- Designation and delegation of responsibilities.

HANDLING CONSIDERATIONS

9-11. The care and control of DCs fulfill a dual purpose—to ensure that DCs receive the minimum essentials to subsist (food, water, clothing, shelter, and emergency medical aid) and to maximize the mobility of tactical forces and minimize civilian interference with military operations. The CA and MP forces coordinate and establish movement control early. Major considerations include a stay-put policy, collection points, and assembly areas (see Figure 9-1):

- **Stay-put policy.** Civilians remain near their homes and under controlled movement. The policy assumes the capability for enforcement, information dissemination, and ES. The HN may have a policy that US forces support, but US forces do not have the authority or the right to enforce the policy. It is not within the authoritative capability of US forces.
- **Collection points.** A collection point establishes control and direction over the movement of the civilian populace, and it is the primary measure for gaining initial control over DCs. It is a temporary area for small numbers of DCs until they can return to their homes or move to a safer area. It is as far forward as possible during the flow of battle. Because a collection point is temporary, screening by CA forces, MI, or MP is quick and may include screening for intelligence information and emergency assistance. Screening takes place to segregate EPWs, CIs, and allied soldiers from DCs. Local civilians or civilian agencies can operate collection points under the supervision of tactical or support troops or CA personnel. The MP become involved in DC operations when civilian congestion along MSRs threatens the mobility of the maneuver force. They may be the first US elements to address DC problems and initiate actions to restore force mobility.
- **Assembly areas.** Assembly areas are temporary holding areas for civilians before they return to their homes or move to a more secure area. Detailed screening or segregation of DC categories takes place at

Figure 9-1. Sample DC Overlay

assembly areas. They are usually located in a secure, stable environment and may include schools, churches, hotels, and warehouses. When selecting a specific area, consider the ability to provide overnight accommodations for several days. Local civilians can operate assembly areas under the supervision of tactical or support troops or CA personnel.

EVACUATION

9-12. Evacuation creates serious problems and is only considered as a last resort. Per US doctrine, a division or higher commander can order an evacuation. When the decision is made to evacuate a community, CA and MP make detailed plans to prevent uncontrolled groups from disrupting the movement of military units and supplies. Consider the following when planning a mass evacuation:

- **Transportation.** The CA plans for the maximum use of civilian transportation.
- **Security.** The CA helps the Assistant Chief of Staff, G2 (Intelligence) (G2) with security screening and documentation of evacuees. Since the civilians are being removed from the area where they can best take care of themselves, the military provides security for them after

evacuation. They also provide security for property left behind, including farm animals and pets.

- **Documentation.** Evacuees may need ID documents showing their name and the locality from which they were evacuated. As a control technique, CA personnel prepare a manifest that lists evacuees for movement.
- **Briefing.** The MCO briefs evacuees before movement. He uses leaflets, loudspeakers, posters, and other means available. The briefing explains details of the move, such as restrictions on personal belongings and the organization and schedule for the movement.
- **Rations.** For a movement lasting no more than 2 days, supply personnel issue rations to each evacuee at the time of departure or at designated points en route.
- **Health care.** The public health team makes maximum use of civilian medical personnel, equipment, and supplies to provide health care to evacuees. Use military medical personnel, equipment, and supplies as supplements if necessary. Take proper steps to prevent the spread of infectious diseases before movement.
- **Return.** Evacuation plans provide for evacuees' return and the criteria for determining the duration of their absence.

MOVEMENT

9-13. Directing and controlling movement are vital when handling masses of DCs. The G5 and HN authorities are responsible for mass DC operations, and the MP may help direct DCs to alternate routes. If possible, incorporate HN assets in planning and implementation. Consider the following:

- **Route selection.** When selecting routes for civilian movement, CA personnel consider the types of transportation common to the area. They coordinate the proposed traffic circulation plan with the transportation officer and the PM. All DC movements take place on designated civilian evacuation routes.
- **Route ID.** After designating movement routes, CA personnel mark them in languages and symbols that civilians, US forces, and allied forces understand. The PSYOP units, MP, HN military forces, and other allied military units can help mark routes.
- **Control and assembly points.** After selecting and marking movement routes, CA and HN authorities establish control and assembly points at selected key intersections. The G5 or S5 coordinates locations with the PM, the movement control center, and the Assistant Chief of Staff, G4 (Logistics) (G4) to include control and assembly points in the traffic circulation plan.
- **Emergency rest areas.** The CA personnel set up emergency rest areas at congested points to provide immediate needs (water, food, fuel, maintenance, and medical services). Notify the PM to ensure that these areas are included in MP area security operations.
- **Local and national agencies.** Using local and national agencies conserves military resources and reduces the need for interpreters and translators. Civilian authorities normally have legal status and are best equipped to handle their own people.

FACILITIES

9-14. When large groups of civilians are quartered temporarily (less than 6 months) or semipermanently (more than 6 months), the commander may task CA units to establish a DC facility. If existing facilities (HN, NGO, IHO, or IO) are suitable for DC facilities and HN personnel are available to administer and operate the facility, MP units may not be required to establish I/R facilities. Under this scenario, CA units provide the HN with technical advice, support, and assistance, depending on the requirements. They may also furnish additional detachments and functional teams or specialists to resolve public health, welfare, and safety problems at the facility.

9-15. If the commander deploys MP units to the TO or tasks them to support DC operations, MP help set up, administer, and operate facilities in close coordination with CA forces, the HN, PSYOP units, NGOs, IHO, IOs, and other interested agencies. The MP unit commander becomes the I/R facility commander.

MILITARY POLICE SUPPORT TO DISLOCATED-CIVILIAN OPERATIONS

9-16. The support of DC operations begins before an MP unit arrives in the TO or is tasked with the mission. The I/R facility commander has a thorough understanding of international law, the concept of DC operations, and how they apply to the mission. If time permits, he contacts the in-country G5/S5, CA units, and other organizations that may have a role in DC operations (see Chapter 1). The CA forces provide MP leaders and soldiers with expertise on factors that directly affect DC operations. Some of the factors include—

- The availability of HN agencies and the status of infrastructure.
- Ethnic differences and resentments.
- Social structures (family and regional).
- Religious and symbolic systems (beliefs and behaviors).
- Political structures (distribution of power).
- Economic systems (sources and distribution of wealth).
- Links among social, religious, political, and economic dynamics.
- The cultural history of the area.
- Attitudes toward US military forces.
- Logistical requirements.

9-17. When deployed to the TO, MP leaders coordinate with higher headquarters G5/S5, CA, PSYOP, HN, NGOs, IHO, and IOs before setting up and operating the I/R facility. After a clear understanding of the mission, the concept of operations, and other available information, the I/R facility commander uses the MDMP to determine specific tasks the MP unit performs to accomplish the mission. Some considerations include—

- Location.
- Construction.
- Setup.
- Processing.
- Screening.

- Classification.
- ID.
- Clothing and equipment.
- Subsistence.
- Dining facilities.
- Medical and sanitation.
- Self-government.
- Discipline.
- Control.
- Administration.
- L&O.
- ROI.
- ROE.
- Transportation.
- Disposition.

LOCATION

9-18. The I/R facility commander coordinates with CA, the G5/S5, and other military and nonmilitary organizations when selecting a site for DC operations. The location depends on the availability of supply routes, food, water, power, and waste disposal. Avoid sites near vital communications centers, large military installations, or other potential military targets. Also consider the susceptibility of the area to natural and man-made disasters (floods, pollution, and fire) and the use of facility personnel as a source of local labor support.

CONSTRUCTION

9-19. The DCs, local agencies, or government employees construct facilities when possible. The supporting command's logistics and transportation assets acquire and transport materials to build or modify existing facilities. Local sources may provide materials within legal limitations. The supporting command also furnishes medical, subsistence, and other supporting assets to establish DC facilities. Engineer support and military construction materials may be necessary when I/R facilities are set up in areas where local facilities are unavailable; for example, hotels, schools, halls, theaters, vacant warehouses, and unused factories.

9-20. The TCMS contains basic plans, specifications, and material requirements for building EPW/CI facilities based on population. The plans can be easily modified for DC operations in temperate, frigid, tropic, and desert climates.

9-21. If necessary, CS MP units and I/R MP units set up the facility using acquisitioned tentage and additional materials. The I/R facility commander considers the type of construction necessary to satisfy the needs of the DC operation. Some considerations are the—

- Local climate.
- Anticipated permanency of the facility.

- Number of facilities to be constructed.
- Availability of local materials.
- Extent of available military resources and assistance.

SETUP

9-22. Subdivide the facility into sections or separate compounds to ease administration and DC tension. Each section can serve as an administrative subunit for transacting facility business. Major sections normally include facility headquarters, hospital, dining facility, and sleeping areas. Subdivide sleeping areas for families, unaccompanied children, unattached females, and unattached males. Consider cultural and religious practices, and try to keep families together. Figure 9-2, page 9-10, shows a sample DC I/R facility. Additional facilities, fencing, and other requirements are based on the—

- Number of civilians.
- Diversity of the population.
- Resources available.
- Need for a reactionary force.
- Need to establish an animal compound.
- Need to establish a vehicle-parking area.

PROCESSING

9-23. The initial reception of DCs begins with their transport from the assembly area to the inprocessing center of the I/R facility. Conduct processing in a positive manner because DCs are fearful. Ensure that DCs clearly understand why they are being processed and know what to expect at each station. The facility commander, a HN representative, or another official conducts an entrance briefing to DCs upon their arrival.

9-24. While the EPW/CI processing procedures discussed in previous chapters provide a foundation, I/R personnel must be aware of unique aspects when processing DCs. Military personnel provide training and support, while NGOs, IHOs, and IOs actually process DCs. The number and type of processing stations vary from operation to operation. Table 9-1, page 9-11, shows stations that may be required during DC operations.

9-25. The I/R facility commander determines the accountability procedures and requirements necessary for DC operations. Translators are present throughout processing. A senior person greets new arrivals and makes them feel welcome. Brief DCs on facility policies and procedures and screen them to identify security and medical concerns. Offer them the use of personal-hygiene facilities, and always maintain family integrity.

9-26. Conduct pat-down searches to ensure that weapons are not introduced into the compound. Conduct same-gender searches when possible, and do not conduct strip searches. Speed and security considerations may require mixed-gender searches. If so, perform them in a respectful manner, using all possible measures to prevent any action that could be interpreted as sexual molestation or assault. The on-site supervisor carefully controls soldiers doing mixed-gender searches to prevent allegations of sexual misconduct. Using HN, NGO, or IHO assets to conduct searches may prevent an intense situation from developing.

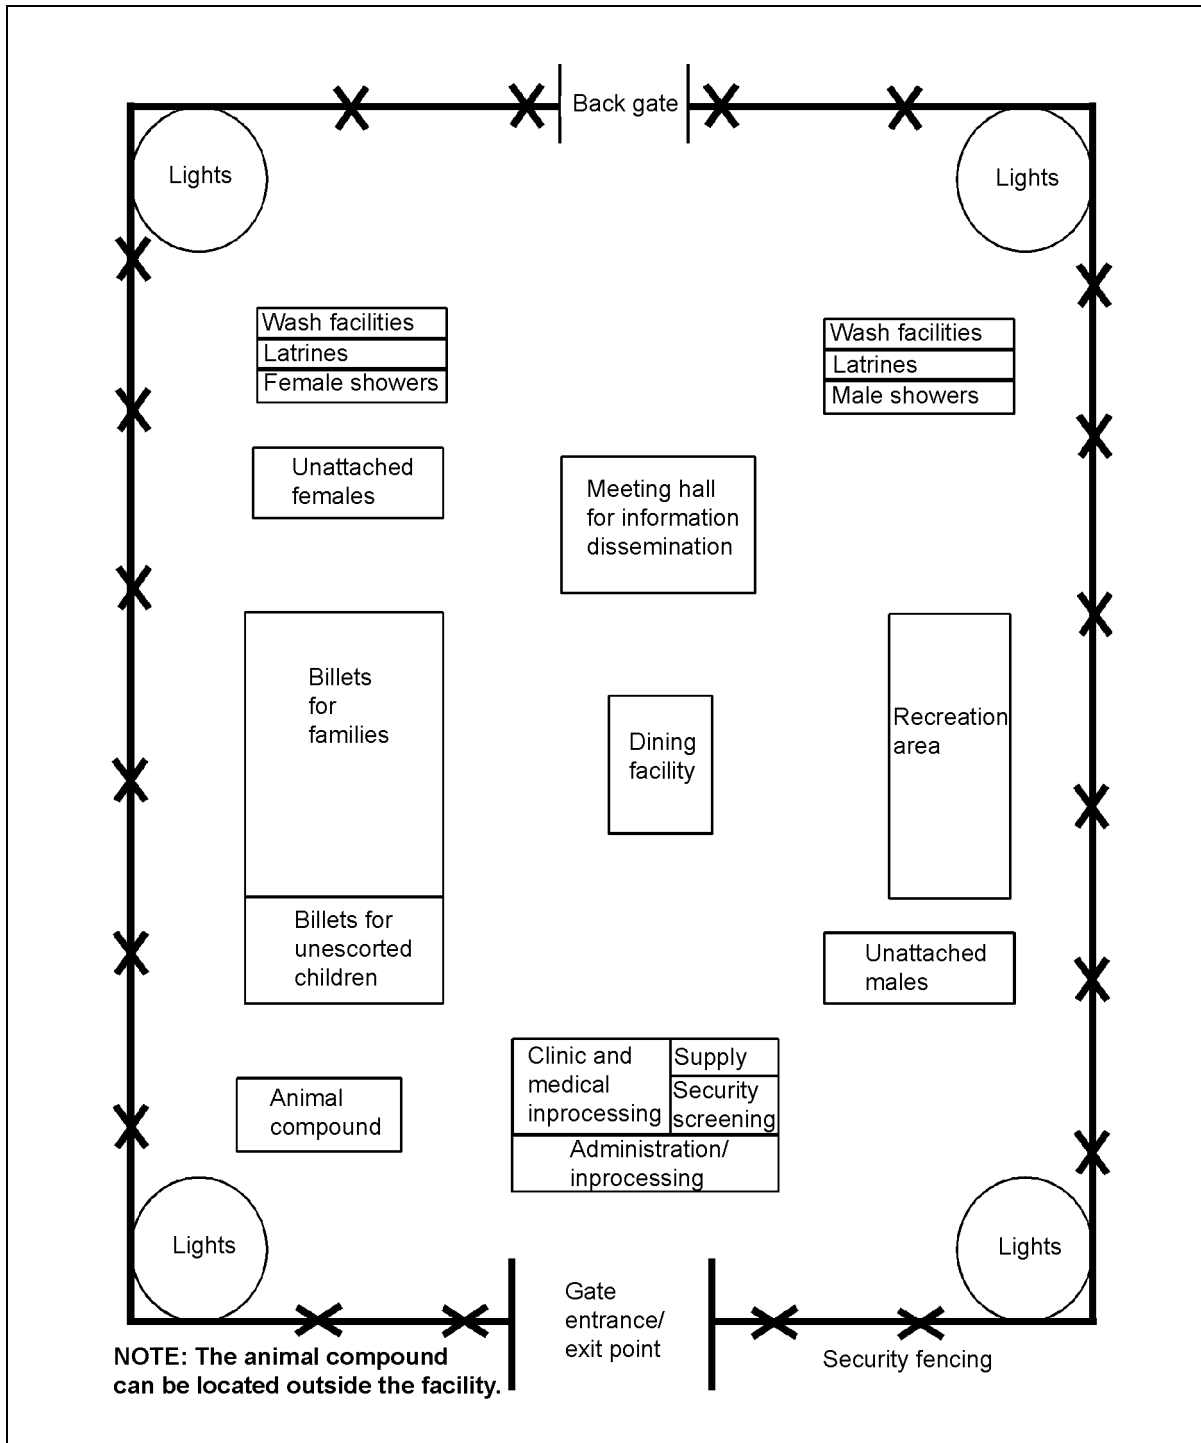

Figure 9-2. Sample DC I/R Facility

Table 9-1. Actions During Inprocessing

Station	Purpose	Responsible Individuals*	Actions
1	Search and screening	I/R staff, MI, NGOs, IHOs, and IOs	Conduct a pat-down search to ensure that weapons are not introduced into the facility. Ensure that the facility is not infiltrated by insurgents.
2	Accountability	I/R staff	Prepare forms and records to maintain accountability of DCs. Use forms and records provided by HN, CA, or those used for EPW/CI operations that may apply to DCs.
3	ID card or band	I/R staff	Issue an ID card or band to each DC if required to ease facility administration and control.
4	Medical evaluation	Medical personnel	Evaluate DCs for signs of illness or injury, and treat them as necessary.
5	Assignment	I/R staff	Assign a sleeping area to each DC.
6	Personal items	I/R staff	Issue personal-comfort items and clothing if available.

*The number of people performing these tasks depends on the number of DCs and the time available. When possible, allow HN authorities to conduct most of the inprocessing.

SCREENING

9-27. Screening may be necessary to prevent infiltration by insurgents, enemy agents, or escaped members of hostile armed forces. Although intelligence and other units may screen DCs, friendly and reliable local civilians can perform this function under the supervision of MP and CA personnel. Screeners carefully apply administrative controls to prevent infiltration and preclude alienation of people who are sympathetic to US objectives. The screening process also identifies technicians and professionals to help administer the facility; for example, policemen, schoolteachers, doctors, dentists, nurses, lawyers, mechanics, carpenters, and cooks.

CLASSIFICATION

9-28. The MP classify DCs during processing. They coordinate with CA, NGOs, IHOs, and IOs to determine proper classifications. Expect a continuing need for reclassification and reassignment of DCs. Statements made by a DC and the information on his ID papers determine his initial classification. Agitators, enemy plants, and individuals who should be classified as EPWs or CIs will be identified by their activities. Reclassify them according to their identity or ideology.

IDENTIFICATION

9-29. Identifying DCs may or may not be necessary; it depends on guidance from higher headquarters, CA, the HN, and other agencies. The need for ID varies from operation to operation, and it is used to—

- Verify rosters against the actual population.

- Provide timely reunification of family members.
- Match DCs with their medical records in case of a medical emergency or evacuation.
- Check identities of DCs against the transfer roster.

9-30. An ID card can be used to facilitate ID. It contains the DC's name, photograph, and control number. The control number may be an ISN or a sequenced control number specific to the DC. Color-coded IDs permit ID by categories (see Chapter 1). An ID band permits rapid, reliable ID of an individual and may also be used in DC operations. While DCs cannot be prevented from removing or destroying ID bands, most will accept their use for ID purposes. When ID bands or cards deteriorate, replace them immediately.

CLOTHING AND EQUIPMENT

9-31. Supply DCs with adequate, suitable clothing and sleeping equipment if they do not have supplies with them. Requisition clothing and equipment through NGOs, IHOs, IOs, and HN sources when possible. In a combat environment, use available captured clothing and equipment. Ensure that DCs wear clothing until it is unserviceable, and replace it as necessary.

SUBSISTENCE

9-32. Ensure that food rations are sufficient in quantity, quality, and variety to maintain health and prevent weight loss and nutritional deficiencies. Consider the habitual diet of the DC population, and be aware that DCs may bring their own rations and cooking utensils. Allow DCs to prepare their own meals after coordination with CA; the HN; and NGOs, IHOs, IOs who support the facility.

9-33. Ensure that expectant and nursing mothers and children under the age of 15 receive additional food in proportion to their needs. Increase the rations of workers based on the type of labor performed. Provide plenty of fresh water. A good planning factor is 20 gallons per individual per day.

9-34. Make minimal menu and feeding-schedule changes to prevent unrest among the DC population. Inform the DC leadership when changes must be made.

DINING FACILITIES

9-35. Dining-facility requirements vary depending on the number of DCs and the availability of equipment. If deemed necessary, the I/R facility commander can authorize local procurement of cooking equipment. Consult with SJA to determine the purchasing mechanism and the legality of items being purchased. Coordinate with NGOs, IHOs, and IOs for food service support. Train selected DCs to perform food service operations, and ensure that they are constantly supervised by US food service personnel.

MEDICAL AND SANITATION CONSIDERATIONS

9-36. Due to the temporary nature of an I/R facility, the need for medical care and sanitation intensifies. If possible, locate a sick call tent adjacent to each

major compound inside the facility to ensure prompt medical screening and treatment. Enforcement and education measures ensure that the facility population complies with basic sanitation measures. Provide medical care via organic I/R medical personnel or coordinate with the appropriate HN medical authorities. To prevent communicable diseases, follow the guidance in FM 21-10 and other applicable publications. Conduct routine, preplanned health, comfort, and welfare inspections that appear to be random. Inspections ensure that the facility is safe, sanitary, and hazard-free. When conducting inspections—

- Ensure that their purpose is conveyed and emphasized to DC leaders.
- Respect cultural beliefs such as religious tenets and shrines. The INS, international support groups, community leaders, CA, and DC leaders are good sources for information regarding cultural sensitivities.
- Treat DCs and their possessions with respect.

SELF-GOVERNMENT

9-37. One of the best ways to ensure DC cooperation in a facility is to establish a form of self-government. It minimizes the impression that DCs are under the control of a foreign government and allows them to feel a degree of control over their lives. Chapter 5 and AR 190-8 contain procedures for establishing a CI committee. Use the procedures as a model for establishing a DC self-government, and coordinate with CA for assistance.

9-38. Self-government leaders can help solve problems before they become major events. The infrastructure of self-government promotes a stable environment where rapport is built between the facility commander, the DC leadership, and the DC population. This, in turn, reduces tension and provides an effective means of communicating reliable information to the facility population.

9-39. The DCs can submit complaints and requests to the I/R facility commander via—

- An elected DC internment committee.
- A written complaint.
- A visiting representative of the UNHRC or a similar agency.

DISCIPLINE

9-40. Facility commanders establish and strictly enforce measures to maintain discipline and security. Establish rules that can be easily followed by everyone, and coordinate the rules with SJA and HN authorities. Determine how to enforce rules and how to deal with DCs who violate noncriminal rules. Establish daily or periodic routines and responses that are conducive to good discipline and control. Ensure that facility personnel—

- Enforce policies and procedures to control DCs.
- Give reasonable orders decisively and in a language that DCs understand.
- Post copies of the UN mandate relating to the situation in every compound where DCs can easily read them.

- Post facility rules, regulations, instructions, notices, orders, and announcements that DCs are expected to obey in an easily accessed area. Ensure that the information is printed in a language that DCs understand, and provide a copy to DCs who do not have access to posted copies.
 - Ensure that DCs obey orders, rules, and directives.
 - Report DCs who refuse or fail to obey an order or a regulation to DC leaders and HN authorities.
 - Do not fraternize with DCs.
 - Do not donate or receive gifts or engage in any commercial activity with DCs.
- 9-41. Discipline and control also apply to I/R facility personnel. They—
- Observe rigorous self-discipline.
 - Maintain a professional, impersonal attitude.
 - Follow ROI and ROE guidelines.
 - Cope with hostile or unruly behavior and incidents calmly.
 - Take fair, immediate, decisive action.

CONTROL

9-42. Controlling personnel is the key to successful facility operations. The I/R facility commander ensures efficient, effective control that meets US obligations under international law. Facility control includes measures to reduce waste and avoid duplication of effort. The commander—

- Establishes and maintains discipline quickly and fairly.
- Publishes and enforces rules of conduct and updates them as necessary.
- Serves as the single POC, coordinating all matters within the facility and with outside organizations and agencies.
- Establishes and posts barracks rules such as those shown in Figure 9-3.

9-43. Use HN civilians as cadre for facility administration, and encourage DCs to become involved in facility administration. Past experience shows that about 6 percent of DCs should be employed on a full-time basis. If possible, I/R facility and CA personnel organize and train cadre before the facility opens. The HN civilians come from public and private welfare organizations and are under military supervision.

9-44. Problems might stem from DCs' state of mind. The difficulties they experienced may affect their acceptance of authority. They may have little initiative or may be uncooperative because of an uncertain future. They may be angry because of their losses, or they may resort to looting and general lawlessness because of their destitution. The I/R facility commander can minimize difficulties through careful administration and—

- Maintaining different national and cultural groups in separate facilities or sections.
- Keeping families together.

Barracks Rules	
1.	Do not move from assigned barracks without permission.
2.	Maintain the sanitary and physical condition of barracks.
3.	Empty and wash trash cans daily.
4.	Do not bring food or cooking utensils in barracks.
5.	Do not take food, except baby food and fruit, from the dining facility.
6.	Do not have weapons in barracks or surrounding facilities.
7.	Do not have pets in the dining facility.
8.	Turn off indoor lights in barracks by 2300.
9.	Do not play radios, record players, or tape recorders in barracks after 2300.
10.	Do not allow children to play on fire escapes.
11.	Watch children carefully, and do not allow them to wander out of residential areas.
12.	Do not throw diapers or sanitary napkins in toilets. Place these items in trash cans.
13.	Do not allow children to chase or play with wild animals because they bite and carry diseases.
14.	Obtain barracks supplies from the barracks chief.
15.	Do not smoke, use electrical appliances for heating or cooking, or have open fires in barracks.

Figure 9-3. Sample Barracks Rules

- Separating unaccompanied males, females, and children under the age of 18 (based on HN laws as to when a child becomes an adult).
- Furnishing DCs with information about their status and future.
- Allowing DCs to speak freely to facility officials.
- Involving DCs in facility administration, work, and recreation.
- Establishing quick contact with agencies for aid and family reunification.

ADMINISTRATION

9-45. Disseminating instructions and information to the facility population is vital. Communications may be in the form of notices on bulletin boards, posters, public address systems, loudspeakers, facility meetings and assemblies, or a facility radio station. The CA teams and area PSYOP units can help disseminate information.

9-46. Another tool for effective administration is using liaison personnel. Liaison involves coordination with all interested agencies. The US government and military authorities, allied liaison officers, and representatives of local governments and international agencies can provide assistance. Implement the following standards related to DC treatment:

- Do not penalize or expose them to unfavorable treatment because their presence in the country is considered unlawful.

- Do not restrict their movement except when necessary for public health and order.
- Allow them to enjoy their fundamental rights.
- Treat them as persons whose plight requires special understanding and sympathy. Provide necessary assistance; and do not subject them to cruel, inhumane, or degrading treatment.
- Do not discriminate because of race, religion, political opinion, nationality, or country of origin.
- Recognize that they are persons before the law who enjoy free access to the courts of law and other competent administrative authorities.
- Base the I/R facility's location on the safety needs and well-being of DCs and the security needs of the receiving state.
- Provide them with necessities (food, shelter, and basic sanitary and health facilities).
- Maintain family units when possible.
- Provide assistance for tracing relatives.
- Protect minors and unaccompanied children.
- Allow them to send and receive mail.

LAW AND ORDER

9-47. The I/R facility commander is also the safety and security officer. He deals with crimes against persons and property, performs security patrols, and conducts reaction team operations. If an L&O team is attached to the organization, it performs L&O-related functions. Otherwise, the commander uses organic resources, such as an MP guard company, to establish an MP desk and blotter and perform other specific functions. The location of the MP station depends on the facility's layout and the commander's needs.

9-48. Some other sources for security officers include local police forces, HN paramilitary and military forces, and the facility population. Police personnel within the population can supplement security teams or constitute a facility police force if necessary. Internal and external patrols are necessary; however, ensure that security does not give the impression that the facility is a prison. Base patrol areas and distribution plans on the size of the facility and the number of DCs in each subdivision. If a DC is apprehended for committing a crime, coordinate with SJA and HN authorities to determine the disposition and the status of the subject and the disposition of the case paperwork, evidence (including crime lab analysis results), and recovered property. Also obtain information on items, procedures, and agreements unique to the supported HN.

9-49. Be prepared to perform civil-disturbance operations to restore L&O. Identify a reactionary force that can be immediately deployed and employed inside the facility to control a disturbance. The size of the reactionary force depends on the facility population and the available military forces. The reactionary force is well trained, well organized, and knowledgeable of applicable ROE, the use-of-force policy, and the use of NLWs and civil-disturbance measures. (See Appendix B and FM 19-15 for more information.)

9-50. Basic guidelines and the foundation for I/R facility L&O are provided in FMs 19-10 and 19-20. The I/R facility commander tailors the forms and procedures to his specific mission.

RULES OF INTERACTION

9-51. The ROI provide soldiers with a guide for interacting with the DC population. The following points may be included in the ROI:

- Avoid discussing politics or immigration policies with DCs.
- Avoid making promises to DCs. If cornered, reply with, "I will see what I can do."
- Refrain from making obscene gestures at DCs because they may understand the meaning.
- Avoid making derogatory remarks or political comments about DCs. Local linguists understand English, and DCs might understand it.
- Treat DCs equally. They may become offended if they do not receive the same treatment or resources others receive.
- Respect religious articles and materials.
- Treat medical problems seriously.
- Treat DCs with respect.
- Greet DCs in their own language.
- Clear phrases that DCs teach to soldiers through a linguist to ensure that they do not contain obscene language.

