points of contact that might be used or called upon to respond to domestic support operations. The FEMA also has automated systems, such as their Disaster Analysis System (an automated mapping program), which they make available to military commanders to facilitate analyses and mapping of the closest critical resources. Typical EEI are discussed briefly below.

In preparing the analysis of the area of operations, the information that the CMO team gathers to satisfy the commander's EEI normally includes:

- Location of victims needing rescue, evacuation, and emergency medical treatment and status of local emergency medical capabilities. Of particular importance are severe weather and terrain conditions that may significantly displace the population. Existing facilities or locations for temporary housing of displaced persons should be identified.
- Description and status of lines of communication (LOCs), including major roads, railroads, waterways, ports, and airports. Typically, the detailed status of airfields, ports and harbors, rail facilities, facilities for maintenance and storage, and electronic media and telephone towers is unknown during the first hours or day after the event. If possible, information on these infrastructure facilities within the impacted area should state the nature and extent of damage and projected repairs.
- Weather conditions. List or refer to other documents containing, for the period under study, meteorological conditions, including precipitation, fog, cloud conditions, temperature, relative humidity, light data (including moon phases, moonrise and moonset, beginning and end of nautical and civil twilights), magnetic phenomena, extended forecast, and other data as appropriate.
- Characteristics of physical damage in specific disaster areas, that is, housing, commercial, industrial, public utilities, and so forth. In

residential areas, damage assessment should start in high-density and low-income areas. Mobile homes are especially vulnerable and may contain a larger proportion of the elderly and children than other areas. High-rise apartment buildings and business offices are potential areas of risk in no-warning events (earthquakes and tornados), depending on the time of the occurrence.

- Numbers and locations of displaced persons. Economically distressed areas are characterized by higher residential density, lower maintenance, and older structures, which combine to increase the probability of victims. These areas are frequently adjacent to manufacturing or industrial areas containing potentially hazardous materials. Identifying fires, chemical spills, or ruptured pipelines near residential areas is a priority.
- Population of discrete areas such as trailer parks, apartments, and subdivisions. Residents of economically distressed areas are more likely to remain in the area and require a greater level of support after the event than those in more affluent areas. School buildings and warehouses in these areas are excellent candidates for shelter, feeding, and life-support sites. Generally, the more affluent population live in less densely populated areas with better construction. If not trapped, they have the economic resources to seek alternative living arrangements.
- General age distribution of population in above areas.
- General ethnic distribution of population in disaster areas; include types of linguists required.
- Areas without electricity.
- Areas without water, status of water purification systems, and availability of commercial purification equipment and products.
- Location and capabilities of medical facilities (hospitals, clinics, nursing homes, and so forth).
- Status of sanitation systems.
- Relief and drainage systems. Determine effects on trafficability for unit vehicles involved in rescue and relief efforts. Estimate time to improve drainage in flooded areas; include bridging requirements if applicable.

- Obstacles. Identify areas where debris impedes trafficability.
- Surface materials. Identify type and distribution of soils and subsoils in area and soil trafficability.
- Man-made features. Identify man-made changes in the topography, including roads, railroads, bridges, tunnels, mines, towns, industrial areas, and piers. Identify unsafe structures requiring demolition.
- Sources of all classes of supply needed for critical restoration activities.
- Local sources of media reproduction, especially high-speed, large-format printing.
- Availability of civilian engineer equipment and personnel.

The above EEI will be significantly modified after the first 72 hours and will be replaced by increasing demands for specific information on other aspects of the event. The management of information may become more difficult as the quantity and quality of information increase. As additional state and federal assets arrive in the area of operations, coordination and communication become more complicated.

New information requirements are generated by the need to deploy the resources efficiently and effectively. DOD planners and operators at this point should be integrated, if possible, with the FEMA's ESF-5, Information and Planning Operations, which focuses on establishing a centralized repository of data for executing relief operations.

SOURCES OF INFORMATION

Sources of information that will satisfy many of the commander's EEI include:

- Information provided by federal, state, and local governments and commercial and private agencies.
- National and local media and their reports.
- Aerial reconnaissance.
- The engineer's terrain analysis.
- The staff weather officer's meteorological data.

- The provost marshal's analysis of route reconnaissance, state of law and order, and other information.
 - Analysis prepared by other headquarters.
 - Information on city, county, and state government; city, county, and state police; utility districts; fire, ambulance, and hospital districts; and federal/national agencies (USACE, Red Cross, and so forth). Intelligence personnel can be used for liaison as well as other intelligence support activities, but their use must be in accordance with governing directives.
 - Maps. The US Geological Service and the Defense Mapping Agency are two sources for maps. DOD customers requiring USGS products may process requests through the DMA. Maritime and coastal maps may be obtained from the USCG as required. Local topography and maps can be provided by state land-use master plans, state pollution control, state water management, local public works departments, local water and sewer works, zoning boards, county recorder, local map printers, local tourism departments, local geographic information systems, chambers of commerce, and university departments.
 - Imagery Products. Imagery or imagery-derived products supporting domestic operations can be obtained from commercial or government sources. The USACE district offices can provide imagery products for floodplain areas. A request can also be forwarded through the chain of command to the Army Operations Center. Civilian aircraft imagery should be obtained wherever possible. If commercial capabilities are not available, aerial assets may be used.
 - Demographics and business data for metropolitan areas. These are provided by the US Bureau of Census, the US HUD Community Block Grant Program, state agency or local housing authority, and commercial data base products.
- The above list is not all-inclusive. As the operation progresses, changes in the mission or receipt of additional or more accurate information will require revision of the analysis and modification of the EEL.

Civil authorities

Those elected and appointed officers and employees who constitute the government of the United States, of the 50 states, the District of Columbia, the Commonwealth of Puerto Rico, US possessions and territories, and political subdivisions thereof.

Civil defense

All those activities and measures designed or undertaken to minimize the effects caused, or that would be caused, by an attack upon the United States or by a natural or technological disaster; to deal with the immediate emergency conditions that would be created; and to effect emergency repairs to, or the emergency restoration of, vital utilities and facilities destroyed or damaged by any such attack or disaster.

Civil disturbances

Riots, acts of violence, insurrections, unlawful obstructions or assemblages, or other disorders prejudicial to public law and order. The term includes all domestic conditions requiring or likely to require the use of federal armed forces pursuant to the provisions of Chapter 15, Title 10, United States Code.

Civil emergency

Any natural or man-made disaster or emergency that causes or could cause substantial harm to the population or infrastructure. This term can include a “major disaster” or “emergency” as those terms are defined in The Stafford Act, as amended, as well as consequences of an attack or a national security emergency. “Major disasters” and “emergencies” are defined substantially by action of the President in declaring that extent circumstances and risks justify his implementation of the legal powers provided by statute.

Civil emergency preparedness

The nonmilitary actions taken by federal agencies, the private sector, and individual citizens to meet essential human needs, to support the military effort, to ensure continuity of federal authority at national and regional levels, and to ensure survival as a free and independent nation under all emergency conditions, including a national emergency caused by threatened or actual attack on the United States.

Civil government resources

Civil resources owned by, controlled by, or under the jurisdiction of civilian agencies of the US Government, or of state and local government agencies. Civilian law enforcement official An officer or employee of a civilian agency with responsibility for enforcing the laws within the jurisdiction of the agency. These may include the DEA, the FTA, the FBI, or state police.

Civil resources

Resources that normally are not controlled by the government, including the work force, food and water, health resources, industrial production, housing and construction, telecommunications, energy, transportation, minerals, materials, supplies, and other essential resources and services. No one except authorized civil government authorities can order such resources to support the needs of the public.

ESF 1 Transportation

This ESF coordinates federal transportation support to state and local government entities, voluntary organizations, and federal agencies requiring transportation to perform disaster assistance missions following a catastrophic earthquake, significant natural disaster, or other event requiring federal response.

ESF 2 Communications

This ESF assures the provision of federal telecommunications support to federal, state, and local response efforts following a Presidentially declared emergency, major disaster, extraordinary situation, and other emergencies under the Federal Response Plan.

ESF 3 Public Works and Engineering

Public works and engineering support includes technical advice and evaluations, engineering services, potable water, construction management and inspection, emergency contracting, emergency repair of wastewater and solid waste facilities, and real estate support as required.

ESF 4 Firefighting

The purpose of this ESF is to detect and suppress wildland, rural, and urban fires resulting from, or occurring coincidentally with, a catastrophic earthquake, significant natural disaster, or other event requiring federal response assistance.

ESF 5 Information and Planning

The purpose of this ESF is to collect, process, and disseminate information about a potential or actual disaster or emergency to facilitate the overall activities

of the federal government in providing response assistance to an affected state.

ESF 6 Mass Care

This ESF coordinates efforts to provide shelter, food, and emergency first aid following a catastrophic earthquake, significant natural disaster, or other event requiring federal assistance; to operate a DWI System to collect, receive, and report information about the status of victims and to assist with family reunification within the disaster area; and to coordinate bulk distribution of emergency relief supplies to disaster victims following a disaster.

ESF 7 Resource Support

This ESF provides logistical/resource support following a catastrophic earthquake, other significant natural disaster, or other event requiring federal response, including emergency relief supplies, space, office equipment, office supplies, telecommunications, contracting services, transportation services (in coordination with ESF 1), and personnel required to support immediate response activities.

ESF 8 Health and Medical Services

This ESF provides government-coordinated assistance to supplement state and local resources in response to public health and medical care needs following a significant natural disaster or man-made event.

ESF 9 Urban Search and Rescue

The US&R activities include locating, extricating, and providing for the immediate medical treatment of victims trapped in collapsed structures.

ESF 10 Hazardous Materials

This ESF provides federal support to state and local governments in response to an actual or potential discharge and/or release of hazardous materials following an earthquake or other disaster.

ESF 11 Food

This ESF identifies, secures, and arranges for the transportation of food to affected areas following a major disaster or emergency or other event requiring federal response.

ESF 12 Energy

This ESF facilitates restoration of the nation's energy systems following a catastrophic earthquake, natural disaster, or other significant event requiring federal assistance.

EUCOM

federal

Federal coordinating officer

The FCO is the senior federal official appointed to coordinate overall response and recovery activities. The FCO represents the President in coordinating the federal relief activities in a designated area.

Federal function

Any function, operation, or action carried out under the laws of the United States by a department, agency, officer, or employee of the United States.

Federal property

Property that is owned, leased, possessed, or occupied by the federal government.

Federal region A grouping of states and territories by which FEMA coordinates responsibilities of the state governments with those of federal departments and agencies for disaster relief, civil defense, and planning for both civil and national security emergencies. These regions are sometimes referred to as "FEMA regions" to distinguish them from any one of the various alignments of other federal departments and agencies, all of which are circumscribed by FEMA's coordination authority.

Federal Response Plan (FRP)

The interdepartmental planning mechanism, developed under FEMA leadership, by which the federal government prepares for and responds to the consequences of catastrophic disasters. Federal planning and response are coordinated on a functional group basis, with designated lead and support agencies for each identified functional area.

FEMA

Federal Emergency Management Agency

Immediate response

Any form of immediate action taken by a DOD component or military commander under the authority

of the FRP and any supplemental guidance to assist in saving lives, preventing human suffering, or mitigating great property damage under imminently serious conditions where there has not been an attack or any declaration of major disaster or emergency by the President.

Imminently serious conditions

Emergency conditions in which, in the judgment of the military commander or responsible DOD official, immediate and possibly serious danger threatens the public and prompt action is needed to save lives, prevent human suffering, or mitigate great property damage. Under these conditions, timely prior approval from higher headquarters may not be possible before action is necessary for effective response.

Improvised explosive device

A nonstandard item, usually crude and simple in design, containing an arming or timing system, an initiator, and an explosive filler. A homemade bomb.

INS

Immigration and Naturalization Service

Insurrection.

The act of unlawfully rising in open resistance against established authority or government or against the execution of the laws of government.

National Disaster Medical System.

An interdepartmental mutual aid system developed by federal departments and agencies to provide for the medical needs of victims of major disasters and to provide backup support for DOD and VA medical systems in caring for casualties from military conflicts. The DHHS serves as the lead federal agency for administering NDMS and coordinates NDMS operations in response to civil emergencies. The DOD could activate and coordinate NDMS operations in support of military contingencies. National security emergency Any occurrence, including natural disaster, military attack, technological emergency, or other emergency, that seriously degrades or threatens the national security of the United States.

Planning agent
A military or civilian official of any DOD component who has been designated by the head of that component to exercise delegated authority for civil assistance planning for the entire component (i.e., "principal planning agent") or for certain subordinate elements or a specified geographic area (e.g., "region planning agents"). Authority and responsibilities of each planning agent will be defined by the component and may include civil assistance response as well as planning at the election of any component. Planning agents' actual authority will be communicated to others as determined by the DOD component, or when requested by the DOD executive agent.

PLL
prescribed load lists

POA
point of arrival

POC
point of contact

Point of arrival
The designated location (typically an airport) within or near the disaster-affected area where newly arriving

staff, supplies, and equipment are initially directed. Upon arrival, personnel and other resources are dispatched to either the DFO, a mobilization center, a staging area, or a disaster site.

Point of departure

The designated location (typically an airport) outside of the disaster-affected area from which response personnel and resources will deploy to the disaster area.

RECA

residual capability assessment

Regional military emergency coordinator

An individual designated on behalf of the Secretary of Defense and the DOD executive agent to coordinate, exchange, information, and perform liaison functions on behalf of the DOD with any federal emergency management structure established at the regional level.

Regional Operations Center (ROC)

The facility established at a FEMA regional office (or a federal regional center) in response to (or in

anticipation of) an event that may require federal assistance under the FRP. The ROC is staffed by FEMA regional personnel and representatives from the ESF primary agencies as required. It serves as an initial point of contact in the region for the affected state(s), the national emergency support team, and federal agencies.

Residual capability assessment

An assessment of the effects of a nuclear or conventional attack on US resources or of a major peacetime disaster that results in the declaration of a national security emergency. Such an assessment is made (through all appropriate means) to determine the remaining capabilities of the United States, with emphasis on military preparedness.

Resource claimancy

The procedure, employed during any period of attack or national security emergency, whereby authorized federal agencies determine definitive requirements and justify the allocation of civil government and civil resources needed to support programs under their cognizance. It does not imply procurement activity, nor does it involve the government as an intermediary in the normal mechanisms of trade other than in expediting essential activities and ensuring equitable distribution of civil resources. Resource claimancy occurs at both the national and regional levels.

Risk

An expression of possible loss over a specific period of time or number of operating cycles.

Risk assessment

The process of detecting hazards and systematically assessing their overall risk. It is a part of the risk management process.

Risk management

The process whereby decisions are made and actions implemented to eliminate or reduce the effects of identified hazards.

TC

training circular

Technological hazard

A range of hazards emanating from the manufacture, transportation, and use of such substances as radioactive materials, chemicals, explosives, flammables, agricultural pesticides, herbicides, and disease agents; oil spills on land, coastal waters, or inland water systems; and debris from space.

Terrorism.

The calculated use of violence or the threat of violence to attain goals that are political, religious, or ideological in nature. This can be done through intimidation, coercion, or instilling fear. Terrorism includes a criminal act against persons or property that is intended to influence an audience beyond the immediate victims.

Preface

In 1996, the United States (US) Army Military Police (MP) Corps restructured its four combat support (CS) missions into the following five CS functions. These functions adequately describe MP capabilities in support of US forces deployed worldwide.

- Maneuver and mobility support.
- Area security.
- Law and order (L&O).
- Internment/resettlement (I/R).
- Police intelligence operations.

Field Manual (FM) 3-19.40 depicts the doctrinal foundation, principles, and processes that MP will employ when dealing with enemy prisoners of war (EPWs), civilian internees (CIs), US military prisoner operations, and MP support to civil-military operations (populace and resource control [PRC], humanitarian assistance [HA], and emergency services [ES]). FM 3-19.40 is not a standalone manual, and it must be used in combination with other publications. These publications are pointed out throughout the manual, and a consolidated list is provided in the bibliography.

This manual provides guidance that can be used by US Army service schools, students, sister services, and federal agencies. It is fully compatible with current joint, multinational, and interagency doctrine.

The proponent of this publication is HQ TRADOC. Send comments and recommendations on Department of the Army (DA) Form 2028 directly to Commandant, US Army Military Police School, ATTN: ATSJ-MP-TD, 401 MANSCEN Loop, Suite 2060, Fort Leonard Wood, Missouri 65473-8926.

This publication implements Standardization Agreement (STANAG) 2044, Procedures for Dealing With Prisoners of War (PW) (Edition 5), 28 June 1994. **NOTE: The DA term EPW is interchangeable with the term PW used in STANAG 2044. The DA uses the term PW when referring to US soldiers who are prisoners of the enemy and uses the term EPW when referring to enemy soldiers who are prisoners of the US.**

Appendix A contains a metric conversion chart.

Unless this publication states otherwise, masculine nouns and pronouns do not refer exclusively to men.

PART ONE

Fundamentals of Internment/Resettlement Operations

Part One provides information that is critical in understanding the I/R function. Chapter 1 introduces the manual by providing key definitions, establishing the I/R objectives and principles, and providing a list of agencies concerned with I/R operations. Chapter 2 describes commander and staff responsibilities that are unique to I/R operations. Together, these chapters provide leaders and soldiers with the foundation necessary for successful implementation of national military objectives as they relate to I/R operations.

Chapter 1

Introduction

This chapter provides key definitions as set forth by the Geneva and Hague Conventions, Army regulations (ARs), and the Uniform Code of Military Justice (UCMJ). These definitions explain personnel categories that the MP commander may be tasked to handle, protect, and account for. He must ensure that personnel are treated according to established laws, regulations, and international agreements. The MP leaders and soldiers conducting I/R operations must maintain task proficiency for each category.

PROCEDURES

1-1. Unlike EPW/CI operations in the past, I/R operations include additional detained persons. The I/R operations include handling, protecting, and accounting for dislocated civilians (DCs) and conducting battlefield confinement of US military prisoners. With the alignment of these additional categories, leaders and soldiers must ensure that they understand and are prepared to apply the rules of engagement (ROE) and the rules of interaction (ROI) that apply to each category. The keys to a successful I/R operation are getting the mission accomplished and performing the mission under the correct mind-set. For example, the ROE that may apply to an EPW may not apply to a refugee or a US military prisoner. However, an MP may be tasked to handle each category during the course of an operation. This dimension is addressed throughout the manual to increase the MP commander's situational awareness (SA) as it relates to this aspect of I/R operations.

DEFINITIONS

1-2. The following terms are defined below:

- Combat zone (CZ).
- EPW.
- CI.
- Retained person (RP).
- Other detainee (OD).
- DC.
 - Displaced person (DP).
 - Refugee.
 - Evacuee.
 - Stateless person.
 - War victim.
 - Migrant.
 - Internally displaced person (IDP).
 - Expellee.
- US military prisoner.

COMBAT ZONE

1-3. The CZ is the area required by combat forces to conduct operations. It normally extends forward from the land force's rear boundary. The communications zone (COMMZ) is the rear part of the theater of operations (TO). It is behind and contiguous to the CZ. The COMMZ contains lines of communication (LOC), supply and evacuation areas, and other agencies required for the immediate support and maintenance of field forces. It reaches to the continental United States (CONUS), to a supporting combatant command's area of responsibility (AOR), or to both. An EPW must be moved as quickly as possible from the CZ to the COMMZ where an I/R unit interns him.

NOTE: For a complete discussion on the operational framework of a CZ, see FM 3-0.

ENEMY PRISONER OF WAR

1-4. As defined in the Geneva Convention Relative to the Treatment of Prisoners of War (GPW), 12 August 1949, an EPW is—

- A member of an enemy armed force or a member of a militia or a volunteer corps forming part of an enemy armed force.
- A member of a militia or a volunteer corps (including an organized resistance movement) that (1) belongs to an enemy power, (2) operates in or outside its own territory (even if the territory is occupied), and (3) fulfills the following conditions:
 - The organization is commanded by a person responsible for his subordinates.
 - The organization has a fixed, distinctive sign that is recognizable at a distance.
 - The members are carrying arms openly.

- The organization is conducting operations according to the laws and customs of war.
- A member of an enemy armed force who professes allegiance to a government or an authority not recognized by the detaining power (the US).
- A person who accompanies an enemy armed force without actually being a member (a civilian member of a military aircraft crew, a war correspondent, a supply contractor, a member of a labor unit, or a member of a service that is responsible for enemy welfare) if he has authorization and an identification (ID) card from the armed force.
- A crew member (a master, a pilot, or an apprentice of a merchant marine or a member of a civil aircraft under the enemy's power) who does not benefit from more favorable treatment under other provisions of international law.
- Inhabitants of an unoccupied territory who spontaneously take up arms to resist invading US armed forces (without having time to form themselves into a regular armed unit) if they carry arms openly and respect the laws and customs of war.

1-5. The following persons are treated as EPWs:

- A person who qualifies for EPW status under paragraph 1-4 (if the US is a party to the conflict) and falls into the hands of the US as a neutral or nonbelligerent power.
- A person belonging to or having belonged to an armed force of a country occupied by the US (if the US considers it necessary by reason of such allegiance to intern him) even though he may have been originally liberated from EPW status by the US while hostilities were going on outside the occupied territory. Particular application is made to a person who has made an unsuccessful attempt to join an armed force that is engaged in combat or who has failed to comply with a summons for internment.

1-6. Captured enemy personnel are presumed to be EPWs immediately upon capture if the circumstances are unmistakable (armed, uniformed enemy). If questions arise as to whether captured personnel belong in the EPW category, they receive the same treatment as EPWs until their status is determined by a competent military tribunal according to AR 190-8.

CIVILIAN INTERNEE

1-7. A CI is a person who is interned during armed conflict or occupation if he is considered a security risk or if he needs protection because he committed an offense (insurgent, criminal) against the detaining power. A CI is protected according to the Geneva Convention Relative to the Protection of Civilian Persons in Time of War (GC), 12 August 1949.

RETAINED PERSON

1-8. An RP is an enemy who falls within one of the following categories:

- A person who is a member of the medical service of an enemy armed force.

- A medical person exclusively engaged in—
 - Searching, collecting, transporting, or treating wounded or sick personnel.
 - Preventing disease.
 - Administering a medical unit or establishment.
- A chaplain attached to an enemy armed force.
- A member of the International Federation of Red Cross and Red Crescent Societies (IFRC) or another voluntary aid organization. The organization must be duly recognized and authorized by its government. The staff may be employed in the same duties as medical personnel if the organization is subject to military laws and regulations.

1-9. An RP is a special category for medical personnel and chaplains because of their special skills and training. They may be retained by the detaining power (see FM 27-10) to aid EPWs, preferably those of the armed force to which the RP belongs. Per the Geneva Conventions, RPs receive the same benefits and protection as EPWs. The following privileges and considerations are extended to RPs due to their professions:

- Correspondence privileges that are over and above those afforded to EPWs.
- Facilities to provide medical care, spiritual assistance, and welfare services to EPWs.
- Transportation for periodic visits to EPW branch I/R facilities and hospitals outside the EPW I/R facility to carry out medical, spiritual, and welfare duties.
- Work assignments that are restricted to medical and religious duties they are qualified to perform.
- Quarters that are separate from EPW quarters when practicable.

NOTE: For a complete discussion on RPs, see AR 190-8.

OTHER DETAINEE

1-10. A person in the custody of US armed forces who has not been classified as an EPW (Article 4, GPW), an RP (Article 33, GPW), or a CI (Article 78, GC) is treated as an EPW until a legal status is ascertained by competent authority.

DISLOCATED CIVILIAN

1-11. A DC is a civilian who left his home for various reasons. His movement and physical presence can hinder military operations. He most likely requires some degree of aid (medicine, food, shelter, or clothing). A DC may not be native to the area (local populace) or to the country where he resides. A DC is a generic term that is further subdivided into the following categories:

- **DP.** A DP has been dislocated because of war, a natural disaster, or political/economic turmoil. Consequently, the motivation for civilians to flee and their status under international and domestic laws vary, as does the degree of assistance required and the location for relief

operations. Likewise, the political, geographical, environmental, and threat situations also vary.

- **Refugee.** The Geneva Convention Relative to the Status of Refugees (1951) states that a refugee is a person who “owing to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership in a particular social group, or political opinion, is outside the country of his nationality, and is unable to or, owing to such fear, is unwilling to avail himself of the protection of that country.”
- **Evacuee.** An evacuee is a civilian who is removed from his place of residence by military direction because of personal security or other requirements of the military situation.
- **Stateless person.** A stateless person is a civilian who has been denationalized, whose country of origin cannot be determined, or who cannot establish his right to nationality claimed.
- **War victim.** A war victim is a civilian who suffered an injury, a loss of a family member, or damage to or destruction of his home because of war.
- **Migrant.** A migrant is a worker who moves from one region to another by chance, instinct, or plan.
- **IDP.** An IDP may have been forced to flee his home for the same reasons as a refugee, but he has not crossed an internationally recognized border.
- **Expellee.** An expellee is a civilian who is outside the boundaries of his country of nationality or ethnic origin and is being forcibly repatriated to that country or a third country for political or other purposes.

UNITED STATES MILITARY PRISONER

1-12. A US military prisoner is sentenced by a court-martial to confinement or death and ordered into confinement by competent authority, whether or not the sentence has been approved by the convening authority. A person placed into confinement by competent authority pending trial by court-martial is a pretrial prisoner or a pretrial detainee.

OBJECTIVES

1-13. The objectives of I/R operations are to process, handle, care for, account for, and secure—

- EPWs.
- CIs.
- RPs.
- ODs
- DCs.
- US military prisoners.

1-14. The principles employed to achieve the objectives are according to the Hague Convention (1907), the Geneva Conventions (1949), the Geneva Convention Relative to the Status of Refugees (1951) and its protocol (1967), and current STANAGs. These principles include—

- Humane treatment and efficient care.
- Prompt evacuation from the CZ.
- Provisions for captive or detainee interrogation.
- Procedures for evacuation, control, and administration of internees with other CS and combat service support (CSS) operations.

NOTE: The principles employed for US military prisoners are outlined in AR 190-47 and Department of Defense (DOD) Directive 1325.4.

AGENCIES

1-15. The expanded MP functions of I/R involve certain international and domestic organizations not previously considered during MP operations. There are numerous private relief organizations, foreign and domestic, that are involved in humanitarian relief and I/R operations. Likewise, the media normally provides extensive coverage of I/R operations. In many instances, the DOD will not be the lead agency in I/R operations, which adds to the complexity. For instance, the DOD could be tasked in a supporting role, with the Department of State (DOS) or another agency in the lead.

DEPARTMENT OF DEFENSE

1-16. Under the Geneva Conventions and subsequent protocols, a capturing power is responsible for proper and humane treatment of detainees from the moment of capture or other apprehension. The Secretary of the Army is the executive agent for DOD I/R operations and administration. He is responsible for plans, policy development, and operational coordination for persons captured and interned by US armed forces. Navy, Marine, and Air Force units that detain or capture persons turn them over to the Army at designated receiving points after initial classification and administrative processing.

1-17. Per DOD Directive 3025.1, the Secretary of the Army tasks DOD components to plan and commit DOD resources in response to requests for military support from civil authorities. The Director of Military Support (DOMS) provides leadership in this effort.

1-18. Examples of DOD decision makers are the Under Secretary of Defense (USD) for Policy and the Deputy Assistant Secretary of Defense (DASD) for Humanitarian and Refugee Affairs (H&RA). The USD for Policy develops and administers military policies and programs for international HA and foreign relief operations. The DASD for H&RA executes the policies and tasks the services accordingly.

DEPARTMENT OF STATE

1-19. The DOS is organized into functional and regional bureaus. It represents the US via embassies throughout the world.

FEDERAL EMERGENCY MANAGEMENT AGENCY

1-20. Per the Stafford Act, the federal government responds to disasters and emergencies to save lives and protect public health, safety, and property. The

Federal Emergency Management Agency (FEMA) is responsible for the nation's emergency management system. Local and state programs are the heart of the nation's emergency management system, and most disasters are handled by local and state governments. When devastations are especially serious and exceed local and state capabilities and resources, states turn to the federal government for help.

1-21. When the President declares a major disaster, FEMA coordinates response activities for federal agencies that may participate. The agencies help states and localities recover from disasters by providing services, resources, and personnel. They transport food and potable water, provide medical aid, assist with temporary housing, and furnish generators for hospitals and other essential facilities. The FEMA also works with states and territories during nondisaster periods to plan for disasters, develop mitigation programs, and anticipate requirements.

1-22. The Federal Response Plan addresses the consequences of disasters and emergencies. It applies to natural disasters (earthquakes, hurricanes, typhoons, tornadoes, and volcanic eruptions), technological emergencies (radiological and hazardous material [HM] releases), and other incidents. The plan describes the basic mechanisms and structures to mobilize resources and conduct activities that augment state and local efforts. It uses a functional approach to group the types of federal assistance that a state is most likely to need under emergency support functions (ESFs). Each ESF is headed by a primary agency based on its authorities, resources, and capabilities in the functional area. The ESFs are the primary mechanisms through which federal assistance is provided. Federal assistance is provided to affected states under the overall coordination of a federal coordinating officer, who is appointed by the FEMA director on behalf of the President.

MISCELLANEOUS AGENCIES

1-23. Other federal agencies provide advice, assistance, and resources to plan, implement, and accomplish I/R operations. They are the—

- **Department of Transportation (DOT).** Its technical capabilities and expertise in public transportation are available to assist in specific operations.
- **United States Department of Agriculture (USDA).** It has projects and activities ongoing in foreign countries and provides technical assistance and expertise.
- **United States Agency for International Development (USAID).** Although not directly under the control of DOS, USAID coordinates activities at the department and country levels within the federal government.
- **Office of Foreign Disaster Assistance (OFDA).** It provides prompt nonmilitary assistance to alleviate death and suffering of foreign disaster victims. The OFDA may request DOD assistance for I/R operations. The coordination and determination of forces required is normally accomplished through DOD and the joint task force (JTF).
- **United States Information Agency (USIA).** The USIA helps achieve US objectives by influencing public attitudes overseas. It

advises the US government on the possible impacts of policies, programs, and official statements on foreign opinions. The USIA helps HA forces gain popular support and counters attempts to distort and frustrate US and JTF objectives.

- **Department of Justice (DOJ).** The I/R forces may contact the DOJ Community Relations Service for assistance in domestic HA operations. It provides on-site resolution assistance through a field staff of mediators and negotiators.
- **Public Health Service (PHS).** It promotes protection and advancement of the nation's physical and mental health. The US forces work with the PHS during refugee operations in and near the US and its territories.
- **Immigration and Naturalization Service (INS).** It provides information and services to the public while enforcing immigration control. The INS is essential for processing and settling migrants and refugees in the US and its territories.

CIVILIAN ORGANIZATIONS

1-24. Civilian organizations are responsible for a wide range of activities encompassing HA; human rights; the protection of minorities, refugees, and DPs; legal assistance; medical care; reconstruction; agriculture; education; arts; science; and project funding. The commander must understand the mandate, role, structure method, and principles of civilian organizations. Without this understanding, it is impossible to establish an effective relationship with them.

1-25. These organizations may already be in the area of operations (AO), providing HA or some type of relief when I/R operations are planned and implemented. The principle coordinating federal agency is the USAID, and civilian organizations are required to register with the USAID to operate under US auspices.

Types of Civilian Organizations

1-26. There are three principle types of civilian organizations:

- **International organization (IO).** An IO is established by intergovernmental agreements and operates at the international level. Examples of IOs include the—
 - United Nations (UN).
 - United Nations High Commissioner for Refugees (UNHCR).
 - United Nations Development Program (UNDP).
 - United Nations Office for the Coordination of Humanitarian Affairs (UNOCHA).
 - World Food Program (WFP).
 - International Medical Corps (IMC).
- **Nongovernmental organization (NGO).** An NGO is a voluntary organization that is not funded by a government. It is primarily a nonprofit organization that is independent of a government, an IO, or

a commercial interest. It is legally different than an IO because it writes its own charter and mission.

The NGOs are increasingly numerous and sophisticated, and they can number in the hundreds in any conflict. They remain strongly independent from political control to preserve their independence and effectiveness. In many cases, their impartiality has been of great benefit, forming the only available means of rebuilding relations when political dialog has broken down. They are often highly professional in their field and extremely well motivated and prepared to take physical risks in appalling conditions. Examples of NGOs include the—

- Save the Children Foundation (SCF).
- Médecin Sans Frontières (Doctors Without Borders) (MSF).
- Catholic Relief Services (CRS).
- National Council of Catholic Bishops (NCCB).

An NGO is mandated or nonmandated:

- **Mandated.** A mandated NGO has been officially recognized by the lead IO in a crisis and has been authorized to work in the affected area.
- **Nonmandated.** A nonmandated NGO has no official recognition or authorization and, therefore, works as a private concern. A nonmandated NGO can be subcontracted by an IO or a mandated NGO. It can also obtain funds from private enterprises or donors.
- **International humanitarian organization (IHO).** An IHO is an impartial, neutral, and independent organization whose mandate is to assist and protect victims of conflict. It carefully guards its neutrality and does not desire to be associated with or dependent upon the military for fear of losing its special status in the international community that allows it to fulfill its mandate. Examples of IHOs include the—
 - International Organization for Migration (IOM).
 - International Committee of the Red Cross (ICRC).
 - IFRC.

Civilian Lead Agencies

1-27. A lead agency is mandated by the international community to initiate the cooperation of civilian organizations that volunteer to participate in an operation. The lead agency is normally a major UN agency, such as the UNHCR or the UNOCHA, and it—

- Acts as the point of contact (POC) for other agencies.
- Coordinates field activities to avoid duplicating effort and wasting resources.

Understanding Civilian Organizations

1-28. A good working relationship can be established with NGOs, IOs, and IHOs through trust and understanding. The most effective way for military forces to understand an organization's knowledge, skills, and abilities is to

establish and maintain a liaison with it. This understanding can also be gained through educating military leaders in military schools and courses.