RULES OF ENGAGEMENT

9-52. The DC ROE vary from operation to operation. The CINC establishes ROE in conjunction with SJA and upon joint staff approval. The CINC approves special ROE developed for use in DC facilities that are controlled and secured by MP. The ROE may evolve to fit the changing environment, ensuring continued protection and safety for the DC population and US personnel. Ensure that ROE remain simple and understandable so that soldiers are not confused and do not have to memorize extensive checklists. Key definitions are—

- **Deadly force.** Force that is likely to cause death or serious bodily harm. An attack with an edged weapon and the use of a firearm are examples of deadly force.
- **Hostile act.** An attack or the use of deadly force against a person.
- **Hostile intent.** A threat of deadly force against a person. This term is used to anticipate a hostile act or to react to a threat before it occurs by applying graduated levels of nondeadly force.

9-53. Design ROE around escalating use of force. Resolve a conflict with the minimum force necessary, but allow leaders and soldiers to escalate the level of force as necessary to retain control. For example—

- First: Give a verbal warning.
- Second: Present a show of force, such as pepper spray, a stun gun, or a shotgun.
- Third: Use pepper spray or a stun gun.

- Fourth: Use a riot baton.
- Fifth: Fire a shotgun using nonlethal rounds or bird shot.

9-54. Nonlethal measures can be authorized by the ROE anytime during an operation to protect soldiers and DCs from injury. The NLWs include riot batons, pepper spray, stun guns, and shotguns loaded with nonlethal munitions or bird shot. The ROE may include nondeadly force to protect mission-essential equipment from damage or destruction. Mission-essential equipment includes tactical and nontactical vehicles, communications equipment, weapons, computers, and office and personal equipment.

9-55. The ROE normally authorize the use of deadly force only in extreme situations, such as—

- When there is an immediate or imminent threat of death or serious bodily harm to US personnel, civilians, or DCs.
- When its use would not significantly increase the risk of death or serious bodily harm to innocent persons.
- When lesser, nondeadly force fails or is impractical.
- When it is a last resort.

TRANSPORTATION

9-56. The DC facility requires adequate transportation assets. Since MP units have limited organic transportation assets, the unit MCO or the CA transportation specialist coordinates and determines the types and numbers of vehicles required and makes provisions to have them on hand. The I/R facility commander uses civilian or captured enemy vehicles when possible.

DISPOSITION

9-57. The final step in DC operations is the disposition of DCs. Allowing DCs to return to their homes as quickly as tactical considerations permit lessens the burden on military and civilian economies. It also reduces the danger of diseases that are common among people in confined areas. When DCs return home, they can help restore their towns and can better contribute to their own support. If DCs cannot return home, they may resettle elsewhere in their country or in a country that accepts them. Guidance on the disposition of DCs comes from higher authority upon coordination with US forces, national authorities, and international agencies.

9-58. The most important step in the disposition of DCs is the final handling of personnel and property. Before the DC operation is terminated, the I/R facility commander consults with higher headquarters, the SJA, and other pertinent agencies to determine the proper disposition of records.

Chapter 10

Humanitarian Assistance and Emergency Services

The HA operations encompass short-range programs aimed at ending or alleviating human suffering. They are usually conducted in response to natural or man-made disasters. The HA operations are designed to supplement or complement the efforts of HN civil authorities or agencies that have primary responsibility to provide relief. This type of assistance must not duplicate other forms of assistance provided by the US government. Government agencies are primarily responsible for ES operations (police, fire, rescue, and disaster preparedness). The effectiveness of ES plans and organization has a direct impact on CMO, and support to ES agencies can be provided as civil-military assistance. Although HA and ES operations can be conducted OCONUS, they are primarily conducted in CONUS.

SECTION I - HUMANITARIAN ASSISTANCE

10-1. Military forces provide a secure environment for humanitarian-relief efforts. The HA mission covers a broad range of tasks, and specific requirements are situation-dependent. The HA operations have different meanings to different people, based on their perspective. The operation can encompass reactive programs (disaster relief) and proactive programs (humanitarian and civic assistance [H/CA]).

10-2. The HA operations present a different set of challenges to US military forces. While civilian and military authorities exercise PRC, they may not know the magnitude of the situation requiring HA. In addition, US forces may be tasked to perform HA operations in numerous and complex environments. As with MP support to PRC operations, the MP commander has a clear understanding of the operational environment, the ROE, and legal considerations before setting up an I/R facility to support HA operations.

OPERATIONAL ENVIRONMENT

10-3. The US force commander coordinates with other responding organizations and assesses the environment where US forces will conduct HA operations. The operational environment includes the political situation, physical boundaries, the potential threat to forces, global visibility, and the media interest climate.

10-4. After the US force commander confirms the operational environment, he determines the types and numbers of forces required to meet the mission.

The operational environment also determines the ROE to be used within the AO. The more permissive the environment, the more predictable the outcome of the mission. The HA operational environments are categorized as permissive, uncertain, and hostile. The distinction between HA conducted in a permissive environment versus a hostile environment is clear. Failure to make this distinction results in inadequate planning and unrealistic expectations.

PERMISSIVE ENVIRONMENT

10-5. A permissive environment is normally associated with relief operations following a natural disaster or an economic collapse. Assistance is provided at the request of the host government. A permissive environment is conducive to HA operations, and little or no opposition or resistance to military forces is expected. Nonhostile, anti-US interests may try to disrupt US military activities. The physical-security environment may be permissive; however, other nonthreatening means (demonstrations) may be employed to impair credibility or to reduce the effectiveness of US military activities. A permissive environment is characterized by—

- A commonality of purpose for all parties.
- A quantifiable problem (often a single, natural disaster).
- Clear objectives (providing support until normalcy returns).
- HN cooperation.

UNCERTAIN ENVIRONMENT

10-6. In an uncertain environment, FN forces do not have effective control of the territory and population in the intended AO. They may or may not be receptive to HA operations.

HOSTILE ENVIRONMENT

10-7. A hostile environment includes conditions, circumstances, and influences ranging from a civil disorder or a terrorist act to full-scale combat. Forces conducting HA must be prepared for a full range of contingencies. Commanders can employ forces to safeguard the populace, defend the perimeter, provide escort convoys, screen the local populace, and assist in personnel recovery operations. A hostile environment is characterized by—

- Multiple conflicting parties.
- Imminent danger to all parties.
- Relief as a weapon manipulated by combatants for political gain.

10-8. The more hostile the environment, the less predictable the outcome of the mission. The HA forces must be prepared to counter actions by hostile forces attempting to disrupt the HA mission and to counter actions by a previously friendly populace. Commanders do not depend on their humanitarian mission to shield them from hostile acts. The joint forces commander (JFC) coordinates with higher authorities and determines the appropriateness of the use of force. The effects of the environment on HA activities are shown in Figure 10-1. As the environment becomes more hostile, the requirement for security increases and the capability for HA (such as food distribution and medical assistance) decreases. (See FM 100-23-1 for more information on HA operations.)

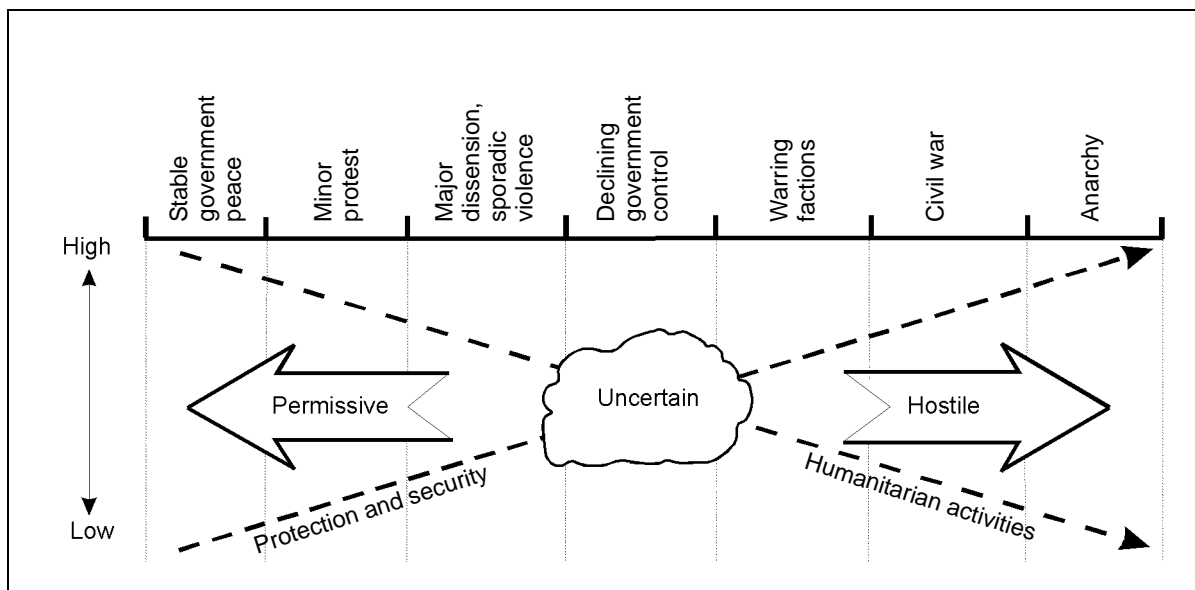

Figure 10-1. HA Environment

RULES OF ENGAGEMENT

10-9. The sensitive political and international nature of HA operations means that the CINC must coordinate the ROE details (which may change as the operation evolves) with the JFC. Under normal circumstances, the joint chief of staff's (JCS's) standing ROE apply to all military operations. The CINC requests supplemental measures to deal with the specifics of the mission. Actual ROE established for each HA mission depend on the individual situation and the operational environment.

10-10. The ROE development for forces participating in HA operations is essential to mission success and is characterized by restraint. The levels of force, tactics, and weaponry are evaluated and addressed. For multinational operations, all participating military forces establish common HA ROE to provide consistency within the force. Individual nations using separate ROE respond differently to the same situation. The following precepts are essential to the ROE for US military forces:

- The right of self-defense is never prohibited. The two elements of self-defense are necessity and proportionality.
- A unit commander defends against a hostile act or intent. A hostile act must occur or a hostile intent must be apparent. The use of force must be reasonable in intensity, duration, and magnitude to ensure the safety of forces.

LEGAL CONSIDERATIONS

10-11. Regardless of the circumstances under which US forces are employed, international law obligates the commander with respect to civilians, governments, and economics. Agreements or the law of land warfare usually specify the requirements. The Hague and Geneva Conventions and similar

documents set forth treaty obligations, and FM 27-10 and other service publications explain the commander's legal obligations.

10-12. The JFC must be aware of existing international agreements that may limit the flexibility of the HA mission. Existing agreements may not be shaped to support HA operations. Military HA commanders dealing with HNs and IOs should anticipate the difficulties that international agreements can impose on HA operations.

10-13. Normally, the law of land warfare does not apply to HA operations. However, it is used in conjunction with the Geneva and Hague Conventions, protocols, and custom laws that may provide guidance to the JFC. Commanders, unless otherwise directed by competent authorities, comply with the principles and spirit of the law of land warfare during HA operations. Mission imperatives and tasks must have a sound legal basis, and commanders ensure that personnel conform to internationally accepted standards of behavior and actions—especially as they relate to the humane treatment of civilians, the respect for private property, and the use of force.

MILITARY POLICE SUPPORT

10-14. There are some key differences between MP support to DC operations and MP support to HA. Since HA operations are usually conducted in response to a disaster, the level of property devastation and human suffering may require special attention and planning considerations. One of the special considerations may be the need for temporary shelter. If the JFC determines that the availability of HN shelters or other services is inadequate, he may request the assistance and deployment of CS or I/R units to accomplish the HA mission. When the decision is made to employ an MP unit, the MP commander becomes the I/R facility commander.

10-15. The MP support to HA operations begins before the unit arrives in the TO or is tasked with the mission. The I/R facility commander has a thorough understanding of the legal considerations and the concept of operations, including how they apply to the MP mission. If time permits, the I/R facility commander contacts the JFC G5/S5, SJA, CA, and other organizations that may have a role in HA operations. The CA forces can provide expertise on factors that affect HA operations, such as—

- The availability of HN agencies and the status of infrastructure.
- Ethnic differences and resentments.
- Social structures (family and regional).
- Religious and symbolic systems (beliefs and behaviors).
- Political structures (distribution of power).
- Economic systems (sources and distribution of wealth).
- Links among social, religious, political, and economic dynamics.
- The cultural history of the area.
- Attitudes toward US military forces.

10-16. When deployed to the TO, an I/R facility commander coordinates with and receives updated information from higher headquarters G5/S5, CA, and PSYOP; the HN; and applicable NGOs, IHOs, and IOs before setting up and

operating an I/R facility. He uses the MDMP to determine the specific tasks the MP unit performs to accomplish the HA mission. Some considerations include—

- Location.
- Construction.
- Setup.
- Processing.
- Screening.
- ID.
- Clothing and equipment.
- Subsistence.
- Dining facilities.
- Medical and sanitation.
- Self-government.
- Control and discipline.
- Administration.
- L&O.
- ROI.
- Transportation.
- Disposition.

LOCATION

10-17. The location of the I/R facility is extremely important, especially when responding to a disaster. Consider METT-TC, the susceptibility of the area to natural or man-made disasters (flood, pollution, and fire), and the use of HN personnel as a source of local labor support. The location also depends on the availability of supply routes, food, water, power, and waste disposal. The I/R facility commander selects the location of the facility after coordinating with JFC, CA, G5/S5, the HN, and other military and nonmilitary organizations.

CONSTRUCTION

10-18. Try to construct the facility using local agencies or government employees. The goal is to have the facility fully constructed and operational before accepting any civilians. This is important because the civilian population may have suffered total family or property loss and may not be in the best psychological or physical condition to help with construction efforts. Within legal limitations, use local sources and materials if they are available. Otherwise, use the supporting command's logistics and transportation assets to acquire and transport the resources required to build or modify existing facilities for HA operations. The supporting command and the HN also furnish medical, subsistence, and other supporting assets to establish I/R facilities. Engineer support and military construction materials may be necessary when I/R facilities are set up in areas where local facilities are unavailable or destroyed; for example, hotels, schools, halls, theaters, vacant warehouses, unused factories, or workers' camps. The TCMS can be used for HA operations. If necessary, MP units set up a facility using acquisitioned tentage and additional materials. The I/R facility commander considers the type of

construction necessary to satisfy the needs of the HA operation. Some considerations are—

- The local climate.
- The anticipated permanency of the facility.
- The number of facilities to be constructed.
- Local materials available.
- Military resources and assistance available.

SETUP

10-19. Subdivide the facility into sections or separate compounds to ease administration and alleviate stress among civilians. Each section can serve as an administrative subunit for transacting facility business. Major sections normally include facility headquarters, a hospital, a dining facility, and sleeping areas. Subdivide sleeping areas for families, unaccompanied children, unattached females, and unattached males. Consider cultural and religious practices, and try to keep families together. Figure 10-2 shows a sample HA I/R facility. Additional facilities, fencing, and other requirements are based on—

- The number of civilians.
- The diversity of the population.
- Resources available.
- The need for a reactionary force.
- Guidance from higher headquarters, CA, and the HN.
- The need for temporary storage.
- The duration of the operation.
- The number of animals to be housed.
- The number of vehicles.

PROCESSING

10-20. Processing may or may not be required. Coordinate the decision to process civilians with NGOs, IHOs, IOs, the HN, CA, and other interested agencies. The initial reception begins with the transport of civilians from their neighborhoods or other places to the inprocessing center of the I/R facility. The HN (in coordination with NGOs, IHOs and IOs) normally arranges transportation. Civilians may be fearful and in a state of shock, so conduct processing in a positive manner. In most situations, they should clearly understand why they are being processed and know what to expect at each station. The facility commander, an HN representative, or another official conducts an entrance briefing to civilians upon their arrival.

Figure 10-2. Sample HA I/R Facility

10-21. While DC processing procedures in Chapter 9 provide a foundation, I/R facility personnel must be aware of unique aspects when conducting HA operations. Military personnel normally provide training and support, and HN authorities do the actual processing. The number and type of processing stations vary from operation to operation. Table 10-1 shows stations that are required for HA operations.

Table 10-1. Actions During Inprocessing

Station	Purpose	Responsible Individuals*	Actions
1	Accountability	HN and I/R staff	Prepare forms and records to maintain accountability of civilians. Use forms and records provided by the HN, CA, or those used for EPW/CI operations that may apply to HA operations.
2	ID card or band	HN and I/R staff	Issue ID cards or bands to facilitate administration and control of the facility if necessary.
3	Medical evaluation	HN, I/R staff, and medical personnel	Evaluate civilians for signs of illness or injury.
4	Assignment	HN and I/R staff	Assign each civilian a sleeping area.
5	Personal items	HN and I/R staff	Issue personal-comfort items and, if available, clothing.

*The number of people performing these tasks depends on the number of civilians and the time available. Allow HN authorities to conduct most of the inprocessing.

10-22. The I/R facility commander determines the accountability procedures and requirements necessary for HA operations. Translators are present throughout processing. A senior person greets new arrivals and makes them feel welcome. Brief civilians on facility policies and procedures and screen them to identify security and medical concerns. Offer them the use of personal-hygiene facilities, and always maintain family integrity.

10-23. Conduct pat-down searches to ensure that weapons are not introduced into the compound. Conduct same-gender searches when possible, and do not conduct strip searches. Speed and security considerations may require mixed-gender searches. If so, perform them in a respectful manner, using all possible measures to prevent any action that could be interpreted as sexual molestation or assault. The on-site supervisor carefully controls soldiers doing mixed-gender searches to prevent allegations of sexual misconduct.

SCREENING

10-24. Depending on the environment, screening may or may not be necessary. The screening process also identifies technicians and professionals to help administer the facility; for example, policemen, schoolteachers, doctors, dentists, nurses, lawyers, mechanics, carpenters, and cooks.

IDENTIFICATION

10-25. Identifying DCs may or may not be necessary; and it depends on guidance from higher headquarters, CA, and the HN. The need for ID varies from operation to operation, and it is used to—

- Verify rosters against the actual population.

- Provide timely reunification of family members.
- Match civilians with their medical records in case of a medical emergency or evacuation.
- Check identities of civilians against the transfer roster.

10-26. An ID card can be used to facilitate ID. It contains the civilian's name, photograph, and control number. The control number may be an ISN or a sequenced control number specific to the civilian. Color-coded IDs may be necessary to permit ID. An ID band permits rapid, reliable ID of an individual and may also be used in HA operations. While civilians cannot be prevented from removing or destroying bands, most will accept their use for ID purposes. When ID bands or cards deteriorate, replace them immediately.

CLOTHING AND EQUIPMENT

10-27. Supply civilians with adequate, suitable clothing and sleeping equipment if they do not have supplies with them. Requisition clothing and equipment through NGOs, IHOs, and IOs when possible. In a hostile environment, use available captured clothing and equipment. Ensure that civilians wear clothing until it is unserviceable, and replace it as necessary.

SUBSISTENCE

10-28. Ensure that food rations are sufficient in quantity, quality, and variety to maintain health and prevent weight loss and nutritional deficiencies. Consider the habitual diet of the civilian population. Ensure that expectant and nursing mothers and children under the age of 15 receive additional food in proportion to their needs. Increase the rations of workers based on the type of labor performed. Provide plenty of fresh potable water. Make minimal menu and feeding-schedule changes to prevent unrest among the population, and inform civilians when changes must be made.

DINING FACILITIES

10-29. Dining-facility requirements for HA operations are similar to those for DC operations. If deemed necessary, the I/R facility commander can authorize local procurement of cooking equipment. Consult with SJA to determine the purchasing mechanism and the legality of items being purchased. Coordinate with NGOs, IHOs, and IOs for food service support. A qualified food service person is authorized in each 19547AB I/R detachment, and a food operations sergeant and a first cook provide food service support for each compound. Train selected civilians to perform food service operations, and ensure that they are constantly supervised by US food service personnel.

MEDICAL AND SANITATION CONSIDERATIONS

10-30. The need for medical care and sanitation intensifies in an I/R environment due to its temporary nature, the lack of proper sanitation facilities, and the lack of basic community services (potable water and sewer). Enforcement and education measures ensure that the facility population complies with basic sanitation measures. Provide medical care via organic I/R medical personnel or coordinate with the appropriate HN medical authorities. To prevent communicable diseases, follow the guidance in FM 21-10 and other

applicable publications. Conduct routine, preplanned health, comfort, and welfare inspections that appear to be random. Ensure that inspections cause minimal disruption of space and privacy. Inspections ensure that the facility is safe, sanitary, and hazard-free. When conducting inspections—

- Ensure that their purpose is conveyed and emphasized to the civilian population.
- Respect cultural beliefs such as religious tenets and shrines. The INS, international support groups, community leaders, CA, and HN authorities are good sources for information regarding cultural sensitivities.
- Treat civilians and their possessions with respect.

SELF-GOVERNMENT

10-31. The I/R facility commander determines whether self-government is required and appropriate. If responding to a natural disaster, such as an earthquake, the civilian government may not be affected and the I/R facility may be used as shelter only. However, if the civilian government cannot be established or is nonoperational, self-government may be appropriate. Chapter 5 and AR 190-8 contain procedures for establishing a CI committee. Use the procedures as a model for establishing a CA self-government, and coordinate with CA for assistance.

10-32. Self-government leaders can help solve problems before they become major events. The infrastructure of self-government promotes a stable environment where rapport is built between the facility commander, the civilian leadership, and the civilian population. This, in turn, reduces tension and provides an effective means of communicating reliable information to the facility population.

10-33. Civilians can submit complaints and requests to the I/R facility commander via—

- An elected civilian internment committee.
- A written complaint.
- A visiting representative of the UNHRC or a similar agency.

CONTROL AND DISCIPLINE

10-34. Controlling people is the key to successful facility operations. Civilians housed in I/R facilities during HA are not prisoners. Consider this fact when drafting rules and guidelines. Establish, maintain, and enforce discipline and security to avoid unstable conditions that may further affect civilians during HA operations. Establish and explain rules that can be easily followed by everyone in the facility. Coordinate with SJA and HN authorities to determine how to enforce rules and how to deal with civilians who violate noncriminal rules. Publish and enforce rules of conduct and update them as necessary. The I/R facility commander serves as the single POC and coordinates all matters with outside organizations or agencies. Keep barracks rules brief and to a minimum (see Figure 9-3, page 9-15).

10-35. Discipline and control also apply to I/R facility personnel. They—

- Observe rigorous self-discipline.

- Maintain a professional, impersonal attitude.
- Follow the ROI and the ROE.
- Cope with hostile or unruly behavior and incidents calmly.
- Take fair, immediate, decisive action.

10-36. The I/R facility commander takes positive action to establish daily or periodic routines and responses that are conducive to good discipline and control. He ensures that I/R facility personnel—

- Enforce policies and procedures.
- Give reasonable orders decisively and in a language that residents understand.
- Post facility rules, regulations, instructions, notices, orders, and announcements that residents are expected to obey in an easily accessed area. Ensure that the information is printed in a language that residents understand, and provide a copy to residents who do not have access to posted copies.
- Ensure that residents obey orders, rules, and directives.
- Report residents who refuse or fail to obey an order or a regulation.
- Do not fraternize with residents.
- Do not donate or receive gifts or engage in any commercial activity with residents.

ADMINISTRATION

10-37. Due to the large number of civilians requiring control and care, use HN civilians as cadre for facility administration when possible. The HN civilians should come from public and private welfare organizations and be under military supervision. Also encourage residents to become involved in facility administration. If possible, CA and I/R facility personnel organize and train cadre before the facility opens.

10-38. Problems might stem from civilians' state of mind. The difficulties they experienced may affect their acceptance of authority. They may have little initiative or may be uncooperative because of an uncertain future. They may be angry because of their losses, or they may resort to looting and general lawlessness because of their condition. The I/R facility commander can minimize difficulties through careful administration and—

- Maintaining different national and cultural groups in separate facilities or sections.
- Keeping families together.
- Separating unaccompanied males, females, and children under the age of 18 (based on HN laws as to when a child becomes an adult).
- Allowing civilians to speak freely to facility officials.
- Involving civilians in facility administration, work, and recreation.
- Establishing quick contact with agencies for aid and family reunification.

10-39. The I/R facility commander administers the facility to ensure that civilians are treated according to the following basic standards:

- Do not restrict their movement except when necessary for public health and order.
- Allow them to enjoy their fundamental rights.
- Treat them as persons whose plight requires special understanding and sympathy. Provide necessary assistance, and do not subject them to cruel, inhumane, or degrading treatment.
- Do not discriminate because of race, religion, political opinion, nationality, or country of origin.
- Recognize that they are persons before the law who enjoy free access to the courts of law and other competent administrative authorities.
- Provide them with necessities (food, shelter, and basic sanitary and health facilities).
- Maintain family units when possible.
- Provide assistance for tracing relatives.
- Protect minors and unaccompanied children.
- Allow them to send and receive mail.
- Permit material assistance from friends and relatives.
- Arrange for the registration of births, deaths, and marriages if possible.
- Grant them the means necessary to obtain a satisfactory, durable solution.
- Permit them to transfer assets to the country where they obtain a durable solution.
- Take steps to facilitate voluntary repatriation.
- Provide humane treatment and protect them against violence, intimidation, insults, and public curiosity.

10-40. Disseminating instructions and information to the facility population is vital. Communications may be in the form of notices on bulletin boards, posters, public address systems, loudspeakers, camp meetings and assemblies, or a facility radio station. The CA teams and area PSYOP units can help disseminate information.

10-41. Another tool for effective administration is using liaison personnel. Liaison involves coordination with all interested agencies. The US government and military authorities, allied liaison officers, and representatives of local governments and international agencies can provide assistance.

LAW AND ORDER

10-42. The I/R facility commander is also the safety and security officer. He deals with crimes against persons and property, performs security patrols, and conducts reaction team operations. If an L&O team is attached to the organization, it performs L&O-related functions. Otherwise, the commander uses organic resources, such as an MP guard company, to establish an MP desk and blotter and perform other specific functions. The location of the MP station depends on the facility's layout and the commander's needs.

10-43. Some other sources for security officers include local police forces, HN paramilitary and military forces, and the facility population. Police personnel within the population can supplement security teams or constitute a facility police force if necessary. Internal and external patrols are necessary; however, ensure that security does not give the impression that the facility is a prison. Base patrol areas and distribution plans on the size of the facility and the number of civilians in each subdivision. Before apprehending a civilian, the commander coordinates with SJA and HN authorities to determine his jurisdiction and authority. He determines the disposition and the status of the subject and the disposition of the case paperwork, evidence (including crime lab analysis results), and recovered property. The commander also obtains information on items, procedures, and agreements unique to the supported HN.

10-44. Be prepared to perform civil-disturbance operations to restore L&O if HN reactionary forces are unavailable. Identify a reactionary force that can be immediately deployed and employed inside the facility to control a disturbance. The size of the reactionary force depends on the facility population and the available military forces. The reactionary force is well trained, well organized, and knowledgeable of applicable ROE, the use-of-force policy, and the use of NLWs and civil-disturbance measures. (See Appendix B and FM 19-15 for more information.)

10-45. Basic guidelines and the foundation for I/R facility L&O are provided in FMs 19-10 and 19-20. The I/R facility commander tailors the forms and procedures to his specific mission.

RULES OF INTERACTION

10-46. The ROI provide soldiers with a guide for interacting with the civilian population. The following points may be included in the ROI:

- Avoid discussing politics or other policies with civilians.
- Avoid making promises. If cornered, reply with, "I will see what I can do."
- Refrain from making obscene gestures because civilians may understand the meaning.
- Avoid making derogatory remarks. Local linguists understand English and civilians might.
- Treat civilians equally. They may become offended if they do not receive the same treatment or resources others receive.
- Respect religious articles and materials.
- Treat medical problems seriously.
- Treat civilians with respect.
- Greet civilians in their own language.
- Clear phrases that civilians teach to soldiers through a linguist to ensure that they do not contain obscene language.

TRANSPORTATION

10-47. The I/R facility requires adequate transportation assets. Since MP units have limited organic transportation assets, the unit MCO, the CA

transportation specialist, the HN, NGOs, and IHOs coordinate and determine the types and numbers of vehicles required and make provisions to have them on hand.

DISPOSITION

10-48. The final step in HA operations is the disposition of civilians. Allowing civilians to return to their homes as quickly as conditions permit lessens the burden on military and civilian economies. It also reduces the danger of diseases that are common among people in confined areas. When civilians return home, they can help restore their towns and can better contribute to their own support. If civilians cannot return home, they may resettle elsewhere in their country. Guidance on the disposition of civilians comes from higher authority upon coordination with US forces, national authorities, and international agencies.

SECTION II - EMERGENCY SERVICES

10-49. Government agencies are primarily responsible for ES (police, fire, rescue, and disaster preparedness). Military support to ES agencies can be provided as civil-military assistance. The ES operations are normally conducted in CONUS, but they can be conducted OCONUS.