UNITED NATIONS

1-29. The UN is involved in the entire spectrum of HA operations from prevention to relief. Typically, UN relief agencies establish independent networks to execute their humanitarian-relief operations. The UN system delegates as much as possible to agency elements located in the field, with supervisory and support networks traced from field officers back to UN headquarters. Military planners must be familiar with UN objectives to ensure compatibility with military plans and orders. The UN agencies include the United Nations Disaster Relief Coordinator (UNDRC) and the UNHCR:

- **UNDRC.** It coordinates assistance to persons compelled to leave their homes because of disasters.
- **UNCHR.** It—
 - Provides international protection to refugees. It promotes the adoption of international standards for the treatment of refugees and supervises implementation of the standards.
 - Seeks permanent solutions for refugee problems. It facilitates voluntary repatriation and reintegration of refugees into their country of origin. Where practical, it facilitates their integration into a country of asylum or a third country.
 - Provides other activities that include emergency relief counseling, education, and legal assistance. These activities entail a very active role in monitoring human rights.
 - Helps governments meet their obligations concerning refugees under various international statutes.

INTERNATIONAL RED CROSS AND RED CRESCENT MOVEMENTS

1-30. Three organizations make up the International Red Cross and Red Crescent Movement. They are the—

- **IFRC.** It provides relief operations to help victims of natural and man-made disasters. It has a unique network of national societies throughout the world. The IFRC is the umbrella organization for the ICRC.
- **ICRC.** It acts as a monitoring agent for the proper treatment of EPWs and other detained persons. It coordinates National Red Cross and Red Crescent Societies' international relief operations for victims of conflict. The ICRC reports violations of international humanitarian laws and promotes awareness and development of humanitarian laws among nations.
- National Red Cross and Red Crescent organizations.

NOTES:

1. These organizations are distinctly different and have separate mandates and staff organizations. Do not consider them to be one organization.

2. Red Crescent organizations are found in predominately Muslim countries. They have the same goals and missions as Red Cross organizations.

1-31. Although the ICRC is essentially Swiss, it has worldwide operations and acts as a neutral intermediary in armed conflicts. The ICRC ensures that conflict victims receive appropriate protection and assistance within the scope of the Geneva Conventions, their protocols, and the ICRC mandate. The ICRC undertakes protection and assistance activities for the benefit of detainees and civilian populations by—

- Visiting detainees and attempting, through confidential contacts, to ensure compliance with the Geneva Conventions.
- Supervising prisoner releases and exchanges.
- Providing emergency relief to civilians who are affected by an armed conflict or a natural disaster.
- Tracing individuals who are displaced because of an armed conflict or a natural disaster.
- Organizing family contacts and reunions.

PROTECTION OF CAPTIVES AND DETAINEES

1-32. The provisions of the Geneva Conventions are applicable to captives and detainees from the time they are captured until they are released or repatriated. AR 190-8 is the implementing regulation. When a person is captured during the heat of battle, he is entitled to protection as a detainee.

1-33. Detainees receive humane treatment without distinction of race, nationality, religious belief, political opinion, or similar criteria. Captives and detainees are not murdered, mutilated, tortured, or degraded. They are not punished for alleged criminal acts without previous judgment pronounced by a legally constituted court that has accorded them judicial guarantees which are recognized as indispensable to a fair trial. Individuals and capturing nations are responsible for acts committed against detainees if the acts violate the Geneva Conventions.

1-34. Captives and detainees are entitled to respect, and they are treated with honor and as human beings. They are protected against violence, insults, public curiosity, and reprisals. They are not subjected to physical mutilation or medical or scientific experimentation that is not required for normal medical, dental, or hospital treatment. Coercion is not inflicted on captives and detainees to obtain information. Those who refuse to answer are not threatened, insulted, or exposed to unpleasant or disadvantageous treatment. Female captives and detainees are treated with respect and accorded fair and equal treatment.

PROTECTING POWER

1-35. A neutral state or a humanitarian organization, such as the ICRC, is designated as a protecting power. The protecting power monitors whether detainees are receiving humane treatment as required by international law. Representatives or delegates of a protecting power are authorized to visit detainees where they are interned or confined and to interview them

regarding their internment, welfare, and rights. The interview may be conducted without witnesses. Such visits cannot be prohibited except for imperative military necessity.

UNITED STATES POLICY TOWARDS DETAINEES

1-36. Basic US policy underlying the treatment of detainees and other captured or interned personnel during the course of a conflict requires and directs that all personnel be accorded humanitarian care and treatment from the moment of custody until their final release or repatriation. The US personnel are fully and equally bound to observe this policy whether capturing troops, custodial personnel, or anyone else, regardless of the capacity they may be serving. This policy is equally applicable for protecting detained and interned personnel whether they are known to have committed or are suspected of committing a serious offense that could be characterized as a war crime. The punishment of such persons is administered by the due process of law and under legally constituted authority. Inhumane treatment, even if committed under stress of combat and with deep provocation, is a serious and punishable violation under national law, international law, and the UCMJ.

PROTECTION OF ENEMY PRISONERS OF WAR AND CIVILIAN INTERNEES

1-37. The Geneva Conventions, comprised of four treaties, form part of the supreme law of the land and provide the internationally recognized humanitarian standards for the treatment of war victims. The US ratified the Geneva Conventions for the Protection of War Victims, 12 August 1949. It recognizes the spirit and intent of these treaties in its treatment of EPWs, CIs, and detained and interned persons. The Geneva Conventions became effective in 1956, and the US observes and enforces the terms of these conventions. They are collectively referred to as the Geneva Conventions and include the—

- **GPW.** This convention provides humane treatment of EPWs. It regulates the treatment of internees (care, food, clothing, and housing), discipline and punishment, labor and pay, external relations, representation, the international exchange of information, and the termination of captivity.
- **GC.** This convention deals with the protection for populations against the consequences of war, the status and treatment of protected persons, and the treatment of CIs.
- **Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field, 12 August 1949 (GWS).** This convention provides protection for members of the armed forces and other persons on the battlefield who are wounded or sick. Members in the conflict search for and collect wounded and sick persons, protect them against pillage and ill treatment, and ensure their adequate care. They also search for dead persons and prevent them from being despoiled.
- **Geneva Convention for the Amelioration of the Condition of Wounded, Sick, and Shipwrecked Members of Armed Forces at**

Sea, 12 August 1949 (GWS [SEA]). This convention provides humane treatment and protection for members of the armed forces and other persons at sea who are wounded, sick, or shipwrecked. It also protects hospital ships and burial at sea.

1-38. STANAG 2044 prescribes concepts and procedures for the control and administration of EPWs by US armed forces operating in Europe under operational control (OPCON) of the North Atlantic Treaty Organization (NATO), in coordination with one or more NATO allies, and supported by the doctrine contained in this manual. STANAG 2044 provides—

- Terms and definitions relating to EPWs.
- Procedures for using EPW personnel record forms.
- Procedures for handling EPWs, their personal property, and their money.

PROTECTION OF REFUGEES

1-39. The Geneva Convention Relative to the Status of Refugees (1951) and its protocols (1967) provide a general, universally applicable definition of refugee. They address the minimum standards for the treatment of refugees, specifying the obligations of the host nation (HN) and the refugees to one another. Among the important provisions of the 1951 Convention is the principle of nonrefoulement (Article 33). The principle of nonrefoulement is often referred to as the cornerstone of international protection. This principle prohibits the return or expulsion of a refugee to the territory of a state where his life, freedom, or personal security would be in jeopardy. Through widespread practice, the principle is considered to be a rule of customary law, binding nations whether or not they are signatories.

1-40. The 1951 Convention also provides protection of refugees. A refugee has the right to safe asylum; however, international protection comprises more than physical safety. Refugees receive the same rights and help as any other foreigner who is a legal resident, including certain fundamental entitlements of every individual. Refugees have basic civil rights, including freedom of thought and movement and freedom from torture and degrading treatment. Similarly, refugees have economic and social rights. Every adult refugee has the right to work, and no child refugee is deprived of schooling. In certain circumstances, such as large-scale inflows of refugees, asylum states may feel obliged to restrict certain rights, such as freedoms of movement, work, and education. Such gaps should be filled by the international community when possible. When resources are unavailable from the government of the asylum country or other agencies, the UNHCR will assist.

NOTE: For further details, see the UNHCR Handbook for the Military on Humanitarian Operations, First Edition, 1995.

Chapter 2

Commander and Staff Responsibilities

All MP commanders and staff members must be familiar with applicable ARs, Army directives, and international laws necessary for the successful operation of I/R and confinement facilities. This chapter discusses areas of greatest concern when performing the I/R function.

SECTION I - COMMANDERS

2-1. An MP battalion commander tasked with operating an I/R facility is also the facility commander. As such, he is responsible for the safety and well-being of all personnel housed within the facility. Since an MP unit may be tasked to handle different categories of personnel (EPW, CI, OD, refugee, and US military prisoner), the commander, the cadre, and support personnel must be aware of the requirements for each category.

PROCEDURES

2-2. Commanders are familiar with applicable regulations, directives, international laws, and administrative procedures. The servicing staff judge advocate (SJA) provides legal advice and training on I/R matters. Regulations and other guidance relative to the administration, employment, and compensation of internees are prescribed in—

- AR 190-8.
- Defense Finance and Accounting Service—Indianapolis (DFAS-IN) 37-1.
- FM 14-100.
- DA Pamphlet (Pam) 37-100-95.
- FM 27-10.

2-3. Copies of the Geneva Conventions and compound regulations, orders, and notices relating to internee conduct and activities are posted in each facility, in the language of internees who are housed there. If internees do not have access to posted copies, the facility commander makes copies available to them.

2-4. The commander is responsible for the administrative processing of each internee. When processing is complete, he submits a DA Form 2674-R to the servicing internment/resettlement information center (IRIC), which functions as the field operations agency for the national IRIC located in CONUS.

PRINCIPLES AND POLICIES

2-5. The following principles apply to I/R facilities:

- Use housed personnel for internal maintenance and operation.
- Use captured supplies and equipment (excluding weapons and ammunition).
- Maintain control.

2-6. An EPW/CI has the right to—

- Submit requests and complaints regarding the conditions of confinement.
- Elect representatives.
- Send and receive correspondence.

NOTE: The rights of US military prisoners are outlined in AR 190-47 and DOD Directive 1325.4.

STANDING ORDERS

2-7. Standing orders provide uniform, orderly administration of an I/R facility. The orders to be obeyed by housed personnel are published in their language and posted where they can read the orders and refer to them. Standing orders include rules, procedures, and instructions (see Figure 2-1) governing the following activities and other matters as deemed appropriate:

- Schedule of calls, including—
 - Reveille.
 - Morning roll.
 - Readiness of quarters for inspection.
 - Sick.
 - Mess.
 - Evening roll.
 - Lights out.
- Housed personnel actions that support the emergency action plans of the internment facility, such as—
 - Fire drills.
 - Air raid drills.
 - Emergency evacuations.
 - Natural disaster drills.
 - Blackouts.
 - Escapes.
- Hours for religious services, recreation activities, and so forth.
- Procedures for emergency sick call.
- Designated smoking areas.

1. You must comply with rules, regulations, and orders. They are necessary for safety, good order, and discipline.
2. You must immediately obey all orders of US personnel. Deliberate disobedience, resistance, or conduct of a mutinous or riotous nature will be dealt with by force.
3. You are subject to disciplinary or judicial punishment if you disobey a rule, a regulation, or an order or if you commit any act, conduct, disorder, or neglect that is prejudicial to good order or discipline.
4. You will not receive disciplinary or judicial punishment until you have an opportunity to explain your conduct and to defend yourself. If you commit an offense for which judicial punishment may arise, investigation of the offense will be coordinated with the SJA before being undertaken to ensure that it is conducted according to the Geneva Conventions. You may call witnesses, and if necessary, you will be provided with the services of a qualified interpreter.
5. You may receive disciplinary punishment that includes discontinuing privileges over and above the treatment provided for by the Geneva Conventions. You may receive a fine up to one half of your 30-day advance and working pay. Privates may be assigned fatigue (extra) duty up to 2 hours daily, noncommissioned officers (NCOs) may be required to perform supervisory duties only, and officers may not be compelled to work.
6. You may not establish courts or administer punishment over other captives.
7. You may not have knives, sticks, metal pieces, or other articles that can be used as weapons in your possession at any time.
8. You may not drill or march in military formation for any purpose except as authorized and directed by the facility commander.
9. You may not meet or issue propaganda for political purposes.
10. You may not wear or display national political items.
11. You may not gamble.
12. You may not possess or consume alcoholic beverages.
13. You may retain personal effects and property that are authorized by the facility commander.
14. You may smoke at times and places specified by the facility commander.
15. You will follow the required courtesies toward your army's officers. If you are an enlisted captive, you will salute all US commissioned officers. If you are an officer captive, you will salute US commissioned officers of a higher grade and the facility commander, regardless of his grade.

Figure 2-1. Sample Standing Orders

NOTICE OF PROTECTION

2-8. To protect persons from acts of violence, bodily injury, and threats of reprisals at the hand of fellow internees, post a notice of protection (Figure 2-2) in the internees' language in every compound.

NOTICE
<p>A detainee who fears that his life is in danger, or fears that he may suffer physical injury at the hands of another detainee, should immediately report to a US member of the facility without consulting his representative. The facility commander ensures adequate protection for the victim by segregation, transfer, or other means. A detainee who mistreats a fellow detainee will be punished.</p> <p style="text-align: right;">(Signed by the Commanding Officer)</p>

Figure 2-2. Sample Notice of Protection

RECORDS AND REPORTS

2-9. The commander establishes local records and reports necessary for the effective operation of the I/R facility. They provide information about the control, supervision, and disposition of personnel housed in the facility. He determines the type (administrative, operational, logistical, intelligence, and personnel) of reports and the frequency (routine or as required). Normal reports (duty officer logs, worksheets, and situation maps) are also required.

MEDICAL AND SANITATION CONSIDERATIONS

2-10. Commanders consider the following when establishing medical care (see AR 190-8):

- A medical officer, a physician's assistant (PA), or a nurse practitioner examines each internee monthly and—
 - Records his weight on DA Form 2664-R.
 - Monitors his general health, nutrition, and cleanliness.
 - Examines him for contagious diseases, especially tuberculosis (TB), venereal disease, lice, louse-borne disease, and human immunodeficiency virus (HIV).
- The medical treatment facility provides isolation of communicable diseases, disinfection, and inoculations. Use retained medical personnel and EPWs with medical training to the fullest extent possible when caring for sick and wounded EPWs. When medical care is inadequate, transfer housed personnel to military or civilian medical facilities where the required treatment is available.

2-11. Certain sanitation standards must be met to prevent disease and ensure cleanliness. These standards include—

- Ensuring that internees receive as much water as US soldiers.
- Providing adequate space within housing units to prevent overcrowding.
- Providing sufficient showers and latrines and ensuring that they are cleaned and sanitized daily.
- Teaching dining-facility workers the rules of good food sanitation and ensuring that they are observed and practiced.
- Disposing of human waste properly to protect the health of all individuals associated with the facility according to the guidelines established by preventive medicine (PVNTMED).
- Providing sufficient potable water for drinking, bathing, laundry, and food service.
- Providing materials for personal hygiene.
- Training personnel on proper garbage disposal to prevent insects and vermin that can contribute to health hazards.

SOCIAL PROGRAMS

2-12. Encourage and support active education, religious, recreation, and employment programs when practical. If possible, provide adequate facilities, instruction material, and recreation equipment.

2-13. Accredited representatives of protecting powers and the ICRC are allowed full access to the I/R facility and internees. Representatives of approved religious organizations, relief societies, NGOs, IHOs, and other organizations assisting housed personnel are permitted to visit according to policies and procedures prescribed by the DA.

2-14. Advanced coordination is encouraged by representatives of NGOs, IOs, and IHOs who want access to internees. This avoids confusion when representatives arrive at the facility. Likewise, the facility staff coordinates in advance with organizations to establish an access roster of representatives and a means of verifying their identity.

Religion

2-15. Housed personnel are allowed freedom of worship, including attendance at services of their respective faith held within the facility. Retained chaplains and other EPW clergymen are permitted to devote their time to ministering to members of their faith. The MP commander may permit other ordained clergymen, theological students, or chaplains to conduct services within the compound. The US personnel will not attend services with EPWs, RPs, CIs, or ODs.

Recreation

2-16. Participation in recreation activities promotes general health and welfare and alleviates tension and boredom. In addition to athletic contests, group entertainment can be provided by concerts, plays, recorded music, and motion pictures.

SAFETY PROGRAM

2-17. Set up and administer a safety program for housed personnel in each I/R facility. Follow the procedures outlined in AR 385-10 and associated circulars and pamphlets to establish the safety program. Maintain records and reports for the internee safety program separate from those for the Army safety program.

AGRICULTURAL PROGRAM

2-18. The EPWs are allowed to raise vegetables for their use. Subsequently, commanders must be aware of resources, procedures, and HN guidelines applicable to this program.

SECURITY

2-19. The MP commander establishes security measures that effectively control housed personnel with minimal use of force. The same use of force that is employed for one category of housed personnel may not be applicable to another. Commanders protect housed personnel from threats outside the facility. The physical construction of the facility and the presence of guard personnel create the most obvious means of providing internal and external security. Maintaining a high state of discipline, a system of routines, and

required standards of behavior are all measures that enhance effective security and control.

2-20. Many housed personnel will actively cooperate with US authorities or will assume a passive, compliant role. They will be composed, in part, of individuals with ideologies favorable to the US. Others, through resignation or apathy, will simply adapt themselves to the conditions of their internment.

2-21. Some housed personnel will engage in a campaign of embarrassing and harassing US personnel to create propaganda of value to their cause. The EPWs want to force the use of maximum US troops for other-than-combat missions. The leaders of the uncooperative faction may try to establish a united effort and blind obedience by all its members. They will not be content with merely planning and attempting to escape or using normal harassment tactics. The leaders will assign duties and missions to individuals so that resistance will not stop while they are interned. Any relaxation of security will be immediately detected and fully exploited.

2-22. Maintain firm control at all times. Adapt policies, tactics, techniques, and procedures (TTP) to achieve this end state.

FACILITY GUARD FORCE

2-23. The facility guard force provides internal and external security. The force has a commander of the guard, one or more sergeants of the guard, a relief commander for each shift, and the necessary number of guards. There are two types of orders for guards:

- **General orders.** All guards are required to know, understand, and comply with the general orders outlined for sentinels in FM 22-6.
- **Special orders.** They apply to particular posts and duties. Special orders supplement general orders and are established by the commander.

2-24. The facility guard force is the primary source of security for the I/R facility. Its responsibilities include—

- Internal.
 - Sally port.
 - Search teams.
 - Receiving and processing lines.
 - Escorts.
 - Facility gates.
- External.
 - Holding area.
 - Towers.
 - Transfer area.
 - Work site.
 - Perimeter.
 - Brigade tactical operations center (BTOC).

Standby Guards

2-25. Standby guards are soldiers who are not on duty. The standby guard force is large enough to reinforce tower and sally port guards; however, it is not normally used as a quick-reaction force (QRF) to enter enclosures and quell disturbances or conduct searches.

Tower Guards

2-26. Tower guards are posted in towers and positioned so that they have overlapping fields of vision of the entire perimeter. This allows one or more guards to observe activities within enclosures. A tower guard's primary duties are to prevent escape and to observe and report unauthorized or suspicious activities.

Walking Patrols

2-27. Walking patrols supplement the perimeter security when weather conditions or electrical failure prevents tower guards from clearly observing the entire perimeter. Gate guards are posted at perimeter gates and the sally port to—

- Exercise control over personnel, vehicles, and work details.
- Conduct shakedown searches according to facility standing operating procedures (SOPs), special orders, and security regulations.
- Prevent the smuggling of weapons or other contraband items into the facility.
- Prevent escapes.

Military Working Dogs

2-28. Military working dogs (MWDs) offer a psychological and real deterrent against physical threats presented by housed personnel. However, they cannot be used as security measures against US military prisoners. The MWDs reinforce security measures against penetration and attack by small enemy forces that may be operating in the area. They also provide a positive, effective alternative to using firearms when preventing disturbances. The various techniques for employing MWDs are—

- **Demonstrations.** Hold periodic demonstrations in full view of housed personnel to increase the psychological deterrent of MWDs. Emphasize how easily and quickly an MWD can overtake a fleeing individual, highlight his ability to attack and overcome physical resistance, and demonstrate his tracking ability. To ensure a successful demonstration, use only the best qualified MWD teams.
- **Perimeter security.** Use an MWD team as an adjunct to perimeter security by making periodic, unscheduled patrols around the perimeter fence during periods of darkness. During inclement weather, a temporary blackout, or an electrical failure, increase the number and frequency of patrols. Ensure that housed personnel are aware of MWD presence by having dogs bark at infrequent intervals during the night.

- **Inspections.** Walk an MWD team through living areas to search for contraband. Depending on the type of MWD team available, it can search for explosive devices and components and/or illegal drugs.
- **Work details.** Position an MWD between the work detail and the area offering the greatest avenue of escape. The MWDs provide a valuable adjunct to work detail guards, particularly those employed in areas offering the greatest potential for escape.

USE OF FORCE AND RULES OF ENGAGEMENT

2-29. An MP commander ensures that soldiers understand use-of-force guidelines and the ROE established by higher headquarters for each mission. Because the use of force and the ROE vary depending on the category of housed personnel and the operational environment, the commander develops SOPs that follow the guidance provided. He balances the physical security of forces with mission accomplishment and the protection of deployed forces.

NOTE: For more information on the use of force, see Appendix B.

2-30. The restrictions on combat operations and the use of force are clearly explained in the ROE and are understood and obeyed at all levels. Soldiers study and train on the use of the ROE and discuss them for their mission. The ROE address the distinctions between internee categories and the instruments of control available for each category. Use the following issues to develop ROE guidelines:

- What is considered lethal force?
- Under what conditions is lethal force used?
- Under what conditions is nonlethal force used?
- What are the required warnings, if any, before using force (lethal or nonlethal)?

TYPES OF DISTURBANCES

2-31. Housed personnel may organize a disturbance within the facility to weaken the guard force. At the beginning of a disturbance, initiate a record of events. Commanders must be concerned with two types of disturbances—riots and disorders:

- Riots.
 - **Organized.** Leaders of housed personnel organize the internee population into quasi-military groups.
 - **Unorganized.** It is spontaneous in nature, although it can be exploited and diverted by leaders into an organized riot.
 - **Multiple.** When housed personnel in one compound start rioting, personnel in other compounds also riot.
- Disorders.
 - **Organized.** It can be a demonstration, a refusal to work or eat, a work slowdown, or the damage or destruction of property.
 - **Unorganized.** It is spontaneous in nature.

NOTE: For more information on riots and disorders, see Appendix B.

SECTION II - STAFF OFFICERS

2-32. Staff officers at tactical headquarters and CSS commands are normally responsible for the same functional areas inside an I/R or confinement facility. However, the emphasis on different aspects and the scope and magnitude of EPW, CI, and US military prisoner activities vary in CS and CSS commands. This section describes additional staff officers that may be found at different echelons of command (primarily I/R MP units) and their areas of responsibility. FM 101-5 describes the roles, relationships, organization, and responsibilities of staffs in the US Army.

ADJUTANT GENERAL

2-33. The adjutant general (AG) maintains personnel records for EPWs, CIs, and US military prisoners. The AG's personnel and administrative section can inprocess eight persons per hour, depending on the category. It—

- Provides accountability documents to the IRIC if applicable.
- Maintains labor records and time cards for prisoners.
- Submits the required reports on prisoners.
- Prepares documents for administrative court-martial charges for EPWs, CIs, and US military prisoners.

FINANCE OFFICER

2-34. The finance officer—

- Accounts for impounded financial assets (cash and negotiable instruments) of housed personnel.
- Records pay/labor credits, canteen purchases/coupons, and other transactions.
- Prepares payrolls, makes disbursements, and processes repatriation settlements.
- Advises the commander on finance and accounting issues.

NOTE: See FM 14-100 for more information.

CIVIL-MILITARY OPERATIONS OFFICER

2-35. The civil-military operations (CMO) officer—

- Provides technical advice and assistance on strategies for community relations and information.
- Plans community relations programs to gain and maintain public understanding and goodwill and to support military operations.
- Provides liaison and coordination with other US government agencies; HN civil and military authorities concerned with I/R operations; and NGOs, IOs, and IHOs in the AO.
- Coordinates with the SJA on the ROE for dealing with housed personnel.

- Provides technical advice and assistance on the reorientation of enemy defectors, EPWs, CIs, and detainees.

CHAPLAIN

2-36. The chaplain or the unit ministry team—

- Provides religious support for assigned soldiers and internees.
- Advises the commander on the impact of faiths and practices of indigenous religious groups in the AO and internees within the facility.
- Provides religious support to the command and the community, including confined and hospitalized personnel.
- Exercises supervision and control over internee religious leaders within the facility.

ENGINEER OFFICER

2-37. The engineer officer is a captain in a brigade and a lieutenant in a battalion. He trains and supervises internees who perform internal and external labor (construction and repair of facilities). The engineer officer is responsible for—

- Construction, maintenance, repair, and operation of utilities (water, electricity, heat, and sanitation).
- Construction support.
- Fire protection.
- Insect and rodent control and fumigation.

PUBLIC AFFAIRS OFFICER

2-38. The public affairs officer (PAO)—

- Understands and fulfills the information needs of soldiers, the Army community, and the public in matters relating to internees and the I/R facility.
- Serves as the command's spokesman for all communication with the external media.
- Facilitates media efforts to cover operations by expediting the flow of complete, accurate, and timely information.

SIGNAL OFFICER

2-39. The signal officer is located in the brigade. He is responsible for all matters concerning signal operations, automation management, network management, and information security.

STAFF JUDGE ADVOCATE

2-40. The SJA is located in the brigade and the brigade liaison detachment (BLD). He—

-
- Provides operational law advice and support for US military prisoner operations and resettlement operations, particularly the interpretation of the Geneva Conventions.
 - Provides advice on the application of force to quell riots and other disturbances.
 - Provides support and advice during investigations following the death or injury of an internee during internment.
 - Serves as the recorder for Article 5 tribunals. (A tribunal determines the status of a person who has committed a hostile act but whose status is doubtful.)
 - Serves as the commander's liaison to the ICRC.
 - Provides legal advice on—
 - Military justice.
 - Administrative law (investigations and command authority).
 - Civil law (contract, fiscal, and environmental laws).
 - International law (law of land warfare, Geneva Conventions, status of forces, ROE, and treatment of detained persons).
 - Claims.
 - Legal assistance.
 - Provides technical advice and assistance on the internee labor policy as it relates to supporting local indigenous requirements not directly advancing the war effort.
 - Complies with all treaties and conventions.

MEDICAL OPERATIONS

2-41. The surgeon section—

- Is responsible for the combat health support (CHS) of the command and internees within the facility.
- Advises the commander.
- Plans and directs echelon I CHS.
- Arranges echelons II and III CHS (including air/ground medical evacuation and hospitalization) when required.
- Provides disease prevention through PVNTMED programs.

2-42. The medical treatment squad—

- Provides routine medical care (sick call) and advanced trauma management for duty soldiers and internees.
- Supervises qualified RPs who are providing medical care for internees.
- Performs initial medical exams to determine the physical fitness of arriving internees as stipulated by the Geneva Conventions.
- Is capable of operating as two separate treatment teams.

2-43. The PVNTMED section—

- Provides limited PVNTMED services for the facility.
- Performs sanitary inspections of housing, food service operations, water supplies, waste disposal operations, and other operations that may present a medical nuisance or health hazard to personnel.

- Provides training and guidance to the staff, unit personnel, and others.

MOVEMENT CONTROL OFFICER

2-44. The movement control officer (MCO)—

- Plans and coordinates the movement of internees and their property with the Corps Support Command (US Army) (COSCOM) movement control center.
- Coordinates with brigade operations for daily transportation requirements and evacuation and transfer of internees. This includes determining the transportation requirements for the evacuation of detainees from one level of internment to the next and coordinating the arrangements.

INSPECTOR GENERAL

2-45. The inspector general (IG) is located in the brigade. He—

- Advises the commander on the organization inspection policy (OIP).
- Conducts inspections, surveys, and studies to comply with international, state, and US laws.
- Receives allegations and conducts investigations and inquiries based on reports and information obtained from EPWs, CIs, DCs, US military personnel, and multinational guard and police forces.
- Consults with international and US agencies in matters pertaining to the overall health and welfare of the protected population.
- Determines the MP unit's discipline, efficiency, morale, training, and readiness and provides feedback to the chain of command.
- Assists the protected population in coping with family issues and resolving complaints consistent with military necessity.
- Identifies trends to correct and improve I/R operations consistent with current doctrine, military laws, international laws, UN mandates, and foreign-nation (FN) and state laws.
- Assists in the resolution of systemic issues pertaining to the processing and administration of the protected population.
- Reports allegations of war crimes (from protected personnel or US soldiers) through the chain of command to the SJA or the United States Army Criminal Investigation Command (USACIC). The responsibility for investigating alleged war crimes rests with the SJA and the criminal investigation division (CID), not the IG.

PSYCHOLOGICAL OPERATIONS

2-46. Psychological operations (PSYOP) are not part of the I/R structure; however, the PSYOP officer in charge (OIC) of the EPW/CI PSYOP team supporting I/R operations serves as the special staff officer responsible for PSYOP. The PSYOP officer advises the MP commander on the psychological impact of actions to prevent misunderstandings and disturbances by EPWs and CIs. The EPW/CI PSYOP team—

- Assists the MP force in controlling EPWs and CIs.
- Exposes EPWs and CIs to US and allied policies.
- Develops and executes PSYOP programs to condition EPWs and CIs to accept facility authority and regulations.
- Gains the cooperation of EPWs and CIs to reduce guard needs.
- Identifies malcontents, trained agitators, and political officers within the facility who may try to organize a resistance or create a disturbance.
- Develops and executes indoctrination programs to reduce or remove proenemy attitudes.
- Recognizes political activists.
- Helps the MP commander control EPWs and CIs during emergencies.
- Plans and executes a PSYOP program that produces an understanding and appreciation of US policies and actions.
- Uses comprehensive information, reorientation, educational, and vocational programs to prepare EPWs and CIs for repatriation.

NOTE: See FMs 3-05.30 and 33-1-1 for additional information about PSYOP support to I/R operations.

SECTION III - TRAINING

2-47. The necessary care and control of housed personnel is best achieved with carefully selected and trained personnel. The specialized nature of duty at different facilities requires individuals who can be depended on to cope successfully with behavior or incidents that call for calm, fair, and immediate decisive action. These personnel must possess the highest qualities of leadership and judgment. They are required to observe rigid self-discipline and maintain a professional attitude at all times.

2-48. Personnel assigned or attached to I/R facilities are trained on the care and control of housed personnel. They are fully cognizant of the provisions of the Geneva and UN Conventions and applicable regulations as they apply to the treatment of housed personnel. A formal training program should include—

- Principles and laws of land warfare, specifically provisions of Geneva and UN Conventions and HN laws and customs.
- Supervisory and human relations techniques.
- Methods of self-defense.
- The use of force, the ROE, and the ROI.
- Firearms qualification and familiarization.
- Public relations, particularly CONUS operations.
- First aid.
- Stress management techniques.
- Facility regulations and SOPs.
- Intelligence and counterintelligence techniques.
- Cultural customs and habits of internees.

- The basic language of internees.

2-49. The guard force should receive additional training in—

- Riot control measures, control agents, and dispersers.
- QRF actions.
- Searching techniques, including the use of electronic detection devices.
- Nonlethal equipment and weapons.

2-50. Medical soldiers assigned to the facility may be required to deliver babies and care for infants and small children. Their training should include—

- Delivery procedures.
- Birthing techniques.
- Medical conditions associated with malnutrition and water-, food-, and arthropod-borne diseases.

PART TWO

Enemy Prisoners of War and Civilian Internees

Part Two addresses handling, securing, and accounting for EPWs and CIs. The MP performing EPW/CI operations must follow specific ROE and ROI applicable to this category of I/R operations. The EPWs and CIs are not treated as DCs or US military prisoners. Leaders and soldiers must be knowledgeable of the Geneva and Hague Conventions, applicable protocols, ARs, and US laws. During war or military operations other than war (MOOTW) involving US forces, the accountability and safe, humane treatment of captives are essential. The US policy demands that all persons who are captured, detained, or held by US forces during conflict be treated humanely. This policy applies from the moment captives are taken until they are released, repatriated, or transferred. Chapter 3 describes division collecting points (CPs) and corps holding areas (CHAs) that may be established throughout the battlefield. Chapter 4 addresses procedures for EPWs, and Chapter 5 describes procedures for CIs. Chapter 6 addresses unique planning requirements to be considered when operating an I/R facility.

Chapter 3

Division Collecting Points and Corps Holding Areas

Chapters 3 and 4 implement STANAG 2044.

A large number of captives on the battlefield hampers maneuver units as they move to engage and destroy an enemy. To assist maneuver units in performing their mission—

- Division MP units operate CPs in the division AO.
- Corps MP units operate holding areas in the corps AO.

OVERVIEW

3-1. The MP units accept captives from capturing units as far forward as possible, and captives are held in CPs and CHAs until they are removed from the battlefield. Normally, CPs are operated in the division AO and CHAs are operated in the corps AO; but they can be operated anywhere they are needed. The CPs and CHAs sustain and safeguard captives and ensure a minimum level of field processing and accountability. Wounded and sick captives receive medical treatment, and captives who require lifesaving medical attention are evacuated to the nearest medical facility.

3-2. The MP establish listening posts (LPs), observation posts (OPs), guard posts, and fighting positions to protect captives and prevent their escape. Captured soldiers are trained to believe that escape from captivity is their duty; therefore, they must be closely guarded. Consider the morale and physical condition of captives when determining the number of guards needed. Guards must be prepared to use and maintain firm control and security.

3-3. The MP work closely with military intelligence (MI) interrogation teams at CPs and CHAs to determine if captives, their equipment, and their weapons have intelligence value. This process is accelerated when MI interrogation teams can observe captives during arrival and processing, and interrogators can also be used as interpreters during this phase. Before a captive is interviewed by MI personnel, he must have a Department of Defense (DD) Form 2745 (Figure 3-1) attached to him and be accounted for on DD Form 2708.