IN CONTINENTAL UNITED STATES

10-50. In the US, the federal government is responsible for ES at all levels. It provides planning advice and coordinates research, equipment, and financial aid. State and local governments determine the allocation of these resources. In the event of an emergency, US forces are prepared to help civil authorities restore essential services, repair essential facilities and, if necessary, ensure national survival. Federal statutes and military regulations govern conditions for employing active component (AC) and United States Army Reserve (USAR) military forces. (See FM 100-19 for more information.)

10-51. The DOD components develop appropriate contingency plans for disaster assistance and ensure coordination with the appropriate federal, state, and local civil authorities. When a disaster is so serious that waiting for instructions from higher authority causes unwarranted delays, a military commander can take action under DOD Directive 3025.1. The directive authorizes military forces to respond immediately to save lives, prevent human suffering, and mitigate great property damage. This support cannot exceed 72 hours without DOD approval. The commander promptly reports the action to higher authority and requests guidance if continued support is necessary or beyond his capability.

10-52. The AC and USAR forces used in disaster relief are under the command of their military superiors. Other military participation and the use of military resources occur on a mission-by-mission basis and end at the earliest practicable time. Commanders ensure that personnel participating in domestic assistance are not in violation of the Posse Comitatus Act. This act prohibits the use of federal military personnel to enforce federal, state, or local

laws unless expressly authorized by the Constitution or by an act of Congress. The act does not apply to state national guard (NG) forces unless they have been federalized. When placed on state active duty, NG forces (Army and Air) are under the C² of state authorities, not federal forces.

10-53. Measures to ensure the continuity of operations, troop survival, and the rehabilitation of essential military bases take precedence over military support of local communities. Consider requests for support on a mission-by-mission basis. With the exception of support directed in response to a nationally declared emergency, the military commander decides the necessity, amount, duration, and employment method of support rendered.

10-54. When committing USAR units or individual reservists to disaster relief operations, ensure that—

- The President's reserve call-up allows CONUS deployment of USAR troops.
- The commitment of USAR volunteers is consistent with Army policy for military assistance and is coordinated with the proper Corps of Engineer district or division to avoid duplication of effort. (The authority to commit USAR volunteers can be delegated no lower than CONUS Army.)
- Civil authorities make a firm commitment to repay active-duty tour (ADT) costs.
- State and local assets (including the NG) are committed if the requested assistance is within their capabilities.

10-55. A USAR commander can approve immediate-response, voluntary USAR participation during imminently serious conditions in a nondrill, nonpay status per DOD Directive 3025.1. The USAR members taking part in such support are performing official duty. The USAR commander—

- Does not order members to participate.
- Approves voluntary participation only when time or conditions do not permit seeking guidance from higher headquarters.
- Ensures that state and local assets are fully committed if the requested assistance is within their capabilities.
- Provides support on a mission-by-mission basis.
- Discontinues support when adequate state and local assets become available.

10-56. The MP units assisting ES operations in CONUS involve DOD-sponsored military programs that support the people and the government at all levels within the US and its territories. These programs and operations are classified as domestic support, and civil law and military regulations closely regulate a commander's authority and responsibilities.

10-57. Protecting life and property within the territorial jurisdiction of a community is the primary responsibility of state and local governments and civil authorities. Federal armed forces can be employed when—

- The situation is beyond state and local capabilities.
- State and local authorities do not take appropriate action.

FEDERAL EMERGENCY MANAGEMENT AGENCY

10-58. The FEMA serves as the single POC within the US government for all emergency planning and management. It establishes and maintains a comprehensive, coordinated emergency management capability in the US. The FEMA plans and prepares for, responds and recovers from, and most importantly, mitigates the effects of emergencies, disasters, and hazards that range from safety and protection in the home to a nuclear attack. Within FEMA, two primary departments provide civil-defense plans and guidance.

Plans and Preparedness Department

10-59. The Plans and Preparedness Department develops and implements overall concepts and policy guidance. It directs activities for nationwide plans and preparedness for emergencies during peace and war. The department develops guidance for federal emergency plans and state and local response capabilities, including tests and exercises for communications, warning, and damage assessment systems. It also develops policy guidance for stockpiling strategic materiel and develops plans, systems, and capabilities—

- To protect the US populace, government, and industry.
- For resource management and stabilization of the economy during emergencies.

Disaster Response and Recovery Department

10-60. The Disaster Response and Recovery Department provides direction and overall policy coordination for federal disaster assistance programs. It advises the FEMA director on the mission, organization, and operation of the agency's disaster assistance program and the federal response and recovery capabilities. It administers federal disaster assistance and provides overall direction and management of federal response and recovery activities. The department develops summaries of existing situations to support the director's recommendation to the President on a state governor's request for a Presidential declaration of a major disaster or an emergency.

MILITARY POLICE SUPPORT

10-61. The MP can be extremely valuable to civil authorities during ES. The CS and I/R MP units can operate an I/R-type facility that may become essential during ES. The MP units may be called upon to provide shelter to people whose community has been struck by a powerful disaster, such as a tornado or a hurricane. When civil authorities request assistance, MP units may be deployed and employed as part of a JTF anywhere in CONUS or its territories.

10-62. The MP support to ES in CONUS varies significantly from other I/R operations. The basic difference is that local and state governments and the federal government and its agencies have a greater impact and role in supporting and meeting the needs of an affected community. In CMO for disaster relief, MP receive missions from the FEMA through the DOMS and the chain of command. The MP commander uses the MDMP to determine the specific tasks necessary to accomplish the mission. Using the same format as

used in HA operations, the commander modifies and tailors the tasks as necessary.

10-63. If tasked to set up and operate an I/R facility, the MP commander retains control of military forces under his command. Depending on the situation, overall control of the facility may or may not be maintained by FEMA or the DOJ. Coordinate the location of the I/R facility with local authorities. The city chief of police, mayor, or ES director may have already selected a site that has easy access, is located on high ground, or is adjacent to other services.

10-64. The I/R facility commander may or may not be able to depend on local labor to help set up the facility. The victims' state of mind and their physical conditions may prevent them from participating in construction efforts. However, assistance may not be required if the Engineer Corps uses the TCMS to build shelters or if other shelters are available. Discuss the facility's setup with local, state, and federal relief agencies. Although the basic setup for HA operations may be adequate, the I/R facility commander can modify the setup to meet local needs. As a minimum, the facility should have stations for processing, medical screening, and distribution of personal-hygiene items.

10-65. Screening, classification, and ID requirements may not be needed in CONUS ES operations. Discuss these capabilities with local authorities to determine the need for them. As with HA operations, clothing requirements may exceed supply. This will be the case during destructive disasters such as tornadoes, fires, and hurricanes. Coordinate clothing, subsistence, medical, and dining-facility requirements with local, state, and federal relief agencies responding to the disaster.

10-66. Since the Posse Comitatus Act prohibits MP from enforcing civilian laws, local, state, and federal law enforcement officials perform discipline, control, and L&O of the facility. The MP can be used in conjunction with local, state, and federal law enforcement officials; but they cannot be directly involved in law enforcement functions such as search, seizure, and arrest. A facility staff member who observes a violation of criminal law reports the incident to civilian law enforcement officials. The ROI, if applicable, are provided by the JFC.

OUTSIDE CONTINENTAL UNITED STATES

10-67. The FNs are responsible for providing ES for their citizens. When requirements exceed their capabilities, they may request assistance through the US Embassy.

10-68. The DOD components support or participate in foreign disaster relief operations when the DOS determines that disaster relief will be provided to the requesting country. Military commanders at the immediate scene of a foreign disaster may provide prompt relief operations to preserve lives and prevent injuries when time is of the essence and when humanitarian considerations make it advisable. Commanders taking such action immediately report operations according to the provisions of DOD Directive 5100.46.

10-69. The Assistant Secretary of Defense (ASD) for Democracy and Peacekeeping is the approval authority for committing DOD resources or services to foreign disaster relief operations. The DASD for H&RA (Global Affairs) is the DOD coordinator for foreign disaster relief operations. The Logistics Directorate (J4) is the joint staff's POC for the DOD Foreign Disaster Relief and Humanitarian Assistance Program.

10-70. The ASD for International Security Affairs approves DOD supplies and services for disaster and humanitarian purposes. He provides supplies and services from the most expedient source, which is normally the geographic command from whose theater the request emanates.

10-71. The geographic CINC assumes the primary coordinating role for providing DOD supplies and services. The military departments and the joint staff support the designated commander of a unified command as required, primarily by coordinating interdepartmental approval and funding processes through the DASD for H&RA (Global Affairs).

10-72. When a request emanates from a country not assigned to a geographic CINC under the Unified Command Plan, the joint staff or the J4 assumes the primary coordinating role in conjunction with the DASD for H&RA. Requests for DOD assistance are received from the DOS or the USAID through the OFDA.

UNITED STATES AGENCY FOR INTERNATIONAL DEVELOPMENT

10-73. The USAID administers the President's authority to coordinate assistance in response to disasters, as declared by the ambassador within the country or a higher DOS authority. The USAID is authorized to provide assistance, notwithstanding any other provision of law. This authority allows the USAID to expedite interventions at the operational and tactical levels using NGOs and other relief sources. The USAID—

- Organizes and coordinates the US disaster relief response.
- Responds to requests for disaster assistance.
- Initiates procurement of supplies, services, and transportation.

10-74. The Foreign Assistance Act is the authority for providing disaster relief to—

- Preserve life and minimize suffering by providing sufficient warning of natural events that cause disasters.
- Preserve life and minimize suffering by responding to natural and man-made disasters.
- Foster self-sufficiency among disaster-prone nations by helping them achieve some measure of preparedness.
- Alleviate suffering by providing rapid, appropriate responses to requests for aid.
- Enhance recovery through rehabilitation programs.

10-75. The USAID coordinates with the DOD on matters concerning defense equipment and personnel provided to the affected nation and to arrange DOD transportation. DOD Directive 5100.46 establishes the relationship between the DOD and the USAID. The DASD for H&RA is the primary POC. When the

USAID requests specific services from the DOD, typically airlift, it pays for the services. The CINC coordinates with the OFDA to arrange military and civilian assistance efforts. The USAID provides an excellent means for military and civilian operational-level coordination.

10-76. The USAID has operational links and grants relationships with many NGOs and IOs that have relief programs outside the US. These include the ICRC, the IFRC, the UNICEF, and the WFP. The USAID also coordinates with other governments responding to disasters through donor country coordination meetings to solve operational and political problems. The USAID can deploy a disaster assistance response team (DART) into the AOR to manage US relief efforts.

DISASTER ASSISTANCE RESPONSE TEAM

10-77. The DART concept was developed to provide rapid response to international disasters. A DART provides specialists trained in a variety of disaster relief skills who assist US Embassies and the USAID in managing the US government's response to disasters.

10-78. The activities of a DART vary depending on the type, size, and complexity of the disaster. The DARTs coordinate with the affected country, other assisting countries, NGOs, IOs, and US military assets deployed to the disaster. During rapid-onset disasters, DARTs—

- Coordinate the needs assessment.
- Recommend US government response actions.
- Manage US government on-site relief activities.

During long-term, complex disasters, DARTs—

- Gather information on the disaster situation.
- Monitor the effectiveness of current US government-funded relief activities.
- Review proposals of relief activities for future funding.
- Recommend follow-on strategies and actions to the OFDA.

10-79. The number of people assigned to a DART depends on the activities needed to meet the strategic objectives. A DART consists of five functional areas—management, operations, planning, logistics, and administration:

- **Management.** It includes the oversight of DART activities, NGOs, IOs, other assisting countries, and the US military. It also involves the development and implementation of plans to meet strategic objectives.
- **Operations.** It includes all operational activities carried out by a DART, such as search, rescue, and aerial operations; technical support; and medical response. This function is most active during rapid-onset disasters.
- **Planning.** It includes collecting, evaluating, tracking, and disseminating information on the disaster. It also includes reviewing activities, recommending future actions, and developing operational (tactical) plans.
- **Logistics.** It includes providing support to the OFDA and DARTs by managing supplies, equipment, and services and by ordering,

receiving, distributing, and tracking people and US government-provided relief supplies.

- **Administration.** It includes the management of contracts, the procurement of goods and services required by the OFDA and DARTs, and the fiscal activities of DARTs.

10-80. The DART team leader organizes and supervises the DART. He is delegated authority from and works for the Assistant Director for Disaster Response or his designee. The delegation lists the objectives, priorities, constraints, and reporting requirements for the DART.

10-81. Before the DART departs, the team leader contacts the USAID or the US Embassy (if present in the affected country) to discuss the situation; review the structure, size, objectives, and capabilities of the DART; and identify the areas of support needed by the DART. Upon arriving in the affected country, he reports to the senior US official or the appropriate country official to discuss DART objectives and capabilities and to receive additional instructions and authority.

10-82. While in the affected country, the team leader advises the USAID or the US Embassy and receives periodic instructions from the agency. The DART follows instructions unless they conflict with OFDA policies, authorities, and procedures. Throughout the operation, the team leader maintains direct LOC with the OFDA.

10-83. The USAID or the US Embassy and the OFDA determine the duration of a DART operation after reviewing the disaster situation and the progress in meeting operational objectives. The DART is a highly flexible, mobile organization that is capable of adjusting its size and mission to satisfy the changing needs of the disaster situation.

10-84. A DART normally tailors its capabilities to the particular situation. It assesses the damage to the civil infrastructure, helps operate temporary shelters, and manages a CMO center. The CA units serve as liaison between military and local relief organizations, NGOs, IOs, and DARTs.

MILITARY POLICE SUPPORT

10-85. The I/R unit support to ES OCONUS is similar to MP support during HA operations. The location, setup, construction, and tasks are based on the nature of the emergency and the needs of the HN.

Appendix A

Metric Conversions

This appendix complies with current Army directives which state that the metric system will be incorporated into all new publications. *Table A-1* is a conversion chart.

Table A-1. Metric Conversion Chart

US Units	Multiplied By	Metric Units
Cubic feet	0.0283	Cubic meters
Feet	0.305	Meters
Inches	2.54	Centimeters
Square yards	0.836	Square meters
Metric Units	Multiplied By	US Units
Centimeters	0.0394	Inches
Cubic meters	35.3	Cubic feet
Meters	3.28	Feet
Square meters	1.196	Square yards

Appendix B

Use of Force and Riot Control Measures

The I/R facility commander provides guidance to all MP guard forces in the appropriate use of force to protect internees and internment facilities and to control unruly and rebellious internee populations. This includes establishing uniform procedures that govern the use of force, weapons, and restraining devices. He ensures that a QRF is organized and trained to respond to disturbances inside and outside the facility—whether prisoners are creating a disturbance or there is a Level I threat against the facility. Supporting MP units train squad- to platoon-sized QRFs and squad-sized elements for extraction and apprehension teams. (See FM 19-15 for more information on civil disturbances.)

USE OF FORCE

B-1. When force is necessary, use it according to the priorities of force and limit it to the minimum degree necessary. (See AR 190-14 for the use of deadly force.) The application of any or all of the priorities of force, or the application of a higher numbered priority without first employing a lower numbered one, depends on and will be consistent with the situation encountered. Per AR 190-47, the priorities of force are—

- First: Verbal persuasion.
- Second: Show of force.
- Third: Chemical aerosol irritant projectors (subject to local and HN restrictions).
- Fourth: Use of physical force (other than weapons fire).
- Fifth: Presentation of deadly force.
- Sixth: Deadly force.

B-2. The I/R commander coordinates with the higher echelon commander and the SJA. He designates representatives who are authorized to direct the use of firearms and riot control agents during riots or disturbances. He includes the rules for using these means in appropriate plans, orders, SOPs, and instructions. He specifies the types of weapons to be used, which are not limited to shotguns and pistols for guarding prisoners.

DEADLY FORCE

B-3. Deadly force causes death or serious bodily harm. It is a destructive physical force against a person using a weapon or equipment that exerts deadly force. Use deadly force in extreme situations, when all lesser means have failed or cannot be used reasonably. Deadly force is authorized for the following reasons:

- **Self-defense and the defense of others.** Deadly force is authorized to protect an MP, a guard, or any person who believes he or others are in imminent danger of death or serious bodily harm.
- **Protection of assets involving national security.** Deadly force is authorized to prevent the theft or sabotage of assets vital to national security.
- **Protection of assets inherently dangerous to others.** Deadly force is authorized to prevent the theft or sabotage of resources, such as operable weapons or ammunition, that are inherently dangerous to others.
- **Serious offenses against persons.** Deadly force is authorized to prevent a serious offense involving violence or a threat of death or serious bodily harm.
- **Arrests and apprehensions.** Deadly force is authorized to arrest or apprehend a person who has committed an offense as specified in bullets 2 through 4 above.
- **Escapes.** The law of land warfare permits deadly force to prevent an EPW or an RP from escaping if he poses a threat of serious bodily harm to security personnel or others. If a CI tries to escape, force can only be used when the ROE authorizes it (see AR 190-8).

NOTE: See AR 190-14 for more information on the use of deadly force.

B-4. The I/R facility commander ensures that soldiers understand the ROE, including the use of the term *halt*, the use of deadly force, and the ban on using physical or imaginary deadlines. He also ensures that EPWs and RPs understand the meaning of the English word *halt*.

B-5. When a prisoner tries to escape, the guard shouts *HALT* three times. He then uses the least amount of force necessary to stop the escape. If there is no other effective means of preventing escape, deadly force can be used. **Do not** fire on a prisoner unless he has cleared the outside fence (barrier, concertina wire, or razor tape) and is making a further effort to escape. **Do not** fire on a prisoner attempting to escape outside a fenced enclosure unless he does not halt after the third command. An escape is successful if a prisoner—

- Reaches the lines of a force of which he is a member or the allies of that power.
- Leaves a territory that is not controlled by the US or its allies.

RULES OF ENGAGEMENT

B-6. Commanders balance the physical security of forces with mission accomplishment and the ROE issued for the mission. The unified commander develops ROE for his forces. They are based on guidance from the national command authority; operational, political, diplomatic, and legal considerations; mission requirements; threat assessments; the law of land warfare; and HN or third-country constraints on deployed forces.

B-7. The political situation may influence the ROE and conflict with physical-security needs. In these cases, commanders weigh the political gains against the risk to the force. They clearly state their objectives with defined

operational limits that allow mission accomplishment and protect deployed forces.

B-8. Restrictions on combat operations and the use of force are clearly explained in the ROE and understood and obeyed at all levels. Soldiers study and train in the use of the ROE and discuss the ROE for their mission. Misunderstandings and actions, no matter how minor, may have far-reaching repercussions because friendly and enemy media can exploit incidents rapidly.

B-9. The ROE address specific distinctions between internee categories and the instruments of control available for each. Use the following issues to develop guidelines:

- What is considered deadly force?
- Under what conditions—
 - Will deadly force be used?
 - Will nonlethal technology be used?
- What are the required warnings (see ARs 190-8 and 190-14) before using force (nonlethal or lethal)?

NONLETHAL WEAPONS

B-10. The DOD defines NLWs as weapons that are explicitly designed and primarily employed to incapacitate personnel or material, while minimizing fatalities, permanent injury to personnel, and undesired damage to property and the environment. Unlike conventional weapons that destroy their targets through blast, penetration, and fragmentation, NLWs employ other means to prevent the target from functioning.

B-11. The NLW doctrine and concepts of operation are designed to reinforce deterrence and expand the range of options available to commanders. They enhance the capability of US forces to accomplish the following objectives:

- Discourage, delay, and prevent hostile actions.
- Limit escalation.
- Take military action in situations where the use of lethal force is not the preferred option.
- Protect US forces.
- Disable equipment, facilities, and personnel.

B-12. The zero probability of producing fatalities or permanent injuries is not a requirement of NLWs. Complete avoidance of these effects is not guaranteed or expected; however, NLWs significantly reduce them as compared to lethal weapons. When drafting the ROE, clearly articulate that using NLWs is an additional means of employing force for the particular purpose of limiting the probability of death or serious injury to noncombatants or belligerents. However, the use of deadly force is an inherent right of individuals when they, their fellow soldiers, or personnel in their charge are threatened with death or serious bodily harm. The use of NLWs adds flexibility when controlling disturbances in an I/R facility by providing an environment where guard forces can permissively engage threatening targets with limited risk of noncombatant casualties and collateral damage (see FM 90-40). Table B-1, page B-4, shows lethal, nonlethal, and ineffective zones of NLWs.

Table B-1. Range of NLWs

NLW	Meters												
	0	5	15	20	25	30	35	50	55	65	95	100	120
MCCM	█	█	█	█	█	█	█	█	█	█	█	█	█
Stun hand grenade	█	█	█	█	█	█	█	█	█	█	█	█	█
12-gauge point	█	█	█	█	█	█	█	█	█	█	█	█	█
12-gauge area	█	█	█	█	█	█	█	█	█	█	█	█	█
40-millimeter point	█	█	█	█	█	█	█	█	█	█	█	█	█
66-millimeter sting ball	█	█	█	█	█	█	█	█	█	█	█	█	█
66-millimeter flash bang	█	█	█	█	█	█	█	█	█	█	█	█	█
66-millimeter CS grenade	█	█	█	█	█	█	█	█	█	█	█	█	█

Lethal zone
 Nonlethal zone
 Ineffective zone

B-13. The use of lethal force under the standing ROE is never denied. Never deploy forces without giving them the ability to defend themselves against a lethal threat. Ensure that they are trained, armed, and equipped for combat. Nonlethal force is a complement to, not a replacement for, lethal force. Expand a proactive response across the range of military operations. Delegate the decision to use NLWs against an adversary during a confrontation to the lowest possible level, preferably to the platoon or the squad. Ensure that all personnel, not just leaders, have a clear understanding of the ROE and the commander’s intent (see FM 90-40).

B-14. Facility commanders consider the use-of-force options discussed in this appendix and AR 190-14 when dealing with disruptions. They substitute nonlethal devices for firearms when they are adequate for MP to safely perform their duties. Currently, MP have the following nonlethal options available for crowd control:

- Riot control agents.
 - O-chlorobenzylidene malonitrile (CS).
 - Oleoresin capsicum (OC).
- MWDs.
- MP clubs.
- Riot batons.

B-15. Commanders and public affairs officers are prepared to address media questions and concerns regarding the use and role of NLWs. They make it clear that the presence of NLWs in no way indicates abandoning the option to employ deadly force in appropriate circumstances.

ADVANTAGES

B-16. The NLWs provide the flexibility to favorably influence a situation with reduced risk of noncombatant fatalities and collateral damage. They are more humane, which is consistent with the political and social intent of humanitarian and peacekeeping missions. The force that properly employs NLWs gains an advantage over forces who rely on lethal options alone because the degree of provocation required to employ these options is substantially less. This advantage provides a proactive posture and a quicker response. It also diminishes the likelihood of a situation escalating to a point where deadly force is required.

B-17. The NLWs are less likely to provoke others; however, they may provoke a negative response. Demonstrated restraint greatly diminishes feelings of anger and remorse when deadly force is required after nonlethal options fail. The NLWs facilitate postincident stabilization by reducing internee alienation and collateral damage.

TRAINING

B-18. Soldiers and leaders are trained in the correct employment of NLWs. They understand the limited use of these systems in environments with restrictive ROE. Their training is continuous at all levels so that they understand when and how to effectively and properly employ NLWs. The incorrect application of NLWs can have significant operational and political ramifications. Well-trained MP leaders who provide timely, clear guidance to soldiers ensure mission accomplishment.

B-19. Many NLWs have maximum-effective and minimum-safety ranges. Individuals struck short of the minimum safety range often suffer severe injuries or death, while the effects of most nonlethal devices are greatly mitigated at longer ranges. Engage the threat within the nonlethal zone, which is beyond the lethal zone and short of the ineffective zone (see Table B-1).

B-20. When training with and planning for the use of NLWs—

- Never apply them in situations where deadly force is appropriate.
- Never apply them in situations that will place troops in undue danger.
- Always cover them with deadly force.

TACTICS

B-21. Establish riot control teams that have a minimum response time. Due to the physical nature of riot control, individuals in riot control formations do not carry long rifles. Lethal attachments follow closely behind riot control formations to provide lethal coverage for the entire formation.

B-22. During a nonlethal engagement, a designated marksman supplies lethal overwatch to provide confidence and safety to those facing a riot. The marksman is in an overwatch position and armed with a standard infantry rifle, mounted with a high-powered scope. If a lethal threat is presented, he can scan the crowd to identify agitators and riot leaders for apprehension. He can also fire lethal rounds if warranted. Designated marksmen are ideally suited for flank security and countersniper operations.

NOTE: See FM 90-40 for an in-depth discussion on the tactics associated with employing NLWs.

CROWD DYNAMICS

B-23. A commander considers crowd control and the dynamics caused by several people living in close quarters. Generally, he is concerned with two types of disturbances—riots and disorders. Prisoners may organize disturbances within an I/R facility to wear down the guard force.

B-24. Simply being a part of a crowd affects a person. Each person is open to actions that are different from his usual behavior. For example, crowds provide a sense of anonymity because they are large, often temporary, congregations. Crowd members often feel that their moral responsibility has shifted from themselves to the crowd as a whole. Large numbers of people discourage individual behavior, and the urge to imitate is strong in humans. People look to others for cues and disregard their own background and training. Only well-disciplined persons with strong convictions can resist conforming to crowd behavior. Crowd behavior influences the actions of disorderly participants and the authorities tasked to control them.

B-25. Under normal circumstances, a crowd is orderly and does not present a problem to authorities. However, when crowd behavior violates laws or threatens life or property, a disturbance ensues.

CROWD BEHAVIOR

B-26. The presence or absence of social factors (leadership, moral attitudes, and social uniformity) may influence crowd behavior. Leadership has a profound effect on the intensity and direction of crowd behavior. When blocked from expressing its emotions in one direction, a crowd's frustration and hostility may be redirected elsewhere. The first person to give clear orders in an authoritative manner may become the leader. Agitators can exploit the crowd's mood and convert a group of frustrated, resentful people into a vengeful mob. Skillful agitators, using clandestine communications within an I/R facility, can reach large portions of the population and incite them to unlawful acts without having direct personal contact. In an I/R environment, any crowd can be a threat to L&O because it is open to manipulation.

B-27. Crowd behavior may be affected by panic or emotional contagion, which provides psychological unity. The unity is usually temporary, but it may be long enough to push a crowd to mob action. When emotional contagion prevails, normal L&O are suppressed, increasing the potential for violence. Panic can occur during a disturbance when—

- Crowd members perceive that their safety is at risk and they attempt to flee the area.
- Crowd members cannot disperse quickly after exposure to riot control agents.
- Escape routes are limited, blocked, or congested.

B-28. Members of the control force are also susceptible to crowd behavior. They may become emotionally stimulated during a tense confrontation and must exercise individual and collective restraint. Rigorous training, firm and

effective leadership, and complete awareness and understanding of the ROE and the ROI are necessary to offset the effect of crowd contagion on the control force.

CROWD TACTICS

B-29. In disturbances, crowds employ any number of tactics to resist control and achieve their goals. Tactics may be planned or unplanned and violent or nonviolent. The more purposeful the disturbance, the more likely the possibility of well-planned tactics.

Nonviolent Tactics (Disorders)

B-30. Nonviolent tactics include name calling, conducting demonstrations, refusing to work or eat, participating in a work slowdown, damaging or destroying property, and building barricades. Demonstrators may converse with control force members to distract them or gain their sympathy. They may use verbal abuse such as obscene remarks, taunts, ridicules, and jeers. Crowd members want to anger and demoralize the opposition, and they want authorities to take actions that can later be exploited as acts of brutality.

B-31. In compounds where women, children, and elders are interned, they may be placed in the front ranks of the demonstration to discourage countermeasures by the control force. When countermeasures are taken, agitators try to stir public displeasure and embarrass the control force through the media. Internees may form human blockades to impede movement by sitting down in footpaths or entrances to buildings within the compound. This disrupts normal activity and forces control personnel to remove demonstrators physically. Demonstrators may lock arms, making it hard for the control force to separate and remove them, so that it appears the control force is using excessive force.

B-32. Nonviolent tactics include the following types of disorders:

- **Demonstrations.** Demonstrations are actions by groups of people whose behavior, while not violent, is in conflict with those in authority. They are characterized by unruliness and vocal expressiveness without violence. Demonstrations may be organized in celebration of national holidays or as protests against food, clothing, living conditions, or treatment.
- **Refusal to work or eat.** Housed personnel may refuse to work or eat, collectively or individually, as a means of harassing the detaining power or in an attempt to gain concessions from the detaining power. This type of disorder can normally be controlled by promptly isolating and segregating offenders and ringleaders.
- **Work slowdown.** Housed personnel may initiate a deliberate work slowdown to delay the completion of projects, thereby harassing the detaining power. Disorders of this nature can also be controlled by promptly isolating and segregating offenders and ringleaders.
- **Damage or destruction of property.** Housed personnel often damage or destroy property to harass the detaining power, to impede or prevent normal operation of the facility, or for tactical purposes.

This type of disorder can normally be controlled by identifying, isolating, and segregating offenders.

- **Unorganized disorders.** Unorganized disorders are spontaneous and are started by the actions of a single individual. Like all disturbances, their prompt control is essential.

Violent Tactics (Riots)

B-33. Violent crowd tactics can be extremely destructive. They include attacking other internees, guards, or government property and setting fires or bombings for escape, grievance, tactical, or political advantages. The attitude and ingenuity of crowd members, the training of their leaders, and the materials available are the only limits to violent crowd tactics. Crowd or mob members may commit violence with crude, homemade weapons or anything else that is available. If violence is planned, crowd members conceal makeshift weapons or tools for vandalism.

B-34. Crowd members can erect barricades to impede movement or to prevent the control force from entering an area or a building. They may use vehicles, trees, furniture, fences, or other material to build barricades. In an effort to breach barriers, rioters may throw grapples into wire barricades and drag them. They may use grapples, chains, wires, or ropes to pull down gates or fences to effect a mass escape. They may use long poles or homemade spears (tent poles) to keep control forces back while removing barricades or to prevent the use of bayonets.

B-35. Rioters can be expected to vent their emotions on individuals, troop formations, and control force equipment. They may throw rotten fruits and vegetables, rocks, bricks, bottles, or improvised bombs. They may direct dangerous objects (vehicles, carts, barrels, or liquids) at troops located on or at the bottom of a slope. They may drive commandeered vehicles toward troops to scatter the control force formation and jump out of vehicles before reaching roadblocks and barricades. Rioters may set fire to buildings or vehicles to block the advance of the control force formation, create confusion and diversion, destroy property, and mask escapes. Types of riots include—

- **Organized riots.** Leaders of housed personnel reorganize the internee population into quasi-military groups. The groups are capable of developing plans and tactics for riots and disorders. Riots can be instigated for—
 - **Escapes.** Leaders organize a riot as a diversion for an escape attempt by selected individuals or small groups or for a mass escape attempt.
 - **Political purposes.** Riots are often organized for propaganda or to embarrass the detaining power in its relations with protecting powers and other nations. They may also be organized to intimidate individuals or groups that may have been cooperative with the detaining power.
 - **Grievance protests.** A grievance protest can be organized as a riot. Under normal circumstances, this type of riot is not extremely violent in nature. It may turn violent when leaders try

to exploit the successes of the riot or the weaknesses of the detaining power.

- **Tactical purposes.** Riots are often organized for the sole purpose of diverting the detaining power, thereby limiting its ability to perform the mission.
- **Unorganized riots.** Unorganized riots are spontaneous, although they can be exploited and diverted by leaders into different types of riots. They may begin as a holiday celebration, a group singing, or a religious gathering. Under determined leadership, the pattern of these gatherings can change to an organized riot.
- **Multiple riots.** When housed personnel in one compound start rioting, personnel in other compounds may also riot. To meet this situation with only one riot control force available, the force commander first subdues the most riotous compound. He also employs riot control teams to contain the other compounds where rioting is taking place until the riot control force is free to subdue offenders. If another alert force is available, it channels additional rioters to a different area than the original rioters.

RECORD OF EVENTS

B-36. Initiate a record of events to provide a basis for preparing and submitting a formal report to higher headquarters. Include the—

- Time the incident was reported and by whom.
- Time the enclosure commander reported to his commander.
- Time the riot control force was alerted.
- Time the riot control force commander reported to the affected enclosure.
- Time the riot control force entered the enclosure.
- Weather conditions as they relate to the use of riot control munitions, the types and amounts used, and their results and effects.
- Number of US personnel injured or killed, a description of how they were injured or killed, and the medical attention they received.
- Number of housed personnel injured or killed, a description of how they were injured or killed, and the medical attention they received.
- Time the operation was completed and when the riot control force cleared the enclosure.

RIOT CONTROL MEASURES

B-37. The commander exercises effective control of internees by quickly restoring order. Have a well-developed, well-rehearsed plan for defusing tense situations, handling unruly captives, and quelling riots. Because of the differences in I/R facilities, consider the—

- Terrain features.
- Types of structures.
- Number of internees.
- Size of control forces.

B-38. Restore order using the least amount of force possible. The PSYOP resources often play an effective role in restoring order to the compound. If necessary, use riot control agents (CS and OC) and NLWs to incapacitate rioters.

B-39. Preplan riot control measures before a crisis occurs. Control forces will be prepared to react in an emergency and can successfully contain and neutralize the situation. The preplanning process includes training, planning, and intelligence gathering.

TRAINING

B-40. Train the QRF and associated teams in the five basic riot control formations—line, wedge, echelon, diamond, and circle—on a regular basis. Establish a continuous training program that includes—

- Law of land warfare principles, specifically the provisions of the Geneva Conventions.
- Supervisory and human relations techniques.
- Self-defense methods.
- The use of force (riot batons, M16 with and without bayonet, and fatal areas of the body to avoid when using them).
- Weapons familiarization and qualification.
- Public relations.
- First aid.
- Emergency plans.
- Compound regulations.
- Intelligence and counterintelligence techniques.
- Cultural customs, habits, and religious practices.
- Simple training in internees' language.
- The use of riot control agents and the various methods of dispersing them.
- The use of NLWs.

B-41. Ensure that personnel assigned or attached to I/R facilities are oriented and specially trained in the custody and control of EPWs and CIs. Everyone working in the compound must be fully cognizant of the provisions of the Geneva Conventions as they apply to EPWs, CIs, and soldiers who are guarding prisoners.

PLANNING

B-42. The planning process begins during the preplanning process. When the QRF is alerted of a riot situation, leaders and members further develop preplans to fit the situation. This planning process is essential to successfully contain and neutralize a riot. When using riot control agents, ensure that plans are flexible enough to accommodate changes in the situation and weather. Consider the strict accountability and control required when employing riot control agents. They can be employed only when the commander specifically authorizes their use, and their use must be reported.

B-43. Other planning factors to consider are the weather; the cause, nature, and extent of the disturbance; and the demeanor and intent of the gathered EPWs. Based on an analysis of these factors, the commander makes an estimate (as thorough as time permits) of the situation. He considers a course of action, selects riot control agents, and determines munition needs.

B-44. Plans also address the security of riot control agents during storage, transportation, and employment. The wind direction, the size of the area, and the proximity of civilian communities may preclude the use of large quantities of riot control agents. In such cases, it may be necessary to use low concentrations to break up a crowd into smaller groups.

B-45. When dealing with a large group of rioting EPWs, plans should indicate how the control force channels and controls EPW movement in a specific direction. This is usually to an area where another force is waiting to receive, hold, and search them. Include information on how riot control agents are employed to cover the target area with a cloud of sufficient strength to produce desired results. Once the proper concentration is reached, the control force maintains the concentration until rioters are channeled into the predetermined area. When dispersers are used, the dispersal team maintains the concentration by moving along the release line at an even rate and repeating the application as necessary.

B-46. During a riot, another riot may start in a neighboring compound, so ensure that contingency plans are in place to subdue it also. Quell the most riotous compound first, and then move to the next. Employ riot control teams to contain other compounds where rioting is taking place until a riot control force is free to subdue them.

B-47. Include serious-incident reporting procedures in riot control plans. Initiate a record of events to provide a basis for preparing and submitting a formal report to higher headquarters. (See paragraph B-36.)

INTELLIGENCE GATHERING

B-48. The preplanning process also includes intelligence gathering. It includes maintaining updated drawings of the I/R compound and identifying potential threats from within the EPW population. (See Chapter 3.)

RIOT CONTROL AGENTS

B-49. There are two riot control agents used to quell riots and disperse crowds. They are CS and OC.

O-CHLOROBENZYLIDINE-MALONITRILE

B-50. The CS is effective in very small quantities, and its effect on eyes and respiratory systems are realized within seconds. It causes an extreme burning sensation in eyes, an abundant flow of tears, coughing, breathing difficulty, tightness in chest, involuntary closing of eyes, stinging sensation on moist-skin areas, and sinus and nasal drip. High concentrations also cause nausea and vomiting, especially when ingested. The effects last 5 to 10 minutes after individuals are removed from the contaminated area and placed

in a clean area. Exposure to CS makes individuals incapable of executing organized or concerted actions.

B-51. Administer first aid to victims by moving them to uncontaminated areas and facing them into the wind. Caution them not to rub their eyes, and keep affected people well apart. Have victims shower with cool water for 3 to 5 minutes and then proceed with normal showering. For gross contamination, flush victims' bodies with large amounts of cool water, wash them with a 5 percent sodium bisulfite solution (except in and around their eyes), and flush them again with water. (A 1 percent sodium carbonate or sodium bicarbonate solution can be substituted for the sodium bisulfite solution.)

B-52. The CS is delivered by a variety means—bursting, aerosol, 37-millimeter and 12-gauge projectiles, and fogging. It has the greatest effect when there is little or no wind, and effectiveness is greatly diminished by rain. The persistency of CS varies according to wind conditions. The powder form persists longer in still air and in wooded terrain, and it should not be used in areas where lingering contamination could cause problems.

OLEORESIN CAPSICUM

B-53. The OC provides a safe, effective alternative to traditionally employed riot control agents. When used properly, it turns the most violent offender into a docile, cooperative individual who no longer poses a threat to others. It diverts the threat's attention from making or continuing an assault. **NOTE: HN laws may prohibit or restrict the use of certain chemical compounds, such as OC.**

B-54. The OC is not a chemical agent, but it is 750 times more powerful than CS. It is an organic, naturally occurring, inflammatory compound that is derived from a blend of 300 varieties of pepper plants. As an inflammatory agent, OC causes swelling of eyes and breathing passages almost immediately. When inhaled, the respiratory tract is inflamed and breathing is restricted to short, shallow breaths. However, it does not shut down the respiratory system. The physiological response increases OC's effectiveness, regardless of the subject's emotional or physical state. It is effective against emotionally disturbed individuals, persons under the influence of drugs or alcohol, and domestic and wild animals.

B-55. The OC causes intense burning of exposed skin, dilation of capillaries, swelling of eyelids, burning and involuntary closing of eyes, uncontrollable coughing, gagging, gasping for air, temporary loss of strength and coordination, and a change in skin color (slight to bright red). The effects of OC last 30 to 40 minutes after removal to fresh air. There is no permanent damage to the respiratory system, eyes, or skin.

B-56. There is a risk of fatalities in persons with preexisting respiratory or cardiac conditions. Ensure that medical support is readily available when using OC in a civilian/refugee situation to prevent injury or death if an individual fails to recover.

B-57. Disadvantages of OC include—

- Canisters will depressurize over time if they are not checked regularly.
- Criminals have access to OC and may use it against the control force.

- Canisters must be shaken on a regular basis.
- Individuals from cultures that use cayenne pepper on a regular basis may become immune to OC.
- Rain decreases the effectiveness and requires a longer spray duration.
- Strong winds decrease effectiveness and can result in blowback that might contaminate control forces.

DISSEMINATION OF CHEMICAL IRRITANTS

B-58. There are five methods of dissemination for chemical irritants. They are pyrotechnic, bursting, aerosol, fogging, and a multipurpose grenade.

Pyrotechnic

B-59. The irritant and an inert material are placed in a canister that is ignited when the device is activated. The irritant is carried into the air on smoke particles of the inert material. This method of dissemination has the following disadvantages:

- May cause a fire.
- Has a very slow saturation time.
- Takes 40 to 45 seconds to completely burn.
- Can be thrown back even while burning.

Bursting

B-60. The irritant and an inert powder are contained in a serrated canister. After a small detonation, the canister splits and expels the irritant in the form of a cloud. This method of dissemination has the following advantages and disadvantages:

- **Advantages.**
 - Has no risk of fire.
 - Cannot be thrown back.
 - Disseminates quickly.
 - Is very effective, easy to carry, and easy to control.
- **Disadvantages.**
 - The canister may fragment when detonated.
 - The fuse head may separate from the canister.
 - The percentage of irritant disseminated is 50 to 90 percent.
 - The direction of the cloud formation depends on where the device is detonated.

Aerosol

B-61. The irritant is suspended in an inert liquid located in the rear of a projectile. When the projectile strikes a structure and penetrates, the rear portion splits open and the irritant is disseminated in the form of a mist. The aerosol device is the most appropriate for tactical operations when chemical irritants are used before entry. This method of dissemination has the following advantages and disadvantages:

- **Advantages.**

- Is easy to carry and control.
- Can be deployed with 40-millimeter, 37-millimeter, or 12-gauge ammunition.
- Disperses contents quickly.
- Is accurate (fin-stabilized), but practice firing is necessary.
- **Disadvantages.**
 - May cause injury if fired from close range.
 - May strike a weak portion of a structure.

Fogging

B-62. The irritant is suspended in a fogging solution and dispersed with a fogging machine. It is used for riot control and crowd dispersal. This method of dissemination has the following advantages and disadvantages:

- **Advantages.**
 - Is capable of producing enough irritant to cover 100,000 cubic feet of an enclosed area in 26 seconds.
 - Disseminates very quickly.
 - Has high-volume capabilities.
- **Disadvantages.**
 - Is too noisy for a close-in tactical situation.
 - Is cumbersome and not recommended for tactical operations.

Multipurpose Grenade

B-63. A multipurpose grenade can be hand-thrown or launched from a shotgun with an adapter. It has an extended shelf life of 6 years and an adjustable fuse delay of 2 to 5 seconds. The irritant is located in the cylinder portion of the device and is forced out the bottom of the grenade upon detonation.

WARNING

Injury to your hand may result if a multipurpose grenade is deployed incorrectly. Observe all safety rules.

POSITIONS

B-64. Riot control formations are usually equipped with riot batons, rifles (with or without bayonets), or shotguns. All personnel use the right hand grip when holding a baton or a weapon. This presents a uniform, formidable appearance to rioters, eliminates weak spots in the formation caused by inconsistent weapon positions, and is safer for soldiers in close movements. (See STP 19-95B1-SM for more information on individual movements and positions.)

BATONS

B-65. Three steps are necessary to obtain a secure grip on the riot baton. This method of gripping the baton provides a secure grasp, and the baton can be released quickly by simply relaxing your hand.

Step 1. Place the thong of the baton around your right thumb.

Step 2. Hold the baton so that the thong hangs over the back of your hand.

Step 3. Roll your hand into the baton handle so that the thong is pressed against the back of your hand.

B-66. There are three baton positions used in riot control. They are parade rest, port, and on guard:

- **Parade rest position.** The parade rest position is a relaxed, ready position. Your feet are shoulder width apart, both arms hang naturally in front of your body, and the baton is horizontal. Your left palm is facing out, and your right palm is facing in toward your body. Your hands are about 6 inches from the ends of the baton.
- **Port position.** The port position is a ready position. It is particularly well suited for individual defense. Your right hand and forearm are parallel to the ground, and your left hand is level with your left shoulder. The striking end of the baton bisects the angle between your neck and left shoulder. The baton is held about 8 inches from your body, and your feet are shoulder width apart.
- **On-guard position.** The on-guard position is a ready position. Do not maintain it for long periods of time, because it is tiring. Your left foot is placed forward of your right foot. Your feet are spread apart, and your knees are slightly bent. Your right hand and the butt end of the baton are placed snugly against your hip. Your body is bent slightly forward at your waist. Your left arm is bent so that your forearm protects your throat area, yet allows a thrust to be made. From the on-guard position, soldiers can execute a—
 - **Short thrust.** Rapidly step forward with your left foot, and drive the striking end of the baton into a vulnerable point of the opponent's body. Return to the on-guard position after delivery.
 - **Long thrust.** Rapidly step forward with your right foot, and thrust the striking end of the baton into a vulnerable point of the opponent's body. Return to the on-guard position after delivery.
 - **Butt stroke.** Advance your body rapidly off your right foot, and snap the butt end of the baton to the left, striking the opponent's shoulder or jaw. Return to the on-guard position after delivery.

Baton Smash

B-67. A baton smash can be delivered from a parade rest, port, or on-guard position. Hold the baton horizontal to the ground, about chest height. Advance your left foot rapidly, snap both arms straight, and smash the length of the baton across the opponent's chest. Return to the on-guard position after delivery.

Fatal Areas

B-68. Do not use a riot baton to strike a fatal area (the head, the side of the neck, the throat, the heart area, or the armpit). Do not raise a riot baton above your head to strike an adversary in club fashion. It is likely to cause permanent injury and also projects an unfavorable image of the control force.

B-69. Soldiers use riot batons to defend themselves against armed and unarmed attackers. Use the baton to block or deflect an opponent's blow; then counter with a thrust, a butt stroke, or a baton smash. These defensive techniques can be performed from any position.

NOTE: See FM 19-15 for detailed information on using a riot baton.

WEAPONS

B-70. There are three weapon positions used in riot control—safe-port, safeguard, and on-guard positions.

- **Safe-port position.** The safe-port position is quite effective when making a show of force. It is similar to the port arms position in FM 22-5, except the weapon is raised until your left, upper arm is parallel with the ground. In this elevated position, participants in the rear of the crowd can see bayonets. The sight of bayonets creates an impression of strength and numerical superiority. Do not keep troops in this position long because it is very tiring. The control force moves into and assembles from all riot control formations with weapons in the safe-port position. Upon receiving the preparatory command to move into or assemble from a riot control formation, soldiers assume the safe-port position.
- **Safeguard position.** This is a position of semireadiness. It is less tiring than the on-guard position and is used to rest troops when circumstances permit. As troops advance, they maintain the safeguard position until contact is made or resistance is expected. The safeguard position is also used when troops are pursuing a crowd that is withdrawing without resistance. In the safeguard position, your right hand is against the right side of your waist, and the weapon is pivoted forward until the bayonet is at the crowd's throat level.
- **On-guard position.** This is a position of complete readiness. It is used when troops are in contact with a group that is showing resistance or hesitation to withdraw. Assume the on-guard position from the safeguard position. Place your feet a comfortable distance apart, and align your left heel with your right toe. Bend your knees slightly and lean forward at your waist, keeping the bayonet at throat level. Do not keep troops in this position long because it is very tiring. Rest troops when circumstances permit.

FORMATIONS

B-71. The five basic formations for riot control operations are line, wedge, echelon, diamond, and circle. Apprehension teams normally use diamond and circle formations. Small teams, squad-sized elements, and augmented squads

are not used for crowds, but they are used by larger riot control forces to snatch or protect.

B-72. Line, wedge, and echelon formations are trained at squad level and above; but they are normally used by platoon- and company-sized units. Squad line, echelon left, echelon right, and wedge formations are the basis for platoon and company formations. Each squad must be adept in the basic formations before practicing in platoon-sized or larger formations. Any size unit can be employed, and a riot control formation can be adapted to fit a unit's organization. (See STP 19-95B1-SM for more information on formations.)

B-73. The platoon headquarters for riot control formations consists of a platoon leader, a platoon sergeant, a selected marksman, and a radio operator or messenger. Figure B-1 shows symbols for a formation element. When directed by the platoon leader, disperser operators, firefighters, and others may augment the platoon headquarters.

Figure B-1. Symbols for a Formation Element

B-74. The control force moves to the site of a disturbance in a column formation and then executes a riot control formation on site. To form a riot control formation from a column formation, the platoon leader moves to the right of the platoon and faces troops when giving commands. He gives the arm-and-hand signal and the preparatory command. On the execution command *MOVE*, he points to the approximate location where he wants the platoon to form. The platoon leader pauses between the preparatory command and the execution command to allow each squad leader to issue a preparatory command to his squad.

B-75. In a three-squad platoon, the first and third squads are usually the lead elements in formations when one squad provides general or lateral support. The support squad, when held in general support, may be in a single column or a column of twos. The following examples presume that the second squad is the support squad.

B-76. When the support squad moves from general support to lateral support or to extend the existing formation, the even-numbered members move to the right and the odd-numbered members move to the left. The squad leader

usually controls the even-numbered members, and the assistant squad leader controls the odd-numbered members. To assemble the support squad from any position to general support, the platoon leader commands *SECOND SQUAD IN SUPPORT, MOVE*. The second squad then returns to a column behind the line formed by the other two squads.

LINE FORMATION

B-77. The line formation (Figure B-2) is used the most because of its offensive and defensive applications. As an offensive formation, it is used to push or drive crowds straight back, across an open area, or up a city street. As a defensive formation, it is used to hold crowds or deny access to restricted streets or areas.

Figure B-2. Line Formation

B-78. The command for forming a platoon line is *PLATOON AS SKIRMISHERS, MOVE*. The second squad moves forward to the point designated by the platoon leader. The number two man of the second squad is the baseman for the platoon formation. The—

- Second squad forms a squad line to the right of the baseman.
- First squad forms a squad line to the left of the second squad.
- Third squad forms a squad line to the right of the second squad.
- First and third squads dress on the second squad.

B-79. When assembling a platoon from the line formation, the platoon leader and headquarters personnel take a position to the rear of the platoon. The platoon leader gives the command *PLATOON ASSEMBLE, MOVE*. He raises his right arm and makes a circular motion above his head. The squad leader of the second squad commands *FOLLOW ME* and double-times to the designated spot. Other squad members follow the squad leader. As the second squad clears the line formation, the first and third squad leaders command *FOLLOW ME* and double-time toward the platoon leader, dressing on either

side of the second squad. All squads halt automatically behind the platoon headquarters and dress.

WEDGE FORMATION

B-80. The wedge formation (Figure B-3) is an offensive formation that is used to penetrate and split crowds. The command for forming the platoon wedge is *PLATOON WEDGE, MOVE*. The second squad executes a squad wedge at the point designated by the platoon leader. The squad wedge consists of an echelon left of the odd-numbered members and an echelon right of the even-numbered members, with the baseman at the apex of the wedge. The first and third squads form echelons left and right, respectively, of the second squad.

Figure B-3. Wedge Formation

B-81. Assembling from a wedge formation is similar to assembling from a platoon echelon. The second squad assembles first. On the command *PLATOON ASSEMBLE, MOVE*, the second squad leader moves to the point designated by the platoon leader. The second squad assembles behind the squad leader in numerical order. The first and third squads move into column formation to the left and right of the second squad, respectively, and dress on the second squad.

ECHELON FORMATION

B-82. The echelon formation (Figure B-4, page B-20) is an offensive formation. It is used to turn or divert groups in open or built-up areas and to move crowds away from buildings, fences, and walls. An echelon formation can be an echelon right or an echelon left, depending on the direction in which the crowd is to be moved.

Figure B-4. Echelon Left Formation

Platoon Echelon Left

B-83. The command for forming a platoon echelon left is *PLATOON ECHELON LEFT, MOVE*. The third squad baseman posts himself at the location designated by the platoon leader. Remaining squad members position themselves one step back and one step to the left of the preceding soldier. As each squad clears the column, the next successive squad moves out and extends the echelon that has been formed.

B-84. To assemble the platoon from an echelon left, the commander takes his position to the rear of the formation with the platoon headquarters. On the command *PLATOON ASSEMBLE, MOVE*, the third squad moves and forms a column at the point designated by the platoon leader. The first and second squads assemble in column formation to the left of and dressed on the third squad.

Platoon Echelon Right

B-85. The command for forming a platoon echelon right is *PLATOON ECHELON RIGHT, MOVE*. The first squad baseman posts himself at the location designated by the platoon leader. Remaining squad members position themselves one step back and one step to the right of the preceding soldier. As each squad clears the column, the next successive squad moves out and extends the echelon that has been formed.

B-86. To assemble a platoon from an echelon right, the commander takes his position to the rear of the formation with the platoon headquarters. On the command *PLATOON ASSEMBLE, MOVE*, the first squad moves and forms a column at the point designated by the platoon leader. The second and third squads assemble in column formation to the right of and dressed on the first squad.

DIAMOND FORMATION

B-87. The diamond formation (Figure B-5) can be used as an offensive formation or a defensive formation. It is used by riot control forces when they enter a crowd to apprehend ringleaders. The diamond formation is also useful when 360-degree security is needed.

Figure B-5. Diamond Formation

CIRCLE FORMATION

B-88. The circle formation (Figure B-6) is used for the same purposes as a diamond formation. It is used for dispersed and nonviolent crowds, where the diamond formation is used when the formation must break into or out of a crowd.

Figure B-6. Circle Formation

VARIATIONS

B-89. Many suitable variations of riot control formations can be employed. Ensure that appropriate commands and signals are devised to execute the formations. Due to their complicated nature and the coordination required, practice the formations extensively before actually using them in a riot.

FORMATION ENHANCEMENTS

B-90. Riot control formations may require enhancement. They can be very tiring and stressful for troops on line, especially when faced with a hostile crowd. The crowd may try to break through the control force to reach a protected facility or to disrupt the efforts of the control force. Likewise, a

determined crowd may refuse to give way to an advancing control force if they believe the line is not solid. Other elements of the control force can be positioned in general, lateral, or close support of the main line as needed. When all the troops in the unit are not required on line at the same time, the remaining elements can be kept in general support. Elements in general support are immediately available to provide lateral or close support as the situation changes.

Platoon Formation With General Support

B-91. The command for forming a platoon formation with a squad in general support (Figure B-7) is *PLATOON AS SKIRMISHERS (ECHELON LEFT, ECHELON RIGHT, WEDGE), SECOND SQUAD IN SUPPORT, MOVE*. The first and third squads execute the formation, and the second squad remains in column formation. The number two man of the third squad is the baseman for the formation.

Figure B-7. Platoon Line, 2d Squad in General Support

B-92. The command for forming a platoon formation with one squad in general support in a column of twos is *PLATOON AS SKIRMISHERS (ECHELON LEFT, ECHELON RIGHT, WEDGE), SECOND SQUAD IN SUPPORT IN COLUMN OF TWOS, MOVE*. The first and third squads execute the formation. The second squad, at the command of its squad leader, executes a column of twos to the right.

B-93. To assemble a platoon with a squad in general support, the procedure is the same as for a formation without support, except the second squad does a countercolumn. The third squad then dresses on the right of the second squad, and the first squad dresses on the left of the second squad.

Platoon Formation With Lateral Support

B-94. Troops deployed in lateral support (Figure B-8) extend the sides of a formation and prevent access to the rear of the formation. The command for forming a platoon formation with lateral support is *PLATOON AS SKIRMISHERS (ECHELON LEFT, ECHELON RIGHT, WEDGE), SECOND SQUAD IN LATERAL SUPPORT, MOVE*. The first and third squads execute the formation, while the second squad stands fast. When the formation is formed, the odd-numbered members of the second squad form in column formation behind the last man of the first squad and the even-numbered members form in column formation behind the last man of the third squad.

Figure B-8. Platoon Echelon Right, 2d Squad in Lateral Support

B-95. To move the second squad from general support to lateral support, the platoon leader commands *SECOND SQUAD, LATERAL SUPPORT, MOVE*. To have the second squad join the formation from general or lateral support, the platoon leader commands *SECOND SQUAD, EXTEND THE LINE (WEDGE), MOVE*. The second squad moves out—odd-numbered members to the left and even-numbered members to the right—to extend the formation of the first and third squads.

B-96. To assemble the platoon from a platoon formation with lateral support is nearly the same as for the platoon line. However, the number two men of the second and third squads do a right face and a left face, respectively, toward their squad leaders. On the execution command, the first and third squads move to the point designated by the platoon leader. As the first and third squads clear the formation, the second squad moves.

Platoon Formation With Close Support

B-97. Troops in close support (Figure B-9) reinforce the line to prevent the crowd from breaking through the control force. This is done by putting a second line of soldiers at a close interval behind the lead element, covering the interval between the soldiers in the lead formation.

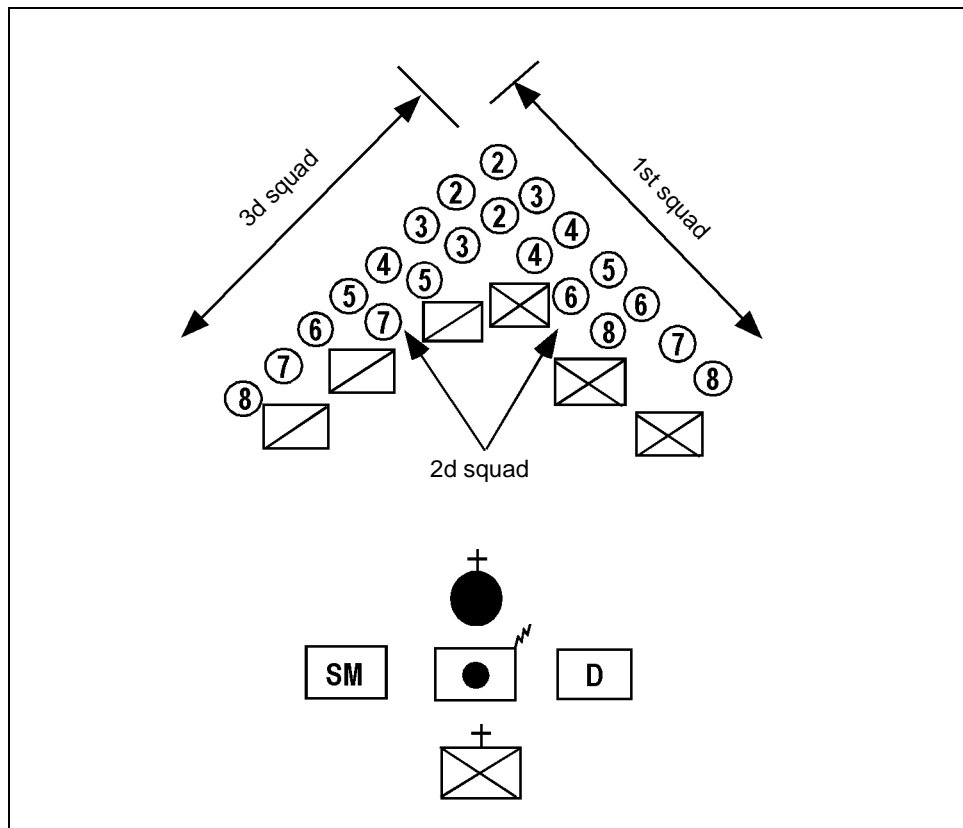

Figure B-9. Platoon Wedge, 2nd Squad in Close Support

B-98. The command for forming a platoon formation with a squad in close support is *PLATOON AS SKIRMISHERS (ECHELON LEFT, ECHELON RIGHT, WEDGE), SECOND SQUAD IN CLOSE SUPPORT, MOVE*. The first and third squads execute the primary formation. After the first and third squads are in position, the second squad executes the same formation to the rear of the first formation and closes in on it. The soldiers in the supporting formation shift to cover the intervals between soldiers in the first formation.