3-4. If the CP or the CHA comes under a nuclear, biological, or chemical (NBC) attack, remove captives from the contaminated area and decontaminate them to the same level as US forces. Request assistance for decontaminating captives through command channels. The supply officer issues NBC protective equipment and clothing to captives, using captured materials (when available) or US materials (if necessary).

PROCESSING CAPTIVES

3-5. Processing begins when US forces capture or detain an individual. The processing is accomplished in the CZ for security, control, intelligence, and the welfare of captives in evacuation channels. This is referred to as *field processing*. The capturing unit begins field processing by using the Five Ss and T procedure (search, segregate, silence, speed, safeguard, and tag). At the CP or the CHA, MP continue processing with the principles of STRESS (search, tag, report, evacuate, segregate, and safeguard).

3-6. After receiving a captive from a capturing unit, MP are responsible for safeguarding and accounting for the captive at each stage of his removal from the battlefield. The processing procedure begins upon capture and continues until the captive reaches the I/R facility and is released. The process of identifying and tagging a captive helps US forces control and account for him as they move rearward from the battlefield. Before a captive is interned, repatriated, or released, MP at the I/R facility must provide full-scale processing.

<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p align="center">ENEMY PRISONER OF WAR (EPW) CAPTURE TAG (PART A)</p> <p align="center">For use of this form, see AR 190-8. Figure 3-1. Sample DD Form 2745

CAPTURING UNIT

3-7. The Five Ss and T procedure is performed by the capturing unit. The basic principles are search, segregate, silence, speed, safeguard, and tag (see Table 3-1).

Table 3-1. Five Ss and T Procedure

Procedure	Description
Search	Search captives for weapons and ammunition, items of intelligence value, and other inappropriate items. NOTE: Conduct same-gender searches when possible. If mixed-gender searches are necessary for speed or security, conduct them in a respectful manner and avoid any action that could be interpreted as sexual molestation or assault. To prevent allegations of sexual misconduct, the on-site supervisor carefully controls soldiers who perform mixed-gender searches.
Segregate	Segregate captives by rank, gender, nationality, and status.
Silence	Do not allow captives to speak or allow anyone to speak to them. Speak to captives only to give orders.
Speed	Remove captives from the battlefield as quickly as possible.
Safeguard	Safeguard captives according to the Geneva Conventions and the US policy. Provide medical care as needed.
Tag	Tag captives with a DD Form 2745 or a field-expedient capture tag that includes the following information: <ul style="list-style-type: none"> • Date of capture. • Location of capture (grid coordinates). • Capturing unit. • Special circumstances of capture (how the person was captured, if he resisted, if he gave up, and so forth). NOTE: The capturing unit must complete a capture tag because failure to do so hinders further processing and disposition.

COLLECTING POINTS AND HOLDING AREAS

3-8. When a captive arrives at a division CP or a CHA, he is processed by the STRESS method. The basic principles are search, tag, report, evacuate, segregate, and safeguard (see STANAG 2044).

Search

3-9. Search and inspect each captive and his possessions. Conduct same-gender searches when possible. If mixed-gender searches are necessary for speed or security, conduct them in a respectful manner and avoid any action that could be interpreted as sexual molestation or assault. To prevent allegations of sexual misconduct, the on-site supervisor carefully controls soldiers who perform mixed-gender searches. Some items can be retained during captivity, some items are impounded and eventually returned, and certain items are confiscated and never returned, even if the captive is released or repatriated.

3-10. **Retained Items.** A captive is allowed to keep certain items during his captivity. They are generally divided into two groups. The first group consists

of items taken during the receiving portion of inprocessing and returned later in the process. The second group consists of items that the captive can keep at all times. **NOTE: These lists are not all inclusive.**

- Group 1.
 - Military mess equipment (except knives and forks).
 - Helmet.
 - Protective clothing and equipment (NBC suits, helmets, and protective masks) for use during evacuation from the CZ.
 - Personal clothing.
 - Badges of rank and nationality.
 - Military decorations.
 - ID cards and tags.
 - Rations (in the early stages of captivity).
- Group 2.
 - Religious literature (within reason).
 - Personal items having no intelligence value (jewelry and pictures).

3-11. **Impounded Items.** A captive is not allowed to keep impounded items during his internment. They can make escape easier or can compromise US security interests. Impounded items normally include—

- Cameras.
- Radios.
- Currency.
- Negotiable instruments.

3-12. **Confiscated Items.** The following items are confiscated when searching a captive:

- Weapons.
- Ammunition.
- Items of intelligence value (maps and orders).
- Other inappropriate items.

3-13. The MP coordinate with MI interrogation teams to determine which confiscated items have intelligence value. Personal items (diaries, letters from home, and family pictures) can be taken by MI teams for review and then returned to the proper owner via MP.

NOTES:

1. Currency is only confiscated on a commissioned officer's order (see AR 190-8), and it must be accounted for on DA Form 4137.

2. For an in-depth discussion on impounded and confiscated property, see AR 190-8 and DFAS-IN 37-1.

3-14. **Property Accountability.** When seizing property from a captive—

- Bundle it or place it in a bag to keep it intact and separate from other captives' possessions.
- Prepare DA Form 4137 for confiscated and impounded property.

- Prepare a receipt for currency and negotiable instruments to be signed by the captive and the receiver. Use cash collection vouchers so that the value can be credited to each captive's account. List currency and negotiable instruments on the captive's personal-property list, but treat them as impounded property.
- Keep the original receipt with the property during evacuation. Give the captive a copy of the receipt, and tell him to keep it to expedite the return of his property.
- Have MI sign for property on DA Form 4137 and for captives on DD Form 2708.
- Return confiscated property to supply after it is cleared by MI teams. Items kept by MI because of intelligence value are forwarded through MI channels.
- Evacuate retained items with the captive when he moves to the next level of internment.
- Maintain controlled access to confiscated and impounded property.

Tag

3-15. Tag each captive with a DD Form 2745. The MP at CPs and CHAs check each tag for the—

- Date and time of capture.
- Capturing unit.
- Place of capture.
- Circumstances of the capture.

The remaining information on the tag is included as it becomes available.

3-16. A DD Form 2745 is a perforated, three-part form that is individually serial-numbered. It is constructed of durable, waterproof, tear-resistant material with reinforced eyeholes on Parts A and C. Part A is attached to the captive with wire or string, Part B is maintained by the capturing unit for their records, and Part C is attached to confiscated property so that the owner can be identified later.

3-17. The MP at division CPs ensure that a DD Form 2745 is placed on each captive who arrives at the CP without one. They may direct the capturing unit to complete a capture tag before accepting the prisoner into the CP. The MP—

- Make a statement on the tag if the captive arrived without it.
- Instruct the captive not to remove or alter the tag.
- Annotate the tag's serial number and the captive's name on a locally developed manifest.

NOTE: See Soldier Training Publication (STP) 21-24-SMCT for more information on DD Form 2745.

Report

3-18. Report the number of captives at each CP through MP channels. This aids in the transportation and security planning processes.

Evacuate

3-19. Evacuate captives from the CZ through appropriate channels as humanely and quickly as possible. Do not delay movement to obtain names, ranks, service numbers, or dates of birth. When moving captives, give them clear, brief instructions in their own language when possible. Military necessity may require a delay in movement beyond a reasonable time. When this occurs, ensure that there is an adequate supply of food, potable water, appropriate clothing, shelter, and medical attention available.

3-20. The MP ensure that the proper paperwork (DA Form 4137, DD Form 515, and DD Form 2708) is complete before captives are evacuated. If necessary, a DD Form 2708 (annotated with the number of prisoners) and a manifest will suffice. Do not expose captives to unnecessary danger, and protect them while they are awaiting evacuation. For seriously wounded or sick captives, medical personnel determine if prompt evacuation is more dangerous than retaining them in the CZ.

Segregate

3-21. The OIC or the noncommissioned officer in charge (NCOIC) is responsible for the custody of captives. He designates segregation procedures and levels to ensure their security, health, and welfare. Segregate captives into the following categories:

- **Officers, NCOs, and enlisted members (male and female).** Deserters and those who gave up without a fight may be further segregated for their protection. Nationally recognized ideologies and ethnic groups can also be segregated.
- **CIs and refugees.** They are separated from EPWs.
- **US military prisoners.** They are separated from all other prisoners/detainees (EPWs, CIs, ODs, and refugees). (See Chapter 8 for a complete discussion on the confinement of US military prisoners.)

3-22. Ultimately, all captives are classified as an EPW, a CI, or an OD. However, it may be impossible to readily classify all captives. If there is any doubt about a captive's status, protect him under the rules of the Geneva Conventions and the US policy until a competent tribunal can determine his status. (See AR 190-8 for further information.)

3-23. Do not use coercion to obtain information from captives. This includes basic information such as name, rank, service number, and date of birth that captives are required to provide under the Geneva Conventions. Coercion or inhumane treatment of captives is prohibited and is not justified by the stress of combat or deep provocation. Inhumane treatment is a serious violation of international law and the UCMJ.

3-24. Do not speak to captives except to give orders or directions. Do not let captives talk to or signal each other. This prevents them from plotting ways to counter security and plan escapes. An uncooperative captive can be gagged in certain tactical situations; however, only use a gag for as long as needed and ensure that it does not harm the captive.

Safeguard

3-25. To safeguard captives according to the Geneva Conventions and the US policy—

- Provide first aid and medical treatment for wounded and sick captives. Evacuate them through medical channels, using the assets available to evacuate US and allied forces.
- Provide food and water. These supplies must be commensurate to those for US and allied forces (see FM 27-10 and STANAG 2044).
- Provide firm, humane treatment.
- Allow captives to use protective equipment in case of hostile fire or NBC threat.
- Protect captives from abuse by other captives and local civilians.
- Report acts and allegations of inhumane treatment through MP channels (see AR 190-40).
- Do not locate captives near obvious targets (ammunition sites, fuel facilities, and communications equipment).

EVACUATING CAPTIVES

3-26. Remove captives from the CZ as quickly as possible. The intent is to move them from division CPs to an I/R facility. The goal is for higher echelons to go forward to lower echelons and evacuate captives to the rear as follows:

- Division MP move forward to the forward CP to escort captives to the central CP.
- Corps MP move forward to the central CP to escort captives to the CHA.
- Echelons above corps (EAC) MP move forward to the CHA to escort captives to the I/R facility.

3-27. If escort guard companies are available in the TO, they are placed under OPCON of the MP commander. They—

- Provide supervisory and security personnel during evacuation and/or movement.
- Go forward to the corps and the division to escort captives to the I/R facility.
- Escort captives from the division forward CP to the corps or the EAC (in coordination with the respective echelon provost marshal [PM]).

SICK AND WOUNDED CAPTIVES

3-28. Medical personnel decide which captives must be medically evacuated or moved within MP channels, while MP or other command-directed nonmedical personnel provide prisoner security. Generally, walking wounded are moved through MP channels and litter patients are moved through medical channels. The US provides the same medical care for wounded and sick captives as it does for its own forces and allied soldiers. The degree of medical care, not status (such as EPW or CI), determines the disposition of wounded soldiers.

3-29. Seriously wounded or ill captives are stabilized and evacuated through medical channels to the rear area as quickly as possible. If the captive requires medical evacuation—

- Report the captive's medical condition through medical channels to the next higher echelon.
- Request disposition instructions from the corps medical regulating officer (MRO).

3-30. The MRO coordinates transportation and identifies the treatment facility where wounded and sick captives are taken. Accountability for captives within medical channels is the responsibility of the MRO and the hospital commander. They coordinate their efforts with the IRIC.

3-31. The MP determine if there is a security risk during medical evacuation of wounded and sick captives. Ordinarily, captives who require medical evacuation are less likely to be a security risk. However, captives well enough to be a security risk are treated and returned to MP control.

3-32. If medical personnel request MP to guard captives at a medical facility in the corps area and the corps commander chooses to delegate that responsibility to the MP, the PM allocates support on a case-by-case basis. The MP structure is not designed to provide MP to guard hospitalized captives on a continuous, uninterrupted basis.

ABLE-BODIED CAPTIVES

3-33. The MP guard able-bodied captives during movement to prevent escape, liberation, or injury. A general planning consideration when determining the number of MP necessary is one for every five to ten captives. An MP unit tasked to escort captives considers the following information when determining the number of guards needed:

- The mission, enemy, terrain, troops, time available, and civilian considerations (METT-TC).
- The number of captives being moved.
- The condition and morale of the captives. Fatigued and/or cooperative individuals require fewer guards than fresh, motivated individuals.
- The type of transportation and its scheduled arrival.
- The type of terrain along the evacuation route. Routes where dense vegetation is close to the road often require more guards than open, clear terrain.
- The threat level along the route. As the threat level increases, so does the need to increase security. Consider the anticipated presence of suspected sympathizers and hostile, local nationals along the route.
- The location of MP units or bases/base clusters along the route.
- The location and number of rest stops. This is based on the transportation, the distance, and the terrain.

3-34. When moving forward to escort captives to the rear area, MP responsibilities begin at the CP or the CHA where custody is accepted. Verify the method of moving captives, the location and time of pickup, and the number of captives contained in orders from higher headquarters. The MP units cannot transport captives with organic assets.

3-35. The preferred method for moving captives through a battlefield is the *backhaul* system. This transportation system relies on assets that have delivered their primary cargo and are available to move personnel and materials to another location. The availability of vehicles will vary, depending on the cargo delivered to the area. The command and control (C²) element of the MP unit tasked with evacuation arranges transportation through the local MCO.

3-36. If the backhaul system cannot be employed, the MP unit guarding the captives requests an alternate means of transportation. Captives are moved on foot only as a last resort and upon approval of the MP unit commander.

DIVISION COLLECTING POINTS

3-37. A division operates two types of CPs—forward and central. A division MP company operates forward CPs in each maneuver brigade AO and a central CP in the division rear area. Both CPs are temporary areas designed to hold captives until they are removed from the battlefield. Forward CPs are positioned as far forward as possible to accept captives from maneuver elements. Central CPs accept captives from forward CPs and local units.

FORWARD COLLECTING POINTS

3-38. Forward CPs (Figure 3-2) are needed when a brigade conducts an offensive operation and is likely to take captives. When a maneuver brigade has an MP platoon in direct support (DS), MP teams set up and operate forward CPs. A brigade without an MP platoon in DS sets up and operates its own forward CPs.

3-39. The number of MP teams needed to operate a forward CP is based on the number of captives expected and METT-TC. The projected number of captives is based on mission analysis and intelligence estimates conducted by the brigade Intelligence Officer (US Army) (S2). Division forward CPs are mobile; they can be set up, expanded, and relocated quickly as the tactical situation warrants.

Location

3-40. The brigade operation plan (OPLAN) or operation order (OPORD) provides the general location of forward CPs. They are located near or in the brigade support area (BSA), in an area that prevents captives from observing activities within the BSA. They are also located near main supply routes (MSRs) to make delivery, evacuation, and resupply easier.

Medical Support

3-41. Medical support is provided by the MP company medical section. Additional medical support can be requested through the forward support battalion (FSB) to the brigade medical officer. The brigade OPORD includes specific actions and support (operational requirements) needed from non-MP units.

Figure 3-2. Forward CP

Planning Considerations

3-42. When a division MP company commander is tasked with planning and operating a forward CP, he—

- Coordinates with the unit responsible for the area.
- Conducts a recon of the area before selecting a location.
- Locates it far enough from the fighting to avoid minor shifts in the main battle area (MBA) (normally 5 to 10 kilometers).
- Notifies the BSA tactical operations center (TOC) and the PM operations section of the selected location (grid coordinates). The BSA TOC reports the location to the brigade TOC, and the brigade TOC notifies subordinate units.
- Coordinates with MI on collocating an MI interrogation team at the CP.
- Provides potable water and, if required, food for captives.

3-43. A forward CP is seldom located near the indigenous population to prevent problems caused by the presence of captives in the area. A forward CP is usually a guarded, roped-off area (concertina or razor tape) or a secure, fixed facility. The capture rate and the captive categories determine the size of

the forward CP. If possible, use existing structures (vacant schools, apartments, and warehouses) to conserve resources and provide protection for captives. When selecting a location, consider—

- Security.
- Medical support.
- Food and potable water.
- Field sanitation (latrine facilities).
- Shelter.
- Cover. (Captives can dig or build cover to protect themselves from direct and indirect fire.)
- Access routes.

Accountability

3-44. Account for each captive and his equipment when they arrive at the forward CP.

Evacuation

3-45. Captives should not remain at a forward CP more than 12 hours before being escorted to the central CP. When they have been processed and are ready for evacuation, MP leaders—

- Report the status to the BSA TOC and the PM (through MP channels).
- Request transportation, rations, and water from the FSB Supply Officer (US Army) (S4).
- Ensure that receipts are ready for signature.
- Ensure that property is properly tagged and given to escort guards.

CENTRAL COLLECTING POINTS

3-46. A central CP (Figure 3-3) is larger than a forward CP, but it has a similar setup and operation. The larger holding capacity of a central CP requires additional MP. If sufficient MP are unavailable, it is augmented by a division, corps, or EAC band to assist with perimeter security. Captives are provided food, water, first aid, and medical attention as required.

Location

3-47. As stated in the division OPLAN or OPORD, a central CP is located near the division support area (DSA) in an area that prevents captives from observing activities within the DSA. It is also located near MSRs to make delivery, evacuation, and resupply easier.

Medical Support

3-48. Prevent captives from incurring disease and nonbattle injuries (DNBI) (heat and cold injuries or communicable diseases) while in captivity. Isolate captives who exhibit obvious signs of disease (diarrhea, vomiting, or fever) until medical personnel make an evaluation. If a large number of captives appear ill, notify medical and command channels for immediate action/treatment.

Figure 3-3. Central CP

- 3-49. The division PVNTMED section supports the central CP by—
- Monitoring drinking water and advising on disinfection procedures.
 - Controlling animals and insects that carry disease.
 - Ensuring that captives help prevent illness by—
 - Drinking enough water.
 - Wearing clothing that is suited for the weather and the situation.
 - Handling heating fuels carefully.
 - Avoiding contact of exposed skin to cold metal.
 - Using insect repellent, netting, and insecticides.
 - Taking approved preventive medication.
 - Using purification tablets when water quality is uncertain.
 - Disposing of bodily wastes properly.
 - Practicing personal hygiene.

Planning Considerations

3-50. When a division MP company commander is tasked with establishing and operating a central CP, he—

- Coordinates with the unit responsible for the area.
- Conducts a recon of the area before selecting a location.
- Notifies the PM of the exact location (grid coordinates). The PM notifies the division rear CP operations cell, who notifies area units.
- Coordinates with MI on collocating an MI interrogation team at the CP.
- Ensures that the location is accessible to units escorting captives from forward CPs.

3-51. Like a forward CP, a central CP is seldom located near the indigenous population. Use existing structures, when available, to conserve resources. If structures are unavailable, construct the central CP from similar material as forward CPs. However, a central CP is larger and must contain some type of tentage or shelter to protect captives from the elements. A bunker in each compound or free access to a bunker is needed to protect captives from direct and indirect fire. Enlisted captives can be tasked to help construct a central CP (especially bunkers); however, officer captives cannot be used.

3-52. A central CP is as mobile as a forward CP. It must also be set up, expanded, and relocated quickly as the tactical situation dictates. Units within the DSA provide support as stated in the division OPORD. The MP company medical section provides medical support to personnel in the central CP, and additional medical support can be requested from the command surgeon.

Accountability

3-53. Account for each captive and his equipment when they arrive at the central CP. Use the STRESS method to process captives who are brought directly to the central CP by a capturing unit (see paragraph 3-8).

Evacuation of Captives

3-54. Captives should not remain at the central CP more than 24 hours before being evacuated to the CHA. When all captives are accounted for, processed, and ready for evacuation to the CHA, MP leaders—

- Report the status to the division rear CP and to the PM (through MP channels).
- Request transportation, rations, and water through logistics channels in the division rear.
- Ensure that receipts are ready for signature.
- Ensure that property is tagged with Part C of DD Form 2745 and given to the escort guards.

CORPS HOLDING AREAS

3-55. A CHA (Figure 3-4) can hold more captives for longer periods of times than a central CP. Depending on the availability of MP units to establish I/R facilities, corps MP units must be prepared to hold captives at the CHA more than 72 hours. If the CHA keeps captives more than 72 hours, MP must plan and coordinate for the increased logistics and personnel required to operate a long-term facility. The decision to hold captives longer is based on METT-TC and the availability of forces. Captives remain in the CHA until they are evacuated to an I/R facility or until hostilities end.

Figure 3-4. Corps Holding Area

3-56. A CHA receives captives from CPs and units that capture them in the rear area. Usually, one CHA is established to support each division conducting operations. However, additional CHAs may be required based on the—

- Size of the corps area.
- Type of terrain.
- Length of the LOC between the CHA and the division central CPs.
- Number of captives being moved.

LOCATION

3-57. A CHA is usually located near a base or a base cluster in the corps rear area. When selecting a site—

- Coordinate with the unit responsible for the area (terrain) and the corps rear CP.
- Conduct a recon to select a location.
 - Is it adjacent to an MSR, a railroad, or an airfield?
 - Are existing buildings available?
 - Is it close to supply facilities?
 - Is it easily protected from enemy activities?
- Ensure that the location allows division of the site into two or more compounds for segregation, security, and ease of control.
- Report the exact location (grid coordinates) through MP channels to the unit responsible for the area. The MI coordinates with MP on collocating an MI interrogation team at the CP. However, MP may have to contact MI to initiate the action.
- Ensure that the site is accessible to units escorting captives from division central CPs.

CONSTRUCTION

3-58. A CHA is more permanent than CPs. Existing structures may be used and are preferred. The capture rate and the captive categories determine the size of the CHA. A multistory building has a smaller perimeter to guard; however, it requires using guards on each floor and may present a security risk for the guards. Depending on the tactical situation, perimeter lighting can be used.

3-59. When constructing a CHA, divide it into two or more compounds for segregation, security, and ease of control. Consider providing more than one entrance into the CHA. Include a reception area for further processing, searching, and examining of selected captives by MI. Include sanitary facilities (showers and latrines) and shelter (tentage and existing buildings) from the elements and direct and indirect fire.

GUARD FORCE

3-60. The exact CHA setup and design depend on many factors, including construction materials, terrain, and forces. An MP platoon or company from a corps MP battalion usually operates a CHA. A platoon can guard 500 captives, while a company can guard 2,000. During mass captures, a guard force augmentation may be required to handle unexpected workload. The corps band can augment MP guards to aid in security. As the population of the CHA increases, evacuations to the I/R facility also increase.

LOGISTICS

3-61. Request supplies through logistic channels for construction, maintenance, and day-to-day operations of a CHA. Support agreements can be arranged between MP headquarters and a base or base cluster where the CHA is located. Plan ahead to provide food and water.

MEDICAL AND SANITATION CONSIDERATIONS

3-62. The CHA guards isolate wounded captives and captives suspected of having a communicable disease until medical personnel can examine them (see Chapter 2). Take necessary sanitary measures to ensure a clean, healthy CHA and to prevent epidemics. Request PVNTMED units to assist and advise unit field sanitation teams on—

- The survey and control of disease-carrying insects and rodents.
- Sanitary engineering (water treatment and waste disposal).

EVACUATION

3-63. The procedures used to escort captives from division forward and central CPs to a CHA are also used to escort captives from a CHA to an I/R facility.

COLLOCATED SCREENING SITES

3-64. To facilitate collecting enemy tactical information, MI may collocate interrogation teams at CPs and CHAs. This provides MI with direct access to captives and their equipment and documents. Coordination is made between MP and MI to establish operating procedures that include accountability. An interrogation area is established away from the receiving/processing line so that MI personnel can interrogate captives and examine their equipment and documents. If a captive or his equipment or documents are removed from the receiving/processing line, account for them on DD Form 2708 and DA Form 4137.

INTERROGATION TEAMS

3-65. The MI interrogation teams screen captives at CPs and CHAs, looking for anyone who is a potential source of information. Screeners observe captives from an area close to the dismount point or processing area. As each captive passes, MI personnel examine the capture tag and look for branch insignias that indicate a captive with information to support command priority intelligence requirements (PIR) and information requirements (IR). They also look for captives who are willing or attempting to talk to guards; joining the wrong group intentionally; or displaying signs of nervousness, anxiety, or fear.

3-66. The MP assist MI screeners by identifying captives who may have answers that support PIR and IR. Because MP are in constant contact with captives, they see how certain captives respond to orders and see the type of requests they make. The MP ensure that searches requested by MI are conducted out of sight of other captives and that guards conduct same-gender searches.

3-67. The MI screeners examine captured documents, equipment and, in some cases, personal papers (journals, diaries, and letters from home). They are looking for information that identifies a captive and his organization, mission, and personal background (family, knowledge, and experience). Knowledge of a captive's physical and emotional status or other information helps screeners determine his willingness to cooperate.

LOCATION

- 3-68. Consider the following when planning an MI screening site:
- The site is located where screeners can observe captives as they are segregated and processed. It is shielded from the direct view of captives and is far enough away that captives cannot overhear screeners' conversations.
 - The site has an operation, administrative, and interrogation area. The interrogation area accommodates an interrogator, a captive, a guard, and an interpreter as well as furniture. Lights are available for night operations.
 - Procedures are implemented to verify that sick and wounded captives have been treated and released by authorized medical personnel.
 - Guards are available and procedures are implemented for escorting captives to the interrogation site.
 - Procedures are published to inform screeners who will be moved and when they will be moved.
 - Accountability procedures are implemented and required forms are available.

COLLECTING POINTS IN OTHER OPERATIONS

- 3-69. The CPs can also be operated during river crossing, amphibious, airborne, armored, and air assault operations:
- **River crossing operations.** Establish temporary CPs on entry and exit sides of the river (corps MP often take control of CPs). Return from the exit bank and evacuate captives to the rear, preventing interference with tactical operations and protecting captives from hostile fire. Coordinate with traffic control personnel at the crossing site to prevent interference with assault forces who are moving forward. Use a secondary crossing site if available.
 - **Amphibious operations.** The assault force initially operates CPs in the beachhead and then escorts captives to designated ships. The MP coordinate with the support force for handling captives after they are escorted from the beachhead. When facilities, supplies, and personnel permit, retain captives in the objective area if they can be protected from enemy fire.
 - **Airborne operations.** The METT-TC considerations for collecting captives include the geographical location of the airhead, the tactical plan, the availability of transportation, and plans for linking up with ground forces. Captives are primarily moved by air during the early stages of the operation, which requires CPs to be established near landing zones (LZs). Consider attaching additional MP elements from area EAC to guard captives during evacuation.
 - **Armored operations.** Armored units can penetrate deep into hostile territory, bypassing pockets of enemy resistance on their way to the objective. This leaves isolated enemy units on the battlefield, which may hinder the normal evacuation of captives to the rear area. Hold captives at the CP until they can be safely evacuated from the battlefield.

- **Air assault operations.** Organic MP elements accompany assault elements to the objective. Establish CPs near LZs and airfields where the evacuation process begins. If necessary, attach nondivisional MP elements to guard captives during evacuation.

Chapter 4

Enemy Prisoners of War

Chapters 3 and 4 implement STANAG 2044.

The MP are responsible for evacuating EPWs from division CPs to CHAs and then to internment facilities (normally located in the COMMZ). This chapter addresses procedures for properly handling, processing, and safeguarding EPWs. The procedures outlined in this chapter are also applicable to RPs. (See Chapter 1 for complete definitions and AR 190-8 for more details.)

EVACUATION

4-1. Corps MP commanders evacuate EPWs from CHAs to internment facilities promptly and safely. Their responsibilities include security, accountability, and support. They also account for equipment and documents and provide escort guards if an escort guard company is unavailable.

4-2. Escort guard companies are responsible for EPW operations in the TO, and they escort EPWs from CHAs to internment facilities. They are assigned to MP I/R battalions and brigades. However, if they arrive before MP I/R units, they are attached to MP CS brigades. To expedite prompt, full evacuation of EPWs, escort guards can be pre-positioned in CHAs so that they are continuously available.

4-3. The evacuation chain normally moves EPWs from a division forward CP to a division central CP, to a CHA, and then to an internment facility. When circumstances permit, such as taking advantage of available transportation, evacuation procedures may bypass one or more echelons below corps (EBC) facilities.

RECEIVING AND PROCESSING AREAS

4-4. Receiving and processing begin when EPWs arrive. However, due to limited manning, these functions are not operational 24 hours a day. An internment facility receives, secures, houses, and feeds EPWs until receiving and processing lines are operational. The EPWs are then brought forward, and the internment process begins.

4-5. Use a controlled-flow format to escort EPWs through the processing line. Normally, four EPWs are processed at a time and the average is eight per hour. These numbers may increase or decrease based on the capture rate and the nature of the operation. Secure unprocessed EPWs in a holding area.

4-6. Request interpreters from MI, PSYOP, allied forces, or local authorities as necessary. This may require identifying and clearing trusted EPWs or local nationals to interpret. Interpreters are usually necessary when entering data into the Internment/Resettlement Information System (IRIS).

4-7. The preparation and dispatch of DA Forms 2674-R are governed by AR 190-8, and they are prepared at each internment facility. Brigade or internment facility commanders may require feeder reports from various compounds to facilitate the preparation of internee strength reports.

NOTE: See STANAG 2044 for more information on reports and accountability as they apply to NATO TOs.

4-8. Table 4-1 outlines the internment process for EPWs. It shows who is responsible for each step and what actions they must accomplish. Based on METT-TC, the commander may tailor stations to meet the situation. Stations 1 through 4 are in the receiving line, and Stations 5 through 9 are in the processing line.

Table 4-1. Processing Actions at the EPW Processing Area

Station	Purpose	Responsible Individuals*	Actions
Receiving Line			
1	Search	MP	Assign ISNs. Follow accountability procedures. Escort EPWs and their property. Strip-search EPWs (by MP of the same sex) before entering the processing area unless prohibited by conditions. Remove and examine property, place it in a container or a tray, mark it with a control number, and take it to a temporary storage area. (Some property may be returned in the processing line.) Supervise the movement of EPWs to the next station.
2	Personal hygiene	MP and processed EPWs (when possible)	Allow EPWs to shower, shave, and get haircuts. Disinfect EPWs using the guidelines established by the PVNTMED officer. Supervise the movement of EPWs to the next station.
*The number of people used to perform tasks depends on the number of EPWs and the amount of time available. Other soldiers assigned to the unit may perform non-MP-specific tasks if necessary.			

Table 4-1. Processing Actions at the EPW Processing Area (continued)

Station	Purpose	Responsible Individuals*	Actions
3	Medical evaluation	Medical personnel and MP	<p>Inspect EPWs for signs of illness or injury.</p> <p>Evacuate EPWs who need treatment at a medical facility.</p> <p>Give immunizations or request immunization support from the supporting medical unit before internment or evacuation.</p> <p>Initiate treatment and immunization records.</p> <p>Place control numbers on medical records to reduce linguist support. (Names, service numbers, and ISNs are entered at Station 1 with the aid of an interpreter.)</p> <p>Annotate medical records with the date and place EPWs were inspected, immunized, and disinfected.</p> <p>Weigh EPWs and establish a weight register.</p> <p>Supervise the movement of EPWs to the next station.</p>
4	Personal items	MP	<p>Issue personal-comfort items (toilet paper, soap, toothbrush, and toothpaste).</p> <p>Issue clothing (clean and distinctive, like brightly colored jumpsuits if available) that is—</p> <ul style="list-style-type: none"> • Taken from EPWs at Station 1. • Obtained from captured enemy supplies. • Obtained through normal supply channels. <p>Ensure that clothing is marked “PW” as required.</p> <p>Escort EPWs to the processing area (Station 5).</p>
Processing Line			
5	Administrative accountability	Processing clerk (assisted by an interpreter, MI, or others) and MP	<p>Ensure that ISNs are assigned to EPWs. Note the capture tag numbers that ISNs are replacing so that late-arriving property can be matched to its owner.</p> <p>Initiate personnel records, ID documents, and property receipts.</p> <p>Use digital equipment to generate forms and records.</p> <p>Prepare forms and records to maintain the accountability of EPWs and their property (STANAG 2044).</p> <p>Prepare forms for repatriation or international transfer as specified in local regulations or SOPs.</p> <p>Supervise the movement of EPWs to the next station.</p>
<p>*The number of people used to perform tasks depends on the number of EPWs and the amount of time available. Other soldiers assigned to the unit may perform non-MP-specific tasks if necessary.</p>			

Table 4-1. Processing Actions at the EPW Processing Area (continued)

Station	Purpose	Responsible Individuals*	Actions
6	Photography and fingerprinting	MP	<p>Fingerprint EPWs. Identify and record the information on fingerprint cards.</p> <p>Take two photographs (with instant film or digital technology). Have EPWs look straight ahead, and fill the frame with their face.</p> <p>Use photograph name boards (black background with white characters). List ISNs and names (translated into English) at the bottom center.</p> <p>Attach one photograph to the EPW's personnel record.</p> <p>Give a completed, laminated ID card (which contains the second photograph) to the EPW.</p> <p>Supervise the movement of EPWs to the next station.</p>
7	Personal property	MP	<p>Inventory and record property (in the presence of EPWs) brought from temporary property storage areas.</p> <p>Make separate lists for returned, stored, impounded, and confiscated property. List property to be returned to EPWs or stored during internment on a separate list.</p> <p>Provide receipts for property placed in temporary storage.</p> <p>Provide receipts for money placed in EPW accounts (AR 190-8 and DFAS-IN 37-1).</p> <p>Return retained property that was taken from the EPW at Station 1.</p> <p>Supervise the movement of EPWs to the next station.</p>
8	Records review	MP	<p>Review processed records for completeness and accuracy.</p> <p>Escort EPWs back to processing stations to correct errors if necessary.</p> <p>Let EPWs prepare notification-of-capture cards. If being interned at the same place as processing, let EPWs prepare notification-of-address cards. If EPWs are unable to write their own cards, have someone authorized by the commander to do it for them.</p> <p>Prepare and maintain an accountability roster of all EPWs.</p>
9	Accountability transfer	MP	<p>Sign for and take custody of EPWs (can use movement manifest), their records, and their impounded property if moving to another facility.</p> <p>Evacuate or ship impounded property separately according to JTRs.</p>
<p>*The number of people used to perform tasks depends on the number of EPWs and the amount of time available. Other soldiers assigned to the unit may perform non-MP-specific tasks if necessary.</p>			

RECEIVING LINE

4-9. When EPWs arrive at the internment facility, segregate them from those who arrived earlier and those who are partially processed. Count the EPWs and match them against the manifest and the receipts for them and their equipment.