Vehicles

B-99. When a control force encounters large riot groups, they can employ vehicles and troops on foot in riot control formations. Employ armored vehicles when practical because they have a strong psychological effect and offer protection for occupants. Consider the following when using vehicles in riot control formations:

- A windshield with safety glass offers some protection in the upright position and minimizes the danger of injury from glass fragments. However, if paint or other obscurants strike the glass, the operator may be unable to see well enough to operate the vehicle safely.
- A wooden or metal frame strung with razor wire and mounted across the front of a vehicle enhances the vehicle's usefulness as a mobile barrier and increases its psychological impact.
- A dismounted formation walking alongside the vehicle may be needed to keep rioters from reaching the sides and rear of the vehicle.

Formation Variations

B-100. During riot control operations, the platoon leader may rotate squads in the lead elements of the formation to give them a rest. He is not limited to using only the squads specified in the preceding examples as the lead elements. By changing the preparatory command, he can choose other squads to lead the unit. For example, if he wants the first and second squads to lead a platoon wedge, he issues the command *PLATOON WEDGE, THIRD SQUAD IN SUPPORT, MOVE*. By designating the support squad in the preparatory command, the platoon leader tells the remaining squads that they will lead the formation.

B-101. The platoon leader may also relieve squads in the lead element by forming the same formation with support squads. The support element then passes through the lead element. This procedure is often necessary when soldiers don protective masks to employ riot control agents.

COMMANDS

B-102. Commands can be given to riot control units in formation orally or with hand signals. Normally, both verbal and nonverbal commands are given. All formation commands are given in two counts—a preparatory command followed by an execution command. All movements into or recovering from riot control formations are performed at the halt.

B-103. The formation commander faces the troops and gives the preparatory oral command, accompanied by the appropriate visual command. On the execution command, the leader drops both arms and points to the position where he wants the element to form. The formation commander gives the following visual commands:

- **Echelon left.** Extends left arm upward at a 45-degree angle and right arm downward at a 45-degree angle, simulating the intended formation.

- **Echelon right.** Extends right arm upward at a 45-degree angle and left arm downward at a 45-degree angle, simulating the intended formation.
- **Line formation.** Extends both arms parallel to the ground.
- **Wedge formation.** Extends both arms downward at a 45-degree angle, forming a wedge.
- **Diamond formation.** Extends both arms above his head, bending elbows slightly and touching fingertips together.
- **Circle formation.** Extends both arms above his head, bending elbows slightly and touching fingertips together, then makes a circular motion with his right hand.
- **Assemble from a riot control formation.** Extends right arm upward and makes a circular motion.

B-104. The oral rifle commands for safe port, safeguard, and on guard and the baton commands for parade rest, port, and on guard are given in one count. Do not rely on oral commands completely, especially with the added noise from vehicles, helicopters, and crowds. Plan to use alternate methods for relaying commands.

B-105. While in the assembly area, each squad leader has his squad count off. The squad leader is always number 1, and the baseman for the formation is number 2. The number each soldier is assigned during the count off determines his position in his unit's control formation. The unit marches in column formation from the assembly area to the disturbance site. It halts a reasonably safe distance from the crowd, within plain view of it. The on-site commander decides the riot control formation to use and the size of the element to commit.

B-106. On the preparatory command, troops assume the safe-port position. On the execution command, troops form the formation with the baseman posting himself at the location pointed to by the element leader. As troops reach their proper positions, they face the direction of the unit's intended advance and come to a halt. They remain halted in the safe-port position and await further orders. Once the troops are in the riot control formation, the commander commands *SAFEGUARD* and issues the proclamation. Following the proclamation, the commander informs disturbance participants that they have a specific time in which to comply with the order to disperse. If participants fail to disperse within the given time, the commander employs measures needed to disperse the crowd.

B-107. When a rifle-equipped formation is commanded to safeguard or on guard, the commands are for the lead element only and the support elements come to port arms. Similarly, when a baton-equipped formation is commanded to port or on guard, the general or lateral support elements assume the port position. Members of support elements give a resounding stomp with their left feet when the lead element goes to on guard. On the command *FORWARD, MARCH*, the support element maintains the same half step as the lead element.

CADENCE

B-108. The usual cadence for moving troops is as follows:

- **Into and out of a riot control formation.** Double time (180 steps per minute). Troops are at safe port with a rifle or at port with a baton when performing these maneuvers.
- **Safeguard position.** Quick time (120 steps per minute).
- **On-guard position.** Cadence is 60 steps per minute. For psychological effect, troops usually accentuate each left step with a stomp.

B-109. The commander may increase or decrease cadence depending on the situation. For example, he may order quick time to keep pressure on a crowd that is withdrawing. He halts a formation moving in the on-guard position by commanding *PLATOON (SQUAD/COMPANY), HALT*. The command of execution is given on the left foot. On the command *HALT*, each soldier in the formation brings his right foot forward, even with his left foot, then takes one more half step with his left foot. He stomps his left foot as he comes to a halt and remains in the on-guard position.

INTERVAL DISTANCE

B-110. The usual interval distance between soldiers in riot control formations is one pace or 30 inches but it can be adjusted for particular situations. A 30-inch interval may not be sufficient in some situations and may have to be lengthened. Some police forces have found that a greater interval makes formation members less vulnerable to thrown objects.

COMMANDER AND LEADER POSITIONS

B-111. When a unit is in a column formation, each echelon commander usually takes a position at the head of the column. In riot control formations, the element leader takes a position where he can best direct and control the unit. The senior formation commander normally centers himself and his staff behind the formation. Subordinate leaders position themselves where they can best control their soldiers within the formation. For diamond and circle formations, the squad leader and the assistant squad leader place themselves in the center of the formation. These are only guidelines, and leaders can adjust positions with respect to their units as they see fit.

B-112. In column formations, messengers, radio operators, marksmen, disperser operators, and other platoon headquarters members usually take positions at the front of the column. In riot control formations, headquarters personnel can be positioned near the commander at his discretion. If the situation does not allow this, headquarters personnel can be positioned behind the control element.

Appendix C

Equipment Guide

Table C-1 lists equipment that may be issued to EPWs when their clothing becomes unserviceable. (See CTA 50-900 when determining what clothing to issue EPWs.) Sundry packs and recreation equipment are also needed, and the facility commander arranges for them through supply or local purchase.

Table C-1. Individual Equipment

Line Item No.	Item, Basis of Issue, and Remarks	Unit	Allowances by Zone						
			I ¹	II ²	III ³	IV ⁴	V ⁵	VI ⁶	VII ⁷
B60252	Belt, trousers, cotton webbing, 1 1/4", per EPW	EA	1	1	1	1	1	1	1
C06886	Boot, combat, men's, leather, black, 8 1/2" high, per EPW	PR	1	1	1	1	1	1	1
C32182	Buckle, belt, trousers, brass, lacquered finish, per EPW	EA	1	1	1	1	1	1	1
C03750	Cap, hot weather, polyester/rayon, OG 106, per EPW	EA	1	1	1	1	1	1	1
NA	Cap, wool, knit, per EPW	EA	0	0	1	1	1	1	1
G48939	Drawers, men's, cotton, thigh length, white, with elastic waistband, per EPW	PR	2	2	2	2	2	2	2
G49213	Drawers, men's, wool knit, ankle length, silver gray, per EPW	PR	0	0	2	2	2	2	2
J62858	Glove inserts, wool and nylon knit, OG 108, per EPW	PR	0	0	1	1	1	1	1
J63269	Glove shells, leather, black, per EPW	PR	0	0	1	1	1	1	1
K35007	Helmet, sun, adjustment chin strap, adjustment head size, per EPW	EA	1	1	1	0	0	0	0
L70789	Liner, wet weather, poncho, camouflage color, per EPW	EA	0	1	0	0	0	0	0
P17415	Poncho, coated, nylon, OG 207, per EPW	EA	1	1	1	1	1	1	1

¹ Zone I—Warm or hot all year. ² Zone II—Warm or hot summers, mild winters. ³ Zone III—Warm or hot summers, cold winters. ⁴ Zone IV—Mild summers, cool winters. ⁵ Zone V—Warm or hot summers, cold or very cold winters. ⁶ Zone VI—Mild summers, cold winters. ⁷ Zone VII—Mild summers, very cold winters.									

Appendix D

Military Police Internment/Resettlement Units

Table D-1 provides a synopsis of the various MP I/R units that may be assigned to the TO.

Table D-1. MP I/R Units

Unit	TOE	Assigned To	Duties
HHC, MP command (I/R)	19641L000	FORSCOM in CONUS and TSC OCONUS	Provides C ² , staff planning, and supervision of I/R operations performed by assigned and attached MP elements.
HHC, MP brigade (I/R)	19762L000	TSC	Provides command, staff planning, and supervision of I/R operations performed by assigned and attached I/R MP elements.
MP detachment, I/R team (C ²)	19543LH	I/R brigade	Provides C ² , staff planning, and supervision of two or three I/R battalions that process and intern 12,000 or fewer people.
MP detachment, I/R team (I/R brigade liaison team)	19543LD	MP brigade (I/R)	Provides the following when the brigade's span of control is exceeded: <ul style="list-style-type: none"> • Extends the capability of the MP brigade (I/R) to plan and supervise collection, internment, and evacuation operations of EPWs, CIs, DCs, and US military prisoners. • Acts as a coordination link to allied and indigenous organizations to ensure that they are complying with the Geneva Conventions concerning EPWs and CIs. • Ensures that EPW operations in the TO follow US policies and directives, international agreements, and US policies implementing international law. • Is an essential link with HN forces securing EPWs, CIs, and DCs. Ensures that policies favorably consider the intent of the US to comply with international treaties pertaining to the care and handling of EPWs, CIs, and DCs.
MP detachment, I/R information center	19643L000	I/R command, I/R brigade, or MP brigade	Receives, processes, maintains, disseminates, and transmits required information and data relating to EPWs, American PWs, CIs, and DCs within the TO.

Table D-1. MP I/R Units (continued)

Unit	TOE	Assigned To	Duties
MP detachment, I/R team (EPW/CI branch camp liaison)	19543LE	One per camp (northeast Asia only)	Provides a coordination link to allied and indigenous I/R facilities. Helps maintain proper custody and control of internees. Ensures that the provisions of US policies, publications, and directives; international agreements; US policies implementing international law; and the Geneva Conventions are fulfilled.
MP detachment, I/R team (EPW/CI processing liaison team)	19543LG	MP detachment, I/R team (I/R brigade liaison team)	Provides a coordination link to allied and indigenous forces. Establishes, organizes, and operates an I/R processing element within an I/R facility or, with an I/R battalion support team, at a location other than an I/R facility.
MP detachment I/R team (I/R processing squad)	19543LC	MP detachment, I/R team (I/R brigade liaison team) (for C ²)	Provides processing capabilities for 8 internees per hour. One squad is assigned for every 200 internees requiring processing per day within a separate/independent corps, division, or brigade force as required.
HHC, MP battalion (I/R) (EPW/CI/DC)	19646L400 or 19546A and 19547AB(4)	I/R brigade in an AO	Provides C ² , administrative, and logistics support to operate an I/R facility. Provides OPCON of attached units. Is capable of interning and supporting 4,000 EPWs and CIs or 8,000 DCs.
HHC, MP battalion (I/R)	19546A000	MP brigade	Provides command, staff planning, administration, and logistical support to operate an I/R facility for EPWs, CIs, or US military prisoners. Provides OPCON of assigned and attached units. Supervises battalion functions (personnel, medical, supply, and food services).
HHC, MP battalion (confinement)	19656L000	MP brigade	Provides command, staff planning, administration, and logistical support for a confinement facility for US military prisoners.
MP detachment (I/R) (confinement)	19547AA00	HHC, MP battalion (I/R)	Provides supervision, administration, health services, and logistical support for US military prisoners.

Table D-1. MP I/R Units (continued)

Unit	TOE	Assigned To	Duties
MP company (guard)	19667L000	I/R battalion	<p>Provides guards for EPWs, CIs, US military prisoners, DCs, and installations and facilities at an I/R facility.</p> <p>Is capable of securing 500 US military prisoners, 2,000 EPWs, 2,000 CIs, or 4,000 DCs in an I/R facility.</p> <p>Provides static guards at rail terminals and sensitive-material facilities (maximum 240,000 square yards).</p> <p>Provides food support for assigned personnel and collocated units.</p>
MP company (escort guard)	19647L000	I/R MP brigade	<p>Provides supervision and security for evacuating and moving EPWs, CIs, DCs, US military prisoners, and other detained persons via vehicles, trains, planes, and road marches.</p>

Shelter and site planning

Introduction

Refugees arriving in any specific area tend to settle down in different ways: often, they concentrate on an unoccupied site and create a 'camp'; at other times, they spread out over a wide area and establish rural settlements; and sometimes they are hosted by local communities (rural or urban). The latter two situations, also called 'open situations', occur less frequently than the first (see below and the Introduction to Part II).

A poorly planned refugee settlement is one of the most pathogenic environments possible. Overcrowding and poor hygiene are major factors in the transmission of diseases with epidemic potential (measles, meningitis, cholera, etc.). The lack of adequate shelter means that the population is deprived of all privacy and constantly exposed to the elements (rain, cold, wind, etc.). In addition, the surrounding environment may have a pronounced effect on refugee health, particularly if it is very different from the environment from which they have come (e.g. presence of vectors carrying diseases not previously encountered).

Camps usually present a higher risk than refugee settlements in open situations as there is more severe overcrowding, and less likelihood that basic facilities, such as water supply and health care services, will be available when refugees first arrive^{2,7}. Relief work is more difficult to organize for very large camp populations, such as some of the Rwandan refugee camps in Zaire (Goma, 1994) which contained more than 100,000 refugees.

In order to reduce health risks, it is essential that site planning and organization takes place as early as possible so that overcrowding is minimized and efficient relief services are provided. Shelters must be provided as rapidly as possible to protect refugees from the environment, and infrastructure installed for the necessary health and nutrition facilities, water supply installations, latrines, etc. All this must be initiated within

the first week of intervention³.

Relief agencies are usually faced with one of two possible situations: either the camp is already established with a refugee population that has spontaneously settled on a site prior to the arrival of relief agencies, or site planning is possible prior to their arrival, for example, when they are being transferred to a new camp.

Whichever is the case, prompt action must be undertaken to improve the site and its facilities; poor organization in the early stages may lead to a chaotic and potentially irreversible situation in regard to camp infrastructure, with consequent health risks. For example, lateral expansion of a site must be accounted for from the beginning in order to avoid overcrowding if refugee numbers increase.

Two possibilities: a refugee camp or integration into the host population

There is always a lot of discussion as to whether the formation of a refugee camp is acceptable, or whether resources would be better directed to supporting local communities who host refugees. The two main types of refugee settlement - camp or integration into the local population - each offer both advantages and disadvantages as laid out below:

Camp or integration into the local population: Advantages and disadvantages^{7,8}

CAMP ADVANTAGES:

- Provides asylum and protection
- More suitable for temporary situation
- Easier to estimate population numbers, to assess needs and monitor health status
- Some basic services are easier to organize (e.g. distributions, mass vaccinations)
- Allows visibility and advocacy
- Repatriation will be easier to plan

CAMP DISADVANTAGES:

- Overcrowding increases risk of outbreaks of communicable diseases
- Dependence on external aid, lack of autonomy
- Social isolation

- Little possibility of realizing farming initiatives
- Degradation of the surrounding environment
- Security problems within the camp
- Not a durable solution

INTEGRATION ADVANTAGES:

- Favors refugee mobility, easy access to alternative food, jobs, etc.
- Encourages refugee survival strategies
- Possibility of refugee access to existing facilities (water, health etc.)
- Enhances reconstruction of social/economic life and better integration in the future

INTEGRATION DISADVANTAGES:

- Population more difficult to reach, leading to difficulties in monitoring health needs
- Implementation of relief programs more complex, requires knowledge of local situation
- Risks destabilizing the local community, risk of tensions between local community and refugees

Health agencies are generally not involved in deciding between the two options. Every refugee situation is specific to itself. The main factors influencing the way in which they eventually settle are the number of refugees, the capacity for the local community to absorb them, the ethnic and cultural links between the refugee and local communities and the political and military situation. In practice, the predominant factor is the relationship between refugees and the local population.

It should, however, be pointed out that relief programs, particularly food aid may well play a role in attracting refugees into a camp situation even when integration would probably be a better option for them.

It is camp situations that are dealt with more specifically here, because camp populations are exposed to greater health risks. However, most of the principles described below may also be applied to open situations.

Site planning

Site planning must ensure the most rational organization of space, shelters and the facilities required for the provision of essential goods and services. This requires supervision by experts (e.g. in sanitation, geology, construction, etc.) which must be integrated into the planning of other sectors, especially water and sanitation. It is therefore essential that there is coordination from the beginning between all the agencies involved and between the different sectors of activity, especially in an emergency situation when time is generally in short supply.

Site planning in refugee situations is normally the responsibility of UNHCR (or an agency delegated by UNHCR). As UNHCR is usually not present where there is an internally displaced settlement, another agency will have to take charge. Although health agencies will not always be involved in organizing a site, they should nevertheless make sure that this is undertaken correctly because of its direct influence on the subsequent health situation; it is therefore necessary to have an understanding of the basic principles of site planning.

As stated above, the possibilities in regard to site planning depend largely on which of the two refugee situations described will be encountered.

1. In most cases refugees have already settled on a site and planners may well be faced with chaotic conditions. The immediate priority must be to improve or reorganize the existing site, and in rare instances it may even be advisable to move the refugee population to another site (see below).
2. The ideal but far less frequently encountered situation is that where site planning can be carried out before the arrival of refugees on a new site. The most appropriate site layout may then be worked out in advance and in accordance with guidelines.

In both situations, the following principles must be respected as far as possible.

- Sufficient space must be provided for everybody: space for every family to settle with the provision of amenities (water and latrines) and other services, and access to every sector. High density camps should be avoided because they present a higher risk for disease transmission, fire and security problems².
- Short-term site planning should be avoided, as so-called temporary camps may well have to remain much longer than expected (e.g. some Palestinian refugee camps have been in existence since 1947) ². This means that consideration must be given to the possibilities for expansion should the population increase¹.
- A few small camps (ideally circa 10,000 people) are preferable to one large camp because they are easier to manage and because they favor a return to self-sufficiency². Unfortunately, this is rarely possible when there is a massive influx of refugees (e.g. the refugee movements in Rwanda and Burundi, 1993-94).
- Refugees should be involved and consulted. Their social organization and their opinions should be taken into account wherever possible.
- Local resources (human and material) and local standards should be employed whenever feasible. Seasonal changes (e.g. the rainy season) must also be taken into consideration.

SITE SELECTION

The ideal site, responding to all requirements, is rarely available. The choice is generally limited, as the most appropriate areas will already be inhabited by local communities or given over to farming. In any case, relief agencies are seldom on the spot to select a site before refugees arrive.

However, there are certain criteria in regard to site selection which must still be taken into account^{1,9}.

- Security and protection: the settlement must be in a safe area (e.g. free of mines), at a reasonable distance from the border, and from any war zones.
- Water: water must be available either on the site or close by.
- Space: the area must be large enough to ensure 30m² per person (see Table 5.2).
- Accessibility: access to the site must be possible during all the seasons (e.g. for trucks).
- Environmental health risks: the proximity of vector breeding sites transmitting killer diseases should be avoided as far as possible (e.g. tsetse fly for trypanosomiasis). Where such areas cannot be avoided, they must be treated.
- Local population: every effort should be made to avoid tensions arising between local and refugee communities; for instance, legal and traditional land rights must be respected.
- It is important that the terrain should slope in order to provide natural drainage for rainwater off the site⁴.

Energy sources should also be considered when selecting a site, particularly as deforestation resulting from using wood for cooking fuel entails politico-ecological problems.

SITE ORGANIZATION

Once the site has been secured, the planning and location of the required infrastructure must be worked out. A map should be used and the road network drawn onto it. The area should then be divided into sections and locations decided for the different facilities. Good access by road to every section and each installation is essential for the transport of staff and materials (e.g. food and drugs) in order to ensure the different services are able to function.

Several factors should be taken into account in deciding the spatial organization of facilities and shelters (location and layout):

- space required per person and for each installation

- accessibility of services
- minimum distance required between facilities and shelters (see table 5.2)
- cultural habits and social organization of the refugee population (clans and extended families)
- ethnic and security factors, relationships among different sections/ members of the community, etc.

Cultural and social traditions are a determining factor in ensuring refugee acceptance of the infrastructure and services provided, particularly in regard to housing, sanitation, burial places, etc.

However, as the layout that might be preferred by the refugees is not always the one that would allow the most efficient delivery of aid, site planning generally requires compromise solutions that take into account the different points of view².

Table 5.2 Some quantified norms for site planning^{1,2}

Area available per person	30 m ²	
Shelter space per person	3.5 m ²	
Number of people per water point	250	250
Number of people per latrine	20	
Distance to water-point	15 m max.	
Distance to latrine	30 m	
Distance between water-point and latrine	100 m	
Firebreaks	75 m every 300 m	
Distance between two shelters	2 m min.	

ESSENTIAL INSTALLATIONS

Essential installations are described in Table 5.3. Some are likely to be centralized:

- reception center
- health center

- hospital
- meeting place for home-visitors, etc.

Other facilities, such as health posts, latrines, washing areas, etc., should be decentralized. Care must be taken to ensure that there is sufficient space for such decentralized services in all the camp sub-divisions.

Table 5.3 Main installations required on refugee sites

- | |
|---|
| <ul style="list-style-type: none"> — Roads and firebreaks — Water supply and sanitation facilities (defecation areas, latrines, waste disposal pits, washing places, etc.) — Health facilities: health center, health posts, hospital, pharmacy and site for cholera camp. — Meeting place for home-visitors — Nutritional facilities: therapeutic and supplementary feeding centers — Distribution site and storage facilities (in separate locations) — Administrative center, reception area — Other community facilities: market, schools, cemetery, meeting places, etc. |
|---|

The location of health facilities must be carefully determined.

- The central health facility should be located in a safe and accessible place, preferably on the periphery of the site in order to avoid overcrowding and allow for future expansion. The space required depends on the type and desired capacity of the medical services to be provided.
- The hospital, if one is necessary, is usually an expansion of the in-patient service of the central facility. The criteria are thus similar but more space is required (in line with the number of beds). It is particularly important to plan space for water and sanitation facilities, as well as room for eventual expansion (e.g. outbreaks of disease).
- The peripheral health facilities should be centrally located within the areas they are to serve so as to ensure easy access. The number required depends mainly on the size of the population (e.g. 1 health post

per 3,000-5,000 refugees).

— A site for a cholera camp must be identified in advance, separate from other health facilities. It must be large enough to ensure sufficient capacity for potential needs and be provided with adequate water and sanitation facilities⁶.

THE LAYOUT OF SHELTERS

The way shelters are grouped has an important influence on the re-establishment of social life, on the use of latrines and water-points, and on security.

In general, the site should be divided into smaller units for management purposes. For example, it could be divided into sectors of 5,000 and sections of 1,000 people. However, the formation of such units must take into account the existence of any groups within the population which may be mutually hostile,

Two main ways of grouping shelters are described:

1. The preferred method is to organize the site into basic community units, constituted by a number of shelters and community facilities (latrines, water-points and washing areas) ^{1,3}. These basic units should correspond in design as closely as possible to that with which the refugees are most familiar. Examples for designing such community units are available in several reference books ^{2,4,9}.

2. Laying out shelters in lines and rows is another possibility, but is usually not recommended because this deprives families of personal space, and increases the distances to latrines and water-points. On the other hand, such a layout can be implemented quickly and is often preferred when there is a sudden and massive influx of refugees to cope with.

Since in most cases the population will have settled on a site before any site planning can be carried out, solutions will have to be sought for improving the situation.

— Usually, the site may be improved without moving all the shelters. A better organization of facilities, improving access to all sections of the camp, and carefully planning sections for new arrivals will decrease health risks and improve camp management,

— A thorough reorganization of the site (and most shelters) may sometimes be necessary, although radical change is usually not advised. Such reorganization should be considered when there is a real threat to refugee health from overcrowding or a danger of fire, etc. For example, it was decided to move and reorganize all shelters in the Rwandan camps for refugees from Burundi in 1993, in order to counter the high fire risk and to facilitate the management of relief assistance.

— Critical problems, such as a lack of water in the area, insecurity or potential danger resulting from the camp's proximity to the border, may present major obstacles to the camp remaining where it is. A move to a new site could then be considered, but the operational problems involved in a move and the social and psychological consequences for the population must be carefully weighed up in advance,

Shelter provision

The objectives of providing shelters are: protection against the elements and against vectors, provision of sufficient housing space for families, and restoring a sense of privacy and security. Shelters are required in every refugee emergency; but the type and design of shelter, who constructs it and how long it should last will vary in every situation².

However, some general principles may be concluded²:

- Shelters that have already been built by refugees or buildings occupied by them (e.g. schools) must be assessed. It is important that consideration is given to the amount of space available for each person, to ventilation (e.g. risk of respiratory infection) and for protection against rain, as these factors may entail significant health risks.
- Wherever possible, refugees should construct their own shelters and should receive material (including appropriate tools) and technical support to assist them in doing so.
- It is best to use suitable local materials where available. Special emergency shelters (e.g. tents) and pre-fabricated units have not yet proven practical because of their high cost and the problems of transporting them. It is also difficult to persuade refugees to accept something which is not within their cultural traditions. However, some types of prefabricated shelter are still being tested and may be suitable for use in the first weeks of an emergency.
- A minimum sheltering space of 3.5m² per person is recommended in an emergency. However, different cultures have different needs. - Single-family shelters are preferable (unless multi-family units are traditional).

WHEN REFUGEES FIRST ARRIVE

The provision of shelter is a high priority. Immediate action should be taken to assess the arrangements already made and provide material for temporary shelters².

There are several common solutions for temporary shelters:

- Shelters built by the refugees themselves, with material found locally or distributed by agencies, are the most common solution.
- Tents may be useful when local material is not available and as very short term accommodation, but they are expensive and do not last long.
- Plastic sheeting may be used for constructing temporary shelters or to protect them. Methods for setting up plastic temporary shelters are described in guidelines⁵.
- Local public buildings, such as schools, may provide shelter initially but are not usually suitable for

large numbers. They are a very temporary solution.

THE POST-EMERGENCY PHASE

Temporary shelters should no longer be used after the emergency stage has passed; an early start must be made to constructing shelters made of more permanent material.

However, it must be acknowledged that there are certain constraints involved in such shelter construction programs¹⁰.

- Any shelter building or rehabilitation program takes time.
- Such programs are costly (although they may produce savings in other sectors).
- As there is a vast range of options for building shelters and a wide range of criteria have to be taken into account, such programs are complex to manage. This is a specialized job and requires expertise.

This can often become a highly political issue with local authorities obstructing the building of (semi-) permanent housing when they want to prevent refugees settling for a long period of time. Longer-term housing should be similar to that with which refugees are already familiar, but should also reflect local conditions². The use of local material is preferable, but its availability may be problematic (e.g. degradation of the environment through deforestation).

In countries such as Afghanistan or the countries of Eastern Europe, where very low temperatures may be experienced in winter, shelter provision is essential for protection against the cold. Although a few solutions have been proposed (e.g. winter tents and the provision of heaters), this is a particularly difficult problem to deal with in an emergency situation.

Once time allows, traditional housing may be built, if the materials are available, and there are sufficient financial resources.

Principal recommendations regarding shelter and site planning

- Site planning and improvement should take place as early as possible in order to minimize overcrowding and make it possible to organize efficient relief services.
- A site should be selected with a view to security, access to water, the provision of adequate space, environmental health risks, and the local population.
- Site planning must ensure the most rational organization of the available space in regard to shelters and the necessary facilities and installations. Where refugees have already settled on a site before any planning could be envisaged, it is not usually advisable to institute radical changes, but improvements and reorganization should be carried out.

- Small sites are preferred. The cultural and social patterns should be taken into account.
- The provision of material for temporary shelters is a high priority when refugees first arrive. These should preferably be single-family shelters, constructed out of local material (when available) by the refugees themselves.

PREFACE

The purpose of this publication is to assist individual service members, unit commanders, unit leaders, and field sanitation teams (FSTs) in preventing disease and nonbattle injury (DNBI). The publication provides information on preventive medicine measures (PMM)

FM 21-10/MCRP 4-11.1D

for the individual service member as well as essential information for the unit commander, unit leaders, and the FST on applying unit-level PMM.

When a problem exists beyond unit capabilities, the brigade or division preventive medicine (PVNTMED) section or corps PVNTMED detachments should be called upon to assist in countering the threat.

The use of trade names or trademarks does not constitute endorsement by the Department of Defense (DOD).

Unless this publication states otherwise, masculine nouns and pronouns do not refer exclusively to men.

The proponent of this publication is the United States (US) Army Medical Department Center and School. Submit changes for improving this publication on Department of the Army (DA) Form 2028 and forward it directly to **Commander, US Army Medical Department Center and School, ATTN: MCCS-FCD-L, 1400 East Grayson Street, Fort Sam Houston, Texas 78234-6175.**

CHAPTER 1

INTRODUCTION TO THE MEDICAL THREAT**Section I. MESSAGE TO THE UNIT COMMANDER****DISEASE AND NONBATTLE INJURY**

A DNBI casualty can be defined as a military person who is lost to an organization by reason of disease or injury, and who is not a battle casualty. This definition includes persons who are dying of disease or injury due to accidents directly related to the operation or mission to which they were deployed. The acronym, DNBI, does not include service members missing involuntarily because of enemy action or being interned by the enemy (as a prisoner of war). The total number of DNBI casualties is evaluated to identify DNBI rates per number of service members in an operation. The DNBI rates are critical in evaluating the effectiveness of PVNTMED missions within the area of operations (AO) and in determining the health of a force within an operation.

Historically, in every conflict the US has been involved in, only 20 percent of all hospital admissions have been from combat injuries. The other 80 percent have been from DNBI. Excluded from these figures are vast numbers of service members with decreased combat effectiveness due to DNBI not serious enough for hospital admission.

FM 21-10/MCRP 4-11.1D

Preventive medicine measures are simple, common sense actions that any service member can perform and every leader must know. The application of PMM can significantly reduce time loss due to DNBI.

*How Much Time Does Your Unit Spend Training Service Members on—
Disease and Nonbattle Injury Prevention?
Combat Injury Prevention?*

YOUR RESPONSIBILITY

You are responsible for all aspects of health and sanitation of your command. Only you can make command decisions concerning the health of your unit in consideration of the—

- Mission.
- Medical threat.
- Condition of troops.

DO NOT LET THIS HAPPEN TO YOU

Togatabu Island, 1942: The 134th Artillery and the 404th Engineer Battalions were part of a task force preparing to attack Guadalcanal. Fifty-five percent of the engineers and sixty-five

percent of the artillerymen contracted a disease called *filariasis* transmitted by mosquitoes. Both units had to be replaced (medically evacuated) without seeing any enemy action because they were not combat ready. The use of insect repellents and insecticides and the elimination of standing water would have prevented this.

Merrill's Marauders: Disease was an important detractor to this famous unit. The medical threat faced by the Marauders in the jungles of Burma was great. Everyone was sick, but some had to stay and fight. Evacuation was limited to those with high fever and severe illness. One entire platoon cut the seats from their pants because severe diarrhea had to be relieved during gunfights. After a bold and successful attack on a major airfield, Merrill's Marauders were so decimated by disease that they were disbanded.

Section II. THE MEDICAL THREAT AND PRINCIPLES OF PREVENTIVE MEDICINE MEASURES

The medical threat is—

- Heat.
- Cold.
- Arthropods and other animals.

FM 21-10/MCRP 4-11.1D

- Food- and waterborne diseases.
- Toxic industrial chemicals/materials.
- Noise.
- Nonbattle injury.
- The unfit service member.

PRINCIPLES OF PREVENTIVE MEDICINE MEASURES

- Service members perform individual techniques of PMM.
- Chain of command plans for and enforces PMM.
- Field sanitation teams train service members in PMM and advise the commander and unit leaders on implementation of unit-level PMM.

Failure to Apply the Principles of PMM Can Result in Mission Failure.

CHAPTER 2

INDIVIDUAL PREVENTIVE MEDICINE MEASURES**Section I. HEAT INJURIES****OVERVIEW**

Heat injuries can occur anywhere, depending on physical activity (work rate) and clothing worn. However, they occur most frequently during warm-weather training, exposure to high climatic temperatures, high humidity, and bright sunlight. These conditions make it difficult for the body to regulate its temperature. Hot weather also increases daily water requirements, because body water is lost as sweat. Dehydration leads to added heat stress, increased susceptibility to heat injury, reduced work performance, and degraded mission capability.

ACCLIMATIZATION

When the mission permits, all personnel should work and exercise in a manner so that they gradually become acclimatized to the heat and humidity in the AO. Significant heat acclimatization requires at least

3 to 5 days and full acclimatization can take up to 2 weeks. Exercising in the heat and humidity for 1 to 2 hours daily, gradually increasing the workload each day, can produce acclimatization. (Refer to Table 3-1 in Chapter 3.) When the mission does not permit time for gradual increases in workload, then leaders and buddies must observe each other and ensure that everyone drinks plenty of water during each work period. Individuals leaving a cold or cool climate will require additional time to become acclimatized to a hot climate.

DRINK PLENTY OF WATER

Depending on the heat and activity level, you may need to drink from $\frac{1}{2}$ to $1\frac{1}{4}$ quarts of water per hour—*3 gallons/12 liters per day in hot, dry climates*. **Drinking water is a must in order to prevent heat injury.** If desired, individuals may add flavoring to the water to enhance consumption. Field rations/meal(s), ready to eat (MRE) have flavoring for water in each meal. If the flavoring is used, add it to water in your canteen cup. **Do not** add flavoring to the water in your canteen; it increases the risk of contamination and illness. Never flavor the bulk source water supply. (Flavoring the bulk source water supply will reduce the action of water disinfectants.) See Table 3-1 for water intake requirements.

- Drink extra water **before** starting any mission or hard work. Cool water (60° to 70° Fahrenheit [F]) is absorbed faster than cold water.
- Drink small quantities of cool fluids frequently. Carbohydrate/electrolyte beverages (sport drinks) may provide supplemental nutrients under conditions of extreme calorie and water requirements; such as extremely vigorous activity. However, they cannot replace and must not be used to meet all water requirements.

- Drink “non-caffeinated” fluids even if you are not thirsty. (Caffeine increases water requirements in all environments.)
- Refill your canteens at every opportunity, using only treated water, if possible.

NOTE

The color and volume of the urine stream are good indicators of a service member’s hydration status. If your urine stream is **dark yellow** and the volume is small, or if you are constipated and experience hard stools, you may not be drinking enough water. Maintain a urine stream that is **clear or light yellow**. Thirst is not a good indicator of dehydration during physical activity.

USE WORK/REST CYCLES

- Work and rest as your leader directs. (See Table 3-1.) A rest period helps prevent dangerous increases in body temperatures by minimizing heat production.
- Work and rest in the shade, if possible.

EAT ALL MEALS TO REPLACE SALTS

Eating all meals in the field will usually provide the body's requirements for salts. Field rations/MRE meet the daily requirements for minerals and electrolytes (sodium). **DO NOT take extra salt in meals** unless medically indicated.

NOTE

DO NOT TAKE SALT TABLETS. One salt tablet increases your water requirement by at least a pint. Salt draws water from muscles to dilute your blood. Salt tablets can cause vomiting.

RECOGNIZE THE RISK OF MISSION-ORIENTED PROTECTIVE POSTURE/BODY ARMOR/ARMORED VEHICLES

- Mission-oriented protective posture (MOPP)/body armor increases your heat stress. (See Table 3-1.) You must—
 - Drink more water. **DO NOT EXCEED 1¹/₄ QUARTS PER HOUR.**
 - Work and rest as your leader directs.

- You may be at a greater risk of heat injuries when in armored vehicles—you may need to drink more water.

MODIFY YOUR UNIFORM

When directed/authorized by your commander to reduce heat stress and to protect against ultraviolet (UV) radiation, you should—

- Unblouse pants from boots.
- Cover all skin exposed to sun; wear sunscreen and lip balm with a sun protection factor of 15 or higher.
- Protect the eyes from UV with UV-protective sunglasses, especially wraparound sunglasses.
- Seek shade when resting outdoors.
- Keep clothing loose at the neck, wrists, and lower legs.

NOTE

When the threat from biting arthropods is high, keep your shirtsleeves rolled down and pants bloused in boots.

NOTE

See Graphic Training Aid (GTA) 8-5-50 and FM 21-11, for information on heat injury prevention and first aid.

Section II. COLD INJURIES

OVERVIEW

Cold injuries are most likely to occur when an unprepared individual is exposed to winter temperatures. They can even occur with the proper planning and equipment. The cold weather and the type of operation in which the individual is involved impact on whether a service member is likely to be injured and to what extent. The service member's clothing, physical condition, and mental makeup are also determining factors. Well-disciplined and well-trained service members can be protected, even in the most adverse conditions. Service members and their leaders must know the hazards of exposure to the cold. They must know the importance of personal hygiene, exercise, care of the feet and hands, and the use of protective clothing. Cold injuries may be divided into "freezing and nonfreezing" types. A freezing type is frostbite. The nonfreezing types are chilblains, trench foot, and immersion foot. (See FM 21-11.)

- Frostbite can occur when the temperature is at or near freezing or colder. Frostbite can also occur when the skin is exposed to winds of less than five miles per hour and actual temperature readings of 30° F.

- Trench foot (and immersion foot) results from prolonged exposure to a wet, cold condition, or the outright immersion of the feet in water with a temperature usually below 50° F.
- At the upper range of temperatures, exposure of 12 hours or more will cause injury. Shorter duration at or near 32° F will cause the same injury.
- A trench foot injury is usually associated with immobilization of the feet.

WEAR UNIFORM PROPERLY

- Wear the clothing your commander and leaders direct.
- Wear clothing in loose layers (top and bottom). Avoid tight clothing, including tight underwear.
- Keep clothing clean and dry. Remove or loosen excess clothing when working or in heated areas to prevent sweating.
- Wear headgear to prevent body heat loss. The body loses large amounts of heat through the head.
- Avoid spilling fuel or other liquids on clothing or skin. Evaporating liquids increase heat loss and cool the skin. Also, liquid stains on clothing will reduce the clothing's protective effects.

FM 21-10/MCRP 4-11.1D

- Change wet/damp clothes as soon as possible. Wet/damp clothing pulls heat from body.

KEEP YOUR BODY WARM

- Keep moving, if possible.
- Exercise your big muscles (arms, shoulders, trunk, and legs) frequently to keep warm.
- If you must remain in a small area, exercise your toes, feet, fingers, and hands.
- Avoid the use of alcohol as it makes your body lose heat faster.
- Avoid standing directly on cold, wet ground, when possible.
- Avoid tobacco products. The use of tobacco products decreases blood flow to your skin.
- Eat all meals to maintain energy.
- Drink plenty of water and/or warm nonalcoholic fluids. Dark yellow urine means you are not drinking enough fluids! You can dehydrate in cold climates too!
- Buddies should monitor each other for cold weather injury.

PROTECT YOUR FEET

- Bring several pairs of issue boot socks with you.
- Keep socks clean and dry. Change wet or damp socks as soon as possible. Socks can become wet from sweating. Apply foot powder on feet and in boots when changing socks.
- Wash your feet daily, if possible.
- Avoid tight socks and boots (completely lace boots up as loosely as possible).
- Wear overshoes to keep boots dry.

NOTE

A decrease in physical activity reduces the exposure **time necessary to produce injury**. In all types of footgear, feet perspire more and are generally less well ventilated than other parts of the body. Moisture accumulates in socks, decreasing their insulating quality. The feet are susceptible to cold injury and are less frequently observed than the remainder of the body.

PROTECT YOUR HANDS

- Wear gloves with inserts, or mittens with inserts.

FM 21-10/MCRP 4-11.1D

- Warm hands under clothing if they become numb.
- Avoid skin contact with snow, fuel, or bare metal.
- Waterproof gloves by treating with waterproofing compounds, such as snow seal.

PROTECT YOUR FACE AND EARS

- Cover your face and ears with a scarf or other material, if available.
- Wear your insulated cap with flaps down or wear a balaclava and secure under your chin.
- Warm your face and ears by covering them with your hands. **Do not rub face** and ears.
- Do not use face camouflage when windchill is -10° F or below; prevents detection of cold weather injury (frostbite).

NOTE

Rubbing cold extremities can be potentially harmful. Frostbitten areas that are rubbed can cause additional injury to the affected areas.

- Wear sunscreen. Solar UV exposure is doubled when you are surrounded by snow.
- Exercise facial muscles.

PROTECT YOUR EYES

- Wear sunglasses (or goggles) (Sun, Wind, and Dust, National Stock Number [NSN] 8465-01-004-2893) to prevent snow blindness (gray lens insert for above system is NSN 8465-01-004-2891).
- Wear Spectacles, Protective, Laser-Ballistic, NSN 8465-01-416-4626, or Special Protective Eyewear, Cylindrical System, NSN 8465-01-416-4626.
- Improvised sunglasses (slit goggles), if actual sunglasses are not available, can be made from the field rations/MRE cardboard box or other opaque material.

PROTECT YOUR BUDDY

- Watch for signs of frostbite on the service member's exposed skin. The affected skin will appear as pale/gray/waxy areas (it may be hard to see these changes in poor lighting or on service members with dark skin).
- Ask the service member if his feet, hands, ears, or face are numb and need rewarming.

- **DO NOT** allow the service member to sleep directly on the ground.
- To prevent carbon monoxide poisoning—
 - **DO NOT** let the service member sleep in or near the exhaust of a vehicle with the engine running.
 - **DO NOT** let the service member sleep in an enclosed area where an open fire is burning

NOTE

Service members may check circulation in the fingers and the toes by pinching the nail beds and checking how fast the color returns in the beds under the nails. The slower the return to a natural color, the more serious the potential for frostbite on the fingers and the toes.

NOTE

See GTA 8-6-12 and FM 21-11 for information on cold injury first aid procedures. During extended activities in a cold environment, warming areas should be provided; for example, a service member performing guard duty.

Section III. ARTHROPODS AND OTHER ANIMALS OF MEDICAL IMPORTANCE

OVERVIEW

Poor sanitation and improper waste disposal under wartime conditions greatly increase the disease vector potential of such common pests as filth flies and rodents. Even in mobile field situations these “camp followers” have historically amplified sanitation problems, often resulting in epidemics of diarrheal diseases that have caused many casualties. This threat is even greater in urban areas converted to temporary or semipermanent military use. A dangerous temptation in field training or in deployment operations is to ignore the field sanitation standards. Some people think, “The rules don’t apply here.” Yielding to that temptation can cost your health and the health of those around you. There is no excuse for forgetting to bring protective equipment or failing to use it. Be sure to follow all safety precautions on all labels of the pesticides that you use. They are there for a reason—to protect your health.

USE THE DEPARTMENT OF DEFENSE INSECT/ARTHROPOD REPELLENTS

The concurrent use of a skin insect repellent (N, N-diethyl-M-toluamide [DEET], NSN 6840-01-284-3982) and a clothing insect repellent (permethrin [NSN 6840-01-278-1336 and 6840-01-345-0237]) is necessary to obtain maximum protection against insects/arthropods.

APPLY N, N-DIETHYL-M-TOLUAMIDE

- Apply DEET insect repellent to all exposed skin.
- Follow label directions.
- Apply a light, even coating to exposed skin, not under clothing.
- **DO NOT** apply to the eyes and lips, or to damaged skin.
- One application may last 8 to 12 hours; if you receive bites, reapply a light uniform coating of repellent.
- Application of DEET can be safely used with camouflage face paint. Apply a thin layer of DEET first, then apply face paint.

NOTE

Reapplication of DEET may be necessary (check container label) due to heavy sweating, or after river-crossing operations, exposure to rain, or in locations where arthropod density is very high.

APPLY PERMETHRIN CLOTHING REPELLENTS TO FIELD UNIFORMS/ SLEEPING EQUIPMENT

- Permethrin is the most effective clothing repellent available.
- Treat military field uniforms, including Nomex®/Kevlar uniforms, tent liners, ground cloths, and bed nets with permethrin. This should be done before wearing in field training or military operations. **Follow label instructions when applying to clothing.**
- Permethrin will remain in the material after repeated washings.
- Treated uniforms can be safely worn in the rain or when crossing rivers or streams.

NOTE

Permethrin does not rinse out in cold water (or rain or streams).

- **DO NOT** apply directly to skin, to underwear, or to cap.
- **DO NOT** wear treated uniforms unless they are first thoroughly dried after treating.
- **Apply permethrin outdoors or in well-ventilated areas only.**

FM 21-10/MCRP 4-11.1D

- Wear uniform as your commander directs.
- Wear a loose fitting uniform, not tightly tailored, to prevent arthropods from biting through the fabric; repair tears/holes.
- When the arthropod threat is high—
 - Blouse pants in boots and completely lace boots.
 - Tuck undershirt in at waist.
 - Wear sleeves down.
 - Button blouse/shirt at the neck and wrist.
 - Do not use aftershave lotion, cologne, or perfumed deodorants or soaps in the field; they attract arthropods.
 - Wear headgear (cap, helmet, arthropod head net) when necessary to protect your head.

KEEP YOUR BODY AND UNIFORM CLEAN

- Bathe every day if possible, or at least once a week. Good personal hygiene practices reduce infestation of insects such as body lice and mites.

- Wash your uniform frequently (a minimum of every 7 days) to remove arthropods and their eggs which may be attached to the uniform. If the situation permits, use the quartermaster laundry; otherwise, use a stream, lake, or washbasin. Air-dry uniforms, especially underwear and socks, if possible.

FOLLOW MEDICAL ADVICE

- Take medications that help prevent diseases (such as anti-malaria pills) when directed by your commander.
- Use medications, such as cream/shampoo, when prescribed by medical personnel for treatment of lice, chiggers, poison ivy, and so forth.

PROTECT YOURSELF AT NIGHT

- Ensure your bed net is in good repair.
- Use your bed net when sleeping.
- Tuck net under sleeping pad or sleeping bag so there are no openings.

FM 21-10/MCRP 4-11.1D

- Follow the label directions and precautions when using DOD-approved insect spray (for example, Insecticide, Aerosol d-PHENOTHHRIN, 2%) if insects are present inside the bed net (and inside closed tent). Allow vapors to disperse for 10 minutes before entering the enclosure.
- Treat bed net with permethrin for added protection.
- Repair holes in your bed net. Generously apply DEET skin repellent to those areas likely to touch the insect net during sleep (knees, hands, elbows, and feet) to prevent bites through holes in the fabric.

PROTECT YOURSELF FROM OTHER MEDICALLY IMPORTANT ARTHROPODS AND ANIMALS

Spiders, Scorpions, and Centipedes—

- Remove spiders from tents or buildings.
- Shake out and inspect clothing, shoes, and bedding before use.
- Eliminate collections of papers, unused boxes, scrap lumber, and metal.
- Thoroughly clean beneath and behind large items; spiders and scorpions may be resting in these areas.

- Check field latrines before use; run a small stick under the rim of the latrine hole to dislodge any spiders or scorpions there. Spiders and scorpions may rest under toilet seat or inside latrine box.
- Wear gloves when handling paper, cloth, lumber, or other items that have been stored for long periods.
- Check around rocks and logs before resting against them.
- Use a long-handled tool or stick to turn over debris before removing it.
- Remove accumulations of boards, rocks, and other debris to eliminate the resting/hiding areas of spiders and scorpions.
- Wear leather gloves to remove rocks, lumber, and such from the ground.

NOTE

In many locations worldwide, centipedes are more of a problem than scorpions, but the PMM are the same for both pests.

Snakes—

- Do not handle, play with, or disturb snakes or other wildlife.

FM 21-10/MCRP 4-11.1D

- Avoid swimming in areas where snakes abound.
- Keep hands off rock ledges where snakes may be hiding or sunning.
- Look over the area before sitting down, especially if in deep grass or among rocks.
- If snakes are known to inhabit the area, sleep off the ground, if possible.
- If military situation permits, avoid walking about an area during the period from dusk to complete daylight, as many snakes are active during this period.
- Avoid camping near piles of brush, rocks, or other debris.
- Never step over large rocks or logs without first checking to see what is on the other side.
- Turn rocks and logs toward you when they have to be removed so you will be shielded should snakes be beneath them.
- Handle freshly killed snakes only with a long-handled tool or stick; snakes can inflict fatal bites by reflex action after their death.

NOTE

If bitten, try to kill the snake and bring its head with you to the medical treatment facility. If you cannot bring the snake's head with you, get an accurate description of the snake to assist medical personnel in treating you. **DO NOT panic!**

DOMESTIC AND WILD ANIMALS OR BIRDS

- **Do not** handle or approach so-called “pets.”
- Exclude such animals from your work and living areas, unless cleared by veterinary personnel.
- **Do not** collect or support (feed or shelter) stray or domestic animals/birds in the unit area, unless cleared by veterinary personnel.

Section IV. POISONOUS PLANTS AND TOXIC FRUITS

OVERVIEW

Many poisonous plants have thorns that can puncture the skin, introduce poison into the skin, or cause infection. (See FM 21-76.) Clothing can serve as a protective barrier for

the skin. Clothing can also be a source of exposure if it is not properly cleaned after contact with poisonous plants. Toxic fruits can also cause significant harm to service members, ranging from minor wounds to rapidly fatal poisoning. The threat is magnified for US military personnel who may be unfamiliar with native species and unaware of these poisonous plants and toxic fruits.

- Avoid contact with poisonous plants by properly wearing the uniform.
- Avoid areas where poisonous plants grow.
- Only eat plants or parts of plants that have been approved. If you do not know, **DO NOT** eat it.
- **DO NOT** put grasses or woody twigs or stems in your mouth; they may be poisonous.

Section V. FOOD-/WATER-/WASTEBORNE DISEASE/ILLNESS

OVERVIEW

Prior to deployment, the key to preventing illnesses and diseases from consumption of food and water is following the strict guidelines and procedures established by PVNTMED. During deployments, apply individual PMM. Infectious diarrhea results from contamination of water and food by bacteria, viruses, and parasites. Water- and foodborne

diarrheal diseases are of particular concern to the military because they can be spread to large numbers of service members simultaneously with disastrous consequences for combat readiness. Parasites (amoebas, Giardia, and tapeworms) consumed in water or undercooked food, especially meat and fish, can cause prolonged illness. Diarrhea, especially when vomiting or fever is present, can cause dehydration.

WATER

Fill your canteen with treated water at every chance. When treated water is not available, you must disinfect the water in your canteen using one of the following methods.

Preferred method—iodine tablets:

- Fill your canteen with the cleanest water available.
- Put two iodine tablets in the canteen of water. Double these amounts in the 2-quart canteen.
- Place cap on canteen. Shake canteen to dissolve tablets. Wait 5 minutes. Loosen the cap and tip the canteen over to allow leakage around the canteen threads. Tighten the cap and wait an additional 25 minutes before drinking.

Alternate methods—

Chlorine Ampules:

- Fill your canteen with the cleanest water available.
- Mix one ampule of chlorine with one-half canteen cup of water; stir the mixture with a clean device until contents are fully dissolved.
- Pour one canteen capful of the above solution into your canteen of water.
- Place the cap on your canteen and shake. Slightly loosen the cap and tip the canteen over to allow leakage around threads. Tighten cap and wait 30 minutes before drinking.
- If the nuclear, biological, and chemical (NBC) canteen cap is used, then use two caps of the solution.

NOTE

By wearing gloves or wrapping the ampule in paper or cloth, you can avoid cutting your hands when breaking open the glass ampule.

Emergency Water Treatment Kit (CHLOR-FLOC® Tablets):

- Tear off the top of the plastic water treatment bag at the perforation (first time use).

- Fill the treatment bag one-half full with the cleanest water available; add 1 tablet.
- Fold bag tightly three times and fold tabs in.
- Hold bag firmly and shake until tablet dissolves. Swirl 10 seconds. Let the bag sit for 4 minutes. Swirl again for 10 seconds.
- Let bag sit for an additional 15 minutes.
- Insert filter pouch in neck of canteen. Pour water from bag through the filter into the canteen. Avoid pouring sediment into the filter.
- Rinse the filter with treated water after use. Always filter through the same side of the filter.
- Rinse sediment from treatment bag. Save bag for water treatment only.

CAUTION

Do not drink from the treatment bag! The water is still contaminated and must be filtered before drinking. Not filtering may cause stomach and intestinal disorders.

Household Bleach:

NOTE

Ensure bleach is unscented. (To check for chlorine residual, see Tasks 7 and 8, Appendix A.)

- Fill your canteen with the cleanest water possible.
- Read the label on the bleach bottle to determine amount of available chlorine. Liquid chlorine laundry bleach usually has about 5 to 6 percent available chlorine. Based upon the strength of the household bleach, add the chlorine to the canteen as directed in Table 2-1.

Table 2-1. Drops of Household Bleach to be Added to a One-Quart Canteen

AVAILABLE CHLORINE	CLEAR WATER	COLD OR CLOUDY WATER
1 PERCENT	10	20
4—6 PERCENT	2	4
7—10 PERCENT	1	2

- Place the cap on your canteen and shake. Slightly loosen the cap and tip the canteen over to allow leakage around threads. Tighten the cap and wait 30 minutes before drinking the water.

BOILING

- When chlorine or iodine is not available, bring water to a rolling boil for 5 minutes.
- In an emergency, boiling water for just 15 seconds will help. Boiled water must be protected from recontamination.

CAUTION

If water is suspected of NBC contamination, do not attempt to treat.
Seek a quartermaster water supply.

FOOD

- Do not buy foods, drinks, or ice from civilian vendors unless approved by veterinary personnel or PVNTMED personnel.

CAUTION

Obtain food from approved sources ONLY.

- In emergency situations, choose low-risk foods such as baked goods (breads) and thick-skinned fruits that you can peel before eating. Eat only fruits and vegetables that grow above the ground.
- When eating in local establishments or from approved vendors, only eat hot food entrees or raw foods that you can wash and peel prior to eating.
- Inspect all cans and food packets prior to use. Discard all cans with leaks or bulges. Discard food packets with visible holes or obvious signs of deterioration.
- Do not eat foods or drink beverages that have been prepared in galvanized containers (*zinc poisoning*). Canned, bottled, or vacuum-packed products should draw in air when opened (suction/hissing sound). If no sound is heard, or if there are any off-odors, colors, or foaming (except for carbonated beverages), discard the product. Do not taste.
- Do not eat or drink local (unapproved) ice, snow cones, open drinks with ice, or similar products; such food can cause foodborne illness/disease.

WASH YOUR HANDS

Use soap and drinking (potable) water—

- After using the latrine.
- Before touching eating utensils or food.
- After eating.
- After handling any item that can potentially transfer germs.
- Frequently during the work day to keep your hands free of germs.

WASH YOUR MESS KIT/EATING UTENSILS

A sure way to get diarrhea is to use a dirty mess kit or eating utensils. Protect yourself by washing your mess kit/eating utensils—

- In a mess kit laundry/sanitation center.
- With treated water or disinfectant solution.

DISPOSE OF YOUR WASTE IN AN APPROVED MANNER

On a march, personal disposal bags should be used first, if available. If not available, personal cat holes can be used only if your unit is on the move! Always dispose of your waste immediately if your unit is on the move to prevent flies from spreading germs from waste to your food. Disposing of your waste also helps keep unwanted animals out of your bivouac area. Chemical toilets or burnouts are to be used in bivouac area. (See Chapter 3, Section V.)

Section VI. PERSONAL HYGIENE AND PHYSICAL AND MENTAL FITNESS

OVERVIEW

Physically fit, well-trained, and well-led service members can succeed under the harshest circumstances.

KEEP PHYSICALLY FIT

- Physically fit service members are less likely to get sick or injured.

- Use caution when exercising in extremely hot or cold weather; heat/cold injuries can occur. Actively participating in physical fitness training assists you in becoming acclimatized to the field environment.

NOTE

See FM 21-20 for more information on physical fitness training.

PREVENT SKIN INFECTIONS

Bathe frequently; if showers or baths are not available, use a washcloth daily to wash—

- Your genital area.
- Your armpits.
- Your feet.
- Other areas where you sweat or that become wet, such as between thighs, (or for females, under the breasts) and between buttocks.

FM 21-10/MCRP 4-11.1D

Keep skin dry.

- Use foot powder on your feet, especially if you have had fungal infections on your feet in the past.
- Use talcum powder in areas where wetness is a problem (such as between the thighs, and for females, under the breasts).

Wear proper clothing.