4-10. Field-process each EPW if the capturing unit or the CP did not field-process him (Chapter 3). Ensure that he receives the serial number from his capture tag (DD Form 2745). (The number is used to track him until he receives an internment serial number [ISN]).

4-11. Record his capture tag serial number and last name on an ID band. Use a banding kit to attach the band to his left wrist. Match his capture tag serial number with the number on his personal property, or if necessary, mark his capture tag serial number on his personal property.

4-12. Store personal property in a temporary storage area until EPWs are fully processed, and control access to the storage area. Ensure that EPWs receive food and water and, if necessary, first aid and medical treatment. Take them to the processing area as soon as the receiving process is complete. If they cannot be processed immediately, hold them in the receiving area.

PROCESSING LINE

4-13. After EPWs have completed the receiving portion of their processing, move them to the processing line, where they are formally processed into the facility. They are entered into the IRIS database, and the IRIC forwards the information to the national IRIC for dissemination to the protecting power. The processing element—

- Keeps segregated EPWs apart as much as possible during processing.
- Conducts administrative processing.
- Expedites the processing of EPWs selected by MI teams for interrogation.
- Assigns each EPW an ISN.
- Replaces the control number on each EPW's wrist with his ISN.

PERSONNEL FILE

4-14. Ensure that the following forms are included in each EPW's personnel file:

- DA Form 1131-R. Use this voucher to verify the balance of funds.
- DA Form 1132-R. List the EPW's personal property on this form.
- DA Form 2662-R. Issue this card if the EPW does not hold one from his country.
- DA Form 2663-R. Prepare this card for each EPW upon processing into the facility.
- DA Form 2664-R. Initiate this form upon inprocessing and update it monthly.
- DA Form 4137. Record confiscated currency on this form.
- DA Form 4237-R. Prepare this form for each EPW processed into the facility.

- DD Form 2708. Use this form to account for evacuated EPWs, regardless of the evacuation channel.
- DD Form 2745. File Part B of this tag in the personnel record.

INTERNMENT SERIAL NUMBER

4-15. The national IRIC forwards blocks of ISNs to designated IRICs in the TO and CONUS as required. The ISNs are used to identify EPWs in US custody. Each ISN is a unique, individual number; no two are alike. An ISN consists of two parts:

- The first part contains the letters "US," a number indicating the TO where the EPW came into US custody, and two letters representing the EPW's country of origin.
- The second part is a series of six numbers that are assigned (in sequential order) to each EPW processed in the command. The numbers are followed by the letters "EPW," "CI," "RP," or "OD" to denote the EPW's category.

For example, the first EPW processed by the US Army in TO 9, whose country designation is AB, is assigned ISN US9AB000001EPW.

4-16. If the situation permits, the IRIC processes EPWs at division CPs and CHAs. Assign ISNs as early as possible. However, if an ISN is not assigned until Station 1 (see Table 4-1, page 4-3), use the capture tag number, the manifest number, or another control number until an ISN is assigned.

NOTE: See STANAG 2044 and AR 190-8 for additional information on ISNs.

IDENTIFICATION BAND

4-17. The EPW ID bands are used to—

- Verify EPW rosters against the compound population.
- Identify compound work details.
- Match EPWs with their medical records.
- Check identities of EPWs being transferred or repatriated against transfer rosters.
- Permit rapid, reliable ID of EPWs.
- Enhance facility administration and operation.

4-18. An EPW can remove his ID band, but doing so destroys the band so that someone else cannot use it without being detected. The MP cannot prevent EPWs from destroying bands; however, most EPWs accept the use of the band for ID purposes.

4-19. Record the EPW's ISN and last name on his ID band, and secure it to his left wrist. To enhance facility administration and operation, use various colored bands to further identify EPWs by category. For example, use—

- Blue for officers.
- Red for NCOs.
- Yellow for enlisted soldiers.
- Black for RPs.

- Green for CIs.
- White for ODs.

If EPW ID bands are unavailable, use a medical wristband or something similar.

4-20. When serious deterioration is detected or the ISN and name is obscured, replace the ID band with a new one. Conduct periodic, random checks to detect wear and tear and efforts to destroy the band. In addition, look for efforts to exchange bands between EPWs (removing the ID band results in damage that is easily detected). When firm ID is needed, such as transfer or hospitalization, carefully examine the ID band for evidence of having been removed. Conduct periodic, routine inspections of randomly selected ID bands in dining-facility lines, during compound inspections, and at other opportune times.

FLOW OF INFORMATION

4-21. Regard the information collected from EPWs as sensitive to protect them and the soldiers who are guarding them. If belligerent nations discover how many EPWs are in a facility or discover the location of a facility, it may be targeted to silence the sources of information. Maintain proper security throughout the information flow, and disseminate information through proper channels. The IRIC acts as a hub for information that CHAs and internment facilities produce. Report personnel records electronically on the IRIS or, if necessary, as a paper file.

4-22. The information flow begins when the EPW is captured and a DD Form 2745 is initiated. The ISN, which is assigned upon arrival at a CHA or an internment facility, is the key to tracking EPWs throughout the I/R system.

4-23. Information collected during processing (initial and full) and entered into the IRIS (CHA or internment facility) is sent to the IRIC. The IRIC collects the entire personnel file; it is normally electronic with a hard-copy backup. The internment facility reports the information to the IRIC, who disseminates it as appropriate. The strength report (DA Form 2674-R) is the only information passed up the internment facility's chain of command. Questions regarding the information or EPW flow in the TO are directed to the IRIC.

NOTE: Hasty processing can be initiated if normal processing cannot be done in a reasonable amount of time (normal processing is completed later).

Initial Processing

4-24. During initial processing (at the point of capture), gather critical information from EPWs and assign ISNs. The minimum information needed during initial processing is the—

- Complete name (first, middle, and last).
- Service number.
- Rank.
- Capturing unit.

- Date of capture.
- Place of capture (grid coordinates).
- Circumstances of capture.

4-25. The above information (along with the capturing country, the TO, the power served, the sequence number, and the EPW category) is enough to move the EPW into an internment facility where additional information is gathered. Much of the information is gleaned from the capture tag. The IRIC provides block ISNs, and other information is theater- and situation-driven. The initial processing is quick and effective.

Intermediate Processing

4-26. Per AR 190-8, the national IRIC is responsible for collecting the following items to complete the intermediate processing:

- The date of birth.
- The city of birth.
- The country of birth.
- The name and address of next of kin (NOK) (father/mother).
- The location of confiscated property.
- The nationality.
- A general statement of health.
- The nation in whose armed services the individual is serving.
- The name and address of a person to be notified of the individual's capture.
- The address to which correspondence may be sent.
- Certificates of death or authenticated lists of the dead.
- The location of war graves (grid coordinates) and particulars of the dead.
- The notification of capture (including the date sent).
- The list of personal articles of value not restored upon repatriation.

Full Processing

4-27. Remember, an EPW is only required to give his name, rank, and service number. However, collect additional information if possible. An EPW is considered fully processed when the personnel file is complete. This includes the fields completed during initial and intermediate processing and those listed below:

- Education.
- Religion.
- Marital status.
- Internment facility unit identification code (UIC).
- Sex.
- Languages spoken.
- Internment facility location.
- Enemy unit.
- Arm of service.

-
- Military occupational specialty (MOS).
 - Civilian occupational specialty (COS).
 - Corps area of capture.
 - Mother's maiden name.
 - Permanent home address.
 - Other particulars from the ID card.
 - Distinguishing marks.
 - Impounded personal property and money.
 - Photograph.
 - Prepared by, date prepared, place prepared, and signature.
 - Immunizations.
 - Internment employment compensation.
 - Serious offenses, punishments, and escapes (including dates).
 - Transfers.
 - Financial status at the time of first and second international transfers.
 - Repatriation.
 - Financial status at the time of repatriation.
 - Remarks.

ASSIGNMENT TO INTERNMENT FACILITIES

4-28. Selectively assign EPWs to internment facilities that best meet their needs and the needs of the detaining power. To prevent problems, isolate EPWs from the general population if they hold violent, opposing ideologies. After EPWs are assigned to a facility, they may be further segregated due to nationality, language, and so forth. Normally, EPWs are segregated into the following categories:

- Officer.
- NCO.
- Enlisted.
- CI.
- RP.
- Male.
- Female.

4-29. The EPWs may be further assigned to separate compounds. Always intern females in compounds that are separate from males. Further separation of EPWs may be necessary depending on security issues. (See Chapter 6 for further information on I/R facilities.)

CLASSIFICATION AND REASSIGNMENT

4-30. The initial classification of an EPW is based on unsupported statements or documentation provided by them. Assignment to a specific compound within the internment facility is based on the assumption that the identity provided by the EPW is correct.

4-31. After an EPW is assigned to a facility, expect a continuing need for further reclassification and reassignment. Because the identity of the EPW was based on unsupported statements or documentation supplied by him, it may be necessary to reclassify him a second time as his identity becomes apparent. Agitators, enemy plants, or EPW leaders are eventually uncovered by their activities. They may be reclassified according to their new identity or ideology and reassigned to a more appropriate facility.

4-32. Anticipate the reclassification and reassignment of EPWs within the facility or to other facilities. The initial classification may be challenged by the EPW or MP assets. An individual may provide statements or documents that indicate he should be reclassified, or observations made by MP or MI may determine that an individual was incorrectly classified.

TRIBUNAL

4-33. A tribunal is held according to Article 5, GPW. It determines the status of an individual who does not appear to be entitled to EPW status but—

- Commits a belligerent act to aid enemy armed forces.
- Engages in a hostile activity to aid enemy armed forces.
- Asserts that he or she is entitled to treatment as an EPW.

TRANSFER BETWEEN FACILITIES

4-34. A transfer may be a result of reclassification or another situation requiring the movement of an EPW. Transfer an EPW from one facility to another under conditions that are comparable to those for a member of the US armed forces when possible. Security measures are determined by MP and are influenced by the type of EPW being transferred, the mode of transportation used, and other pertinent conditions.

4-35. The facility commander—

- Publishes a transfer order and informs EPWs of their new postal addresses in time for them to notify their NOK and the IRIC.
- Verifies the accuracy and completeness of EPW personnel records and provides records (in a sealed envelope) to MP accompanying the movement.
- Verifies that EPWs possess their authorized clothing and equipment.
- Prepares impounded personal property for shipment with escorting MP or separate shipment as appropriate.
- Briefs escort MP on their duties and responsibilities, including procedures to be followed in case of an escape, a death, or another emergency.
- Provides or arranges for rations, transportation, and notifications according to prescribed procedures.
- Ensures that EPWs are manifested by name, rank/status, ISN, power served, nationality, and physical condition. Attach the manifest to the original receipt and forward it to the IRIC.
- Prepares paperwork in English and other languages (if required) before transferring EPWs.

4-36. Each EPW can transfer personal property not exceeding 55 pounds. Chaplains and EPWs who have been serving as clergymen are permitted to transfer an additional 110 pounds to cover communion sets, theological books, and other religious material. If an EPW's personal property exceeds 55 pounds, he selects the items he is going to transfer and disposes of the rest according to established policies.

TRANSFER TO HOST NATION OR ALLIED FACILITIES AND INTERSERVICE

4-37. The permanent transfer of an EPW from the custody of US forces to the HN or other allied forces requires the approval of the Secretary of Defense (SECDEF). The permanent transfer of an EPW to FN control is governed by bilateral national agreements. An EPW can only be transferred from US custody to a power that is a party to the Geneva Conventions. A US representative visits the power's internment facilities and ensures that the power is willing and able to comply with the Geneva Conventions.

4-38. The temporary transfer of EPWs is authorized to accommodate surges in EPW population beyond US capacity. The TO commander develops measures to ensure accountability and humane treatment of EPWs who are temporarily transferred.

4-39. An EPW who is captured or detained by the US Marine Corps, Navy, Air Force, or Coast Guard is turned over to the US Army at receiving points designated by the TO commander. Interservice transfers are effected as soon as possible following initial classification and administrative processing.

REPATRIATION

4-40. Repatriation is the process of returning an EPW to his country of birth or citizenship. An EPW who is not sick or wounded is repatriated or released at the end of hostilities as directed by the Office of the Secretary of Defense (OSD). The keys to a successful repatriation process are control and accountability. Table 4-2, page 4-12, outlines repatriation procedures.

4-41. To complete the transfer, the escort guard company forwards the official receipt of transfer to the IRIC. Upon notification from the IRIC that the transfer is complete, the losing internment facility forwards official records and unreleased confiscated property to the IRIC for final disposition. The IRIC—

- Notifies the national IRIC of the final status of released and repatriated EPWs.
- Forwards EPW records and reports according to AR 25-400-2.
- Disposes of confiscated property according to the national IRIC and applicable regulations.

4-42. The eligibility for repatriation or accommodation of sick and wounded EPWs is determined in a neutral country by a mixed medical commission. The commission is established by Headquarters, Department of the Army (HQDA) according to AR 190-8 and the GPW. Sick and wounded EPWs are not repatriated against their will during hostilities.

Table 4-2. Repatriation Procedures

Step	Actions
Control and accountability	Maintain control and accountability until EPWs are received by the serving power or the designated protecting power. Maintain a manifest that contains the— <ul style="list-style-type: none"> • Name. • Rank/status. • ISN. • Power served/nationality. • Physical condition. <p>NOTE: A manifest is used as an official receipt of transfer and becomes a permanent record to ensure accountability of each EPW until his final release.</p>
Records	Ensure that copies of appropriate personnel, finance, and medical records accompany released and repatriated EPWs. Transfer the records to the designated official receiving EPWs.
Personal property	Ensure that confiscated personal property (that can be released) accompanies released and repatriated EPWs. Conduct an inventory and identify discrepancies. Ensure that EPWs sign property receipts.

CONTROL AND DISCIPLINE

4-43. Treat EPWs fairly and firmly. Ensure that orders are decisive, clear, concise, reasonable, capable of being obeyed, and given in an understood language. Promptly report refusals and failures to obey orders, and take appropriate disciplinary action.

CONTROL

4-44. Maintain humane, firm control of EPWs. To control EPWs—

- Observe rigorous self-discipline.
- Maintain a professional, impersonal attitude.
- Cope with hostile or unruly behavior and incidents calmly.
- Take judicious, immediate, and decisive action.

4-45. The MP establish daily and periodic routines and responses that are conducive to good EPW discipline and control. They—

- Require compliance with policies and procedures.
- Use techniques that provide firm control of EPWs.
- Give reasonable, decisive orders in a language that EPWs understand.
- Post copies of the Geneva Conventions in the compound where EPWs can read them in their own language.
- Post rules, regulations, instructions, notices, orders, and other announcements that EPWs are expected to obey. Ensure that posted information is printed in a language that EPWs understand. Provide copies to EPWs who do not have access to posted copies.
- Ensure that EPWs obey rules, orders, and directives.

- Report refusals and failures to obey orders and regulations.

Treatment

4-46. Equitable treatment enhances the control of EPWs. According to the Geneva Conventions, all EPWs are treated humanely and are protected against violence, intimidation, insults, and public curiosity. Treat all EPWs alike, regardless of rank, sex, and privileged treatment (which may be accorded due to their health, age, or professional qualifications).

4-47. An EPW officer is afforded the following privileges and considerations:

- Quarters and facilities that are commensurate with his grade.
- The privilege of not being compelled to work.
- Enlisted orderlies. They are assigned at a ratio of 1 for each general officer (GO) and 1 for every 12 officers of a lower grade.

4-48. An RP is extended additional privileges and considerations due to his profession and special skills:

- Correspondence privileges for chaplains and senior medical officers that are over and above those afforded EPW officers.
- Facilities necessary to provide EPWs with medical care, spiritual assistance, and welfare service.
- Authority and transportation for periodic visits to hospitals and other internment facilities.
- Work assignments that are restricted to medical or religious duties he is qualified to perform.
- Quarters that are separate from those of other EPWs when practical.

Representation

4-49. A limited system of representation improves communication between US forces and EPWs, thus improving control. According to AR 190-8 and the Geneva Conventions, the senior EPW officer assigned to each facility is recognized as the senior EPW representative, unless he is declared incompetent or incapacitated by US authorities. Enlisted EPWs may elect an enlisted representative if there is no officer representation at the facility. In officer facilities, EPWs choose one or more advisors to assist the senior representative. In officer/enlisted facilities, EPWs elect one or more enlisted advisors to assist the officer representative.

4-50. Elected and appointed representatives have the same nationality, customs, and language as those they represent. Each group of EPWs interned in separate facilities due to language, customs, or ideology is permitted to have an elected representative.

4-51. The primary duties of elected representatives are to promote spiritual, physical, and intellectual well-being of EPWs. Representatives are given freedom of movement within security requirements. They do not have the authority to discipline EPWs, but they are allowed to—

- Inspect labor detachments.
- Receive supplies.
- Communicate with—

- US military authorities.
- Protecting powers. (Protecting powers periodically inspect the internment facility and interview EPWs regarding the conditions of their internment, their welfare, and their rights under international law.)
- The ICRC and its delegates.
- Medical commissions.
- Other organizations authorized to assist EPWs.
- Use postal and other appropriate facilities.

4-52. Representatives do not perform any other work if it interferes with their representative duties. Each representative is elected by secret ballot and serves a 6-month term. The EPWs are permitted to consult freely with their representatives, and representatives are allowed to represent EPWs before—

- The ICRC.
- Protecting powers.
- US military authorities.
- Other relief or aid organizations (NGOs and IOs).

4-53. The facility commander is the final approving authority for each elected EPW representative. After the approval process is complete, a representative assumes his duties. When the commander denies, approves, or dismisses an elected representative, he sends a notice through channels to HQDA, the national IRIC (forwarded to the IRIC), or the protecting power. The notice includes the reason(s) for refusal if applicable. The EPWs are then permitted to elect another representative. Each elected representative can appoint assistants, as approved by the facility commander.

4-54. Medical and chaplain personnel are classified as RPs and are not considered EPWs. They receive, at a minimum, the benefits and protection afforded EPWs by the Geneva Conventions. However, EPW representatives do not represent them. The senior US or FN medical officer at each internment facility is responsible for the activities of retained medical personnel. The senior retained medical officer and the chaplain have the right to correspond and consult with the facility commander on all questions concerning their duties.

RULES OF INTERACTION AND ENGAGEMENT

4-55. The ROI provide soldiers with a guide for interacting with the EPW population. The following directives may be included in the ROI:

- Speak to EPWs only when giving orders.
- Treat all EPWs equally and with respect.
- Respect religious articles and materials.
- Treat all medical problems seriously.
- Do not discuss politics or the conflict with EPWs.
- Do not make promises.
- Do not make obscene gestures.
- Do not make derogatory remarks or political comments about EPWs and their cause.

- Do not engage in commerce with EPWs.

4-56. Commanders balance the physical security of forces with mission accomplishment and the ROE. The basic guidelines on ROE (Chapter 2) apply to EPWs. The employment of nonlethal weapons (NLWs) is clearly stated in the ROE (see Appendix B and FM 90-40).

4-57. The ROE vary from operation to operation. The commander in chief (CINC) establishes ROE in coordination with the SJA and the joint staff. Special ROE can be developed for use in internment facilities, but they must have CINC approval. Specific ROE may evolve to fit the changing environment and to ensure continued protection and safety for US personnel and EPWs. As a general principle, the ROE should remain simple and understandable.

DISCIPLINE

4-58. The facility commander establishes and enforces the rules needed to maintain discipline and security. The EPWs may not establish their own court system. The following actions are not permitted between EPWs and US military or civilian personnel:

- Fraternalization.
- Favoritism.
- Donation or receipt of gifts.
- Engagement in commerce.

4-59. If necessary, the MP commander or his appointed officer initiates general court-martial proceedings against EPWs using Miscellaneous Publication (Misc Pub) 27-7; the UCMJ; and US laws, regulations, and orders. Do not deliver an EPW to civil authorities for an offense unless a member of the US armed forces would be delivered for committing a similar offense.

4-60. Do not discipline an EPW until he is given precise information regarding the offense(s). Allow the accused to explain his conduct and defend himself. Permit him to call witnesses, and use an interpreter if necessary. Maintain a record (on a locally produced form if available) of disciplinary punishment administered to EPWs. Disciplinary measures include—

- Discontinuance of privileges that are granted over and above those allowed by the Geneva Conventions (not to exceed 30 days).
- Confinement (not to exceed 30 days).
- A fine (not to exceed one-half of the advance and working pay that an EPW receives during a 30-day period).
- Fatigue duty (extra duty) (not to exceed 2 hours per day for 30 days). Fatigue duty does not apply to officers, and NCOs are only required to supervise.

CLOTHING

4-61. Supply EPWs with sufficient clothing, underwear, and footwear; and allow for the climate where EPWs are housed. Use captured uniforms of enemy armed forces if they are suitable for the climate. Ensure that clothing is replaced and repaired as necessary. Working EPWs receive clothing that is

appropriate to the nature and location of the work. Clothing worn by EPWs at the time of capture is worn until it is no longer serviceable, and then it is exchanged. (Appendix C provides a synopsis of clothing and equipment that can be issued to EPWs.)

4-62. Mark outer garments with the letters "PW." Use black letters, about 4 inches high; if the clothing is a dark color, use white letters. Mark shirts, coats, and similar items across the back and on the front of each sleeve (between the elbow and the shoulder). Mark trousers, walking shorts, and similar items across the back (slightly below the belt) and on the front of each leg (slightly above the knee). Do not mark hats and other accessories. Sample EPW clothing markings are shown in Figure 4-1.

Figure 4-1. EPW Clothing Markings

4-63. An RP wears a water-resistant armband on his left sleeve bearing a distinctive emblem (such as Red Cross or Red Crescent). It is issued and stamped by the military authority of the power with which he has served. An authorized person who does not have an armband in his possession is provided a Geneva Convention brassard (see AR 670-1).

SUBSISTENCE

4-64. The detaining power feeds EPWs a basic, daily food ration that is sufficient in quantity, quality, and variety to keep them in good health and to prevent weight loss and nutritional deficiencies. A medical officer, a PA, or a nurse practitioner keeps the commander apprised of situational needs and the nutritional health of EPWs. Supply working EPWs with extra rations to compensate for their labor. Sustain the health of EPWs at a level that is equal to that of the US forces guarding them.

4-65. If dining facilities are unavailable, feed EPWs meals, ready-to-eat (MREs). These rations are easily stored and require no additional dietary supplements. However, when perishable food supplies (fresh vegetables, fruit, and meat) are available, substitute them for nonperishable items. Always provide sufficient drinking water. Do not issue extra rations because EPWs can stockpile food and use it for escapes. The commander may authorize EPWs to prepare their own meals under the supervision of US personnel.

4-66. During the early stages of captivity (in brigade and division areas), allow EPWs to retain their own rations. However, arrange for collective feeding of EPWs according to the terms of the Geneva Conventions at the earliest opportunity.

MEDICAL AND SANITATION CONSIDERATIONS

4-67. Ensure that adequate medical and sanitation standards are met. Chapters 2 and 6 contain additional information on these responsibilities.

CORRESPONDENCE

4-68. Within one week of arrival at the internment facility, an EPW completes a DA Form 2665-R. When an EPW is transferred from one internment facility to another, he completes a DA Form 2666-R.

OUTGOING CORRESPONDENCE

4-69. Outgoing correspondence is allowed as follows:

- May mail two letters (DA Form 2667-R) and four postcards (DA Form 2668-R) free of charge as prescribed in AR 190-8.
- May address complaints in writing to US military authorities and the protecting power. Complaints are not limited in length or in number, and they are not charged against an EPW's correspondence allotment. All complaints are transmitted immediately.
- Cannot write letters for other EPWs. If an EPW is unable to write, the facility commander appoints someone to write and countersign the letter.
- Cannot send parcels.

4-70. The facility commander or his designated representative examines and reads letters and postcards. The facility commander requisitions, reproduces, and supplies correspondence forms. If EPWs are prevented from writing

monthly letters due to the lack of forms, allow them to make up their allotment when forms become available.

INCOMING CORRESPONDENCE

4-71. An EPW can receive unlimited letters, cards, and parcels. Censors thoroughly inspect all parcels for unauthorized items and concealed or coded messages. If deemed necessary, the facility commander can request that censors also examine incoming correspondence. Parcels are forwarded to EPWs who have been transferred.

TELEGRAMS AND TELEPHONE CALLS

4-72. The EPWs may send and receive telegrams as determined by the facility commander, and the cost of sending telegrams is deducted from the EPW's account. The EPWs cannot make telephone calls.

CANTEENS

4-73. Provide EPWs with sundry, health, and comfort packs. The packs can be supplemented with items tailored to EPWs' cultural needs as a temporary substitute for establishing canteen operations.

4-74. Canteens are operated according to the GPW and are installed as directed by the TO PM or senior MP officer. The EPWs can procure foodstuffs, soap, tobacco, and other items in canteens. The tariff for items available for EPWs never exceeds local market price, and payment procedures are outlined in DFAS-IN 37-1.

4-75. Profits made by the facility canteen are used to benefit the EPWs, and a special fund is created for this purpose. When an internment facility closes, transfer the credit balance of the special fund to another US internment facility in the TO. When all facilities are closed, transfer funds to an international welfare organization. The special fund is employed for the benefit of EPWs of the same nationality as those who have contributed to the fund. In case of a general repatriation, profits are kept by the US.

NOTE: The EPW representatives can make suggestions regarding the management of canteens and special funds.

SOCIAL PROGRAMS

4-76. Encourage and support active education, employment, and agriculture programs for EPWs. Like other internees, EPWs have active programs for religious worship, recreation, protecting-power visits, and safety. These programs are discussed in Chapter 2. Provide adequate facilities, instruction materials, and agriculture equipment for these activities.

EDUCATION

4-77. Develop education programs according to DA policy. Within the framework of DA guidance and directives issued by other headquarters, develop a separate education program for each EPW facility. Each program reflects the individual attitudes and political orientations of those interned in

the facility. The following factors and considerations may influence an education program:

- Levels of education throughout the EPW population.
- Attitudes toward education and the education program.
- Requirements for essential and necessary EPW work details.
- The availability of qualified instructors (may include EPWs, indigenous personnel, and US Army military and civilian personnel).
- Security considerations that may restrict or prohibit the use of EPWs or indigenous personnel.

4-78. In addition to an academic program, ensure that vocational training is an integral part of the education program. The immediate objective of vocational training is to develop skills that are useful during internment. The long-range goal is for EPWs to learn trades that are useful in civilian life.

EMPLOYMENT

4-79. The EPW population constitutes a significant labor force of skilled and unskilled workers. Employ EPWs to construct, administer, manage, and maintain the facility. The EPWs will be employed in other essential work permitted by AR 190-8 only when qualified civilian labor is unavailable.

4-80. The commander organizes and manages the EPW population in a manner that permits proper, ready employment of each EPW. He—

- Establishes and maintains a current occupational-skill record for each EPW and includes new skills as they are acquired.
- Assigns individual EPWs to a work detail or a job on a regular or permanent basis.
- Establishes vocational-training projects.
- Encourages EPWs to study and develop skills.

4-81. The EPW labor that is external to DOD is regulated through contract. (See AR 190-8 for more information on the employment of and compensation for EPWs.)

Labor Considerations

4-82. The following restrictions apply when employing EPWs:

- An officer cannot be compelled to work.
- An NCO can only be required to supervise the work of enlisted personnel.
- An EPW cannot be compelled to engage in work that is purely military in nature and purpose.
- An EPW cannot be employed on a work detail that is unhealthy or dangerous because of the work's nature or the individual's lack of physical fitness or technical skill. (See the GPW and AR 190-8 for guidance on this type of employment.)
- An EPW/RP cannot be assigned to labor that is considered humiliating or degrading for members of the US armed forces. This prohibition does not include unpleasant, necessary tasks that are connected to administering and maintaining the facility.

- An EPW cannot be employed or retained in an area where he may be exposed to direct or indirect fire.

4-83. If in doubt as to whether work is authorized, request that the SJA review the proposed tasks. This review assures compliance with AR 190-8 and the law of land warfare.

Paid Work

4-84. The EPWs are compensated when they perform work for which pay is authorized. The rate of pay is not less than that prescribed in the GPW. Compensation for work is authorized from US Army appropriated funds, canteen funds, or EPW funds. The EPWs are paid for various types of authorized work, such as—

- Labor performed for a contract employer or a federal agency.
- Services as orderlies and cooks for officer EPWs.
- Services to construct, administer, manage, and maintain EPW facilities, branch facilities, and hospitals when such services are performed by EPWs permanently assigned to certain duties or occupations.
- Labor performed by RPs.
- Spiritual or medical duties.
- Services as EPW representatives or assistants. These individuals are paid from the EPW fund. If an EPW fund does not exist, they are paid from US Army appropriated funds.
- Services as detail leaders or interpreters.

Advance Pay

4-85. The Geneva Conventions state that the detaining power shall grant EPWs a monthly advance of pay, the amount of which shall be fixed by conversion into the currency of the said power, of the following amounts:

- Category I (EPWs below the rank of sergeant [SGT]): 8 Swiss francs.
- Category II (SGTs, other NCOs, and EPWs of equivalent rank): 12 Swiss francs.
- Category III (warrant officers [WOs], commissioned officers below the rank of major [MAJ], and EPWs of equivalent rank): 50 Swiss francs.
- Category IV: (MAJs, lieutenant colonels [LTCs], colonels [COLs], and EPWs of equivalent rank): 60 Swiss francs.
- Category V (GOs and EPWs of equivalent rank): 75 Swiss francs.

NOTE: The facility commander consults with the SJA and the finance office when setting up EPW advance-pay accounts.

AGRICULTURE

4-86. When practical, EPWs should raise vegetables for their use; the labor is classified as paid work. Do not overlook the importance of developing an agriculture program. Agriculture and gardening projects are particularly desirable because they provide gainful employment for several individuals. The food produced by gardening projects provides a valuable supplement to

diets at minimal expense. The produce from gardens operated with EPW labor is US property. It is used for the benefit of EPWs and US armed forces personnel, and it is not sold or traded in civilian markets.

4-87. The types and quantities of agriculture supplies required (seeds, fertilizers, and implements) are procured through local purchase or Army supply channels. Ensure that necessary supplies are ordered in a timely manner.

SECURITY

4-88. The commander is responsible for security measures that effectively control EPWs with minimal use of force. A general discussion of the commander's security responsibilities is found in Chapter 2. The information contained in this chapter applies specifically to EPW security.

ADVERSE ACTIONS

4-89. Dissident actions by EPWs vary from acts of harassment to acts of violence. Enemy forces may support resistance activities, such as EPWs—

- Refusing to eat, work, or attend formations.
- Working in an unsatisfactory manner.
- Malingering.
- Sabotaging equipment or facilities.
- Assaulting other EPWs or guard personnel.
- Taking hostages to secure concessions.
- Escaping or participating in mass breakouts.
- Intimidating other EPWs.
- Fabricating weapons or other illegal items.
- Printing or circulating propaganda material.
- Creating embarrassing situations or making false accusations to influence international inspection teams or members of the protecting power or the ICRC.
- Instigating disturbances and riots to place the facility staff in unfavorable positions (this allows EPWs to gain concessions and influence custodial policies).

4-90. Enemy forces may—

- Establish communications with EPWs by using agents, smuggled radios, and foreign-language newspapers.
- Order members to submit to capture so that they can become agitators in the internment facility.
- Liberate EPWs through direct military action by regular or irregular forces.

PLANNING

4-91. Ensure that security planning is continuous and complete and that it reflects current intelligence information on uprisings, outbreaks, and escapes.

Provide an immediate-response plan that is capable of meeting all internal and external threats to security.

4-92. The EPWs may try to communicate with EPWs from other compounds and facilities. The most common places for communication are—

- **Dispensary and food distribution points.** Messages can be hidden where EPWs from neighboring compounds can find them. Alert observations and periodic searches minimize the possibility of communication in these areas.
- **Hospitals.** If an EPW is sick or injured, examine him carefully to ensure that hospitalization is required. Do not inform the EPW patient of his discharge until the last possible moment. Conduct a complete search of each EPW and his personal effects upon admission and discharge from a hospital.
- **Work details.** Maintain an adequate distance between work details to prevent EPWs from exchanging information.

INTELLIGENCE INFORMATION

4-93. The first objective of MI is observing activities to accurately classify EPWs as cooperative or uncooperative. This minimizes security and control problems by allowing early segregation of hard-core, uncooperative EPWs to maximum-security internment facilities.

4-94. Timely information relative to attitudes and activities enables the facility commander to forecast disturbances and other clandestine activities. This information is an important means of countering resistance movements, minimizing the use of force, and maintaining control. An effective information-gathering system identifies dissident elements, including leaders, plans, and methods.

4-95. All facility personnel must detect and report significant information. They can acquire important information through observation and insight, even though they are not trained intelligence specialists.

4-96. In compounds that house cooperative EPWs, a special intelligence organization is not needed. Tap ordinary sources of information continually and assess them sensitively. These sources include communications, observations, and reports of military, administrative, and security personnel; criminal investigation data; disciplinary reports; and grievance statements.

4-97. Intelligence requirements incorporate information required by the commander to ensure the continued control of EPWs and information requested by higher headquarters and other agencies. The S2 prepares PIR and coordinates intelligence requirements to maintain a constant flow of intelligence to the commander.

4-98. Identify the following essential elements of information (EEI):

- EPW agitators and leaders and their followers.
- Clandestine EPW organizations, including their strength, objectives, and members.
- Underground communications systems and overt attempts to communicate—

- Between EPW compounds and internment facilities.
- With indigenous civilian personnel.
- Suspicious activities by local people near the internment facility (photographing or sketching the facility).
- Fabricated weapons, stores of food, and clothing supplies in the compound.
- Plans to conduct demonstrations, including—
 - The date and time.
 - The number of EPWs involved (by compound).
 - The nature of the demonstration (passive, harassing, or violent act).
 - Objectives (distributing propaganda, weakening or testing authority and security, establishing control, or planning mass escapes or outbreaks).

4-99. Use the following methods to obtain information on clandestine EPW activities:

- Provide opportunities for EPWs to volunteer information of intelligence value and offer protection from reprisal by removal or transfer to safe facilities.
- Conduct periodic, unannounced searches and patrols.
- Search EPWs on departure from and return to the facility.
- Train personnel on the techniques and importance of observing, recognizing, and reporting information that may have intelligence value, such as—
 - Unusual activities, especially before holidays or celebrations.
 - Messages being passed between groups of EPWs on work details.
 - Messages being passed to or from local civilians while EPWs are on work details.
 - Messages being signaled from one compound to another.

4-100. Developing an EPW intelligence network that extends to each compound is invaluable. The reliability of the network depends on the information provided and the verification of that information. Establishing an informant system is subject to local consideration of special hazards that may be involved. Take every precaution to provide safety for EPW informants.

WORK DETAIL GUARDS

4-101. Keep work detail guards to the minimum number necessary to assure reasonable security and prevent EPW escape. Guards maintain a reasonable distance from work details and properly position themselves to provide the best observation of the area. Rest breaks for guards are taken separately while EPWs are working.

MILITARY WORKING DOGS

4-102. The MWDs offer a viable deterrent against EPW escapes, because their tracking capabilities can be used to recapture escapees. Chapter 2 provides more information on MWDs and their use in internment facilities.

ESCAPE PREVENTION

- 4-103. Minimize escapes by—
- Conducting periodic, unannounced, and systematic searches to detect tunneling, caches of food or clothing, weapons, maps, and money or other valuables.
 - Maintaining strict accountability for tools and equipment that EPWs can access or use.
 - Examining perimeter fencing daily to detect cuts or other weaknesses.
 - Examining the lighting system during darkness to detect poorly lighted areas along the perimeter. (Replace burned out or broken light bulbs immediately.)
 - Conducting training and refresher training to ensure that all security and guard personnel are familiar with security precautions, techniques, and procedures.
 - Searching vehicles and containers taken into or out of the internment facility.
 - Supervising the disposition of unconsumed rations (in the internment facility and on work details) to prevent caching of food.

Early Detection of Escape Attempts

- 4-104. To detect escape attempts, conduct—
- Roll calls and head counts on regular and unannounced bases.
 - Roll calls twice daily, preferably early morning and late evening.
 - Head counts immediately after witnessing a mass disturbance, discovering an open tunnel, or detecting a hole or break in a fence.
 - Head counts frequently while on work details and when en route to another facility.

Escape Prevention and the Use of Force

4-105. The facility commander ensures that US soldiers understand the ROE, including the use of the term *halt*, the use of deadly force, and the ban on physical or imaginary deadlines. Per AR 190-8, he also ensures that EPWs understand the use of the English word *halt* and its implications.

4-106. When an EPW tries to escape, a guard shouts *HALT* three times; thereafter, the guard uses the least amount of force necessary to halt the EPW. If there is no other effective means of preventing escape, deadly force can be used. If an EPW tries to escape from a fenced enclosure, do not fire unless he clears the outside fence (barrier, concertina wire, or razor tape) and makes further effort to escape. If an EPW tries to escape outside a fenced enclosure, fire if he does not halt after the third command.

- 4-107. An escape is successful if an EPW—
- Reaches the lines of his forces or the allies of that power.
 - Leaves the territory that the US or its allied powers control.

Per the unit SOP, notify commands and interested agencies of escapes and recaptures.

Chapter 5

Civilian Internees

A civilian whose status cannot be determined is treated as an OD. All rules, regulations, and privileges applicable to an EPW apply to an OD. When an OD is adjudicated by a military tribunal and determined to be a CI, he is removed from the EPW facility and treated as a CI. This chapter discusses the internment process after a military tribunal adjudicates a civilian and determines that he should be interned. A CI internment facility runs parallel to an EPW internment facility, with some differences. A CI—

- Is protected under the provisions of the GC.
- Does not meet the criteria for classification as an EPW or an RP.
- Is considered a security risk.
- Needs protection because he committed an offense against the detaining power (insurgents, criminals, or other persons).

NOTE: AR 190-8 provides detailed information on the administration of a CI internment facility and the treatment of CIs.

GENERAL PROTECTION

5-1. Do not physically torture or use moral coercion against CIs. This does not prevent the use of minimum force necessary to enforce measures authorized or directed by AR 190-8. Ensure that CIs are treated with respect and protected against—

- Violence.
- Insult.
- Public curiosity.
- Bodily injury.
- Reprisal.
- Sexual attack (molestation, prostitution, or any form of indecent assault).

5-2. Treat CIs considerately, without adverse distinction based on race, religion, political opinion, sex, or age. The following are prohibited:

- Measures that may cause physical suffering or death.
- Intimidation.
- Terrorism.
- Reprisal.
- Hostage acts.

- Deportation from the occupied territory to the territory of the occupying power or any other country (occupied or not).

5-3. The CIs can apply for assistance from protecting powers, the ICRC, approved religious organizations, relief societies, and others. Within the limits of military and security considerations, these organizations are allowed access and facilities to assist CIs.

AUTHORIZATION TO INTERN

5-4. The internment of protected civilians is authorized and directed if the following requirements are met:

- Internment is necessary (as determined by competent US military authority) for the security of US armed forces in the occupied territory.
- Internment is directed (by a properly constituted US military court in the occupied territory) as the sentence for an offense that violates penal provisions issued by the occupying US armed forces.

5-5. A protected civilian in the occupied territory is accepted for internment upon receipt of one of the following:

- An internment order for imperative security reasons authenticated by a commissioned officer who is delegated authority by the TO commander.
- An order of an authorized commander, approving and ordering into execution, a sentence to internment pronounced by a properly constituted US military court in the occupied territory.

5-6. A CI can request compassionate internment of his dependent children who are without parental care in the occupied territory. This is normally granted after coordination with SJA when both parents or the only surviving parent is interned.

SAFETY

5-7. Establish and administer a safety program for CIs according to pertinent safety directives. (See AR 385-10 for more information.)

ADMINISTRATIVE RESPONSIBILITIES

5-8. An I/R facility housing CIs is commanded by a commissioned officer of the US armed forces, and he is responsible for the safety and well-being of all housed personnel. He ensures that copies of the Geneva Conventions and facility regulations, orders, and notices relating to the conduct and activities of internees are posted in each facility, in the language of internees housed there. He provides copies to internees who do not have access to posted copies.

5-9. Regulations and other guidance relative to the administration, employment, and compensation of internees are prescribed in detail in AR 190-8 and DFAS-IN 37-1. The commander ensures that all members of his staff and command are familiar with applicable ARs, directives, international laws, and administrative procedures.

5-10. The commander is responsible for administratively processing each internee. When processing is complete, a strength report (DA Form 2674-R) is

transmitted to the IRIC, which functions as the field operations agency for the national IRIC located in the TO.

PRINCIPLES AND POLICIES

5-11. The following principles apply to CI internment facilities:

- Use housed personnel for internal maintenance and operation.
- Use captured supplies and equipment (excluding weapons and ammunition).
- Maintain control.

5-12. A CI has the right to—

- Submit requests and complaints regarding the conditions of his confinement to detaining and protecting powers.
- Elect representatives to the internee committee.
- Send and receive correspondence.

NOTE: Commanders are authorized to impose disciplinary punishment according to the Geneva Conventions and AR 190-8.

STANDING ORDERS

5-13. Standing orders are used to provide uniform, orderly administration of the I/R facility. The orders to be obeyed by housed personnel are published in their language and posted where they can read and refer to them. Standing orders include rules, procedures, and instructions governing the following activities and other matters as deemed appropriate:

- Schedule of calls, including—
 - Reveille.
 - Morning roll.
 - Readiness of quarters for inspection.
 - Sick.
 - Mess.
 - Evening roll.
 - Lights out.
- Housed-personnel actions that support emergency action plans of the internment facility, such as—
 - Fire drills.
 - Air raid drills.
 - Emergency evacuations.
 - Natural-disaster drills.
 - Blackouts.
 - Escapes.
- Hours for religious services, recreation activities, and so forth.
- Procedures for emergency sick call.
- Designated smoking areas.

RECORDS AND REPORTS

5-14. The commander establishes local records and reports necessary to operate the facility effectively. The reports provide information concerning control, supervision, and disposition of the CI population. The commander determines the type (administrative, operational, logistical, intelligence, and personnel) of reports and the frequency (routine or as required). Normal command records and reports, such as duty officer logs, worksheets, and situation maps, are also required.

Processing

5-15. Internees who meet the requirements in the Geneva Conventions and AR 190-8 are entitled to the protected CI status. Process them as follows:

- Issue an ISN to each processed CI using the procedures in Chapter 4 for EPWs. Ensure that the letters "CI" follow the last number of the ISN.
- Complete DA Form 2663-R in duplicate for each CI and each dependent child. Place one copy in the CI's personnel file, which is transferred with him; and forward the other copy to the IRIC.
- Prepare DA Form 2674-R for each facility housing CIs and for each hospital where CIs are assigned. Account for all captives classified as CIs, captives who had a DA Form 4237-R prepared, and dependent children who received compassionate internment.
- Issue DA Form 2677-R to each processed CI. Direct him to retain the card at all times.
- Complete DA Form 2678-R in duplicate. Forward one copy to the CI information agency and the other copy to a relative.
- Prepare DA Form 4237-R for each protected civilian processed in the occupied territory as a CI or a dependent child. Stamp the letters "CI" on the top and bottom of each form.

Dependent Children

5-16. Dependent children who are interned with their CI parents are not classified as CIs or processed, except as required on DA Forms 2663-R, 2674-R, and 4237-R. When dependent children reside in the facility with their parents, they are cared for, accounted for, and managed like their parents. House children and parents together in facilities that allow them to lead a normal family life. Children under the age of 12 are identified by wearing an ID badge or wristband. Ensure that children under the age of 15, who are orphaned or separated from their families as a result of the war, are not left to their own resources.

Assignments

5-17. Assign CIs to appropriate internment facilities, and intern those with violently opposed ideologies in separate facilities. When possible, assign CIs according to their nationality, language, and customs. Do not separate CIs who are nationals of the same country merely because they speak different languages; however, consider political and cultural differences as grounds for

separation. Maintain segregation of males and females, with the following exceptions:

- House members of the same family together (particularly parents and children), allowing them to lead a near-normal family life.
- Provide quarters to a parent (if single or interned without a spouse) and children that are separate from those for single persons.

Identification

5-18. The reasons for identifying CIs are many and varied; among them are—

- Verifying facility rosters against the actual population.
- Identifying family members to allow timely reunification.
- Matching CIs with their medical records in case of a medical emergency or an evacuation.
- Checking identities of CIs being transferred against the transfer roster.

5-19. An ID band (see Chapter 4) permits rapid, reliable ID of CIs. Assign each CI an ISN according to the procedures in Chapter 4 and AR 190-8. Substitute the letters “CI” for “EPW;” for example, US9AB-000001CI. The ID card contains the CI’s name, photograph, and ISN. When serious deterioration of an ID band or card occurs, replace it immediately. Use a DA Form 2677-R to facilitate ID.

CLOTHING

5-20. Allow CIs to retain their clothing and footwear. Provide clothing, equipment, supplies, subsistence, and fuel as necessary. Issue work clothing and, as required by circumstances and climatic conditions, replacement clothing. Account for health and comfort items, such as razors and toothbrushes, with a direct-exchange program.

5-21. Mark outer garments with the letters “CI.” Use black letters, about 4 inches high; if the clothing is a dark color, use white letters. Mark shirts, coats, and similar items across the back and on the front of each sleeve (between the elbow and the shoulder). Mark trousers, walking shorts, and similar items across the back (slightly below the belt) and on the front of each leg (slightly above the knee). Do not mark hats and other accessories. The commander can also direct that a CI’s ISN be placed on the inside of his clothing. (See Figure 4-1, page 4-16.)

SUBSISTENCE

5-22. Issue food items based on the master CI menu prepared by the TO commander. The CI menu includes a daily food ration that is sufficient in quantity, quality, and variety to maintain good health and to prevent nutritional deficiencies. Consider the customary diet when developing a CI menu. Ensure that—

- Facilities are available to CIs for preparing additional food received or procured from authorized sources.

- CIs performing labor receive increased rations based on the type of work performed.
- Expectant and nursing mothers and children under the age of 15 years receive additional food in proportion to their needs.

5-23. If CIs receive MREs as the main source of nourishment, provide them with at least one hot meal per day. Supplement MREs with fruit, milk, and bread.

RECEIVING AND PROCESSING AREAS

5-24. Use a controlled-flow format to escort CIs through the processing line. Normally, four CIs are processed at a time and the average is eight per hour. Secure unprocessed CIs in a holding area.

5-25. Request interpreters (linguists) from MI, PSYOP, allied forces, or local authorities as necessary. This may require identifying and clearing trusted internees or local nationals to interpret. Interpreters are particularly helpful when entering required data into the IRIS.

5-26. The preparation and dispatch of internee strength reports (DA Form 2674-R) are governed by AR 190-8, and they are prepared at each internment facility. Brigade or facility commanders may require feeder reports from various compounds to facilitate the preparation of internee strength reports.

5-27. Escort internees to the receiving area where the internment process begins. Table 5-1 outlines the internment process for CIs. It shows who is responsible for each step and what actions they must accomplish. Based on METT-TC, the commander may tailor stations to meet the situation. Stations 1 through 4 are in the receiving line, and Stations 5 through 9 are in the processing line.

RECEIVING AREA

5-28. When CIs arrive at the facility—

- Segregate them from those who arrived earlier and those who are partially processed.
- Ensure that a valid internment order was issued and accompanies each CI.
- Verify that receipts for each CI and his equipment match the CI's control number.
- Secure personal property in a temporary storage area until CIs are fully processed. Issue a DA Form 4137 for temporarily and permanently stored property. Do not allow CIs access to storage areas.
- Ensures that CIs receive food, water, access to sanitation facilities and, if needed, first aid.
- Escort CIs to the processing area as soon as the receiving process is complete.
- Hold CIs in the receiving area until they can be processed.

Table 5-1. Processing Actions at the CI Processing Area

Station	Purpose	Responsible Individuals*	Actions
Receiving Line			
1	Search	MP	<p>Assign ISNs.</p> <p>Follow accountability procedures.</p> <p>Escort CIs and their property.</p> <p>Conduct a same-gender search of CIs before entering the processing area unless prohibited by conditions. NOTE: Upon initial apprehension, a mixed-gender search can be conducted; but it is discouraged due to possible negative repercussions. The same-gender search restrictions are based on the detainee being officially adjudicated and declared a CI.</p> <p>Remove and examine property, place it in a container or a tray, mark it with a control number, and take it to a temporary storage area. Issue a DA Form 4137 for stored property.</p> <p>Supervise the movement of CIs to the next station.</p>
2	Personal hygiene	MP	<p>Allow CIs to shower, shave, and get haircuts.</p> <p>Allow CIs access to sanitation facilities.</p> <p>Supervise the movement of CIs to the next station.</p>
3	Medical evaluation	Medical officer and MP	<p>Examine CIs for signs of illness or injury to discover health problems that may require medical treatment or evacuation.</p> <p>Provide medical and dental care according to AR 40-3.</p> <p>Give initial radioscopic chest examinations to look for active diseases.</p> <p>Perform a TB skin test on children up to 14 years of age.</p> <p>Weigh CIs and establish a weight register.</p> <p>Immunize and reimmunize CIs as prescribed by TO policy.</p> <p>Place control numbers on medical records to reduce linguist support. (Names, service numbers, and ISNs are entered at Station 1 with the aid of an interpreter.)</p> <p>Disinfect CIs as prescribed by TO policy.</p> <p>Annotate medical records with the date and place of inspection, immunization, and disinfection.</p> <p>Supervise the movement of CIs to the next station.</p>
4	Personal items	MP	<p>Issue personal-comfort items (toilet paper, soap, toothbrush, and toothpaste).</p> <p>Ensure that clothing is marked "CI." NOTE: The CIs must provide their own clothing and footwear.</p> <p>Escort CIs to the processing area (Station 5).</p>
*The number of people used to perform tasks depends on the number of CIs and the amount of time available.			

Table 5-1. Processing Actions at the CI Processing Area (continued)

Station	Purpose	Responsible Individuals*	Actions
Processing Line			
5	Administrative accountability	Processing clerk (assisted by an interpreter, MI, or others) and MP	<p>Verify the internment order and the authentication, including the signature.</p> <p>Assign ISNs to CIs. Note the temporary control numbers that ISNs are replacing so that late-arriving property can be matched to its owner.</p> <p>Initiate personnel records (DA Form 4237-R), ID documents (DA Form 2677-R), and property receipts.</p> <p>Prepare forms and records to maintain the accountability of CIs, their families, and their property (see STANAGs 2033, 2044, and 2084).</p> <p>Supervise the movement of CIs to the next station.</p>
6	Photography and fingerprinting	MP	<p>Fingerprint CIs. Identify and record the information on fingerprint cards (DA Form 2663-R).</p> <p>Take two photographs (with instant film or digital technology). Have captives look straight ahead, and fill the frame with their face.</p> <p>Use photograph name boards (black background with white characters). List ISNs and names (translated into English) at the bottom center.</p> <p>Attach one photograph to the CI's personnel record.</p> <p>Give a completed, laminated ID card (which contains the second photograph) to the CI.</p> <p>Supervise the movement of CIs to the next station.</p>
7	Personal property	MP	<p>Inventory and record property (in the presence of CIs) brought from temporary storage areas.</p> <p>Make separate lists for returned, stored, impounded, and confiscated property. List property to be returned to CIs or stored during internment on a separate list.</p> <p>Update DA Form 4137, or provide the CI with a new one.</p> <p>Supervise the movement of CIs to the next station.</p>
8	Records review	MP	<p>Review processed records for completeness and accuracy.</p> <p>Escort CIs back to processing stations to correct errors if necessary.</p> <p>Allow CIs to prepare DA Form 2678-R. If CIs are unable to write their own cards, have someone authorized by the commander to do it for them.</p> <p>Prepare and maintain an accountability roster of all internees.</p>
9	Movement to living area	MP	<p>Brief CIs on facility rules and regulations.</p> <p>Escort CIs to their new living areas.</p>
*The number of people used to perform tasks depends on the number of CIs and the amount of time available.			

5-29. A medical officer—

- Examines CIs upon arrival at the facility and monthly thereafter.
- Determines medical fitness, state of health, nutrition, and cleanliness.
- Checks for communicable diseases (vermin infestations, TB, malaria, sexually transmitted diseases [STDs], and HIV), and isolates CIs with communicable diseases.
- Records weight on DA Form 2664-R. This process monitors abrupt changes in weight that may affect health.

NOTE: When possible, use qualified CI personnel for the medical and hygiene work necessary for the well-being of CIs.

PROCESSING AREA

5-30. After CIs have completed the receiving portion of their processing, move them to the processing area where they are formally processed into the internment facility. They are entered into the IRIS database, and the IRIC forwards the information to the national IRIC for dissemination to protecting powers. The processing element—

- Keeps CIs segregated as much as possible during processing.
- Conducts administrative processing.
- Expedites the processing of CIs (suspected spies and saboteurs) selected by MI teams for interrogation.
- Assigns each CI an ISN.
- Replaces the control number on each CI's wrist with the ISN.

FLOW OF INFORMATION

5-31. Regard the information collected from CIs as sensitive to protect them and the soldiers who are guarding them. If belligerent nations discover how many internees are in a facility or discover the location of a facility, it may be targeted to silence the sources of information. Maintain proper security throughout the information flow, and disseminate information through proper channels. The IRIC acts as a hub for information that CHAs and I/R facilities produce. Report personnel records electronically on the IRIS or, if necessary, as a paper file.

5-32. The information flow begins when the prisoner is captured and a DD Form 2745 is initiated. The ISN, which is assigned upon arrival at a CHA or an I/R facility, is the key to tracking CIs throughout the I/R system.

5-33. A CI was initially processed as an EPW (see Chapter 4), and the information gleaned during that process is used to process him as a CI. Once an individual is adjudicated by a military tribunal as a CI, specific information must be electronically entered on DA Forms 2674-R and 4237-R:

- **DA Form 2674-R.** Enter the following information in Section B:
 - The first and last names of the CI and his dependent children who are given compassionate internment.
 - The ISN. Assign an ISN if the individual does not have one. (Dependent children are not assigned an ISN.)
 - The grade, the civilian capacity, and/or the title.

- The sex of the CI and his dependent children.
- The nationality. This is the name of the country that the CI claims for citizenship.
- The occupational skill.
- The name of the person who approved the internment order, the headquarters, and the date.
- **DA Form 4237-R.** Prepare a DA Form 4237-R for each protected civilian processed in an occupied territory as a CI or a dependent child. Enter all available pertinent information and information that the CI is willing to give. Note information that the CI is unable or unwilling to give.

5-34. Information collected during processing (initial and full) and entered into the IRIS (CHA or I/R facility) is sent to the IRIC. The IRIC collects the entire personnel file (it is normally electronic with a hard-copy backup). The I/R facility reports the information to the IRIC, who disseminates it as appropriate. The strength report (DA Form 2674-R) is the only information passed up the I/R facility's chain of command. Information also flows to the ICRC, the state department, and other federal agencies as required. Questions regarding the information or internee flow in the TO are directed to the IRIC.

CONTROL AND DISCIPLINE

5-35. Treat all CIs fairly. Ensure that directions are reasonable, capable of being obeyed, and given in an understood language. Promptly report refusals and failures to obey facility rules through the chain of command.

CONTROL

5-36. The MP maintain control of CIs and efficiently administer internment facilities. This includes reducing waste and avoiding duplication of effort. Facility personnel quickly and fairly establish and maintain discipline. For example, they—

- Observe rigorous self-discipline.
- Maintain a professional, impersonal attitude.
- Follow the guidelines established in the ROI and the ROE.
- Cope with hostile or unruly behavior or incidents calmly.
- Take fair, immediate, and decisive action.

5-37. Guards take positive action to establish daily and periodic routines and responses that are conducive to good discipline and control. They—

- Enforce policies and procedures.
- Give reasonable, decisive orders in a language that CIs understand.
- Post copies of the Geneva and UN Conventions in a language that CIs understand and ensure that copies are easily accessed. The internee committee provides copies to CIs who do not have access to posted copies.
- Post rules, regulations, instructions, notices, orders, and announcements that CIs are expected to obey. They ensure that the

information is easily accessed and is in a language that CIs understand. The internee committee provides copies to CIs who do not have access to posted copies.

- Ensure that CIs obey orders, rules, and directives.
- Report refusals and failures to obey orders and regulations.

NOTE: Per AR 190-8, single CI females are directly supervised or guarded by female personnel. A parent with children, if single or interned without a spouse, is provided quarters that are separate from those for single persons.

5-38. The CIs can be searched for security purposes, but only same-gender searches are allowed. A strip search can be conducted to recover contraband and to report injuries and signs of drug use.

5-39. To protect CIs from violence, bodily injury, and threats of reprisal at the hand of fellow internees, post a notice of protection (Figure 5-1) in every compound. Ensure that the notice is posted in a language that internees understand.

NOTICE
<p>An internee (regardless of faith or political belief) who fears that his life is in danger or that he may suffer physical injury at the hands of another internee, should immediately report the fact to a US Army officer of this facility without consulting the internee committee. The facility commander provides adequate protection to the internee (such as segregation or transfer). An internee who mistreats a fellow internee will be punished.</p> <p style="text-align: right;">(Signed by the Commanding Officer)</p>

Figure 5-1. Sample Notice of Protection

DISCIPLINE

5-40. Maintain and enforce discipline and security, and deal with offensive acts promptly. Maintain a record of disciplinary actions, which may be inspected by protecting powers. The internee committee does not have disciplinary power over and cannot administer punishment to fellow internees. The following actions are not permitted between CIs and US military or civilian personnel:

- Fraternization.
- Donation or receipt of gifts.
- Engagement in commercial activity.

5-41. The facility commander is authorized to order disciplinary punishment for a CI under the provisions of AR 190-8 and the Geneva Conventions. Before imposing disciplinary punishment, provide an interpreter if necessary and—

- Provide the CI with precise information regarding the offense.
- Give the CI an opportunity to defend the allegation.
- Permit the CI to call witnesses.

5-42. The following disciplinary actions are authorized:

- Discontinuance of privileges that are beyond those granted by AR 190-8 and the Geneva Conventions.
- Confinement.
- A fine (not to exceed one-half of the wages received during a 30-day period).
- Extra fatigue duty to maintain the internment facility (not to exceed 2 hours per day).

5-43. The duration of a single disciplinary punishment will not exceed 30 consecutive days—even if the CI is answerable for several breaches of discipline (related or not) at the time punishment is imposed. The period lapsing between pronouncing the disciplinary punishment and completing its execution will not exceed 30 days. After a disciplinary action has been executed, another disciplinary action cannot be imposed on the same CI until 3 days has lapsed between the execution of any two punishments, if the duration of one of the two punishments is 10 days or more.

CONFINEMENT

5-44. A CI accused of an offense for which disciplinary punishment is contemplated will not be confined unless it is essential to facility order and discipline. If a CI does spend time in confinement awaiting a hearing, it will not exceed 14 days and it will be deducted from his sentence.

5-45. A CI who is subject to confinement serves the time in a facility stockade. Females and males are confined in separate quarters, and females are supervised by females. While undergoing confinement for pretrial, for posttrial, or in connection with disciplinary or judicial proceedings, a CI is—

- Allowed to exercise and stay in the open air at least 2 hours a day.
- Allowed to attend daily sick call, receive medical attention and, if necessary, be transferred to a hospital.
- Given enough food to maintain health.
- Permitted to confer with visiting representatives of the protecting powers and the ICRC.
- Permitted to receive spiritual assistance.
- Treated with proper regard.
- Provided hygienic living conditions.
- Provided adequate bedding, supplies, and facilities necessary for personal cleanliness.
- Allowed to send and receive letters, cards, and telegrams. (Parcels and remittance of money can be withheld from a CI until his punishment is complete.)

INTERNEE COMMITTEE

5-46. One of the best ways to ensure cooperation within a facility is to establish a form of self-government. This minimizes the impression that CIs are prisoners under the control of a foreign government and allows them to feel a sense of control over their lives. The internee committee represents the local CI population to the detaining power, protecting powers, the ICRC, and

other authorized relief and aid organizations. The committee's communications with these organizations are unlimited.

5-47. The internee committee has two or three elected members, and each member can have an assistant who acts as an interpreter. The facility commander approves each elected member and assistant. Members are elected by secret ballot every 6 months, and they can be elected to more than one term. When the commander disapproves an election, it is submitted in writing and states the reason for disapproval. He forwards the disapproval through channels to the IRIC, who forwards it to the national IRIC and protecting powers.

5-48. Duties of a internee committee include—

- Furthering spiritual, physical, and intellectual well-being.
- Being responsible for and having jurisdiction over mutual assistance organizations set up by CIs.
- Visiting outside labor details.
- Checking the management of the canteen and the canteen fund.
- Presenting and transmitting petitions and complaints to appropriate authorities.
- Distributing and disposing of collective relief shipments.
- Receiving briefings about ongoing and final judicial proceedings.

CORRESPONDENCE

5-49. The correspondence system for CIs parallels that for EPWs (Chapter 4). The exceptions are that DA Form 2679-R is used for letters and DA Form 2680-R is used for postcards.

COMPLAINTS AND REQUESTS

5-50. A CI can make a complaint or a request to the facility commander, who tries to resolve the issue. If the CI is not satisfied with the resolution, he may address it to HQDA. A CI can make a complaint by mail, in person to a visiting representative of protecting powers, or through the internee committee.

MEDICAL TREATMENT

5-51. Provide personnel, material, and facilities for routine and emergency medical treatment. Ideally, transfer patients requiring inpatient care to a civilian hospital. If a civilian hospital is unavailable or if its use is infeasible due to security considerations, transfer patients to a US military hospital. Ensure that the treatment they receive is as good as that provided for the general population, and provide guards as necessary.

SANITATION

5-52. Proper sanitation and cleanliness of a facility prevents the spread of disease among the CI population and the US forces guarding them. The facility commander—

- Conducts periodic, detailed sanitary inspections.
- Publishes a detailed sanitary order in a language that CIs understand and posts it in each compound.
- Provides sanitary supplies, services, and facilities necessary for personal cleanliness and sanitation.
- Ensures that—
 - Hygiene and sanitation measures conform to AR 40-5 and related regulations.
 - Latrines are available 24 hours a day.
 - Separate showers and latrines are available for males and females.
 - Adequate space is allocated to prevent overcrowding within housing units, while maintaining proper segregation and family integrity.
 - Good food sanitation and personal hygiene is observed by food service personnel.
 - Waste is disposed of properly.
 - Sufficient potable water is available for drinking, bathing, doing laundry, and preparing food.
 - Materials are available for personal hygiene, including products for female hygiene and infant care.

TRANSFER

- 5-53. The CIs may be transferred, subject to the following conditions:
- They cannot be transferred outside the borders of the occupied country where they are interned, except when material reasons prevent displacement.
 - They will be transferred if they are exposed to greater risk by remaining at the facility if the CZ moves closer to the location.
 - Sick, wounded, infirmed, or maternity cases are not transferred if the transfer would be detrimental to their health.
- 5-54. The facility commander—
- Informs CIs of their impending transfer and new postal address so that they have enough time to pack and notify NOK.
 - Verifies the accuracy and completeness of personnel records and provides records (in a sealed envelope) to escort guards.
 - Verifies that CIs have authorized clothing and equipment.
 - Prepares impounded personal effects and property for forwarding with escort guards or by separate shipment as appropriate.
 - Instructs escort guards on their duties and responsibilities, including procedures to be followed in case of an attack, an escape, a death, or another emergency.
 - Provides or arranges for rations, transportation, and notifications according to prescribed procedures.
 - Ensures that CIs are manifested by name, ISN or ID number, nationality, and physical condition.

-
- Notifies the IRIC and the national IRIC of CI transfers immediately.
- 5-55. The transfer of personal effects and property parallels that of EPWs (Chapter 4), except—
- Belongings that exceed the 55-pound limit are shipped separately.
 - Parcels and mail are forwarded to the new facility.
 - Items donated by welfare agencies and items used in religious services are forwarded as community property.

RELEASE

5-56. A CI can be released to a representative of his country of residence or a designated protecting power if control and accountability are maintained. He can be released after hostilities cease (subject to pending judicial proceedings) if the reasons for his internment no longer exist as determined by the TO commander. A CI who is eligible for release but has judicial proceedings pending for offenses not exclusively subject to disciplinary punishment is detained until the close of proceedings. The TO commander may decide that a CI must serve his penalty before being released, and a CI already serving a penalty may be similarly detained. Rosters of detained CIs are forwarded to the IRIC and the national IRIC for transmittal to protecting powers.

SOCIAL PROGRAMS

5-57. The commander coordinates social programs. He provides premises and facilities for these activities and procures needed materials and supplies through normal supply channels. The CIs are encouraged to participate, but they are not required to do so.

5-58. Carefully selected and qualified civilian nationals and CIs (supervised by US military personnel) can be used to guide social activities. The selected individuals will not introduce political overtones or further enemy propaganda objectives while conducting these activities.

EDUCATION

5-59. Encourage and support an active, intellectual education program for CIs. Coordinate adequate facilities and instruction material through local agencies. Consider the following when developing an education program:

- Levels of education throughout the CI population.
- Basic courses of education, including—
 - Reading.
 - Writing.
 - Geography.
 - Mathematics.
 - Language.
 - Literature.
 - History.
 - Music.
 - Art.

- The education of dependents who reside with their CI parents.
- Vocational training to develop skills that may be useful during internment.

RELIGION

5-60. Allow CIs the freedom of worship, including attendance at services of their faith held within the internment facility. Permit chaplains and other clergy to minister freely to those who request their help. The facility commander may permit ordained clergy or theological students to conduct services.

VISITS

5-61. Permit close relatives and other persons authorized by the TO commander to visit CIs according to TO regulations. All visitors are subject to security precautions. Under emergency conditions and subject to the TO commander's policy, a CI may visit a close relative who is seriously or terminally ill and may attend the funeral of a close relative.

5-62. Allow accredited representatives of protecting powers and the ICRC full access to the internment facility and the internees. Per DA policies and procedures, permit visits of approved religious organizations, relief societies, NGOs, IOs IHOs, and other organizations who assist housed personnel. Organizations who want access to internees should coordinate visits in advance to avoid confusion upon arrival at the facility. The facility staff establishes an access roster of representatives and develops a method to verify their identity.

RECREATION

5-63. Encourage and support active participation in recreation activities to promote general health and welfare and to alleviate tension and boredom. In addition, provide athletic contests and group entertainment (concerts, plays, music, and motion pictures). Provide playgrounds for dependent children of CIs.

AGRICULTURE

5-64. When practical, CIs should raise vegetables to supplement their diet. Do not overlook the importance of developing an agriculture program. Gardening projects are particularly desirable because they provide gainful employment for large numbers of individuals. The food produced is used for the benefit of the CI population, and it provides a valuable supplement to diets at minimal expense.

5-65. Procure the types and quantities of agriculture supplies required (seeds, fertilizers, and implements) through local purchase. Ensure that the supplies are procured in a timely manner.

EMPLOYMENT

5-66. The TO commander may issue instructions governing the employment and compensation of CIs for labor. The CIs can be employed to construct,

administer, manage, and maintain the facility; and they are compensated according to DFAS-IN 37-1. The CIs are required to work if the labor is consistent with their age and physical condition. Their fitness for work is determined in the same manner as EPWs (Chapter 4). The CIs cannot be compelled to work if they are under the age of 18. They can be compelled to perform the following types of work and may volunteer to perform other types of work:

- Administrative, maintenance, and domestic work within the compound.
- Duties relative to protecting CIs against aerial attack or other war risks.
- Medical duties if they are professionally and technically qualified.