- Wear loose fitting uniforms; they allow for better ventilation. Tight fitting uniforms reduce blood circulation and ventilation.
- Do not wear nylon or silk-type undergarments in hot or humid environments.

PREPARE FOR THE FIELD

- All service members need to bring toilet articles such as soap, shampoo, washcloths, towels, toothbrush, dental floss and fluoride toothpaste, and talcum powder and foot powder, with them. **Do not share these items** to prevent the spreading of infections.
- Males need a razor and blades. Females need sanitary napkins or tampons.

Remember, during a deployment, you may not be able to easily obtain these items if you run out; bring at least a 2-month supply.

PREVENT DENTAL DISEASE

Tooth decay and gum infections can cause severe illness if not prevented or treated early.

- Brush teeth and gums after meals, or at least once a day. Use fluoride toothpaste. If toothpaste is not available, brush without it.
- Use dental floss at least once a day.
- Rinse your mouth with potable water after brushing and flossing; also, rinse frequently during the day when drinking water.
- Remember, consuming sugary food and drink requires more frequent cleaning of teeth and gums.

PREVENT GENITAL AND URINARY TRACT INFECTIONS

For males:

- Wash the head of your penis when washing your genitals. If uncircumcised, pull the foreskin back before washing.
- Protect yourself from sexually transmitted diseases (STD). Avoid sexual contact or use a condom; condoms reduce the chance of STD transmission.

For females:

- Wash your genital area daily.
- Do not use perfumed soaps or feminine deodorants in the field; they cause irritation and attract arthropods.
- Protect yourself from STD. Avoid sexual contact, or at least insist that your sex partner uses a condom—condoms help prevent STD transmission.
- **DO NOT** douche unless directed by medical personnel.
- **DO NOT** wear nylon or silk undergarments; cotton undergarments are more absorbent and allow the skin to dry.

NOTE

Some individuals do not drink enough fluids and tend to hold their urine due to a lack of privacy in the field. Urinary tract infections are one of the most frequent medical problems females face in the field. Drinking extra fluids and urinating more often will help prevent these infections.

SLEEP WHEN YOU CAN

- Follow your leaders' instructions and share tasks with buddies so everyone gets some time to sleep safely.
- Sleep whenever possible.
 - Take catnaps as the mission allows, but expect to need a few minutes to fully wake up.
 - Sleep as much as you can *before* going on a mission that may prevent sleep.
 - Learn and practice techniques to relax yourself quickly.

NOTE

Only sleep in safe and/or designated areas. Never sleep in parked vehicles while the motor is running.

MEASURES AGAINST THE EFFECTS OF SLEEP LOSS

Protect against the temporary effects of sleep loss on alertness, mood, and task performance.

- Take short stretch breaks or get light exercise in place.

- **Do not trust your memory; write things down.** Get into the habit of writing things down that you must remember (except crucial details that might compromise the mission if they were lost or captured). Double-check your communications and calculations.
- Watch out for your mind playing tricks (seeing things that are not there) when very tired; check strange observations before acting.

IMPROVE RESISTANCE TO STRESS

- Fear and physical signs or symptoms of stress are normal reactions before and during combat or other dangerous/life-threatening situations. You should not let fear or stress keep you from doing your job.
- Talk about what is happening with your buddies, especially during after-action debriefings.
- Learn ways to relax quickly.
- Integrate new replacements into your group and get to know them quickly.
- If you must join a new group, be active in establishing friendships.

- Give each other moral support.
- Care for your buddies and work together to provide everyone food, water, sleep, and shelter, and to protect against heat, cold, poor sanitation, and enemy action.

NOTE

See FM 21-11 for first-aid procedures for stress reactions.

Section VII. NOISE

OVERVIEW

If you have to raise your voice to be understood, it is too noisy. Put on hearing protectors. The use of hearing protective devices will enhance hearing and comprehension in the presence of a hazardous noise.

PROTECT YOURSELF AND YOUR MISSION FROM NOISE

- Wear properly fitted earplugs. Different types include single flange, triple flange, and hand formed.

- Use vehicle headgear such as a helicopter crew helmet, an armor crew helmet, or earmuffs.
- Keep earplugs and earmuffs clean to prevent ear infections.
- Avoid noise or limit time around noise to only critical tasks.

Section VIII. TOXIC INDUSTRIAL CHEMICALS/MATERIALS

OVERVIEW

Consider risk management in planning all operations; identify potential sources of danger or mission hazards that can be anticipated in performing a mission. Always weigh the risks and benefits and establish controls to reduce unnecessary hazards.

RECOGNIZE AND PREPARE FOR TOXIC INDUSTRIAL CHEMICALS/ MATERIAL THREATS

Occupational hazards.

- Exhaust from engines and fuel space heaters.

- Gases from weapons firing, such as rockets and M8 smoke.

NOTE

When using M8 smoke in training or operations, follow unit standing operating procedures (SOPs) and leaders and controller's instructions for use of protective masks and for moving through smoky areas, especially in buildings and tunnels.

- Solvents used to clean weapons.
- Greases and oil from vehicle maintenance repair.
- Detergents used to clean equipment.

Industrial hazards.

- Compressed gases.
- Industrial solvents.
- Hazardous chemical waste.

FM 21-10/MCRP 4-11.1D

- Materials used at water treatment plants.
- Materials and water used at waste sewage and water treatment plants.

Biological/radiological hazards.

- Medical waste.
- Materials used at medical research facilities.
- Radioactive isotopes.
- Substances at nuclear power plants.
- Depleted uranium.

RECOGNIZE THE INJURY

- Carbon monoxide is colorless, odorless, and tasteless. It causes headache, sleepiness, coma, and death.
- Hydrogen chloride is a very irritating gas that reacts with water (body fluids) to produce hydrochloric acid in the throat, lungs, and eyes. It causes coughing, tissue acid burns, and flu-like lung disease.

- M8 smoke is a very irritating gas. It can cause severe coughing, wheezing, and lung damage, if inhaled.
- Bore/gun gases cause the same effects as carbon monoxide and hydrogen chloride.
- Solvents, greases, and oils cause skin rashes, burns, drying, and infections. They cause damage to the liver, blood, and brain. Also, many are poisons that may cause cancer.
- Medical waste causes disease.
- Radioactive materials cause radiation illness.

**PROTECT YOURSELF AND YOUR MISSION FROM TOXIC INDUSTRIAL
CHEMICALS/ MATERIALS**

NOTE

Service members should always be aware that material safety data sheets (MSDS) accompany stores of toxic chemicals when units are deployed, and they serve as an immediate reference in cases of exposure or injury. Once a unit is deployed and set up, these MSDS should be kept as part of the unit's SOP when handling the specified chemicals/materials.

Carbon monoxide.

- Run engines outdoors or with shop doors/windows open.
- Keep sleeping area windows slightly open where you sleep for ventilation and air movement.
- **DO NOT** sleep in vehicles with the engine running or use engine exhaust for heat.
- **DO NOT** park vehicles near air intakes to tents, trailers, or environmental control units.

Bore/gun gases.

- Use onboard vehicle ventilation systems.
- Keep bore evacuator well maintained.
- Try to keep some air movement in gun emplacements or in protected batteries.

Solvents, greases, and oils.

- Use “safety” Stoddard solvent.
- Never substitute one solvent for a “better” one; for example, never use benzene or fuel in place of Stoddard.

- Wear coveralls, if available, and rubber gloves.
- Wash or change clothing often, especially when soiled by chemicals or fuel.
- Always follow label instructions for use and safety precautions.
- Use ventilation systems in areas where fumes are present or when conditions and materials dictate.

Biological waste.

- Always use disposable rubber gloves when working with biological materials.
- Wear coveralls/rubberized aprons, as necessary.
- Wear goggles or safety glasses, as necessary.
- Wear facemasks and air-filtered breathing masks approved for specific tasks, as necessary, when removing/working with biological waste.
- Dispose of biological waste materials according to unit SOPs and product label instructions.

CHAPTER 3

LEADERS' PREVENTIVE MEDICINE MEASURES**NOTE**

In addition to the specific measures that follow, leaders must remember and apply the principle that the most effective PMM they can apply is to visibly set the example in the use of all the individual PMM that are discussed throughout this FM.

Section I. HEAT INJURIES**PLAN FOR THE HEAT**

- Maximize physical fitness and heat acclimatization before deployment.
- Use your FST to train individuals and their leaders in PMM against heat.
- Acclimatize personnel to high temperatures as gradually as the mission will allow.

FM 21-10/MCRP 4-11.1D

- Brief service members on dangers of sunburn and skin rashes and the importance of good personal field hygiene.
- Obtain weather forecast for time/area of training/mission.
- Ensure adequate supplies of potable water are available (up to 3 gallons per day per service member just for drinking) (See Table 3-1). Issue a second canteen to service members in hot weather operations. In the desert, additional canteens may be required.
- Know the location of water distribution points.
- Set up a buddy system to maximize rehydration and minimize heat injuries.
- Ensure medical support is available for treatment of heat injuries.
- Plan the placement of leaders to observe for and react to heat injuries in dispersed training (road marches), or operational missions.
- If the mission permits, plan to—
 - Train during the cooler morning hours.

- Serve heavy meals in the evening, rather than at noon.

OBTAIN AND USE HEAT CONDITION INFORMATION

- Obtain heat condition information per your unit's SOP or contact the local supporting PVNTMED detachment or section. Heat condition may be reported as--
 - Category: 1, 2, 3, 4, and/or 5.
 - Wet bulb globe temperature (WBGT) index.
- Use heat condition information to determine required water intake and work/rest cycles (Table 3-1).

NOTE

Training by lecture or demonstration, maintenance procedures on equipment, or personal hygiene activities (such as skin and foot care) can be performed during rest periods.

*Table 3-1. Fluid Replacement Guidelines for Warm Weather Training
(Applies to Average Acclimated Service Member Wearing Hot Weather Uniform)*

HEAT CATEGORY	WBGT INDEX DEGREES F	EASY WORK		MODERATE WORK		HARD WORK	
		WORK/ REST MIN	WATER INTAKE QT/HR	WORK/ REST MIN	WATER INTAKE QT/HR	WORK/ REST MIN	WATER INTAKE QT/HR
1	78-81.9	NL	1/2	NL	3/4	40/20	3/4
2 (GREEN)	82-84.9	NL	1/2	50/10	3/4	30/30	1
3 (YELLOW)	85-87.9	NL	3/4	40/20	3/4	30/30	1
4 (RED)	88-89.9	NL	3/4	30/30	3/4	20/40	1
5 (BLACK)	> 90	50/10	1	20/40	1	10/50	1

The work/rest times and fluid replacement volumes will sustain performance and hydration for at least 4 hours of work in the specified heat category. Individual water needs will vary $\pm 1/4$ quart/hour.

NL= no limit to work time per hour.

Rest means minimal physical activity (sitting or standing) accomplished in shade, if possible.

CAUTION: Hourly fluid intake should not exceed 1 1/4 quarts.

Daily fluid intake **should not exceed 12 liters.**

Wearing body armor adds 5° F to WBGT Index.

Wearing all MOPP overgarments adds 10° F to WBGT Index.

*Table 3-1. Fluid Replacement Guidelines for Warm Weather Training (Continued)
(Applies to Average Acclimated Service Member Wearing Hot Weather Uniform)*

EASY WORK	MODERATE WORK	HARD WORK
WEAPON MAINTENANCE WALKING HARD SURFACE AT 2.5 MPH, ≤ 30 LB LOAD GUARD DUTY MARKSMANSHIP TRAINING DRILL AND CEREMONY	WALKING LOOSE SAND AT 2.5 MPH, NO LOAD WALKING HARD SURFACE AT 3.5 MPH, ≤ 40 LB LOAD CALISTHENICS PATROLLING INDIVIDUAL MOVEMENT TECHNIQUES, SUCH AS LOW CRAWL, HIGH CRAWL DEFENSIVE POSITION CONSTRUCTION	WALKING HARD SURFACE AT 3.5 MPH, ≥ 40 LB LOAD WALKING ON LOOSE SAND AT 2.5 MPH WITH LOAD FIELD ASSAULTS

WARNING

Hourly fluid intake should not exceed 1¹/₄ quarts. Daily fluid intake should not exceed 12 liters.

ENFORCE INDIVIDUAL PREVENTIVE MEDICINE MEASURES

Leaders must—

- Enforce water intake by—
 - Observing service members drinking required amounts. Encourage frequent drinking of water in small amounts.
 - Ensuring that service members practice good field hygiene.
 - Providing cool water; if desired, you can add flavoring after disinfection to enhance consumption. Personnel should use their canteen cup for consumption of flavored water. **DO NOT add flavoring to canteen water; use only plain water in canteen.**
 - Ensuring troops drink water before starting any hard work or mission (in the morning, with/after meals).
 - Ensuring buddy system is being used.
 - Frequently checking service members' canteens for water; not beverages.

- Making sure service members have adequate time to eat and drink as mission permits. Permit personnel to consume carbohydrate/electrolyte beverages (sports drinks) as supplemental nutrients under conditions of extreme calorie and water requirements; such as extremely vigorous activities.
- Reduce heat injuries by—
 - Enforcing work/rest cycles when the mission permits. Permitting personnel to work/rest in the shade, if possible.
 - Encouraging service members to eat all meals for needed salts.
 - Adjusting workload to size of individuals, when possible.
 - Be prepared for heat casualties and decreased performance when water and work/rest cycle recommendations cannot be met.

MODIFY WEAR OF THE UNIFORM

Direct/authorize service members to—

- Keep skin covered while in sun.
- Keep uniform loose at neck, wrists, and lower legs (unblouse pants).

NOTE

If the medical threat from biting arthropods is high, keep sleeves rolled down and pants bloused in boots.

IDENTIFY SPECIAL CONSIDERATIONS

Identify and modify training/physical activity for service members with high-risk conditions of heat injuries, such as—

- Diseases/injuries, especially fevers, vomiting, diarrhea, heat rash, or sunburn.
- Use of alcohol within the last 24 hours.
- Overweight/unfit.
- Over 40 years old.
- Fatigue/lack of sleep.
- Taking medication (especially for high blood pressure, colds, or diarrhea).
- Previous heatstroke/severe heat exhaustion.
- Lack of recent experience in a hot environment.

Section II. COLD INJURIES

PLAN FOR THE COLD

- Use your FST to train individuals and their leaders in PMM against cold.
- Obtain weather forecast for time/area of training/mission.
- Ensure the following are available as the tactical situation permits:
 - Covered vehicles for troop transport, if tactical situation permits.
 - Cold weather clothing.
 - Laundry services.
 - Warming tents/areas.
 - Hot rations/hot beverages.
 - Drinking water.
- Inspect service members (before starting training/mission) to ensure—
 - Availability, proper fit, and wear of cold weather gear.

FM 21-10/MCRP 4-11.1D

- Clean, dry, proper-fitting clothing.
- Each service member has several pairs of socks, depending on the nature and duration of the mission.
- Frequently rotate guards or other service members performing inactive duties.
- Ensure medical support is available for treatment should cold weather injuries occur.

DETERMINE AND USE WINDCHILL FACTOR

- Obtain temperature and wind speed information as directed by your unit's SOP or contact the local supporting PVNTMED detachment or section.
- Calculate windchill from Table 3-2.

NOTE

Cold injuries can and do occur in nonfreezing temperatures. Hypothermia can occur in mildly cool weather.

Table 3-2. Windchill Chart

ESTIMATED WIND SPEED (IN MPH)	ACTUAL TEMPERATURE READING (°F)											
	50	40	30	20	10	0	-10	-20	-30	-40	-50	-60
	EQUIVALENT CHILL TEMPERATURE (°F)											
CALM	50	40	30	20	10	0	-10	-20	-30	-40	-50	-60
5	48	37	27	16	6	-5	-15	-26	-36	-47	-57	-68
10	40	28	16	4	-9	-24	-33	-46	-58	-70	-83	-95
15	36	22	9	-5	-18	-32	-45	-58	-72	-85	-99	-112
20	32	18	4	-10	-25	-39	-53	-67	-82	-96	-110	-121
25	30	16	0	-15	-29	-44	-59	-74	-88	-104	-118	-133
30	28	13	-2	-18	-33	-48	-63	-79	-94	-109	-125	-140
35	27	11	-4	-20	-35	-51	-67	-82	-98	-113	-129	-145
40	26	10	-6	-21	-37	-53	-69	-85	-100	-116	-132	-148
(WIND SPEEDS GREATER THAN 40 MPH HAVE LITTLE ADDITIONAL EFFECT.)	LITTLE DANGER IN LESS THAN ONE HOUR WITH DRY SKIN. MAXIMUM DANGER OF FALSE SENSE OF SECURITY.				INCREASING DANGER DANGER FROM FREEZING OF EXPOSED FLESH WITHIN ONE MINUTE.				GREAT DANGER FLESH MAY FREEZE WITHIN 30 SECONDS.			
	NOTE: 1. TRENCH FOOT AND IMMERSION FOOT MAY OCCUR AT ANY POINT ON THIS CHART. 2. $F = 9/5 C + 32$.											

Table 3-3. Windchill Categories (See Windchill Table)

WORK INTENSITY	LITTLE DANGER	INCREASED DANGER	GREAT DANGER
<p>HIGH DIGGING FOXHOLE, RUNNING, MARCHING WITH RUCKSACK, MAKING OR BREAKING BIVOJAC</p>	<p>INDIVIDUALS OR SMALL UNIT LEADERS: BLACK GLOVES OPTIONAL; MANDATORY BELOW 0 DEGREES F; INCREASED HYDRATION.</p>	<p>INCREASED SURVEILLANCE BY EXTREME COLD WEATHER SYSTEM OR EQUIVALENT; MITTENS WITH LINERS; NO FACIAL CAMOUFLAGE; EXPOSED SKIN COVERED AND KEPT DRY; REST IN WARM, DRY, SHELTERED AREA; COLD WEATHER, VAPOR BARRIER BOOTS BELOW 0 DEGREES F.</p>	<p>POSTPONE NON- ESSENTIAL ACTIVITY; ESSENTIAL TASKS ONLY WITH LESS THAN 15 MINUTES EXPOSURE; COVER ALL SKIN.</p>
<p>LOW WALKING, MARCHING WITHOUT RUCKSACK, DRILL AND CEREMONY</p>	<p>INCREASED SURVEILLANCE; COVER EXPOSED FLESH WHEN POSSIBLE; MITTENS WITH LINERS AND NO FACIAL CAMOUFLAGE BELOW 10 DEGREES F; FULL HEAD COVER BELOW 0 DEGREES F; KEEP SKIN DRY, ESPECIALLY AROUND NOSE AND MOUTH.</p>	<p>RESTRICT NONESSENTIAL ACTIVITY; 30-40 MINUTE WORK CYCLES WITH FREQUENT SUPERVISORY SURVEILLANCE FOR ESSENTIAL TASKS (SEE ABOVE).</p>	<p>CANCEL OUTDOOR ACTIVITY, IF POSSIBLE.</p>
<p>SEDENTARY SENTRY DUTY, EATING, RESTING, SLEEPING, CLERICAL WORK</p>	<p>SEE ABOVE; FULL HEAD COVER AND NO FACIAL CAMOUFLAGE BELOW 10 DEGREES F; COLD WEATHER, VAPOR BARRIER BOOTS BELOW 0 DEGREES F; SHORTEN DUTY CYCLES; PROVIDE WARMING.</p>	<p>POSTPONE NONESSENTIAL ACTIVITY; 15-20 MINUTE WORK CYCLES FOR ESSENTIAL TASKS; WORK GROUPS OF NO LESS THAN 2 PERSONNEL; NO EXPOSED SKIN.</p>	<p>CANCEL OUTDOOR ACTIVITY, IF POSSIBLE.</p>

These guidelines are generalized for worldwide use. Commanders of units with extensive extreme cold weather training and specialized equipment may opt to use less conservative guidelines.

- Then use Table 3-4 to apply PMM guidance:

Table 3-4. Windchill Preventive Medicine Measures

WINDCHILL	PREVENTIVE MEDICINE MEASURES
30° F AND BELOW	ALERT PERSONNEL TO THE POTENTIAL FOR COLD INJURIES.
25° F AND BELOW	LEADERS INSPECT PERSONNEL FOR WEAR OF COLD WEATHER CLOTHING. PROVIDE WARM-UP TENTS/AREAS/HOT BEVERAGES.
0° F AND BELOW	LEADERS INSPECT PERSONNEL FOR COLD INJURIES. INCREASE THE FREQUENCY OF GUARD ROTATIONS TO WARMING AREAS. DISCOURAGE SMOKING.
-10° F AND BELOW	INITIATE THE BUDDY SYSTEM—HAVE PERSONNEL CHECK EACH OTHER FOR COLD INJURIES.
-20° F AND BELOW	MODIFY OR CURTAIL ALL BUT MISSION-ESSENTIAL FIELD OPERATIONS.

FM 21-10/MCRP 4-11.1D

- The windchill index gives the equivalent temperature of the cooling power of wind on exposed flesh.
 - Any movement of air has the same effect as wind (running, riding in open vehicles, or helicopter downwash).
 - Any dry clothing (mittens, scarves, masks) or material which reduces wind exposure will help protect the covered skin.
- Trench foot injuries can occur at any point on the windchill chart and—
 - Are much more likely to occur than frostbite at “LITTLE DANGER” windchill temperatures, especially on extended exercises/missions and/or in wet environments.
 - Can lead to permanent disability, just like frostbite.

IDENTIFY SPECIAL CONSIDERATIONS

- Conditions that place service members at high risk of cold injuries include—
 - Previous trench foot or frostbite.

- Fatigue.
 - Use of alcohol.
 - Significant injuries.
 - Poor nutrition.
 - Use of medications that cause drowsiness.
 - Little previous experience in cold weather.
 - Immobilized or subject to greatly reduced activity.
 - Service members wearing wet clothing.
 - Sleep deprivation.
- Identify the special hazards of carbon monoxide poisoning and fire that may affect your cold weather operations.

ENFORCE INDIVIDUAL PREVENTIVE MEDICINE MEASURES

- Ensure service members wear clean and dry uniforms in loose layers.

FM 21-10/MCRP 4-11.1D

- Ensure service members remove outer layer(s) before starting hard work or when in heated areas (before sweating).
- Have service members inspect their socks and feet at least daily when operating in cold and/or wet environments.
- Ensure service members to—
 - Wash their feet daily.
 - Wear clean and dry socks.
 - Use warming areas when available.
 - Eat all meals to ensure sufficient calories are consumed to maintain body heat.
 - Drink plenty of water and/or nonalcoholic fluids. In cold weather, fluid intake is often neglected, leading to dehydration.
 - Exercise their big muscles or at least their toes, feet, fingers, and hands to keep warm.
- Institute the buddy system in cold weather operations. Service members taking care of each other decrease cold injuries.

Section III. ARTHROPODS AND OTHER ANIMALS OF MEDICAL IMPORTANCE

PLAN FOR THE ARTHROPOD, RODENT, AND OTHER ANIMAL THREAT

- Obtain information on biting and stinging arthropods and other animals (such as snakes, domestic and wild animals, or birds) which could be a threat—
 - Through unit medical channels from the command PVNTMED representative.
 - From the health service support (HSS) annex to operation plan/order.
- Use your FST—
 - Train your service members in PMM.
 - Control insects and other medically important arthropods in your AO.
 - Control rodents and other medically important animals in your AO.
 - Remind service members to avoid handling insects, arthropods, snakes, and other animals to prevent bites or injury. Animals that appear to be healthy may transmit rabies and other zoonotic diseases.

FM 21-10/MCRP 4-11.1D

- Keep personnel from eating in sleeping/work areas; prevent attracting insects, rodents, and other animals.
- Animal mascots should not be kept or maintained unless cleared by veterinary personnel.
- Ensure that—
 - Each service member has a bed net in good repair and treated with permethrin repellent.
 - Immunizations are current. Prophylaxis (for example, anti-malaria tablets) is available for issue as required.
 - Laundry and bathing facilities are available.
 - Field sanitation team supplies and equipment are available and can be replenished.
- Request assistance from a PVNTMED unit (through medical or command channels) when control of biting arthropods, rodents, or other animals is beyond the capabilities of your unit.

ENFORCE INDIVIDUAL PREVENTIVE MEDICINE MEASURES

- Ensure all uniforms are impregnated with permethrin before field training or deployment.

- Ensure each service member has DOD skin (DEET) and clothing (permethrin) insect repellent and uses them. However, cooks, other food handlers, and kitchen police personnel must not use repellent on their hands when preparing and serving food, or when cleaning food service utensils, dishes, and food serving areas.

- Direct service members to keep—
 - Shirts buttoned.

 - Sleeves rolled down.

 - Pants bloused inside boots.

- Ensure service members—
 - Bathe/shower regularly (field expedients will do); a field shower or bath with a clean change of uniform should be accomplished once each week to control body lice.

 - Discontinue the use of aftershave lotions, colognes, perfumes, and scented soaps; they attract insects.

 - Use permethrin treated bed nets and the DOD-approved aerosol insect (Insecticide, d-Phenothrin, 2%, Aerosol, NSN 6840-01-412-4634); spray inside the net if necessary.

FM 21-10/MCRP 4-11.1D

- Observe service members taking anti-malaria pills or other prophylaxis (when prescribed by the medics).
- Use your FST to identify suspected lice infestations and refer for medical treatment.

MINIMIZE EXPOSURE TO ARTHROPOD, RODENT, AND ANIMAL THREAT

- If the mission permits—
 - Use your FST to assist you in selecting bivouac sites.
 - Occupy areas distant from insect/arthropod breeding areas such as natural bodies of water.
 - Avoid areas with high grass or dense vegetation.
 - Use FST recommendations and assistance in applying pesticides for area control around living areas and in natural bodies of water.
 - Drain or fill in temporary standing water sites in occupied area (empty cans, used tires, or wheel ruts after rains).
 - Clear vegetation in and around occupied area.

- Maintain area sanitation by enforcing good sanitation practices.
 - Properly dispose of all waste.
 - Protect all food supplies.
 - Police area regularly.
 - Exclude pests (rats, mice, lice, and flies).

NOTE

See Appendix A for performance of tasks relating to PMM against arthropods and rodents.

Section IV. POISONOUS PLANTS AND TOXIC FRUITS

- Obtain information on poisonous plants and toxic fruits that could be a threat—
 - Through unit medical channels from the command PVNTMED representative.
 - From the HSS annex to operation plan/order.

FM 21-10/MCRP 4-11.1D

- Use your FST to—
 - Train your service members in PMM.
 - Display and provide information on the kinds of dangerous plants and fruits in the unit area.
- Enforce individual PMM by—
 - Proper wearing of the uniform.
 - Avoidance of poisonous plants where possible.
 - Avoidance of consuming potentially dangerous vegetation and fruits.
 - Avoidance of putting grasses and twigs in the mouth.

Section V. FOOD-/WATER-/WASTEBORNE DISEASE/ILLNESS

PLAN FOR SAFE WATER

- Know the location of approved water distribution points.

- Make sure your unit has an adequate supply of—
 - Iodine water purification tablets (1 bottle for each individual).
 - Field chlorination kits.
 - Bulk chlorine.
 - Chlor-Floc® kits.
- Ensure water trailers and tankers (400 gallon and above) are inspected by PVNTMED personnel semiannually.
- Inspect water containers before use.
- Check the residual chlorine of bulk water supplies (5-gallon cans, water pillows, water trailer) before drinking and at least daily thereafter. (See Tasks 7 and 8, Appendix A.)

PLAN FOR SAFE FOOD

- Ensure food service personnel maintain foods at safe temperatures.
- Inspect food service personnel daily and refer for medical evaluation those with illness and/or skin infections.

FM 21-10/MCRP 4-11.1D

- Make sure foods, drinks, and ice purchased from civilian vendors are approved by the command medical authority.
- Supervise the use of the mess kit laundry/sanitation center.
- Ensure food service personnel and service members use handwashing devices.
- Ensure all food waste is transported to an approved disposal site, buried, or burned daily (at least 30 meters from food preparation area and water source).

PLAN FOR THE CONSTRUCTION AND MAINTENANCE OF FIELD SANITATION DEVICES

- Determine type of field waste disposal devices required.
 - The primary type of human waste disposal devices in bivouac areas are the chemical toilets. Individual waste collection bags are the primary type used when on the march.
 - The type of improvised waste disposal used will depend on the mission, length of stay in the area, terrain, and weather conditions. When chemical toilets are not available, the burn-out latrine is the preferred improvised waste disposal device.

NOTE

Always check local, state, federal, or host-nation regulations for restrictions or prohibitions on using standard or improvised field devices and waste disposal in the field.

- Select locations for field latrines.
 - As far from food operations as possible (100 meters or more). Downwind and down slope, if possible.
 - Down slope from wells, springs, streams, and other water sources (30 meters or more).
- Set up, construct, and maintain latrines (see Task 9, Appendix A, for requirements).
 - As soon as the unit moves into a new area, detail service members to set up chemical toilets or dig latrines. (See previous **NOTE**.)
 - Detail service members to clean latrines daily.
 - Instruct the FST to spray the latrines with insecticide as necessary (not the pit contents).
 - Always provide handwashing facilities at the food service facilities and the latrines. Make use of handwashing devices at latrines mandatory.