SECURITY

5-67. The facility commander is responsible for security measures that effectively control CIs with minimal use of force. The physical construction of the facility and the presence of guard personnel (Chapter 2) constitute the most obvious means of providing security. Maintaining a high state of discipline, a system of routines, and required standards of behavior enhance effective security and control.

5-68. Most CIs actively cooperate with US internment facility authorities or assume a passive, compliant role. Cooperative CIs are composed, in part, of individuals with ideologies favorable to the US. Others, through resignation or apathy, will simply adapt themselves to the conditions of their internment.

5-69. Some CIs will engage in a campaign of embarrassing and harassing US personnel to create propaganda of value to their cause that would have negative ramifications on the US. The leaders of the uncooperative faction may try to establish a united effort and blind obedience by all its members. Any relaxation of security is immediately detected and fully exploited.

ADVERSE ACTIONS

5-70. Dissident actions by CIs vary from acts of harassment to acts of violence. Such actions may include—

- Sabotaging equipment or facilities.
- Assaulting other CIs or custodial personnel.
- Taking hostages to secure concessions.
- Intimidating other CIs.
- Fabricating weapons or other illegal items.
- Creating embarrassing situations or making false accusations to influence international inspection teams or members of protecting powers.
- Instigating disturbances or riots to place the facility staff in unfavorable positions (this allows CIs to gain concessions and influence custodial policies).

5-71. Paramilitary forces may—

- Establish communications with internees by using agents, smuggled radios, or foreign-language newspapers.
- Order members of its armed forces to infiltrate the facility and become agitators.

PLANNING

5-72. Ensure that security planning is continuous and complete and that it reflects current intelligence information on CIs. Implement an immediate-response plan that is capable of meeting all internal and external threats to security. Security planning for a CI compound is similar to that for an EPW compound (Chapter 4). (See Chapter 2 for more information on security planning.)

RULES OF ENGAGEMENT

5-73. The CINC establishes the ROE in coordination with the SJA and the joint staff. Special ROE can be developed for use in I/R facilities, but they must have CINC approval.

MILITARY WORKING DOGS

5-74. The MWDs enhance the security and safety of an I/R facility. They can be used for patrolling and detecting explosives and narcotics. (See Chapter 2 and AR 190-12 for more information.)

DISTURBANCES

5-75. Disturbances within the compound may range from riots to less violent disorders, and they can be organized or unorganized. (See Chapter 3 and Appendix B for more information.)

FACILITY MARKINGS

5-76. When military considerations permit, mark CI facilities with the letters “CI.” Place the letters so that they are clearly visible in the daytime from the air.

Chapter 6

Internment/Resettlement Facilities

The TO commander is responsible for EPW/CI operations, and he provides engineer and logistical support for the MP commander to establish and maintain I/R facilities. Facility construction is included in the planning phase of an operation, and MP leaders take part in the planning process. Planning, coordinating, and establishing facilities begins during the build-up phase of an operation. Each facility provides appropriate segregation, accountability, security, and support of internees. An I/R facility is semipermanent in nature and normally consists of one to eight compounds, each capable of interning 500 people. (Appendix D provides a synopsis of the various MP I/R units that may be assigned to a TO.)

PLANNING

6-1. Planning for the construction of I/R facilities must be projected into the future. This provides timely notification of engineers, selection and development of facility sites, and procurement of construction materials.

LOCATION

6-2. The MP coordinate the location with engineers, logistical units, higher headquarters, and the HN. The failure to properly consider and correctly evaluate all factors may increase the logistical and personnel efforts required to support operations. If an I/R facility is improperly located, the entire internee population may require movement when resources are scarce. When selecting a site for an facility, consider the following:

- Will the interned population pose a serious threat to logistical operations if the tactical situation becomes critical?
- Is there a threat of guerrilla activity in the area?
- What is the attitude of the local population?
- What classification of internees will be housed at the site?
- What type of terrain surrounds the site, and will it help or hinder escapes?
- What is the distance from the MSR to the source of logistical support?
- What transportation methods are required and available to move internees, supplies, and equipment?

6-3. In addition, consider the—

- METT-TC.
- Proximity to probable target areas.
- Availability of suitable existing facilities (avoids unnecessary construction).

- Presence of swamps, mosquitoes, and other factors (including water drainage) that affect human health.
- Existence of an adequate, satisfactory source of potable water. The supply should meet the demands for consumption, food sanitation, personal hygiene, and sewage disposal.
- Availability of electricity. Portable generators can be used as standby and emergency sources of electricity.
- Distance to work if internees are employed outside the facility.
- Availability of construction material.
- Soil drainage.

CONSTRUCTION

6-4. The type of construction necessary depends on the—

- Climate.
- Anticipated permanency of the facility.
- Number of facilities to be established.
- Availability of labor and materials.
- Conditions under which the detaining power billets its forces in the same area.

6-5. Use local, vacant buildings to reduce the requirements for engineer construction materials and personnel. Use internees and local sources of materials to modify and construct structures. In the absence of existing structures, tents are the most practical means for housing internees.

6-6. The Engineer Corps' Theater Construction Management System (TCMS) contains basic plans, specifications, and material requirements for I/R facilities based on the anticipated internee population. The plans can be easily modified for temperate, frigid, tropic, and desert climates. The TCMS also provides specifications and material requirements for the facilities when dimension and/or population requirements are supplied.

SECURITY REQUIREMENTS

6-7. Separate the compounds from each other to prevent communication between internees. Take advantage of irregular terrain features as obstacles to communication. Locating compounds in close proximity increases efficiency and security; however, distances of a mile may be required between compounds on level terrain. Minimal security requirements include—

- **Clear zones.** A 12-foot clear zone surrounds each facility housing EPWs or CIs. The clear zone is free of vegetation and shrubbery between the inside and outside perimeter fences, and it is constructed around the circumference of the facility.
- **Guard towers.** Locate guard towers on the perimeter of each facility. Place them immediately outside the wall or, in case of double fencing, where they permit an unobstructed view of the lane between the fences. The space between towers must allow overlapping observation and fields of fire. During adverse weather, it may be necessary to augment security by placing fixed guard posts between towers on the

outside of the fence. Ensure that towers are high enough to permit an unobstructed view of the compound and low enough to permit an adequate field of fire. Tower platforms should have retractable ladders and be wide enough to mount crew-served weapons.

- **Lights.** Provide adequate lighting, especially around compound perimeters. Illuminating walls and fences discourages escapes, and illuminating inner strategic points expedites the handling of problems caused by internees. Protect lights from breakage with an unbreakable-glass shield or a wire mesh screen. Ensure that lights on walls and fences do not interfere with guards' vision. Provide secondary emergency lighting.
- **Patrol roads.** Construct patrol roads for vehicle and foot patrols. They should be adjacent to outside perimeter fences or walls.
- **Sally ports.** A sally port (a series of gates) is required to search vehicles and personnel entering or leaving the main compound. Consider placing a sally port at the back entrance to the facility.
- **Communications.** Ensure that communication between towers and operation headquarters is reliable. Telephones are the preferred method; however, ensure that alternate forms of communication (radio and visual or sound signals) are available in case telephones are inoperable.

LAYOUT

6-8. The facility layout depends on the nature of the operation, the terrain, building materials, and HN support. A standard 4,000-man I/R facility consists of eight 500-man compounds. A sample 500-man compound is shown in Figure 6-1, page 6-4. Each compound has—

- Barracks (may be general purpose [GP] medium tents in the early stages of an operation).
- Kitchen facilities (may include providing internees with culinary equipment and provisions or using military cooks).
- Bath houses.
- Latrines.
- A recreation area.

6-9. The administrative area of each facility has—

- A command post.
- An administrative building.
- Religious and educational buildings.
- A dispensary and an infirmary to treat minor illnesses and injuries.
- A supply building for storage and issue of expendable supplies.
- Latrines.
- Parking areas.
- Trash collection points.
- Potable-water points.
- Storage areas (open and covered).
- Generator and fuel areas.

Figure 6-1. Sample 500-Man Enclosure With One Compound

RECEIVING AND PROCESSING CENTERS

6-10. Captives must be fully processed before being interned, evacuated, or repatriated. The size of a processing center depends on the anticipated number of internees. It may be set up near overseas terminals, international transfer points, and medical facilities. There is no set design for a processing center (Figure 6-2), and a processing center may also have minimal internment capabilities (Figure 6-3, page 6-6).

Figure 6-2. Sample Processing Center (Theater)

6-11. When establishing a processing center, coordinate with engineers for construction. If structures are available, use them; otherwise, use tents. Ensure that shelter, water, and latrines are available and that the processing center is equal in quality to facilities used by US forces. Arrange the processing center so that internees are not aware of what is taking place in the next station.

6-12. The prescribed standards of treatment and care place a great demand on the logistical system. When possible, use captured supplies and equipment and ensure that internees wear captured clothing. Properly secure and account for all supplies and equipment to avoid exploitation by internees.

SUBSISTENCE

6-13. Ensure that daily food rations are sufficient in quantity, quality, and variety to maintain good health and prevent weight loss and nutritional

Figure 6-3. Sample Processing Center with Internment Capability

deficiencies. Medical personnel apprise the commander of situational needs and the nutritional health of the internee population. Provide working internees with additional rations when required. Ensure that internees have sufficient drinking water and latrine facilities. Sustain the health of internees at a level that is equal to that of guarding US forces.

6-14. If dining facilities are unavailable, feed internees MREs. They can be stored easily and require no additional dietary supplements. If fresh fruits and vegetables are available, substitute them for nonperishable items. Consider the habitual diet of internees, and allow them to prepare their own meals under the supervision of US personnel (see AR 190-8). Ensure that internees do not stockpile rations to use for escapes.

6-15. Food service equipment requirements vary depending on internees' habitual diets and customs. The commander may authorize local procurement of cooking equipment instead of requiring internees to use standard-issue kitchen equipment. One food operations sergeant and one first cook will be assigned to each 19547AB MP detachment (I/R) (EPW/CI). Food service personnel train and supervise selected internees to perform food service operations.

CHAPEL FACILITIES

6-16. Provide chapels and religious materials in I/R facilities. Allow internees to make chapel fixtures from available material or, if necessary, obtain material through supply channels.

RECREATION EQUIPMENT

6-17. Obtain recreation equipment through supply channels if possible. If necessary, secure equipment through local purchase.

CLEANING SUPPLIES

6-18. Each I/R facility requires housekeeping supplies. The types and quantities required vary depending on the environment, the housing, and the food service facility. Common Table of Allowance (CTA) 50-970 contains an extensive list of housekeeping supplies. Use it as a guide to develop allowances for janitorial and cleaning supplies. Ensure that there is plenty of potable water available in each compound.

MEDICAL AND SANITATION CONSIDERATIONS

6-19. Ensure that medical treatment is available for all internees. Each I/R facility has an infirmary where internees with contagious diseases, mental conditions, or other illnesses can be isolated from other patients. Internees have 24-hour access to latrines, which are clean and conform to the rules of hygiene. Provide separate latrines for male and female internees. Provide internees with facilities, soap, and water for their personal needs and laundry. Consider the following sanitation standards to prevent disease and ensure cleanliness of the facility:

- Distributing information to internees (in their language) on the importance of proper hygiene, sanitation, and food sanitation.
- Teaching food sanitation procedures and ensuring that they are observed and practiced.
- Disposing of human waste properly to protect the health of everyone associated with the facility according to the guidelines established by PVNTMED.
- Providing—
 - Adequate space to prevent overcrowding.
 - Sufficient showers and latrines and ensuring that they are cleaned and sanitized daily.
 - Enough potable water for drinking, bathing, doing laundry, and conducting food service operations.
 - Personal-hygiene materials.

PART THREE

United States Military Prisoners

The US military prisoner operations are conducted under the umbrella of the Army Corrections System (ACS). The ACS is an integral part of the military justice system, which provides incarceration and correctional services for US military personnel. The ACS provides custody and control of military offenders, while providing access to basic education, offense-related counseling, selected academic courses, and training necessary for return to military duty or the civilian community. Specific use-of-force guidelines and the ROI apply to US military prisoner operations. On the battlefield, US military prisoner operations parallel the internment and evacuation systems for EPWs, CIs, RPs, ODs, and DCs. However, US military prisoners are not treated as or confined with them.

Chapter 7 contains information on the ACS and provides the foundation and guidance for conducting US military prisoner operations during wartime. Chapter 8 discusses the short-term confinement of US military prisoners abroad during wartime, the field detention facility (FDF), and the field confinement facility (FCF).

Chapter 7

Army Corrections System

The ACS provides confinement and correctional treatment for US military prisoners. It operates on a corrective basis, rather than a punitive basis, and its goal is to help prisoners become responsible, productive citizens. The ACS facilities are staffed with carefully selected, well-trained, professional personnel. Prisoners have access to programs that provide education and rehabilitation. The staff and the programs are dedicated to helping prisoners recognize and resolve their problems, correct their behavior, and improve their attitudes.

LEVELS OF CONFINEMENT

7-1. The Army maintains a three-tiered correctional system to meet the needs of prisoners. Although the mission at all levels is to confine and provide correctional treatment, the mission emphasis differs at each level. These differences are based on the length of time prisoners are confined and the facilities and services required by the confinement.

LEVEL I—CONFINEMENT FACILITIES

7-2. Confinement facilities provide—

- Pretrial confinement.
- Short-term posttrial confinement (normally 90 days or less).
- Custody.
- Control.
- Administrative support.
- Limited counseling.

7-3. Installations without ACS facilities can contract to incarcerate pretrial prisoners in federally approved civilian jails. Agreements must provide for segregation of prisoners by rank (officer, NCO, and enlisted), sex, and posttrial status. Forward copies of agreements with civilian jurisdictions to HQDA (DAMO-ODL-C). A sentenced prisoner who is pending transfer to an ACS facility cannot be confined in a civilian jail for more than 10 days. However, an installation commander can notify HQDA (DAML-ODL-C) and authorize exceptions for prisoners sentenced to 30 days or less.

LEVEL II—REGIONAL CORRECTIONS FACILITIES

7-4. Regional corrections facilities (RCFs) provide—

- Pretrial confinement support.
- Multifaceted correctional-treatment programs.
- Vocational and military training to prepare prisoners for return to duty or, if determined suitable, return to civilian society.
- Administrative support.
- Basic educational opportunities.
- Employment.
- Selected mental-health programs.
- Custody.
- Control.

LEVEL III—UNITED STATES DISCIPLINARY BARRACKS

7-5. The United States Disciplinary Barracks (USDB) is a maximum-custody facility that provides long-term incarceration for prisoners. It is the only ACS facility authorized to permanently incarcerate posttrial prisoners who are sentenced to death.

7-6. Although federal civilian penal institutions are not a part of the ACS, they may be used to confine prisoners. The Federal Bureau of Prisons administers and operates the federal penal system. Military prisoners whose disciplinary and adjustment records indicate a need for treatment that is available in a federal penal institution may be transferred to that system. Those scheduled for incarceration in a federal institution are first confined at the USDB and then transferred to the federal institution. (See AR 190-47 for more information.)

CORRECTIONAL FACILITIES

7-7. Based on operational requirements and programs, HQDA (DAMO-ODL-C) determines where prisoners are incarcerated if they are sentenced to more than 30 days. The RCF provides short- and medium-term confinements, and the USDB provides long-term confinement.

7-8. The facility commander is responsible for the administration and operation of specialized correctional programs. The programs provide the professional evaluation, counseling, education, and administration needed to prepare prisoners for return to military or civilian life. Chapter 8 discusses procedures and guidelines for establishing FDFs and FCFs.

LEGAL RIGHTS AND REQUIREMENTS

7-9. The UCMJ and local and service regulations govern the restraint and confinement of military personnel. The ACS provides legal, humane, and just treatment of prisoners throughout the confinement process, from pretrial confinement to sentence expiration.

PRISONERS' RIGHTS

7-10. Soldiers do not automatically forfeit all of their rights upon confinement. Prisoners retain most of the rights guaranteed by the US Constitution, although perhaps to a lesser degree. The most important constitutional rights for prisoners are:

- First Amendment (freedom of speech and religion).
- Fourth Amendment (freedom against unreasonable search and seizure).
- Fifth Amendment (right against self-incrimination [Miranda Rights]).
- Sixth Amendment (right to counsel).
- Eighth Amendment (prohibition of cruel and unusual punishment).

CONFINEMENT REQUIREMENTS

7-11. Prisoners in pretrial confinement are informed of the charges causing their confinement. Within 48 hours of their confinement (via their chain of command), a US magistrate reviews the circumstances of the confinement and determines whether continued pretrial confinement is necessary.

7-12. Individuals are accepted for confinement only on receipt of a court-martial order, a report of the trial results, or a confinement order. The convening authority ordering the execution of the sentence must issue the court-martial order. If a commissioned or warrant officer is placed in pretrial confinement, the confinement order originates with his commander. The confinement order is read to the soldier by a commissioned officer. An enlisted soldier may be pretrial confined by order of his commanding officer or any commissioned officer who has personal knowledge of the offense or has made inquiry into it.

7-13. Specific procedures for pretrial confinement are contained in local SOPs and local supplements to AR 27-10. A new confinement order is not needed to reconfine a soldier who is convicted at trial by court-martial following pretrial

confinement. A commander or the trial counsel, if such authority is delegated to him, can order the soldier into posttrial confinement with a report of the trial results.

PRISONER STATUS

7-14. A prisoner or a pretrial detainee is informed of his status upon arrival at a confinement facility. His status is necessary in response to judicial proceedings and other actions. The following statuses pertain to US military prisoners:

- **Casual.** A casual prisoner is confined awaiting—
 - Further instructions from another command or military service.
 - Transfer to another facility.
 - Return to his unit.
- **Detained.** A detained prisoner (pretrial detainee) is an enlisted service member who is confined awaiting—
 - Charges to be filed.
 - The disposition of charges.
 - A trial by court-martial.
 - A trial by a foreign court.
- **Adjudged.** An adjudged prisoner has been sentenced in open court, but the convening authority has not approved the sentence.
- **Approved-adjudged.** An approved-adjudged prisoner's sentence has been approved and adjudged, but it has not been ordered into execution.
- **Sentenced.** A sentenced prisoner is serving a sentence that has been ordered into execution.
- **Officer.** An officer prisoner or an officer pretrial detainee is a commissioned or warrant officer on active duty who has been placed in confinement, but his sentence has not been ordered into execution.

SEGREGATION

7-15. Segregate prisoners as follows:

- **Pretrial detainee.** A pretrial detainee is not treated the same as a posttrial prisoner whose status is adjudged, approved-adjudged, or sentenced. He has not been proven guilty of an offense. His confinement is not a punishment, but it ensures his presence for trial and prevents further misconduct. If possible, segregate his living and working areas from all other prisoners.
- **Officer.** An officer prisoner whose sentence has not been ordered into execution is entitled to certain rights and privileges. These privileges end when an officer's sentence begins and his status changes from an officer prisoner to a sentenced prisoner. House a posttrial officer prisoner in the general prisoner population.
- **Female.** A female prisoner or a female pretrial detainee is confined in a facility that is approved for housing women. If an on-post facility is unavailable, coordinate confinement with local officials who have a federally approved detention facility for women. A civilian facility may

only be used for pretrial or short-term, posttrial confinement. Segregate female prisoners from male prisoners except when they are participating in supervised classes, vocational education, or group counseling. Female correctional personnel supervise and control female prisoners in administration or disciplinary segregation. If two female guards are unavailable, use precautions when escorting a female prisoner. For example, use two male guards or one male guard and one female guard. Female prisoners are incarcerated in ACS facilities when directed by HQDA (DAMO-ODL-C).

CUSTODY AND CONTROL

7-16. Custody and control are basic functions for every confinement or correctional facility. Facility personnel achieve and maintain custody and control by subjecting prisoners to a structured schedule of calls 24 hours a day.

CUSTODY MEASURES

7-17. Custody is restricting a prisoner's freedom of movement by placing physical barriers on or around him. It is maintained within a facility by the presence of guards, walls, fences, protective lighting, alarms, and locking devices. Outside a facility, custody is maintained by the presence of supervisors and guards. Prisoners designated as trustees are afforded custody and control by the conditions placed on their parole agreement.

CUSTODY GRADES

7-18. Each prisoner is assigned a custody grade (trustee, minimum, medium, or maximum) that designates the degree of supervision required to control his movements. The facility commander assigns custody grades to prisoners based on signs of emotional disturbance and instability, history of escape, drug addiction, violence, and access to sensitive material.

7-19. Custody grades are assigned based on the minimum level of control necessary. A custody grade can be changed at any time, and reclassification is based on continual observation and evaluation of the prisoner. Each prisoner is promptly advised of his custody grade.

7-20. For example, each incoming RCF prisoner is assigned a maximum custody grade for the first 72 hours of confinement. During that time, the correctional staff observes and evaluates the prisoner's behavior. At the end of the evaluation period, the staff reviews the prisoner's behavior and assigns the appropriate custody grade.

ADMINISTRATIVE SEGREGATION

7-21. Sometimes, prisoners must be separated from the larger population for more intense custodial supervision. Facility commanders may authorize the segregation of prisoners individually or by groups. Administrative segregation is imposed for the benefit of the segregated prisoner(s) or the prisoner population. Prisoners may be placed in administrative segregation while awaiting the results of an investigation or for protective measures, medical reasons, or homosexual behavior.

7-22. Segregated prisoners requiring increased supervision are placed in close confinement and are escorted when they leave their cells. Privileges for administratively segregated prisoners are the same as those of prisoners not in close confinement. However, exceptions to this requirement are suicidal and disciplinary segregated prisoners (see the facility SOP for details).

7-23. Prisoners placed in administrative segregation can be kept in close confinement 24 hours a day or only at night. They must receive at least 60 minutes of exercise daily and can be employed if the work is consistent with the purpose of the segregation. A qualified mental-health professional interviews and prepares a written report on each inmate who is segregated more than 30 days.

CONTROL MEASURES

7-24. Control is placing limitations on a prisoner's actions and behaviors. It is invoked by the correctional staff's insistence on a state of order and military discipline among the prisoners. Control is sustained by a consistent routine in daily lives. For example, prisoners are routinely required to provide a daily display of their clothing, equipment, and health and comfort supplies. Control is reflected in the disciplined appearance, bearing, and conduct of the prisoners and by their prompt obedience to rules, regulations, and orders.

DISCIPLINARY MEASURES

7-25. Disciplinary measures are imposed on prisoners to correct deviant behavior and to protect other prisoners, the staff, and government property. Abusive measures are not imposed in the ACS. Prisoners are medically cleared before being placed in disciplinary segregation, which may not exceed 60 consecutive days. Prisoners undergoing disciplinary measures are not employed, except to clean their own quarters. They must receive at least 30 minutes of exercise each day if their behavior is manageable. Hand and leg irons or other restraining devices are used during movement outside the cell. Guards inspect prisoners in close confinement according to the facility SOP.

7-26. The imposition of disciplinary measures often begins with an objective disciplinary report. The report presents a detailed summary that addresses the who, what, when, where, why, and how of an incident. The facility commander has several options when he receives a disciplinary report. He may reduce the report to a memorandum of record, refer the prisoner for counseling, refer the case to a discipline and adjustment board, or recommend action under the UCMJ.

PROHIBITED PUNITIVE MEASURES

7-27. The following punitive measures are prohibited:

- Clipping a prisoner's hair excessively close.
- Ordering the lockstep.
- Requiring silence at meals.
- Requiring a prisoner to break rocks.

- Using hand or leg irons, restraining straps or jackets, or shackles as punishment. (The FCF SOP gives authority for the use of these devices and specifies the circumstances warranting their use.)
- Removing a prisoner's underclothing or clothing or using other debasing practices.
- Flogging, branding, tattooing, or using any other cruel or unusual punishment.
- Requiring domicile in a tent as punishment.
- Ordering strenuous physical activity or body positions designed to place undue stress on a prisoner.
- Using hand or leg irons or belly chains that give the appearance of a chain gang.

EMERGENCIES

7-28. Confinement facilities provide custody and control of prisoners during emergencies (fires, escape attempts, and other disturbances). Develop a formal emergency action plan and periodically review it to ensure that it is complete and current. Properly training custodial personnel and reviewing facilities and restraints can prevent or greatly reduce the possibility of escapes. Escapes result in emergency actions being executed and guards and prisoners taking immediate action according to the facility SOP.

7-29. Disturbances among prisoners may be a minor disorder, a major disorder, or a full-scale riot. Disorders and riots may be spontaneous disturbances or organized diversions for escape attempts. How a facility staff handles a minor disorder determines whether it is brought under control or escalates to major proportions. Disperse prisoners who are involved in a disturbance so that they cannot organize as a cohesive group. Once dispersed, prevent participants from rejoining the disturbance. Identify, isolate, and remove ringleaders from the disturbance as soon as possible.

MOVEMENT

7-30. Prisoners have the best opportunity for escape while being moved from one place to another (outside the facility). Established and stringent custody and control measures reduce the likelihood of escapes. Procedures and techniques for moving prisoners can be modified as needed by the facility commander or the commander directing the movement.

7-31. When a prisoner is in pretrial confinement, his unit is responsible for escorting him to the confinement facility unless custody and control become integrity issues. The unit coordinates with the RCF for a briefing on custody and control procedures, future escort requirements, and the use of force.

7-32. Frisk each prisoner before he leaves the facility. Complete a DD Form 2708 (hard copy or electronic) for each prisoner escorted out of the facility. Move prisoners by motor vehicle, rail, air, or foot (if the distance is short enough to justify it and when other means of transportation are unavailable) (see STP 19-95C14-SM-TG).

CORRECTIONAL-TREATMENT PROGRAMS

7-33. Correctional-treatment programs are based on and tailored to the custody, employment, education, and treatment needs of prisoners. Each prisoner and his treatment is professionally monitored. The goal of correctional-treatment programs is to return prisoners to civilian life as productive citizens or to the Army as productive soldiers.

7-34. Correctional-treatment programs provide a professional evaluation and study of each prisoner and his background. They provide for prisoners' health and welfare, include constructive work that teaches work skills, and administer individual and group counseling and therapy.

7-35. Each program specifies the custody grade and disciplinary requirements needed to achieve goals. The goals can be achieved by receiving no disciplinary reports, being involved in an established correctional-treatment plan, or obtaining other program objectives.

EVALUATION

7-36. The facility commander, in conjunction with an evaluation board, determines a prisoner's custody grade and treatment program by a two-phase system. The first phase is to identify the needs that require immediate intervention, and the second phase is an ongoing evaluation of the prisoner while he is in confinement.

7-37. The board uses the following tools to begin its initial evaluation:

- The guard's observation report.
- The mental health's evaluation.
- The chaplain's evaluation.
- The medical officer's evaluation.
- The prisoner's personnel file.

7-38. The prisoner's custody grade and treatment program may change as additional information becomes available during his incarceration. The following aspects are considered and closely monitored during his entire confinement period:

- Employment.
- Education.
- Medical condition.
- Religious participation.
- Family and financial problems.

COUNSELING

7-39. Counseling is a process in which behavioral problems are observed and guidance is provided to induce productive, useful behavior. Counseling programs are based on the type, size, and mission of a confinement facility, its staffing abilities, and AR 190-47. At a minimum, counseling is available for problem solving and crisis intervention. The ACS regional facilities and the USDB provide the following:

- Chemical abuse treatment.

- Anger management.
- Stress management.
- Adjunct therapy (such as Alcoholics Anonymous [AA] and Narcotics Anonymous [NA]).
- The impact of crimes on victims.
- Other programs consistent with staffing, professional support, and prisoner needs.

7-40. The RCF primarily relies on counseling/treatment programs available to all soldiers. Installations unable to provide basic regional counseling services request a waiver from HQDA (DAMO-ODL).

7-41. The counseling program in a correctional facility has two goals:

- Help prisoners set realistic goals and adjust to the confinement environment.
- Help prisoners gain problem-solving techniques and develop acceptable behavior.

7-42. The facility commander can choose counselors from assigned cadre. When possible, he selects experienced, mature NCOs who do not have a corrections background. He ensures that counselors are oriented to the missions, objectives, and operational procedures of the facility before they begin their counseling duties. Counselors must understand and be able to apply certain principles and concepts of human behavior and social values. They—

- Believe in the dignity and worth of an individual.
- Recognize that individuals are different.
- Understand that all behavior has meaning.
- Understand that individuals are the result of their environment and life experiences.
- Understand that attitude and behavior are related.
- Understand that there are always reasons or causes for changes in behavior.
- Believe that people have the capacity to change.
- Believe that people have a right to participate in decisions affecting their welfare.
- Understand that judging individuals in terms of right and wrong is not within their purview.
- Are objective and unbiased.
- Are alert for situations that exceed their capabilities and responsibilities, and if necessary, refer the prisoner for specialized counseling or problem solving.

7-43. Staff members identify and report prisoners who are—

- Escape-minded.
- Dangerous.
- Alcoholic.
- Drug-addicted.
- Sexually deviant.

- Suicidal.
- Emotionally disturbed (refer prisoners to mental health for evaluation).

7-44. Continuity is essential to a successful counseling program. Ideally, a counselor is assigned to a prisoner and continues to work with him throughout his confinement. The counselor makes contact with the prisoner within 48 hours of his inprocessing. The counselor completes necessary records (journal and worksheet) and initiates a follow-up plan. He maintains a case file on each prisoner that contains a record of counseling sessions, a personal-data sheet, observation reports, or other correspondence. High prisoner morale and the lack of disciplinary problems reflect a successful counseling program. The final test is a prisoner's satisfactory adjustment on his return to society. (See FMs 8-51 and 22-100 for more information on counseling.)

EMPLOYMENT AND EDUCATION

7-45. Prisoners can be employed in tasks that benefit them and meet the needs of the facility. Education activities take priority over work projects. The USDB employment and education programs are key correctional tools for preparing prisoners to return to civilian life. The programs provide prisoners with marketable skills and self-confidence, and they teach the value of self-discipline. Job training opportunities range from unskilled, manual labor to highly skilled trades.

7-46. Close coordination between the facility commander and the garrison commander or his equivalent is maintained to establish worthwhile work projects for prisoners. The facility commander approves work projects and the assignment of prisoners to work projects. The employment section determines the best type of employment for each prisoner. The needs of the facility are considered along with the prisoner's—

- Education.
- Aptitude and achievement scores.
- MOS.
- Attitude and interests.

RECREATION

7-47. Nonduty activities fill gaps between work and education activities and take up idle time that might otherwise be used for undesirable activities. Encourage prisoners to develop nonduty time interests, and when possible, set up a program to guide and direct nonduty activities. A prisoner's involvement in nonduty activities indicates that he is adjusting to confinement. Note and report soldiers who are not participating in nonduty activities.

7-48. Ensure that prisoners have access to a library and recreation facilities. Based on the commander's approval, prisoner recreation programs may include sporting events, hobbies, motion pictures, videotapes, and religious activities. Encourage prisoners to further their academic education by taking part in the facility's education program or through self-study courses offered by the Army Correspondence Course Program (ACCP).

COMPENSATION, CLEMENCY, AND PAROLE

7-49. Prisoners who respond well to correctional treatment can be rewarded in several ways. The severity of their sentences may be lessened, their sentences may be reduced, or they may be granted greater freedom and more privileges. These rewards help maintain morale, discipline, and welfare.

COMPENSATION

7-50. An inmate who is serving a sentence to confinement (other than a life sentence) can earn time off the sentence term by taking part in selected activities for which extra good-conduct time (EGCT) is authorized. The EGCT is an additional incentive to prisoners who demonstrate excellence in work, education, or vocation. It is awarded at the rate shown in Table 7-1. Only those prisoners who demonstrate ability, initiative, and productivity and meet the eligibility criteria for their assigned duties are recommended for EGCT.

Table 7-1. Rates for EGCT

Level	Description	EGCT
1	Prisoners continuously employed 1 to 5 months	1 day per month
2	Prisoners continuously employed 6 to 10 months	2 days per month
3	Prisoners continuously employed 11 to 15 months	3 days per month
4	Prisoners continuously employed 16 to 20 months	4 days per month
5	Prisoners continuously employed 21 to 25 months	5 days per month
6	Prisoners serving as assistant instructors or supervisor assistants (following attainment of Level 5) ¹	6 days per month
7	Trustees who have maintained Level 6 for 6 months ²	7 days per month
<p>¹A prisoner (including a trustee) who loses his position as an assistant instructor or a supervisor assistant is reduced to Level 5 or the earning level held prior to elevation, whichever is less.</p> <p>²The Level 7 increase is removed if a prisoner is removed from trustee status. He is reduced to Level 6 or the earning level held prior to elevation, whichever is less.</p>		

7-51. Additional EGCT can be authorized for participation in community service programs and special projects that support institutional goals or missions. It is awarded in a lump sum and does not exceed 3 days for any event or 5 days in any month.

CLEMENCY

7-52. Clemency modifies the severity of a court-martial sentence and can be achieved through mitigation, suspension, or remission as follows. The facility commander makes recommendations concerning each prisoner's sentence if he has responded in a positive manner to correctional programs.

- **Mitigation.** Mitigation lessens the severity of a sentence.
- **Suspension.** Suspension is the granting of a probationary period that results in remission if it is completed successfully.
- **Remission.** Remission cancels the unexecuted part of a sentence to which the remission applies.

PAROLE

7-53. A parole is based on conduct during confinement or on special circumstances. There are three types of paroles that a prisoner may be awarded—a parole, a temporary home parole (THP), and an emergency home parole (EHP):

- **Parole.** A parole serves as a transition between the strict supervision of confinement and the conditions most likely to ensure a prisoner's earliest assumption of responsibilities as a productive, law-abiding citizen.
- **THP.** A THP is a temporary release from confinement granted to strengthen family relationships, and it provides incentive and reinforcement to positive behavior and morale.
- **EHP.** An EHP is a temporary release from confinement due to an emergency, such as the death or critical illness of an immediate family member or a disaster.

7-54. The facility commander notifies victims and witnesses who are identified in the prisoner's correctional-treatment file (CTF) that a prisoner is being released from confinement (see AR 190-47, DOD Directive 1030.1, and DOD Instruction 1030.2). Notify victims and witnesses by the most direct means practicable before releasing a prisoner on THP or EHP. This allows the victim or witness the opportunity to respond, favorably or negatively, to the proposed release.

CLEMENCY AND PAROLE BOARD

7-55. The facility commander appoints a permanent board that consists of at least three voting members (one officer and two enlisted). He may also assign nonvoting members to the board. The board considers factors involved in a prisoner's request for clemency or parole and recommends acceptance or rejection of the request to the Army Clemency and Parole Board.

CORRECTIONAL STAFF

7-56. The ACS correctional staff consists of dedicated professionals who serve as positive role models for prisoners. Staff members include corrections NCOs and specialists (MP who have entered the corrections career program and received resident training in MOS 95C at the US Army Military Police School). Due to their close contact with prisoners, corrections NCOs and specialists must be firm, fair, and decisive. Their behavior and attitude form an integral part of the correctional-treatment process. Support personnel are experts in areas other than corrections, but their expertise plays an important role in the facility.

CORRECTIONAL-SUPERVISION BRANCH

7-57. The chief, correctional-supervision branch (CSB) (senior corrections NCO)—

- Assists in the custodial operations of the facility.
- Supervises correctional and custodial personnel within the facility.

- Informs the facility commander of matters that affect the custody, control, and security of the facility.
- Ensures that rules, regulations, and SOPs are followed and enforced.

Guard Commander

7-58. The guard commander—

- Supervises custodial personnel.
- Is responsible for prisoner activities during his tour of duty.
- Monitors custody, control, and security measures.
- Ensures compliance with the schedule of calls.
- Initiates emergency control measures.
- Maintains the facility blotter.
- Deals with situations involving prisoner admission in the absence of the chief, CSB, and the chief, prisoner services branch (PSB).

Prisoner Control Team

7-59. The prisoner control team NCOIC performs many of the same duties in an I/R battalion module as in a garrison confinement facility. This specialized environment requires the same corrections background to respond to behavioral incidents requiring calm, decisive action. During I/R operations, the NCOIC is responsible for—

- Security.
- Accountability.
- Intelligence. Intelligence is information obtained through observation and reports submitted by guards who are in daily contact with prisoners. The best source of intelligence gathering for the CSB is the guard force.
- The guard force. There are two types of orders for the guard force—general and special. General orders apply to all guards, and special orders apply to particular posts and duties.
- Escape prevention. The MWDs can be used to track an escapee, but they cannot be used to apprehend him.

Cellblock Guards

7-60. Cellblock guards—

- Maintain custody, control, and discipline of prisoners under their supervision.
- Supervise all activities according to the schedule of calls.
- Supervise the response to emergency action plans.
- Conduct periodic inspections, searches, head counts, roll calls, and bed checks.

Close-Confinement Guards

7-61. Close-confinement guards—

- Maintain custody and control of prisoners who are segregated from the general population due to inprocessing or administrative or disciplinary reasons.
- Accomplish activities within the schedule of calls, as applicable to the close-confinement area.
- Conduct 30-minute checks (or 15-minute checks for special-status prisoners) when a DD Form 509 is required.
- Ensure that all required signatures on DD Form 509 are obtained on a daily basis.

Dining-Facility Guards

7-62. Dining-facility guards—

- Maintain custody and control of prisoners during mealtime.
- Ensure that the dining-facility traffic plan is followed.
- Prevent congestion at condiment and juice areas.
- Account for silverware before and after a meal.
- Search prisoners before they leave the dining facility.

Employment Detail Guards

7-63. Employment detail guards—

- Maintain custody, control, and supervision of prisoners while on details.
- Ensure that work details are accomplished and safety precautions are observed.
- Maintain strict accountability of equipment and tools.
- Assist with frisks and strip searches of prisoners returning from details.
- Account for prisoners on details according to the schedule of calls.
- Track prisoners' locations at all times while on details.

Escort and Absent-Without-Leave Apprehension Guards

7-64. Escort and absent-without-leave (AWOL) apprehension guards—

- Maintain custody and control of prisoners while moving them to and from designated places.
- May be armed with a pistol if required and authorized by the facility commander.
- Are qualified with a pistol and trained in the use of force and the ROE.
- Are trained in firearms safety procedures necessary to transport prisoners by land, air, and sea.

Main Gate and Sally Port Guards

7-65. Main gate and sally port guards—

- Maintain custody and control of prisoners.
- Ensure that only authorized persons enter the facility.
- Inspect vehicles entering and exiting the facility.

- Inspect packages.
- Conduct inventories of items entering and exiting the facility.
- Require noncustodial personnel to register on sign-in logs.

Visitor Room Guards

- 7-66. Visitor room guards—
- Maintain custody and control of prisoners during visits by family members and other authorized persons.
 - Detect violations of rules and regulations, improper behavior, and contraband.
 - Position themselves in inconspicuous places and observe conversations rather than listening to them.
 - Identify and report infractions, which may be grounds for terminating visits.

Hospital Guards

- 7-67. Hospital guards—
- Maintain custody and control of prisoners while escorting them to and from medical appointments and during hospitalization.
 - Ensure that rooms are clear of contraband.
 - Prevent unauthorized communications.

Tower Guards

- 7-68. Tower guards—
- Maintain custody and control by observing specific sectors of the perimeter.
 - Are briefed on the use of force and are familiar with a 12-gauge shotgun.
 - Ensure that contraband is not passed through the fence.
 - Provide protection for compound guards.

TRAINING

- 7-69. Personnel assigned to a confinement facility are oriented and trained in the procedures of custody and control. The formal training program includes—
- Supervisory and interpersonal communications skills.
 - Self-defense techniques.
 - Use of force (priorities of force).
 - Weapons qualification (see DA Pam 350-38).
 - First aid.
 - Emergency action plans.
 - Facility regulations.
 - Riot control techniques.

SUPPORT PERSONNEL

7-70. Support personnel in a confinement facility include chaplains, medical personnel, the SJA, and the IG. They perform the same functions as support personnel in a garrison.

PRISONER SERVICES BRANCH

7-71. The chief, PSB—

- Supervises the administrative concerns of the facility.
- Maintains records and forms.
- Computes sentences.
- Manages property and funds.
- Processes prisoners for transfer or release.
- Monitors admissions, services, THPs, EHPs, and the victim/witness program.
- Advises the facility commander of administrative concerns involving prisoners.

7-72. Some administrative procedures at ACS facilities are unique to confinement and corrections operations. Key procedures include inprocessing prisoners, maintaining records and forms, computing sentences, managing property and fund accounts, and transferring and releasing prisoners. In addition to ensuring the day-to-day functioning of facilities, these procedures have a direct impact on prisoner discipline and morale. A prisoner's first contact with the facility staff is during admissions processing, when he is briefed on the facility rules and his legal rights.

ADMISSION PROCEDURES

7-73. Prisoners begin their confinement by inprocessing. Segregate newly confined prisoners from the main prisoner population until they are processed according to the following guidelines:

- Check the DD Form 2707 for accuracy.
- Search and segregate authorized and unauthorized property.
- Strip-search each prisoner.
- Issue appropriate health and comfort supplies to each prisoner, and complete DD Form 504.
- Photograph and fingerprint each prisoner.
- Complete individual prisoner forms.
- Inform prisoners of their visitation rights.
- Arrange for a medical officer to examine each prisoner within 24 hours of confinement, and complete DD Form 503.

CORRECTIONAL-REPORTING SYSTEM

7-74. The Correctional-Reporting System (CRS) is the primary means of information management within the ACS. (See AR 190-47 for more information.)

REQUIRED REGULATIONS AND FORMS

7-75. Each facility must have a complete, current set of regulations covering correctional administration. The facility commander ensures that the facility is part of the publications distribution system. The following regulations and publications must be available:

- AR 15-130.
- AR 190-14.
- AR 190-47.
- AR 210-174.
- AR 633-30.
- Misc Pub 27-7.
- UCMJ.

7-76. Confinement facilities use a variety of forms to maintain records and reports. The following forms must be available:

- DA Form 1124.
- DA Form 1125-R.
- DA Form 1128.
- DA Form 1129-R.
- DA Form 1130-R.
- DA Form 1131-R.
- DA Form 1132-R.
- DA Form 1134-R.
- DA Form 1135-R.
- DA Form 3078.
- DA Form 3955.
- DA Form 3997.
- DD Form 2 (ACT).
- DD Form 499.
- DD Form 503.
- DD Form 504.
- DD Form 506.
- DD Form 509.
- DD Form 515.
- DD Form 2707.
- DD Form 2710.
- DD Form 2718.
- Federal Bureau of Investigation (FBI) Form FD-249.

CORRECTIONAL-TREATMENT FILE

7-77. Establish a CTF within the first 72 hours of confinement, and maintain it throughout the confinement period. (See AR 190-47 for more information.)

SENTENCE COMPUTATION

7-78. Compute sentences according to AR 633-30 and DOD Directive 1325.4. The facility commander ensures that selected corrections NCOs working in the PSB are properly trained to compute sentences. Incorrect computations result in incorrect release dates and can violate a prisoner’s legal rights. The rate of earnings for good-conduct time is calculated based on the prisoner’s length of confinement, including pretrial time (see Table 7-2).

Table 7-2. Rates for Good-Conduct Time

Length of Sentence	Good-Conduct Time
Less than 1 year	5 days for each month of the sentence
1 year to less than 3 years	6 days for each month of the sentence
3 years to less than 5 years	7 days for each month of the sentence
5 years to less than 10 years	8 days for each month of the sentence
10 years or more, excluding life	10 days for each month of the sentence
NOTE: If the term of confinement is reduced or if an additional sentence increases the term of confinement, recompute the good-conduct time at the abatement appropriate to the new term of confinement.	

PERSONAL PROPERTY AND FUNDS

7-79. Prisoners are permitted to place personal property in safekeeping if it is not authorized for retention by the facility commander. Without an exception, the number of items stored cannot exceed the capacity of a 12- by 16-inch envelope. Account for personal property and funds according to AR 210-174, and place the funds in the prisoners’ deposit fund. The facility commander appoints (in writing) a commissioned officer, a warrant officer, or a DA civilian as the custodian of the prisoners’ property and funds. The appointee must be bonded as outlined in AR 600-13.

7-80. The custodian safeguards prisoners’ property and funds in trust. With few exceptions, any action involving property or funds requires the prisoner’s authority and consent. The exceptions to this rule are as follows:

- The Internal Revenue Service (IRS) can levy a prisoner’s personal deposit fund to satisfy delinquent federal income taxes.
- Property that has evidentiary value is subject to impounding. When the property is taken from a prisoner, disposition is made only by instructions received from a competent authority. (See AR 190-22 for more information.)
- Property of an escapee is disposed of according to DOD 4160.21-M.

PROCEDURES

7-81. A system of internal controls is used to protect prisoners’ property and funds, to ensure the accuracy of records, and to promote efficiency in operations. The custodian and the correctional staff must ensure that prisoners are denied access to property and funds (their own and other prisoners’). Staff members inventory the prisoners’ property and list the items

on DA Form 1132-R (five copies). (See ARs 190-47 and 210-174 for detailed procedures.)

7-82. Dispose of an escapee's or a deceased prisoner's personal property according to ARs 630-10 and 700-84. The facility commander or the installation commander appoints a disinterested officer to audit the prisoner's personal property. When the audit is complete, the officer signs a DA Form 1132-R in lieu of and for the prisoner.

7-83. A prisoner's sentence determines if and how much he is paid. Prisoners are not allowed to have money in their possession. All money received while in confinement is deposited in the prisoners' deposit fund, which is a trust fund. It contains the personal funds of all the prisoners in the facility. The fund's balance equals the total of the individual accounts on the ledger.

7-84. Take all money from each prisoner during processing. Deposit US currency and US government paychecks in his deposit fund. Prepare a DA Form 1124 (in triplicate) that lists all the money received for deposit, and issue a receipt for personal checks surrendered by the prisoner.

7-85. Deposit all cash receipts in the name of the fund, and make daily deposits when practical. Ensure that checks received by prisoners while in confinement are endorsed immediately for deposit to the fund, and promptly deposit the checks in the bank for collection.

7-86. When a prisoner is transferred from one confinement facility to another, transfer his personal deposit fund to the receiving facility. When a prisoner is released and his personal deposit fund is \$50 or less, pay the entire amount to him in cash. If the balance is more than \$50, issue the balance of his personal deposit fund in the form of a check.

PETTY-CASH FUND

7-87. The USDB commandant and the RCF commander are authorized to set up a petty-cash fund, which provides prisoners with cash to make minor purchases. The commandant or the commander determine each prisoner's contribution to the petty-cash fund, and the amount is drawn from each prisoner's personal deposit fund. The commandant or the commander sets the limit, in writing, on the amount of money in the petty-cash fund.

7-88. Expenditures from the petty-cash fund may not exceed \$50 for anyone authorized expenditures except when the prisoner is released from confinement. When a petty-cash disbursement is made to a prisoner, he submits a DA Form 1128 to the cashier of the petty-cash fund.

MAIL AND CORRESPONDENCE

7-89. The correctional staff keeps a record of each prisoner's mail, correspondence, and authorized correspondents on DD Form 499. They conduct inspections to control trafficking of contraband, money, and valuables. Incoming and outgoing mail is normally inspected but not read. However, it can be read, rejected, or censored if the facility commander has probable cause to believe that it contains plans for criminal activities or escapes, codes or plans for activities in violation of facility rules, requests for prohibited gifts or

money, or obscenity. If a prisoner's mail is being censored or rejected, notify him of the decision and provide the author of the letter a reasonable opportunity to appeal the decision. An official, other than the person who originally disapproved the correspondence, decides appeals, and the appellate official's decision is final. (See AR 190-47 for more information.)

7-90. Different rules apply to inspecting and reading privileged mail. Privileged mail can be opened and inspected to control contraband, money, and valuables and to verify authenticity; but it cannot be read. If a letter qualifies as privileged mail, it is usually delivered to the prisoner unopened. If privileged mail is opened, it must be opened in the presence of the prisoner and a commissioned officer, an NCO (E7 and above), or a civilian (GS7 and above). Privileged mail consists of correspondence between prisoners and—

- The President or his representative.
- The Vice President or his representative.
- A member of Congress or his representative.
- The US Attorney General or his representative.
- The Judge Advocate General or his representative.
- The prisoner's defense counsel or an attorney of record.
- A chaplain or a clergy when recommended by the installation chaplain.

SUPPORT PERSONNEL

7-91. Support personnel aid the correctional process in numerous areas as follows:

- **Chaplain.** The chaplain promotes the spiritual and moral welfare of prisoners through worship services; special religious activities; counseling; and emphasis on moral, ethical, spiritual, and social values.
- **Medical activity.** The commander of the local medical activity provides medical services for prisoners. Medical services include the services of psychiatrists, psychologists, and social workers. They provide professional evaluations of prisoners and help develop correctional-treatment programs. The medical-activity commander coordinates with the PM and the facility commander to ensure that custody and control measures conform to medical requirements.
- **IG.** The IG may assist the facility commander by investigating complaints, allegations, and charges. These actions frequently provide a basis for corrective action and discourage unfounded allegations by prisoners. The PM and the facility commander establish and maintain close liaison with the IG.
- **SJA.** The SJA serves as the legal advisor to the commander and the staff. The SJA plays a major role in correctional treatment and administrative activities. He provides legal advice and assistance to the PM and the facility commander, legal assistance to prisoners when consistent with professional responsibility requirements, and official information to prisoners about the status of cases and sentences as prescribed by law and regulation. The SJA coordinates with the US

Trial Defense Service, an independent legal organization, to ensure that prisoners have independent legal advice relating to military justice.

- **AG.** The AG processes recommendations for administrative elimination of prisoners without a punitive discharge from the service. He advises the facility commander and unit commanders on processes and procedures.
- **Technical service.** Technical service provides support to education and employment programs. Work programs permit on-the-job training for prisoners in carpentry, mechanics, painting, and masonry. They may also include skilled tasks required to maintain and operate the installation.

TRANSFER AND DISPOSITION PROCEDURES

7-92. The transfer of a prisoner or a pretrial detainee refers to his relocation from one confinement facility to another to continue a sentence. AR 190-47 provides detailed guidance on the administrative and operational processing required for a prisoner transfer.

7-93. A prisoner or a pretrial detainee is released from confinement only with the proper authorization. At the USDB and the RCF, the installation commander can authorize the facility commander to authenticate DD Form 2718. A prisoner or a pretrial detainee is released for the following reasons:

- A causal prisoner is returned to his unit.
- The charge is dismissed.
- Parole or clemency is granted.
- Pretrial confinement is no longer deemed necessary.
- The sentence expires.
- The sentence is mitigated, suspended, or remitted.

7-94. A confined prisoner—

- Can be kept in confinement and a new confinement order can be issued if he completes a sentence and has additional charges pending.
- Is released from confinement if he is adjudged and completes a sentence before determination is made to punitively discharge him. However, he remains subject to military jurisdiction until the sentence is approved and the discharge is executed.
- Is released from confinement when he completes a sentence that includes a punitive discharge or a dismissal.
- Is released from confinement if his sentence is mitigated or remitted by the convening authority or another competent authority.
- Cannot be released from confinement until a release order is executed if a court-martial renders a decision of not guilty while he is confined.
- Cannot be released from confinement until a release order is executed if the charges are withdrawn.
- Can be retained under military jurisdiction after release for treatment of an illness or an injury that occurred or was aggravated during military service or confinement.

LOGISTICS

7-95. Confinement facilities provide supplies for prisoners during their incarceration and for the correctional staff during their daily tour of duty. The quality of treatment programs and the morale of prisoners and staff are directly affected by the availability of supplies.

7-96. Unit commanders ensure that soldiers in pretrial status have the necessary clothing when they enter confinement. Prisoners confined in outside continental United States (OCONUS) confinement facilities wear a battle dress uniform (BDU), and those confined in CONUS facilities wear a distinctive prisoner uniform as prescribed in CTA 50-900. Prisoners are also issued two blankets, two sheets, one pillow, and one pillowcase.

7-97. The supply branch issues general and janitorial items to prisoners and staff as needed. Items include mops, buckets, brooms, cleansers, and office supplies.

FOOD SERVICE SUPPLIES

7-98. Food service operations are important for maintaining morale and discipline. Provide prisoners wholesome, sufficient food that is prepared from the Army master menu. Supply them with a full complement of eating utensils (fork, knife, and spoon). Prisoners in close confinement and those who have lost privileges can be denied supplemental rations as described in the Army master menu.

HEALTH AND COMFORT SUPPLIES

7-99. The facility commander ensures that basic supplies are available for prisoners to maintain personal hygiene and comfort. Health and comfort supplies are issued to new prisoners during inprocessing and regularly thereafter. Prisoners request additional supplies on DD Form 504, and they receive the supplies gratuitously if they are in a nonpay status. Basic supplies include haircuts, postage stamps, safety razors, bath soap, toothbrushes, toothpaste, and shoe polish.

7-100. A physical inventory is reconciled and balanced monthly (minimum) with the previous inventory, supplies received, and supplies issued to prisoners. The facility commander or a designated representative verifies the inventory in writing.

SUPPLY SERVICES

7-101. Supply functions in a confinement facility are the same as those in other military units. However, stronger security measures are necessary to prevent certain supplies and equipment from falling into the hands of prisoners.

7-102. Weapons, ammunition, and emergency equipment (protective masks and hand and leg irons) must be stored in maximum-security, locked racks or cabinets in a room that is located away from prisoner areas. Guards draw weapons and ammunition as needed, and the staff keeps records of all transactions. To reduce hazards, set up an area for loading and unloading weapons outside the facility.

MEDICAL AND DENTAL TREATMENT

7-103. The facility commander establishes a close liaison with commanders of local medical and dental facilities to ensure their full support of the confinement facility. He ensures that prisoners receive the same medical and dental care as other soldiers.

7-104. Medical officers or other medically trained personnel conduct sick call, perform emergency medical treatment, and dispense medication. Hold sick call daily at a time that does not interfere with duties and training of prisoners. Medical examinations and treatment usually require using instruments and medications that can cause custody and control problems. Secure medications and equipment when they are not in use, and inventory them frequently.

7-105. Corrections NCOs dispense medication to prisoners in cellblocks, supervise the ingestion or application of the medication, and maintain a medication issue register. When possible, use qualified medical personnel to dispense prescription medication.

Chapter 8

Battlefield Confinement of United States Military Prisoners

In a mature TO, MP may operate FDFs and FCFs to hold US military prisoners and pretrial detainees in short-term pretrial or posttrial confinement. Posttrial confinement includes temporary custody of prisoners until they are evacuated to permanent facilities and custody of prisoners with short-term sentences as determined by the combatant commander. Leaders tasked with performing US military prisoner operations must be familiar with the doctrine in this chapter and Chapter 7, the policies outlined in AR 190-47, the ACS, and the tasks described in STP 19-95C14-SM-TG.

PLANNING

8-1. There are two types of battlefield facilities—FDF and FCF. When the combatant commander makes the decision to retain prisoners in the TO, FDFs are set up in the CZ and an FCF is set up in the COMMZ. Prisoners are evacuated from one facility to another according to established guidelines and available facilities (see Figure 8-1, page 8-2).

8-2. The MP plan US military prisoner operations to meet the needs of the combatant commander. The commander may decide to establish facilities throughout the TO if he encounters any of the following:

- The projected or actual amount of prisoners exceeds the unit's handling capability and may interfere with military operations.
- The distance between the TO and the CONUS/OCONUS facility is too great and makes evacuation impractical.
- Transportation assets are unavailable for expeditious evacuation to other facilities.
- The length of military operations and the maturity of the TO enable facilities to be established.
- The facilities are necessary to meet other operational needs.

8-3. The PM is a key player and assumes an important role by keeping the combatant commander informed throughout the planning process. The PM coordinates with the SJA, civil affairs (CA), the HN, the appropriate echelon coordinating staff, and the major subordinate commands before recommending that US military prisoner facilities be established. During the planning process, the PM must determine—

- The date a facility is required.
- The location of an FCF in the COMMZ.
- The resources and logistical support needed to construct and operate a facility.

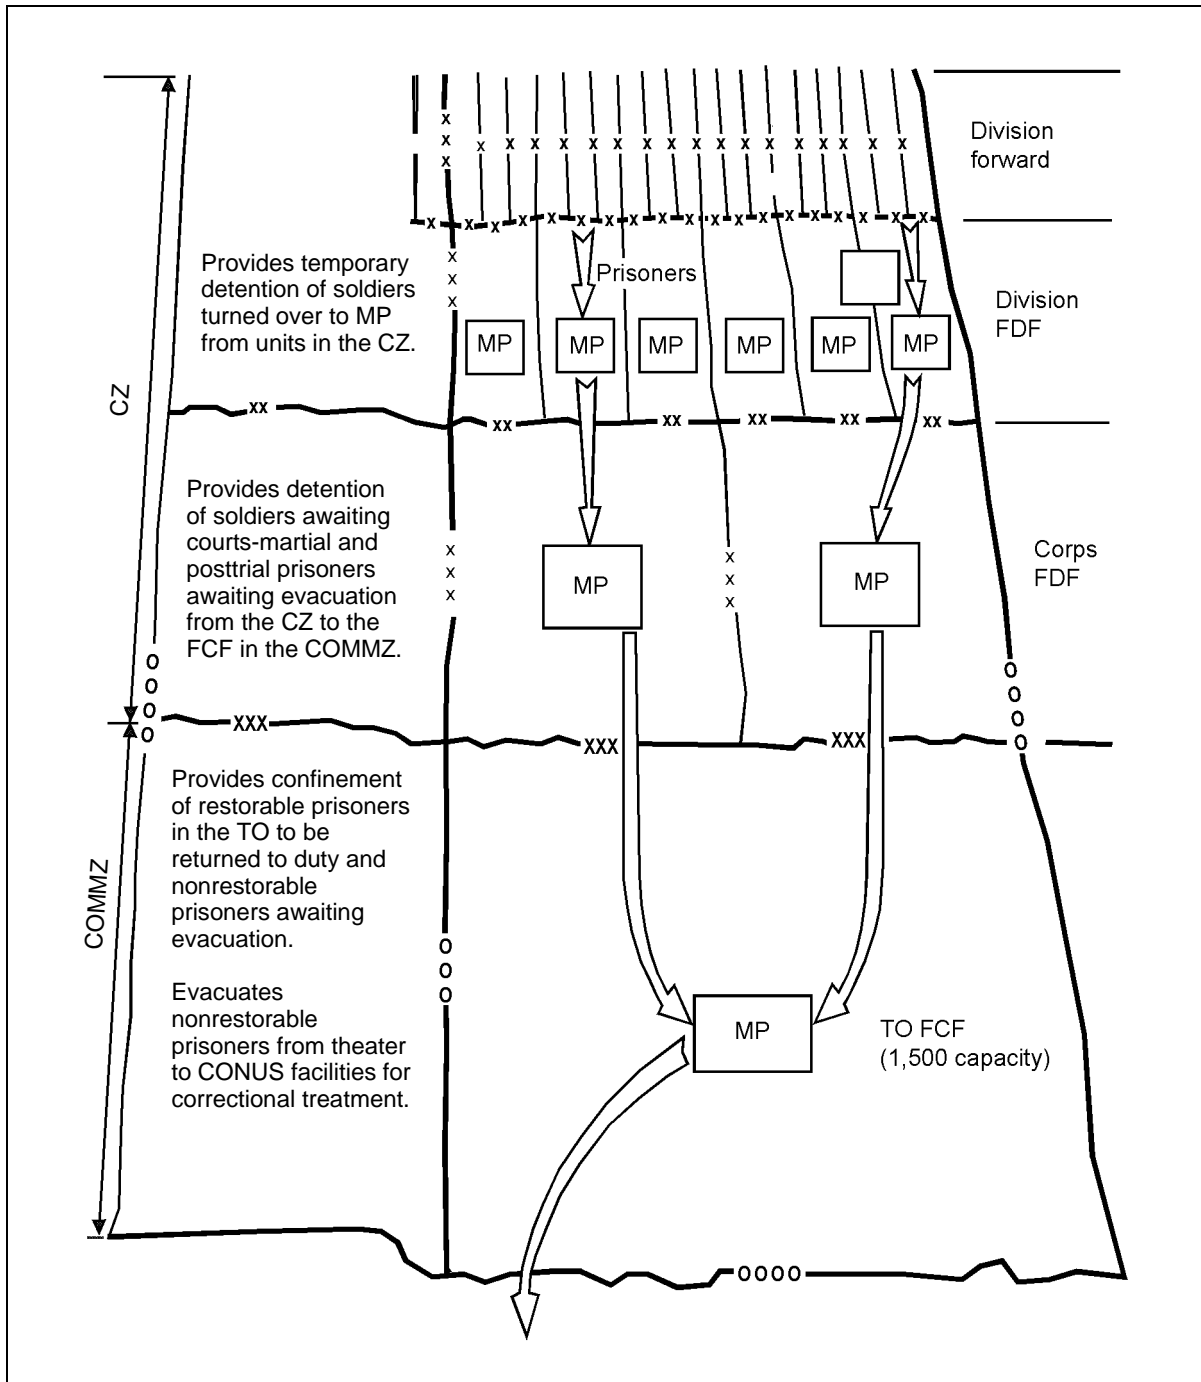

Figure 8-1. TO Confinement Evacuation Flow

- The availability of MP forces (CS MP forces in the TO or an I/R MP unit deployed from CONUS).
- The type of prisoners to be interned (pretrial, posttrial, and multiservice).
- The evacuation requirements and other prisoner-specific considerations.
- The requirements of division and corps FDFs and other requirements that may impact on the operation.

FIELD DETENTION FACILITY

8-4. In the CZ, division and corps PMs are responsible for the location, setup, and operation of FDFs for as long as necessary. The MP use FDFs to detain soldiers until they can be tried, sentenced to confinement, and evacuated from the area. Soldiers awaiting trial remain in their units if possible. When the UCMJ requirements of Rules for Courts-Martial (RCM) 305 are met, soldiers are placed in pretrial confinement and retained by MP. Per RCM 305, no one can be ordered into pretrial confinement except for probable cause. Probable cause to order pretrial confinement exists when there is a reasonable belief that—

- An offense triable by court-martial has been committed.
- The person confined committed it.
- Confinement is required by the circumstances. For example, less severe forms of restraint are inadequate or it is foreseeable that the prisoner will engage in serious criminal misconduct or will not appear at trial, pretrial hearing, or investigation.

8-5. When operating an FDF, MP sign a receipt for each prisoner (DD Form 2708) and his property (DA Form 4137). Use existing structures for FDFs if possible. If tents are used, they should be as large as a GP medium tent. Plans for establishing an FDF should include the following list of equipment and supplies:

- Barbed wire and concertina.
- Fence posts.
- Gates and doors.
- Floodlights and spotlights.
- A generator.
- Food service and cleaning equipment.
- Water cans or lister bags.
- First aid equipment and supplies.
- Clothing and bedding.

FIELD CONFINEMENT FACILITY

8-6. The MP establish an FCF in the COMMZ to detain soldiers placed in short-term custody during pretrial or posttrial or while in transit to another facility. An FCF can be a semipermanent or permanent facility, and it is more complex and elaborate than an FDF. A CS MP unit or an I/R MP unit can be tasked with operating an FCF. The respective unit commander uses the

military decision-making process (MDMP) to determine tasks that are necessary to accomplish the mission. Some considerations are—

- Location.
- Construction.
- Setup.
- Processing.
- Classification.
- Identification.
- Clothing.
- Subsistence.
- Dining facilities.
- Medical facilities.
- Sanitation.
- Discipline.
- Control.
- Administration.
- Emergency planning and investigations.
- ROI.
- Use of force.
- Escape.
- Transportation.
- Transfer and disposition of prisoners.

LOCATION

8-7. The PM coordinates with engineers, the SJA, the HN, and the coordinating staff before selecting an FCF site. He ensures that the FCF is located away from perimeter fences, public thoroughfares, gates, headquarters, troop areas, foliage, and wooded areas. The location depends on several factors, such as—

- The availability of logistical assets (transportation and medical facilities).
- The availability of terrain and preexisting structures.
- The enemy situation.
- The battlefield layout.
- LOC.
- METT-TC.

CONSTRUCTION

8-8. The construction of an FCF depends on the availability of existing structures, the work force, and materiel. Use preexisting facilities to the maximum extent possible. If they are unavailable, coordinate with engineers to construct a facility that meets security and safety requirements. If a CS MP unit is tasked to construct an FCF, request supplies and materiel through the established supply channels. An I/R MP unit requires engineer support to

construct guard towers, fences, and perimeter roads and to repair unimproved roads.

SETUP

8-9. The FCF setup corresponds with established standards as outlined in AR 190-47. The physical layout includes facilities for administration, housing, and training (if required) as well as recreation and work areas (if available). The facilities and areas are secure against escape. Figure 8-2 shows a sample FCF setup.

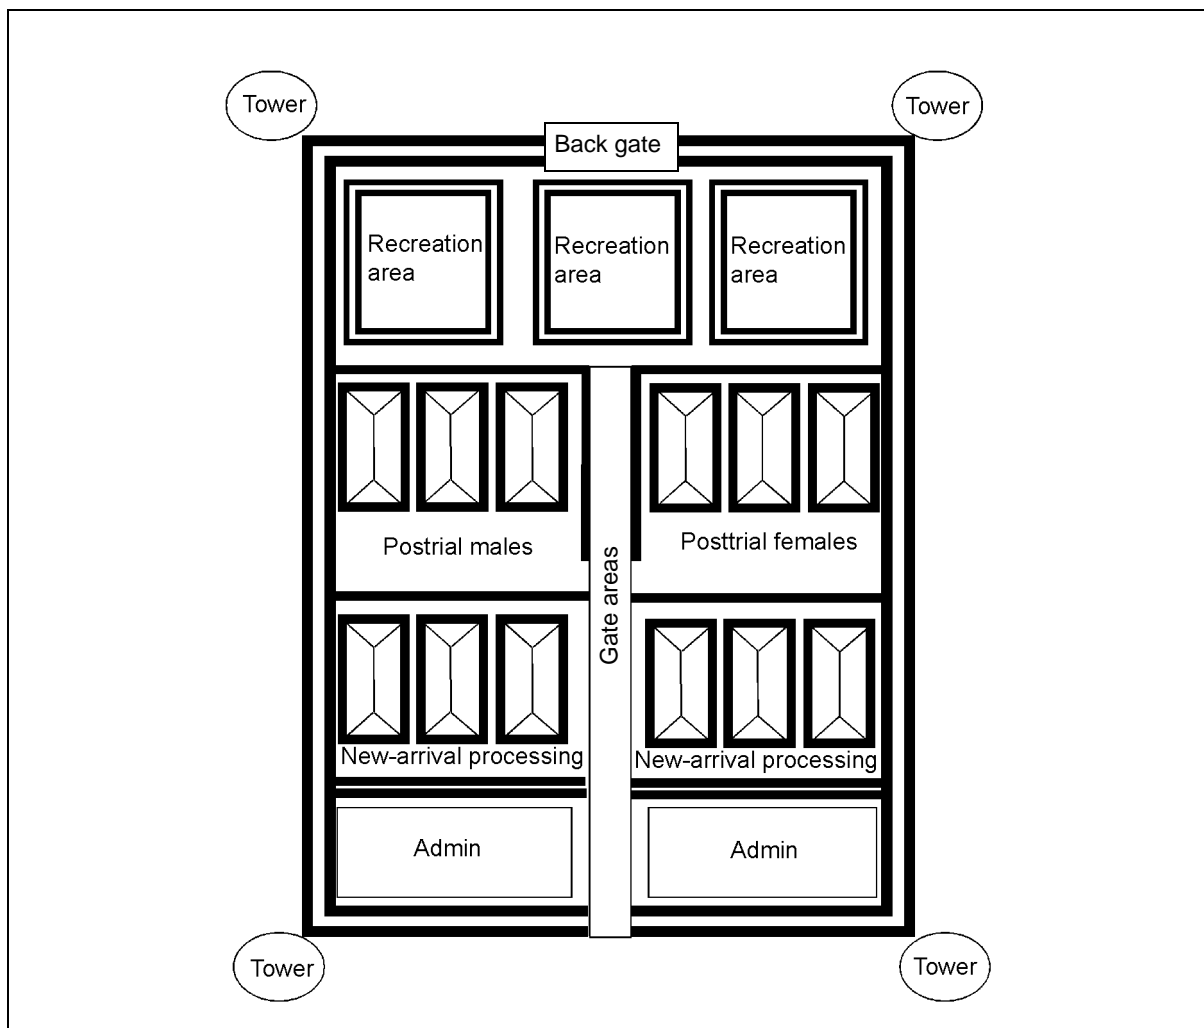

Figure 8-2. Sample FCF Setup

PROCESSING

8-10. Processing begins when the control of a prisoner is transferred from a non-MP unit to an MP unit or from an MP unit to another MP unit. Each time control is transferred, the receiving organization signs a receipt for each prisoner (DD Form 2708) and his property (DA Form 4137).

8-11. Prisoners begin their confinement by inprocessing into the facility. If a confinement detachment is available, it performs all tasks related to inprocessing prisoners. Otherwise, the MP unit commander performs inprocessing with organic assets. Part of the inprocessing procedure is to help prisoners integrate into the confinement environment. Process each newly confined prisoner according to the guidelines in Table 8-1.

Table 8-1. Processing a US Military Prisoner

Station	Purpose	Responsible Individuals*	Actions
1	Search	MP	Escort prisoner and property. Conduct same-gender strip search. Accomplish this before he enters the processing area unless conditions prohibit it. Supervise his movement to the next station.
2	Property inventory	MP	Inventory personal property. List items on DA Form 1132-R. Place items in a container or on a tray. Mark items with his name and SSN. Secure items in a storage area. Confiscate his money, and record it on DA Form 1124. Supervise his movement to the next station.
3	Administrative processing	Processing clerk and MP	Initiate a CTF. Complete individual prisoner forms (see Chapter 7). Supervise his movement to the next station.
4	Photography and fingerprinting	MP	Fingerprint and identify him, and record the information on a fingerprint card. Photograph him with instant film. Use a photographic name board (black background with white characters). List his SSN and name at the bottom center. Attach the photograph to his CTF. Supervise his movement to the next station.
5	Personal hygiene	MP	Allow him to shower, shave, and get a haircut. Supervise his movement to the next station.
6	Medical evaluation	Medical personnel and MP	Examine him within 24 hours of arrival at the confinement facility. Complete DD Form 503. Supervise his movement to the next station.
7	Records review	MP	Review processed records for completeness. Escort him back to processing stations as needed. Prepare and maintain an accountability roster. Supervise his movement to the next station.
*The number of people used to perform tasks depends on the number of prisoners and the time available.			

Table 8-1. Processing a US Military Prisoner (continued)

Station	Purpose	Responsible Individuals*	Actions
8	Briefing	MP	Brief him on rules and regulations and visitation and correspondence rights. Supervise his movement to the next station.
9	Movement	MP	Move him to a secure area.
*The number of people used to perform tasks depends on the number of prisoners and the time available.			

8-12. Ensure that all newly assigned prisoners complete training, as soon as possible, that explains the—

- Facility rules and regulations.
- Counseling procedures.
- UCMJ.
- Disciplinary authority and procedures.
- Work assignments.
- Complaint and grievance procedures per AR 20-1.

8-13. Orient pretrial prisoners and officers on their status, rights, and privileges, including the following:

- They are required to participate in correctional orientation and treatment programs that ensure their control, custody, employment, training, health, and welfare as determined by the facility commander.
- Officer and NCO prisoners will not exercise command or supervisory authority over others. They will comply with facility rules and regulations to the same extent as other prisoners. They are not permitted special privileges normally associated with their rank.

CLASSIFICATION

8-14. Prisoners are classified into two categories—pretrial and posttrial. Separate pretrial prisoners (males and females) from posttrial prisoners. Posttrial prisoners include those retained during short-term sentences and in-transit prisoners who are being evacuated to another facility.

IDENTIFICATION

8-15. Take two front and two profile photographs of each prisoner. Use a name board, if available, and place his last name, first name, and middle initial on the first line and his social security number (SSN) on the second line. Add a prisoner registration number on the third line if desired. (See AR 190-47 for fingerprint card requirements.)

CLOTHING

8-16. Prisoners wear a BDU without rank insignia during incarceration. Return personal clothing and other articles to prisoners per AR 700-84 as determined by the facility commander. Issue clothing to prisoners, except officers, according to AR 700-84 and CTA 50-900. Maintain a DA Form 3078 on prisoners with less than 6 months active-duty service and prisoners who

receive clothing on an issue-in-kind basis. Provide organizational clothing within the allowances prescribed in AR 710-2 and CTA 50-900. Launder and dry-clean clothing for prisoners (except officers on pay status) without charge per AR 210-130. Dispose of clothing and personal property according to AR 190-47.

SUBSISTENCE

8-17. Provide prisoners with wholesome, sufficient food that is prepared from the Army master menu, and supply them with a full complement of eating utensils. The facility commander can deny eating utensils for security or other reasons. Prisoners in close confinement and those who lost privileges associated with approved disciplinary action can be denied supplemental rations as described on the Army master menu. The facility commander can authorize alternate meal control procedures to prevent injury when a prisoner abuses food. The procedures require documentation in the facility blotter and concurrence of a medical officer, and they will not exceed 7 days.

DINING FACILITIES

8-18. Dining facilities can be organic to the unit operating the FCF, or they can be set up through the appropriate contracting procedure. The facility commander decides the best feeding method to sustain prisoners based on the available dining facilities and the logistical and HN support.

MEDICAL TREATMENT

8-19. Medical personnel in support of the FCF provide medical, dental, and mental-health care or referral; limited counseling; and social services. Except in matters requiring protection of medical information, the facility commander provides medical observations and recommendations concerning correctional-treatment requirements. Medical officers, nurse clinicians, or PAs—

- Conduct a daily examination of each prisoner in close confinement.
- Perform a medical examination to determine the fitness of a newly confined prisoner or a prisoner who has been outside military control for more than 24 hours. Complete the examination within 24 hours of a prisoner's arrival or return to confinement.
- Test each prisoner for HIV and TB within 3 duty days after initial incarceration. Record test results on DD Form 503.

SANITATION

8-20. An Army Medical Department (AMEDD) representative, a PVNTMED NCO or officer, an environmental-science officer, a sanitary engineer, or a medical entomologist inspects the facility monthly. This inspection ensures that the operation meets PVNTMED standards. The inspector provides a copy of the inspection results to the facility commander. (See AR 190-47 for further guidance.)

8-21. Ensure that all prisoners bathe and follow basic personal-hygiene practices to prevent communicable diseases. Enforce high sanitation standards in facilities where prisoners share latrines and showers.

DISCIPLINE

8-22. Public law and AR 190-47 authorize facility commanders to—

- Restrict the movement and action of prisoners.
- Take action to maintain control as required.
- Protect the safety and welfare of prisoners and other personnel.
- Ensure orderly operation and administration of the FCF.

8-23. A prisoner is considered in an on-duty status except during mandatory sleeping hours, mealtimes, and reasonable periods of voluntary religious observations (as determined by the facility commander in coordination with the facility chaplain). A prisoner who is denied recreation time as part of an administrative disciplinary action may be required to perform recreation time duties as deemed necessary by the appropriate authority. Recreation time duties are not considered extra duty. Privileges are withheld from prisoners on an individual basis, without regard to custody requirements or grade and only as an administrative disciplinary measure authorized by AR 190-47. The attractiveness of living quarters and the type and amount of material items that can be possessed by prisoners may differ by custody grade to provide incentives for custody elevation. Prisoners are denied the privilege of rendering the military salute. Pretrial prisoners will salute when they are in the appropriate service uniform.

8-24. Authorized forms of administrative disciplinary action and punishment are described in AR 190-47 and the UCMJ. Constantly review procedures, rules, regulations, living conditions, and similar factors affecting discipline for violations and disciplinary problems. Physical and mental punishments are strictly prohibited. Authorized administrative disciplinary actions (listed in ascending order) and are as follows:

- A written or oral reprimand or warning.
- Deprivation of one or more privileges. Visits can be deprived or restricted as a disciplinary action only when the offense involves a violation of visitation privileges. Restrictions on mail cannot be imposed as a disciplinary measure.
- Extra duty. Extra duty on work projects cannot exceed 2 hours per day for 14 consecutive days. It cannot conflict with regular meals, sleeping hours, or attendance at regularly scheduled religious services.
- Reduction of custody grade or classification.
- Segregation. Segregation can be imposed for an indefinite period, but it normally should not exceed 60 consecutive days. Tell prisoners why they are being segregated and that they will be released when the segregation has served its intended purpose. Segregated prisoners receive the same diet as other prisoners. Withhold nonessential food items, such as soft drinks and candies, that are in addition to the diet stipulated by the Army master menu.
- Forfeiture of all or part of earned good-conduct time or EGCT according to AR 633-30. The forfeiture need not specify whether it is good-conduct time or EGCT. Both forms of abatement satisfy forfeiture; however, take good-conduct time before taking EGCT.

8-25. The facility commander is authorized to administer punishment, and he can delegate the authority to a subordinate officer (captain [CPT] or above) for minor punishments. The first field grade commander in the chain of command can impose major punishment when delegated authority by the first general officer in the chain of command. The following are prohibited punitive measures:

- Clipping a prisoner's hair excessively close.
- Ordering the lock-step.
- Requiring silence at meals.
- Requiring a prisoner to break rocks.
- Using hand or leg irons, restraining straps or jackets, or shackles as punishment. (The FCF SOP gives authority for the use of these devices and specifies the circumstances warranting their use.)
- Fastening a prisoner to a fixed or stationary object.
- Removing a prisoner's underclothing or clothing or using other debasing practices.
- Flogging, branding, tattooing, or using any other cruel or unusual punishment.
- Requiring domicile in a tent as punishment.
- Ordering strenuous physical activity or body positions designed to place undue stress on a prisoner.
- Using hand or leg irons or belly chains that give the appearance of a chain gang.

8-26. The following are prohibited security measures:

- Using dogs to guard prisoners. Dogs can be used to track escaped prisoners.
- Using chemicals except as riot control agents.
- Using machine guns, rifles, or automatic weapons at guard towers except to protect the facility from enemy or hostile fire by a belligerent power. Selected marksmen who are equipped with rifles can be used when directed as part of a disorder plan and when specifically authorized by a higher echelon commander other than the facility commander.
- Using an electrically charged wire.
- Securing a prisoner to a fixed object except in emergencies or when specifically approved by the facility commander to prevent potential danger to the facility staff or the outside community. Consult medical authorities to assess the health risk to prisoners.

NOTE: See AR 190-47 for additional guidance and procedures on disciplinary measures.

CONTROL

8-27. The facility commander follows control and custody guidelines as outlined in AR 190-47. The inspecting officer's report includes the verification of prisoner strength. He conducts a physical count of prisoners daily that includes a—

-
- Roll call or a similar accounting method during morning, noon, and evening formations.
 - Head count immediately upon the return of prisoners from work detail.
 - Bed check between 2300 and 2400 and again between 2400 and 0600.

8-28. The degree of custodial supervision necessary for an individual prisoner is based on a review his records, the Army Inmate Correction System (AICS), and the recommendations of correctional supervisors and professional-services support personnel. Prisoners are not assigned a permanent custody grade based solely on the offenses for which they were incarcerated. Classification is the minimum custody grade necessary based on security requirements and the AICS. Custody grades include trustee and minimum, medium, and maximum security. Facility commanders can subdivide the custody grades as required to facilitate additional security controls.

ADMINISTRATION

8-29. The FCF is administered by a CS MP unit or an I/R MP unit with an MP I/R confinement detachment if available. The facility commander appoints a guard commander who—

- Supervises facility guards and correctional and custodial personnel within the facility.
- Monitors custody, control, and security measures and informs the facility commander on matters that affect the facility.
- Ensures that rules, regulations, and SOPs are followed and enforced.
- Is responsible for prisoners' activities and the facility blotter.
- Ensures compliance with the schedule of calls.
- Initiates emergency control measures.

NOTE: CSB personnel assigned to the FCF may also perform these duties.

8-30. Facility guards are responsible for the custody, control, and discipline of prisoners under their supervision. See Table 8-2, page 8-12, for a complete list of their duties.

NOTE: Control team guards assigned to the FCF may also perform these duties.

Table 8-2. Guard Duties

Position	Actions
Close-confinement guards	<p>Maintain custody and control of prisoners who are segregated from the general population due to inprocessing or administrative or disciplinary reasons.</p> <p>Accomplish activities within the schedule of calls, as applicable to the close-confinement area.</p> <p>Conduct 30-minute checks (or 15-minute checks for special-status prisoners) when a DD Form 509 is required.</p> <p>Ensure that all required signatures on DD Form 509 are obtained on a daily basis.</p>
Dining-facility guards	<p>Maintain custody and control of prisoners during mealtime.</p> <p>Ensure that the dining-facility traffic plan is followed.</p> <p>Prevent congestion at condiment and juice areas.</p> <p>Account for silverware before and after a meal.</p> <p>Search prisoners before they leave the dining facility.</p>
Employment detail guards	<p>Maintain custody, control, and supervision of prisoners while on details.</p> <p>Ensure that work details are accomplished and safety precautions are observed.</p> <p>Maintain strict accountability of equipment and tools.</p> <p>Assist with frisk and strip searches of prisoners returning from details.</p> <p>Account for prisoners on details according to the schedule of calls.</p> <p>Track prisoners' locations at all times while on details.</p>
Escort and AWOL apprehension guards	<p>Maintain custody and control of prisoners while moving them to and from designated places.</p> <p>May be armed with a pistol if required and authorized by the facility commander.</p> <p>Are qualified with a pistol and trained in the use of force and the ROE.</p> <p>Are trained in firearms safety procedures for transporting prisoners by land, air, and sea.</p> <p>NOTE: If available, an escort guard MP company may perform these duties.</p>
Main gate and sally port guards	<p>Maintain custody and control of prisoners.</p> <p>Ensure that only authorized persons enter the facility.</p> <p>Inspect vehicles entering and exiting the facility.</p> <p>Inspect packages.</p> <p>Conduct inventories of items entering and exiting the facility.</p> <p>Require noncustodial personnel to register on sign-in logs.</p> <p>NOTE: If available, an MP guard company may perform these duties.</p>
<p>NOTE: The facility commander adjusts the number and type of guards based on the available personnel.</p>	

Table 8-2. Guard Duties (continued)

Position	Actions
Visitor room guards	Maintain custody and control of prisoners during visits by family members and other authorized persons. Detect violations of rules and regulations, improper behavior, and contraband. Maintain positions in inconspicuous places and observe conversations rather than listening to them. Identify and report infractions, which may be grounds for terminating visits.
Hospital guards	Maintain custody and control of prisoners while escorting them to and from medical appointments and during hospitalization. Ensure that rooms are clear of contraband. Prevent unauthorized communications.
Tower guards	Maintain custody and control by observing specific sectors of the perimeter. Are briefed on the use of force and are qualified with a 12-gauge shotgun or their assigned weapon. Ensure that contraband is not passed through the fence. Provide protection for compound guards.
NOTE: The facility commander adjusts the number and type of guards based on the available personnel.	

Required Regulations and Forms

8-31. Each facility must have a complete, current set of regulations covering correctional administration. The facility commander ensures that the facility is part of the publications distribution system. The following regulations and publications must be available:

- AR 15-130.
- AR 190-14.
- AR 190-47.
- AR 210-174.
- AR 633-30.
- Misc Pub 27-7.
- UCMJ.

8-32. Confinement facilities use a variety of forms to maintain records and reports. The following forms must be available:

- DA Form 1124.
- DA Form 1125-R.
- DA Form 1128.
- DA Form 1129-R.
- DA Form 1130-R.
- DA Form 1131-R.
- DA Form 1132-R.
- DA Form 1134-R.
- DA Form 1135-R.

- DA Form 3078.
- DA Form 3955.
- DA Form 3997.
- DD Form 2 (ACT).
- DD Form 499.
- DD Form 503.
- DD Form 504.
- DD Form 506.
- DD Form 509.
- DD Form 515.
- DD Form 2707.
- DD Form 2710.
- DD Form 2718.
- FBI Form FD-249.

Correctional-Treatment File

8-33. Establish a CTF within the first 72 hours of confinement, maintain it throughout the confinement period, and transfer it with the prisoner when he is evacuated to another facility. (See AR 190-47 for more information.)

Sentence Computation

8-34. Based on the type of operation and its projected duration, the theater commander may determine that certain sentences will be served in the TO. The FCF commander computes sentences according to AR 633-30 and DOD Directive 1325.4. He ensures that NCOs working in the personnel section are properly trained to compute sentences. Incorrect computations result in incorrect release dates and can violate a prisoner's legal rights. The rate of earnings for good-conduct time is calculated based on the prisoner's length of confinement, including pretrial time (see Table 8-3).

Table 8-3. Rates for Good-Conduct Time

Length of Sentence	Good-Conduct Time
Less than 1 year	5 days for each month of the sentence
1 year to less than 3 years	6 days for each month of the sentence
3 years to less than 5 years	7 days for each month of the sentence
5 years to less than 10 years	8 days for each month of the sentence
10 years or more, excluding life	10 days for each month of the sentence
NOTE: If the term of confinement is reduced or if an additional sentence increases the term of confinement, recompute the good-conduct time at the abatement appropriate to the new term of confinement.	

Mail and Correspondence

8-35. The FCF staff keeps a record of inspection of each prisoner's mail, correspondence, and authorized correspondents on DD Form 499. The

guidance outlined in Chapter 7 and AR 190-47 also applies to the battlefield confinement of US military prisoners.

Prisoner Personal Property and Funds

8-36. Prisoners in the FCF are permitted to place personal property in safekeeping if it is not authorized for retention by the facility commander. The guidance outlined in Chapter 7 and AR 190-47 also applies to the battlefield confinement of US military prisoners.

Support Personnel

8-37. Support personnel organic to a CS MP unit or an I/R MP unit provide support to the FCF. Support personnel include medical officers, chaplains, and social-service workers. They may help administer the facility and are oriented and trained in custody and control procedures. Establish a formal training program that includes—

- Supervisory and interpersonal communications skills.
- Self-defense techniques.
- The use of force.
- Weapons qualification (see DA Pam 350-38).
- First aid.
- Emergency action plans.
- Facility regulations.
- Riot control techniques.

Supply Services

8-38. Supply functions in an FCF are the same as in other military operations. However, stronger security measures and accountability procedures are necessary to prevent certain supplies and equipment from falling into the hands of prisoners. Weapons, ammunition, and emergency equipment, such as hand and leg irons, must be stored in maximum-security, locked racks or cabinets in a room that is located away from prisoner areas.

8-39. The unit logistics officer ensures that a sufficient amount of general and janitorial items are available to keep the facility sanitary and free of potential diseases. Issue the items under strict control procedures and on an as-needed basis to prisoners and staff. Items include mops, buckets, brooms, cleansers, and office supplies.

8-40. Issue health and comfort items to new prisoners during inprocessing and regularly thereafter. Prisoners request additional supplies on DD Form 504, and they receive the supplies gratuitously if they are in a nonpay status. Basic supplies include safety razors, bath soap, toothbrushes, toothpaste, and shoe polish.

8-41. Conduct a physical inventory monthly to reconcile and balance the records of the previous inventory, supplies received, and supplies issued to prisoners. The facility commander or his designated representative verifies the inventory in writing.

EMERGENCY PLANNING AND INVESTIGATIONS

8-42. The facility commander publishes formal plans for the apprehension of escaped prisoners, fire prevention, facility evacuation, prisoner riots and disorders, NBC evacuation, mass casualty, quarantine, special confinements, and prisoner processing. The plans must form part of the unit's SOP and be tailored to the operational environment where the FCF is located. Test the plans at least every six months, and record tests of emergency action plans in the facility blotter. The EEI are as follows:

- Alarm, notification, and escape validation procedures.
- The manning of critical points outside the facility; for example, crowd control procedures, likely escape routes, observation points, and defensive positions.
- Procedures to secure the prisoner population while executing an emergency action plan.
- Prisoner and cadre recall procedures and a means for organizing forces; for example, search parties and riot control teams.
- Procedures to terminate the plan and follow-up actions.
- The mass casualty plan, including how to secure prisoners.

8-43. The facility commander organizes a reactionary force that is trained in the use of force, riot control procedures, and other emergency actions. The size of the reactionary force depends on the personnel assets available and the nature of the emergency.

8-44. Where appropriate or legally required, use AR 15-6 to investigate reported incidents of misconduct, breaches of discipline, or violations of the UCMJ. Before interviewing prisoners suspected or accused of violations, advise them of their rights under Article 31, UCMJ, against self-incrimination. Any statement made may be used as evidence against them in a criminal trial or disciplinary-and-adjustment board proceeding. They have the right to consult with counsel and to have counsel present during questioning. A request to consult with counsel at this point does not automatically result in the case being referred to a three-member board. If requested, make arrangements for the prisoner to meet with an attorney as soon as practical. Interview relevant witnesses, including those identified by the prisoner, as deemed appropriate; and obtain written, sworn statements when possible. Complete the investigation expeditiously, and submit a disciplinary report to the facility commander.

8-45. Upon receipt of the disciplinary-and-adjustment board report, the facility commander reduces the report to a memorandum for record. He refers the case for counseling or reprimand, refers it to the disciplinary-and-adjustment board, or takes other appropriate action. (See AR 190-47 for more information.)

RULES OF INTERACTION

8-46. The facility commander establishes and enforces the ROI that allow humane treatment and care of prisoners, despite the reason they are incarcerated. The ROI are established by the facility commander, and some include—

- Remaining professional and serving as positive role models for prisoners.
- Being firm, fair, and decisive in actions concerning prisoners.
- Refraining from being too familiar or too belligerent with prisoners.
- Avoiding becoming emotionally or personally involved with prisoners.
- Not gambling, fraternizing, or engaging in any commercial activities with prisoners.
- Not showing favoritism to any prisoners.

USE OF FORCE

8-47. Guidance on the use of force is incorporated in orders, plans, SOPs, and instructions at FDFs and FCFs. Using firearms or other means of deadly force is justified only under conditions of extreme necessity and as a last resort. Do not use physical force against a prisoner except in self-defense, to prevent escape, to prevent injury to others, to prevent damage to property, to quell a disturbance, to move an unruly prisoner, or as otherwise authorized in AR 190-47.

8-48. In the event of an imminent group or mass breakout from the FCF or another general disorder, ensure that prisoners know authority prevails, order will be restored, and means are available to restore order by force if necessary. Before applying force, try to reason with prisoners if the situation permits. If reasoning fails or if the existing situation does not permit reasoning, issue prisoners a direct order to terminate the disorder. Do not give the order until it can be enforced effectively by applying force as the situation requires. Before escalating beyond a show of force, allow uninvolved prisoners to voluntarily assemble in a controlled area away from the disturbance.

8-49. When force is necessary, apply it according to the priorities of force and limit it to the minimum degree necessary. The use of deadly force is prescribed by AR 190-14. The application of the priorities of force, or the application of a higher numbered priority without first employing a lower numbered one, depends on and is consistent with the situation encountered during any particular disorder. The priorities of force for an FCF are as follows:

- First: Verbal persuasion.
- Second: Show of force.
- Third: Chemical aerosol irritant projectors (subject to local and HN restrictions).
- Fourth: Use of physical force other than weapons fire.
- Fifth: Presentation of deadly force capability.
- Sixth: Deadly force.

8-50. The facility commander coordinates with the higher echelon commander and the SJA. He designates representatives who are authorized to direct the use of firearms and riot control agents in the event of a riot or other disturbance. Orders, plans, SOPs, and instructions include use-of-force rules and specify the types of weapons to be used.

ESCAPE

8-51. Provide each guard with a whistle or other suitable alarm. Per AR 190-14, using firearms to prevent an escape is justified only when there is no other reasonable means available. If a prisoner tries to escape from the facility, the guard—

- Alerts other guards of the attempted escape by blowing three short blasts on a whistle or delivering the signal with another alarm.
- Orders the prisoner to halt three times in a loud voice.
- Fires only when the prisoner has passed all barriers of the facility and is continuing to escape. (The location of a barrier is determined by the physical arrangement of the facility. It normally includes fences or walls enclosing athletic, drill, recreation, housing, and administrative areas.)

8-52. Do not fire on an escapee if it endangers others. When firing is necessary, aim shots to disable the prisoner rather than kill him. Guidance for the use of firearms by guards escorting prisoners outside the facility are the same as those for using firearms in the facility. (See AR 190-47 for more information.)

8-53. The facility commander ensures that guards are trained in the use of their assigned weapons. Orient all personnel on policies regarding the use of force and the provisions of AR 190-14. Issue 12-gauge shotguns with cylinder (unchoked) barrels to facility guards, and ensure that barrels do not exceed 20 inches in length. Authorized ammunition for armed guards (perimeter and escort) is number 9 shot in trap loads of 2 3/4 grams of powder and 1 1/8 ounces of shot. Tower guards use number 00 buckshot ammunition.

8-54. Instruct tower and escort guards not to fire at less than 20 meters to prevent prisoner escapes. Ensure that these instructions appear in training programs and special instructions for guards.

8-55. Guards use a 9-millimeter pistol when escorting prisoners. Do not use rifles, machine guns, or submachine guns when guarding prisoners. Do not take weapons inside the controlled areas of an FCF except as directed by the facility commander.

TRANSPORTATION

8-56. The facility commander maintains safety and security for prisoners under his control. He is also responsible for transportation requirements when prisoners are in his custody. Ensure that guard and escort personnel are familiar with the use-of-force guidelines above and the movement tasks outlined in STP 19-95C14-SM-TG. Some of the tasks are as follows:

- **Motor vehicle transport.** Escort guards—
 - Know the type of vehicle, the departure time, the number of prisoners and their status, the number of assigned escorts, and the type of weapon and restraint (if applicable), and the release procedures at the final destination.
 - Know the actions to take in case of a disorder or an escape attempt.

-
- Conduct a thorough vehicle search and remove or secure all items that can be used as weapons.
 - Do not handcuff two escape risk prisoners together or handcuff prisoners to any part of the vehicle.
 - Sign DD Form 2708 for each prisoner escorted out of the facility and frisk him before he enters the vehicle.
 - Follow the loading procedures for the vehicle.
 - **Aircraft transport.** Escort guards—
 - Know the type of aircraft, the departure time, the number of prisoners and their status, the number of assigned escorts, and the type of weapon and restraint (if applicable), and the release procedures at the final destination.
 - Follow the procedures outlined in AR 190-47 for transporting prisoners via a commercial aircraft.
 - Sign for each prisoner on DD Form 2708.
 - Do not secure prisoners to any part of the aircraft.
 - Know latrine, beverage, meal, loading, and unloading procedures as outlined in AR 190-47.
 - **Rail transport.** Use two escort guards (one armed and one unarmed) when transporting prisoners by rail. If possible, transport prisoners in enclosed accommodations or compartments (day and night). If they are unavailable, use coach class or standard sleeping cars. Escort guards seat themselves in such a way that they block avenues of escape. The unarmed guard accompanies prisoners who use latrine facilities and remains in visual contact with them.

TRANSFER AND DISPOSITION OF PRISONERS

8-57. The FCF commander is prepared to transfer US military prisoners from his facility to other confinement facilities outside the TO or back to their units. He releases prisoners from confinement with proper authorization. He coordinates with the SJA and the next higher commander to determine release authority and for authentication of DD Form 2718. (See Chapter 7 and AR 190-47 for detailed guidance on transferring prisoners.)

PART FOUR

Military Police Support to Civil-Military Operations

The CMO establish, maintain, influence, or exploit relations between the civilian populace and military forces or government and nongovernment civilian organizations and authorities. Operations are conducted in friendly, neutral, and hostile AOs to facilitate military operations and to consolidate and achieve US objectives. Military forces may perform activities and functions that a local, regional, or national government normally performs. Activities may occur before, during, or after military operations or, if directed, in the absence of military operations. The CMO may be performed by designated CA forces and/or other military forces.

The CA forces help plan, coordinate, and supervise CA activities to support CMO. The activities are mission-dependent and are determined after careful evaluation of mission requirements and the force mix and time available. Under the umbrella of CMO, CA forces perform FN support, civil-administration support, PRC, HA, and ES.

If required, I/R units are deployed and employed to support CMO in CONUS and OCONUS. The I/R units provide an array of significant capabilities by performing their wartime mission in peace and during conflicts. The MP must understand the intent of CMO because SA and the correct mind-set are critical. Since forces may be called upon to relieve human suffering, such as that encountered after a natural disaster, strict discipline measures and control may not be appropriate.

In Parts Two and Three, this manual addressed MP units' capabilities during internment and confinement operations. Part Four expands on these capabilities and addresses resettlement operations in support CMO.

Chapter 9

Populace and Resource Control

Civilian and military authorities exercise PRC to provide security for the populace, deny personnel and materiel to an enemy, mobilize population and materiel resources, and detect and reduce the effectiveness of enemy agents. Populace control includes curfews, movement restrictions, travel permits, registration cards, and resettlement operations. Resource control includes licenses, regulations, guidelines, checkpoints, ration controls, amnesty programs, and facility inspections. This chapter addresses MP support to DC operations conducted under the umbrella of PRC operations.

DISLOCATED-CIVILIAN OPERATIONS

9-1. The DC operations are a special category of PRC, and they are the most basic collective tasks performed by CA personnel. The DC operations minimize civilian interference with military operations and protect civilians from combat operations. They are normally performed with minimal military resources. Nonmilitary international-aid organizations, NGOs, and IHOs are the primary resources used by CA forces. However, CA forces may depend on other military units, such as I/R MP units, to assist with a particular category of civilians.

9-2. Controlling civilians is essential during military operations because uncontrolled masses of people can seriously impair the military mission. Commanders plan measures to protect civilians in the AO and to prevent their interference with the mission.

CATEGORIES

9-3. During military operations, US forces must consider two distinct categories of civilians—those who remained in place and those who are dislocated. The first category includes civilians who are indigenous to the area and the local populace, including civilians from other countries. They may or may not need help; and if they can take care of themselves, they should remain in place.

9-4. The second category includes civilians who leave their homes for various reasons. They are categorized as DCs, and their movement and physical presence can hinder military operations. They probably require some degree of aid (medicine, food, clothing, water, and shelter) and may not be native to the area or the country. The term *DC* is generic, and it is further subdivided into categories (see Chapter 1).

LEGAL OBLIGATIONS

9-5. All commanders are under the legal obligation imposed by international law, including the Geneva Conventions and other applicable international humanitarian laws. In particular, commanders must comply with the principles and spirit of the law of land warfare during armed conflicts (and other operations unless directed otherwise by competent authorities), regardless of how they are characterized. (See FM 27-10 and the SJA for additional information.)

OBJECTIVES AND PRINCIPLES

9-6. The primary objective of DC operations is to minimize civilian interference with military operations. They also—

- Protect DCs from combat operations.
- Prevent and control the outbreak of disease.
- Relieve human suffering.
- Centralize masses of DCs.

9-7. Although the Assistant Chief of Staff, G5 (Civil Affairs) (G5) or the Civil Affairs Officer (US Army) (S5) is the primary planner of DC operations, all

military planners consider DC operations. The G5 or the S5, in conjunction with supporting CA units, assesses the needs of DCs to ensure that they receive adequate and proper help. He considers the cultural background of DCs and the cultural background of the country where DCs are located. The planning of DC operations differs at each level of command. All commands and national and international agencies involved in DC operations have clearly defined responsibilities within a single overall program. The following principles apply to DC operations:

- Coordinate with the DOS, the UNOCHA, and FN civil and military authorities to determine the appropriate levels and types of aid required and available.
- Minimize outside contributions to meet basic needs as DCs become self-sufficient, and encourage DCs to become as independent as possible.
- Review the effectiveness of humanitarian responses, and adjust relief activities as necessary.
- Coordinate with CA units to use US, HN, international, and third-nation organizations such as the United Nations Children's Fund (UNICEF) and the Cooperative for American Relief Everywhere, Incorporated (CARE). Their use not only capitalizes on experience but also reduces requirements placed on US military forces.
- Restrict the rights of DCs as required. Under international law, DCs have the right to freedom of movement; but in the event of a mass influx, security considerations may require restrictions.

PLANNING DISLOCATED-CIVILIAN OPERATIONS

9-8. The planning scope for DC operations and the actual task implementation differ, depending on the command level and the TO. Before describing how MP units support DC operations, MP leaders must have a basic understanding of how CA forces plan DC operations. Except as specifically noted, planning considerations discussed in this manual are applicable to all tactical scenarios, including logistics operations for units in the COMMZ.

POLICES AND PROCEDURES

9-9. Based on national policy directives and other political efforts, the theater commander provides directives on the care, control, and disposition of DCs. The corps commander integrates the theater commander's guidance with the corps ground tactical plan. The driving force for DC planning must be generated at corps level. At division, COSCOM, and other subordinate command levels, the DC plan must—

- Allow the accomplishment of tasks assigned by higher command echelons.
- Be within the restrictions imposed by higher headquarters.
- Guide subordinate commands in handling and routing DCs.
- Ensure that all concerned parties—including the fire support coordination center and the Assistant Chief of Staff, G3 (Operations and Plans) (G3), or the Operations and Training Officer (US Army)

(S3)—receive information on DC plans, routes, and areas of concentration.

- Help DCs by alleviating their suffering while awaiting status determination.
- Provide security and safety for DCs and soldiers by maintaining proper order and discipline within the facility.
- Provide an aggressive information program by using support agencies and DC leadership.

9-10. The DC plans support the OPLAN. As a minimum, DC plans must address the—

- Authorized extent of migration and evacuation.
- Minimum standards of care.
- Status and disposition of DCs.
- Designation of routes and movement control measures.
- Cultural and dietary considerations.