- Cover, transport, burn, or bury waste daily.
- Use the FST to train service members and unit leaders in PMM against food-/water-/wasteborne diseases.

NOTE

See Appendix A for performance of tasks relating to PMM against food-/water-/wasteborne diseases.

Section VI. PERSONAL HYGIENE AND PHYSICAL AND MENTAL FITNESS

KEEP YOUR UNIT PHYSICALLY FIT

- Ensure that leaders at all levels recognize the benefits of physical fitness. Leaders must be role models, leading by example.
- Take a positive approach to physical fitness with service members. A physically fit service member is less likely to be a combat loss from disease or injury.

NOTE

See FM 21-20 for more information.

PLAN FOR PERSONAL HYGIENE

- Provide shower/bathing facilities in the field. All personnel must bathe at least once a week and have a clean change of clothing to reduce the health hazard associated with body lice.
- Inspect service members' personal equipment to ensure they have sufficient personal hygiene supplies—soap, washcloths, towels, a toothbrush, dental floss, fluoride toothpaste, and razor and razor blades (females should have sanitary napkins or tampons).
 - Ensure undergarments are cotton (not silk, nylon, or polyester).
 - Ensure uniforms fit properly (not tight).
 - Ensure service members have several pairs of issue boot socks; the number will depend on the type and length of the mission.
- Use your FST to train your service members in personal hygiene.

FM 21-10/MCRP 4-11.1D

- Ensure service members receive annual dental examinations and needed oral health care. Make sure all oral health appointments are kept. Use low operational requirement periods to ensure all personnel maintain a good oral health status.

ENFORCE SLEEP DISCIPLINE

- The mission, unit readiness, and individual security must come first, but never miss a chance to give everyone in the unit time to sleep.
- When feasible, set work/rest shifts.
- Do not allow service members to sleep in areas where they may be run over by vehicles, or in other unsafe areas.
- During *continuous operations*, set shifts and rotate jobs to allow everyone at least 3 to 4 hours uninterrupted sleep per 24-hour period.
- During brief (up to 48 hours) sustained operations when shifts are impossible, rotate jobs so all individuals catnap as safely and comfortably as possible. The loss of sleep will reduce the service member's ability to perform his duties and the leader's ability to make decisions.

NOTE

Ensure that sleeping individuals observe safety precautions. Use ground guides for vehicles in bivouac areas.

ENFORCE PREVENTIVE MEDICINE MEASURES FOR THE EFFECTS OF SLEEP LOSS

- Those individuals with the most complex mental or decision-making jobs need the most sleep. This means you and your most critical leaders and operators!
- Cross train individuals to perform the critical tasks and delegate limited authority among leaders, thus enabling all to get necessary rest.

ENSURE WELFARE, SAFETY, AND HEALTH OF UNIT

- Ensure the best and safest water, food, equipment, shelter, sanitation, and sleep possible are provided.
- Educate service members to maintain professional pride and personal caring for themselves, each other, and their equipment.

FM 21-10/MCRP 4-11.1D

- Know the personal backgrounds and the military skills of your service members. Chat with them informally about themselves. Be attentive and understanding while listening to service members.
- Utilize group support and counsel for service members with *home front* problems.
- Assign jobs to maintain a balance between having qualified people in key positions while sharing the load, hardship, and risks fairly.
- Use challenging and difficult environments during training to increase your own and the unit's coping skills and confidence.

REDUCE UNCERTAINTY BY KEEPING EVERYONE INFORMED

- Brief unit personnel on the situation, objectives, and conditions that the mission or environment may involve.
- Explain reasons for hardships, delays, and changes.
- Do not give false reassurances. Prepare your service members for the worst and put any unexpected challenges or reversals in a positive perspective.
- Deal with rumors firmly and honestly. Prevent the spread of rumors.
- Make contingency plans and follow SOP to reduce the effects of surprise.

PROMOTE COHESION WITHIN THE UNIT

- Use equipment drills, physical fitness training, team sports, and field *stress training* to stimulate mutual reliance and closeness.
- Bring unit members together for meals, award ceremonies, and other special occasions.
- Integrate new members by assigning sponsors and ensuring rapid familiarization.

IMPART UNIT PRIDE

- Educate service members in the history and tradition of the small unit, its parent units, and the branch of Service.
- Honor the historical examples of initiative, endurance, and resilience, of overcoming heavy odds, and of self-sacrifice.

Section VII. NOISE

PLAN FOR NOISE

- Identify existing noise in your unit. If necessary, request PVNTMED assistance in identifying sources.

FM 21-10/MCRP 4-11.1D

- Ensure that hearing conservation is part of the unit SOP.
- Ensure all service members are medically fitted for hearing protectors and are issued multiple sets.
- Ensure all service members have annual hearing test/screening.
- Control noise sources.
 - Isolate by distance; that is, keep troops away from noise, if possible.
 - Isolate by barrier; for example, use sandbags.
 - Use organic equipment controls; for example, keep mufflers and engine covers in good repair.
- Train unit to do mission while wearing hearing protectors.
- Post **Noise Hazard** signs in noise hazardous areas and on noise hazardous equipment.

ENFORCE INDIVIDUAL PROTECTIVE MEASURES

Ensure that service members—

- Wear earplugs or other hearing protective devices.

- Do not remove inserts from aircraft or tracked vehicle helmets.
- Avoid unnecessary exposure.
- Limit necessary exposure to short, infrequent, mission-essential times.
- Clean their hearing protectors.

PROTECT MISSION

- Be aware of short-term noise effects on the service member's ability to hear combat significant noise.
- Assign listening post (LP)/observation post (OP) to troops least affected by noise, augment LP/OP with night vision devices and/or increase the number of audible alarms around your position.

Section VIII. TOXIC INDUSTRIAL CHEMICALS/MATERIALS

PLAN FOR CHEMICALS

- Identify sources of toxic industrial chemicals/materials in your unit. If necessary, request PVNTMED assistance in identifying sources.

FM 21-10/MCRP 4-11.1D

- Obtain safer chemicals for unit operations, if available.
- Observe cautions/warnings posted in technical manuals dealing with solvents corrosives, and other hazardous materials. (Refer to MSDS that accompany stores of toxic chemicals/materials.)

ENFORCE INDIVIDUAL PREVENTIVE MEDICINE MEASURES

Ensure that service members—

- Repair engines outside or vent engine exhaust to outside.
- Keep their sleeping quarters ventilated.
- Do not use vehicle engines as heaters.
- Use/maintain onboard ventilation systems.
- Are trained and drilled to self-protect themselves around hydrogen chloride and M8 smoke.
- Maintain bore/gun gas evacuation systems.
- Use “safety” Stoddard solvent.

- Have adequate clean gloves, coveralls, and other protective gear.
- Follow label instructions on chemical containers.

CHAPTER 4

UNIT FIELD SANITATION TEAM**FIELD SANITATION TEAM CONCEPT**

- During World War II, it became apparent that more action was needed at the unit level to counter the medical threat. (Remember Togatabu Island and the jungles of Burma? [pages 1-2 and 1-3]) To answer this need, the FST concept was developed.
- Selected members from each company-sized unit were designated to receive special training in DNBI prevention so they could advise the commander in PMM for DNBI. This training enabled the unit commander to provide arthropod control, individual and unit disinfection of water, and safe food supplies. This resulted in commanders being able to reduce DNBI losses.

SCOPE OF FIELD SANITATION TEAM OPERATIONS

The FST—

- Conducts arthropod and rodent control operations in the field as directed by the commander. In garrison, the FST is in a training status. During mobilization, the FST performs its field sanitation duties.

FM 21-10/MCRP 4-11.1D

- Ensures that unit leaders are supervising the disinfection of unit water supplies. Instructs the troops in methods of individual water purification.
- Assists the commander by inspecting food service operations.
- Monitors the waste disposal procedures and the construction of garbage and soakage pits; and then inspects these devices for proper waste disposal procedures use.
- Ensures personnel have individual waste collection bags and the unit's chemical toilets are set up and operated correctly. Monitors disposal methods of individual bags and chemical toilet contents. Monitors the construction of field latrines and urinals when chemical toilets are not available. Inspects these devices for proper sanitation.
- Provides unit training in the use of individual PMM.
- Applies pesticides as required/necessary for the control of arthropods.

FIELD SANITATION TEAM TASKS

Unit FSTs serve as advisors to the commander on individual and unit PMM that prevent DNBI. To assess the medical threat (disease/illness risk), the team members must be able to perform the following tasks:

- Inspect water containers and trailers.

- Disinfect unit water supplies.
- Check unit water supply for chlorine.
- Inspect unit field food service operations.
- Inspect unit waste disposal operations.
- Control arthropods, rodents, and other animals in unit area.
- Train unit personnel in use of individual PMM.
- Monitor status of PMM in unit.
- Assist in selection of a unit bivouac site.
- Supervise the construction of field sanitation devices.
- Monitor unit personnel in the application of individual PPM.

NOTE

All unit leaders should be able to perform these tasks.

SELECTION OF PERSONNEL

Selection of personnel for the unit FST should be based on the following:

- Units having organic medical personnel (combat medics) **WILL** use them as the FST.
- When organic medical personnel are not available, selected team members should be personnel whose normal field duties allow them to devote time to field sanitation activities.
- At least one member must be a noncommissioned officer when organic medical personnel are not available.

TRAINING

Members of the FST are required to receive training in basic sanitation techniques, disease control, and individual PMM. Training includes—

- Use of insect repellents, uniform impregnants, and protective clothing.
- Use and repair of screening and bed nets.
- Use of residual and space insecticide sprays.
- Rodent control measures.

- Food service sanitation.
- Unit waste disposal procedures.
- Water purification procedures, to include determination of chlorine residual.
- Personal hygiene.
- Heat/cold injury prevention, to include WBGT determination and use of the windchill chart.
- Other subjects as they relate to the medical threat in the unit's AO, to include noise hazards and hearing protection.

HOW TO MAKE YOUR FIELD SANITATION TEAM THE BEST IN THE COMMAND

- Select soldiers you can rely on.
- After they are trained, use them during—
 - Service training and evaluation programs.
 - Field training exercises.

FM 21-10/MCRP 4-11.1D

- Unit training on PMM.
- Predeployment training on the medical threat in the deployment AO.
- Ensure your unit has a functional FST SOP.

NOTE

Do not let your FST just be an Inspector General requirement. Make it an asset you can use. Your FST has a critical role and can assist you in protecting the health of unit personnel.

APPENDIX A

**UNIT-LEVEL PREVENTIVE MEDICINE
MEASURES TASKS**

TASK 1: Control biting insects.

EQUIPMENT NEEDED: 1-gallon or 2-gallon sprayer, ready-to-use insecticide, and individual repellents (DEET and permethrin).

STEPS OF PERFORMANCE:

MOSQUITOES:

STEP 1: Identify common mosquito-breeding areas:

- Mosquito landing counts and trapping.
- Standing water.
- Artificial water containers.

STEP 2: Control:

- If possible, drain standing water.

FM 21-10/MCRP 4-11.1D

- Empty artificial water containers.
- Avoid setting up bivouac sites near mosquito-breeding areas.
- Enforce individual use of DOD insect repellent systems (DEET on skin and permethrin on uniforms and bed nets).
- Have FST spray pesticide on adult mosquito-resting areas using 1-gallon or 2-gallon sprayer (see Task 2), if necessary.

FLEAS:

STEP 1: Identify rodent infestations or the presence of wild or domestic cats and dogs in the unit area (rodents, cats, and dogs carry fleas).

STEP 2: Control:

- Have service members in unit use individual DOD insect repellents.
- Exclude rodents and other wild animals from camps and buildings.
- Have FST spray pesticide, using 1-gallon or 2-gallon sprayer (see Task 2) around rodent burrows and harborage.

- **DO NOT** allow service members to keep “pet” animals.

LICE:

STEP 1: Identify lice infestation:

- Head lice—look for lice and eggs attached to the hair, close to the scalp. Eggs are attached directly to the hairs.
- Crab lice—usually associated with the pubic area (groin), but can be found attached to other body hairs. The eggs are attached directly to the hair.
- Body lice—generally found in the seams of infested persons’ clothing. The eggs are attached to the fibers of the garments. Body lice tend to move to the body of the host only during the actual feeding process.

STEP 2: Control:

- Refer individuals with lice infestation for medical treatment.
- Enforce high standards of personal hygiene. Require frequent showering and laundering of bedding and clothing (once a week at a minimum).

FM 21-10/MCRP 4-11.1D

- To prevent body lice, enforce individual use of permethrin-treated battle dress uniform/cammies.
- Avoid sexual contact (for crab lice).

TICKS AND MITES:

STEP 1: Identify tick- or mite-infested areas—

- Grassy areas.
- Animal trails or resting areas.
- Rodent burrows.

STEP 2: Control:

- Avoid walking through tick-infested areas.
- Cut down vegetation in and around camps.
- Enforce individual use of DOD insect repellent.

- If necessary, have FST spray area with pesticide, using 1-gallon or 2-gallon sprayer to apply pesticide (see Task 2).
- Enforce a buddy system where troops perform checks not only on themselves but on their buddy as well. If ticks are found—
 - Remove any attached ticks promptly and carefully without crushing, using gentle steady traction with forceps (tweezers) close to the skin to avoid leaving mouthparts in the skin;
 - Protect hands with gloves, cloth or tissue when removing ticks from humans or animals;
 - Ensure that the body of the tick is not separated from its head.

NOTE

Lyme disease, Rocky Mountain spotted fever, ehrlichiosis, and encephalitis can be contracted through tick bites. Beware of ticks when passing through the thick vegetation they may cling to. When cleaning host animals for food, or when gathering natural materials to construct a shelter, you must be on the lookout for them. Buddy checks are important. If diagnosed early, the diseases mentioned above can be cured. If not, they can lead to death.

BITING FLIES:

STEP 1: Identify problems with biting flies and their breeding sites.

- Moist soil near ponds and stream banks.
- Decaying vegetation and animal manure.
- Rodent burrows, rock walls, and cracks in walls of buildings.

STEP 2: Control:

- Enforce use of DOD insect/arthropod repellents (DEET on the skin and permethrin on uniforms).
- Avoid areas with biting fly problems or breeding sites.

FILTH FLIES:

STEP 1: Identify infestations and breeding areas, such as—

- Open latrines.
- Uncovered food and waste.
- Ground soaked with liquid kitchen waste or food scraps on wet soil.

- Animal barnyards near AO.

STEP 2: Control:

- Remove, cover, or burn latrine waste.
- Keep food and waste covered.
- Use fly swatters for small to moderate numbers of filth flies. Only use the DOD-approved aerosol (Insecticide, d-Phenothrin, 2%, 12 ounce Aerosol, NSN 6840-01-412-4634) pesticide if large numbers of flies are in an enclosed area (do not use in food service operations).
- Ensure proper disposal of waste collection bags.
- Have FST use a 1-gallon or 2-gallon sprayer to spray pesticide on ground that is wet with kitchen waste, in field latrines, and on fly-resting sites (see Task 2).
- Use toxic fly baits.

COCKROACHES:

STEP 1: Identify cockroach infestations and breeding areas, such as—

- Food service areas.

- Latrines/shower facilities.
- Trash collection points.

STEP 2: Control:

- Enforce good sanitation practices.
- Ensure proper collection and removal of food waste.
- Have FST use a 1-gallon or 2-gallon sprayer to spray pesticide as spot treatment in food service areas and as a residual spray to outside surfaces of buildings and trash collection points.

SPIDERS:

STEP 1: Identify infestations of medically important spiders (black widow, tarantula, and brown recluse spider).

NOTE

Use caution when entering into and clearing out of old, infrequently used buildings.

STEP 2: Control:

- Eliminate unnecessary rubbish and other debris in the bivouac area.
- Have FST use a 1-gallon or 2-gallon sprayer (see Task 2) to spray around tents, field latrines, or other spider habitats.

**SCORPIONS and CENTIPEDES:****STEP 1:** Identify places where scorpions and centipedes are a problem.

- Rocky areas.
- Inside of building.
- Tents.

**STEP 2: Control:**

- Have FST use a 1-gallon or 2-gallon sprayer (see Task 2) on nesting sites around the entire tent or other structure, forming a band 2-feet high from the ground level.
- Saturate all cracks and crevices with insecticide.

BEEES, WASPSS, AND ANTTTS:

STEEPP 1: Identify places where these insects are a problem. Locate the nests.

STEEPP 2: Control:

- Educate troops to avoid nests.
- Have FST use a 1-gallon or 2-gallon sprayer (see Task 2) on the nesting sites. Use caution to avoid stings from disturbed insects. If the task is too great or too dangerous, contact PVNTMED personnel for assistance.

TAAASK 2: Use the 1-gallon or 2-gallon compressed air sprayer.

EQUIPMENT NEEDED: 1-gallon or 2-gallon sprayer and authorized insecticide, respirator, gloves, nonvented goggles, and other personal protective equipment, as appropriate.

NOTE

Only personnel certified as DOD Pesticide Applicator may apply pesticides. Uncertified persons may apply pesticides if they are properly trained by and under the direct supervision of a certified pesticide applicator.

STEPS OF PERFORMANCE:

STEP 1: Determine the job to be done (pest, area to be treated, and pesticide type).

STEP 2: Assemble the compressed air sprayer. Select the correct nozzle and attach to the end of the wand, fill the tank half full of clean water, and pressurize the tank to ensure that the tank and nozzle are operational. Pressurize to approximately 40 to 60 pounds per square inch (psi) of pressure. If the sprayer does not have a gauge, approximately 30 to 35 pump strokes will usually be sufficient. Squeeze the handle on the wand to check nozzle performance. If the sprayer is operational, release pressure from tank. If the sprayer leaks, replace the gaskets or tighten the connections on the hose, wand, and nozzle.

STEP 3: Read the insecticide label.

- Always read the label before doing anything.
- Always follow all instructions on the label. **The label is the law.**

CAUTION

Wear chemical resistant gloves during mixing and spraying. Gloves, Chemical and Oil Protective, NSN 8415-01-012-9294 (size 9) or NSN 8415-01-013-7832 (size 10) are recommended. Wear an approved pesticide respirator, if required by the label. **DO NOT** use the NBC protective mask when applying pesticides. Avoid skin contact with insecticide.

STEP 4: Add pesticide to the clean water in the sprayer tank. Finish filling the sprayer with clean water to the appropriate level. **DO NOT fill the sprayer to the top.** Leave space for pumping air pressure into the tank. Put the pump assembly into the sprayer and tighten.

STEP 5: Pump the sprayer.

- Pump the sprayer 30 to 35 times to achieve 40 to 60 psi pressure.
- There should be a slight resistance to pumping when this pressure is achieved. **DO NOT** over pump.

STEP 6: Spray insecticide.

- Point nozzle at area to be sprayed and squeeze the handle on the wand.
- Continue spraying until area is covered.

NOTE

Record all pesticide applications. The record should include location of application, name of pesticide used, and amount of pesticide used. Pesticide applications must be reported to higher echelon command, using **Department of Defense Form 1532-1** as required by **DOD Instruction 4150.7**.

**STEP 7:** Clean the sprayer.

- Clean the sprayer with soap and water, then flush the tank at least 3 times with clear water.
- Rinse all parts in clear water.

FM 21-10/MCRP 4-11.1D

- Reassemble and spray clear water through nozzle. If the sprayer is not cleaned after use, vital parts will corrode.

STEP 8: Store cleaned sprayer.

- Turn the sprayer tank upside down with pump assembly separated to keep tank dry.

CAUTION

Always wash your hands and chemical resistant gloves, respirator, goggles, and other personal protective equipment with soap and water after spraying. Store personal protective equipment away from pesticides and applicator.

TASK 3: Control domestic rodents.

EQUIPMENT NEEDED: Tamper-proof rodent bait stations, rat snap trap (mechanical spring), mouse snap trap (mechanical spring), and rodenticides.

STEPS OF PERFORMANCE:

STEP 1: Identify rodent infestations and breeding and harborage areas, such as—

- Underground burrows.
- Around building foundations.
- Under rubbish piles.
- Near food sources.

STEP 2: Control:

- Enforce food sanitation practices, such as eliminating garbage and food waste in the bivouac area and keeping all food and waste covered.
- Locate trash dumps away from sleeping/berthing and food service areas.
- Clear all possible nesting areas by removing unnecessary rubbish and other debris.
- Modify buildings and structures to prevent rodents from having easy access.

- Use rodent snap traps and poison baits simultaneously for effective control. Poison baits must be placed in tamper/spill-proof containers with bilingual labels (English and local). Read the label and wear chemical resistant gloves when handling poison baits.

CAUTION

Wear chemical resistant gloves while handling rodenticides. Avoid skin contact with rodenticides. Wear plastic gloves when handling dead rodents. Place dead rodents in plastic bags; seal and dispose of the bags in landfills, or incinerate.

TASK 4: Prevent injuries due to venomous snakebite.

STEPS OF PERFORMANCE:

STEP 1: Be familiar with venomous snakes in the AO and with areas where snakes may be a problem.

- Rocky areas.
- Areas with rodent infestations.
- Heavy vegetation.

STEP 2: Control:

- Be familiar with field treatment of snakebites.
- Educate personnel on avoiding snakes and preventing snakebites.
- Prevent and control rodents (food sources for snakes) around camps and bivouac sites.
- Exclude snakes from buildings.

TASK 5: Inspect unit food service operations.

EQUIPMENT NEEDED: Thermometer, Self-Indicating Bimetallic, 0° F to 220° F, NSN 6685-00-444-6500. Clipboard with writing material.

BACKGROUND INFORMATION:

Some foods support the rapid growth of disease organisms that cause diarrhea; these foods are called:

POTENTIALLY HAZARDOUS FOODS

Examples of potentially hazardous foods include but are not limited to meats, fish, milk, creamed beef, gravies, soups, and chicken. Extra care and precautions must be taken with

FM 21-10/MCRP 4-11.1D

these potentially hazardous foods. Five factors most often involved in outbreaks of diarrhea caused by contaminated foods are—

- Failing to keep potentially hazardous foods cold (below 40° F) or hot (above 140° F).
- Allowing potentially hazardous foods to remain at warm temperatures (41° F to 139° F).
- Preparing foods 3 hours or more before being served.
- Allowing sick employees to work.
- Permitting poor personal hygiene or sanitation practices by food handlers. Example: Not washing hands after using the latrine; improperly washing and sanitizing all cooking utensils.

STEPS OF PERFORMANCE:

IN GARRISON OR WHEN FOOD IS PREPARED IN A FIELD FOOD SERVICE FACILITY:

STEP 1: Have the supervisor check the temperature of potentially hazardous foods.

- If hot—food should be 140° F or above.
- If cold—food should be 40° F or below.

STEP 2: Check personnel for illness and skin infection.

STEP 3: Check food handling techniques and personal hygiene.

STEP 4: Have the supervisor check the food temperature in cold storage units.

STEP 5: Check handwashing facilities. Are they being used by food handlers?

STEP 6: Check doors and windows. Are they closed or screened to prevent flies from entering?

NOTE

See FM 10-23 for the correct operating procedures for a field kitchen facility (mobile field kitchen [MKT-75] or kitchen tent [M-1948]).

WHEN FOOD IS BROUGHT TO YOUR UNIT IN THE FIELD:

STEP 1: Check the preparation of insulated containers.

FM 21-10/MCRP 4-11.1D

- For hot foods, the container should be preheated by the use of boiling water. Foods should be placed in the container while they are hot (above 140° F).
- For cold foods, the container should be prechilled by the use of ice. Foods placed in the container should be cooler than 40° F. Always check the container and the insert seals to ensure that they are intact and in good condition to aid in keeping food at its required temperature.

NOTE

See FM 8-34 and FM 10-23 for the correct procedures for preparing the insulated containers.

STEP 2: When the insulated container arrives, the supervisor must check the food temperature before serving. Make sure it is 140° F or above for hot foods and 40° F or below for cold foods. If the temperature is in the danger zone, contact the medical authority for instructions.

STEP 3: Check for handwashing devices for use by service members.

STEP 4: Check the mess kit laundry, if used. Make sure service members are using the mess kit laundry correctly. The food waste is placed in a scrap can. Wash the kit in warm, soapy water (120° F to 140° F) using a long-handled brush to scrub. Rinse the mess kit in clear, boiling water. Disinfect the mess kit by immersing it in clear, boiling water for 10 seconds. Each mess kit laundry setup of four cans will support 80 personnel. Air-dry mess kits.

NOTE

If a sanitation center or immersion heaters are not available, food service disinfectant may be used. Make sure the label directions are being followed. Each setup of four cans will support 100 personnel. The setup consists of one can for food scraps, one can with soapy water, a clear rinse can, and a final rinse can with food service disinfectant.

STEP 5: Check the sanitation center, if used. The sanitation center is a set of one garbage can and three sinks with the M2 field range burners, or the

modern burner unit, and thermometers. The first sink has warm, soapy water. The second sink has clear, 170° F water. The third sink has clear, 180° F water. If thermometers are not available, the third sink must have boiling water. Food is scraped into the garbage can.

Scrub mess kit in the warm, soapy water by using a long-handled brush. Rinse the mess kit in the second sink of clear, 170° F water. Disinfect the mess kit by immersing it in the third sink of 180° F water for 10 seconds. Air-dry mess kits.

TASK 6: Inspect water containers.

EQUIPMENT NEEDED: None.

WHEN TO INSPECT WATER CONTAINERS:

- Quarterly in garrison when not being used.
- Prior to deployment.

- Before filling at water distribution points.
- Upon completion of use to ensure that all water has been drained from the container before storage.

STEPS OF PERFORMANCE:

UNIT WATER TRAILER:

- Upon completion of use:

STEP 1: Drain plug and spigots: Make sure that the drain plug has been removed and that all spigots have been opened to drain all water

from the tank. Foul odors, bacteria growth, and rust will accumulate during storage if the water is not completely drained.

STEP 2: Manhole cover: Place a thin piece of wood under the manhole cover to provide ventilation. With the manhole cover and spigots open, air circulation will be allowed, thus drying the inside of the water trailer.

NOTE

See the technical manual on your water trailer for additional guidance.

- Quarterly:

STEP 1: Manhole cover: Ensure the sealing gasket is in place, free of excessive cracks and dry rot. Cover should provide an effective seal.

STEP 2: Drain plug: Ensure it is operable; it should be removable without excessive effort.

STEP 3: Interior: Check surface for excessive cracks; check for signs of being used for storage of products other than water such as oil products, gasoline, or diesel fuel. Rust stains and other discoloration caused by common natural chemicals in water (iron or manganese) pose no health problem.

STEP 4: Spigots: Make sure spigots are clean and operable. Covers over spigots should open and close with ease. Spigot handles should operate freely.

NOTE

Questions concerning excessive interior cracks or chipping and use after storage of products other than water should be directed to PVNTMED personnel. Refer to the technical manual on your water trailer for maintenance instructions.

- Before filling at water distribution points:
 - STEP 1:** Check interior for gross contamination.
 - STEP 2:** Check hose used to fill trailer. Water point fill hose should not come in contact with the ground. If the hose is lying on the ground, wash the end before use.
 - STEP 3:** After filling, check manhole cover and drain plug to ensure that they are secure.

CAUTION

Personnel detailed to fill water trailers must be directed to fill the trailers only at approved water points.

COLLAPSIBLE FABRIC DRUMS/PILLOWS/ONION TANKS:

- STEP 1:** Interior: Check for dirt and other contamination; check for holes.
- STEP 2:** Fill holes: Check to ensure that fill holes are clean and covers are in place.

STEP 3: Exterior: Check to ensure the exterior is free of oils and other contaminants that may seep into the bag and contaminate the water.

LYSTER BAGS:

STEP 1: Interior: Check for dirt and other contamination; check for holes.

STEP 2: Cover: Check to make sure it fits. Check for holes.

STEP 3: Spigots: Make sure spigots are clean and in place.

STEP 4: Location: Elevate Lyster bags sufficiently to prevent contamination of spigots by wildlife.

NOTE

Always clean the Lyster bag prior to its first use and periodically thereafter with potable water.

WATER CANS: Check interior for contamination; if can has a fuel odor, such as gasoline, do not use it for drinking water.

TASK 7: Check unit water supply for chlorine residual.

EQUIPMENT NEEDED: Field chlorination kit containing chlorine ampules, color comparator, and chlorine test tablets.

Check the chlorine residual when—

- Filling unit containers at water distribution points.
- Water containers arrive in unit area.
- Directed by command medical authority.
- Treating a raw water supply.

STEPS OF PERFORMANCE:

STEP 1: Determine the desired chlorine residual in milligrams per liter (mg/L).

- At the point of consumption, water obtained from an approved water distribution point should have at least a trace of chlorine residual.
- When the unit must obtain water from a raw water supply, or from another source such as a stream or pond, the finished product should have a 5-mg/L chlorine residual after 30 minutes. Under certain conditions, the local medical authority may direct a higher residual.

STEP 2: Flush the spigots of the water container being checked and fill the color comparator tube to a point just below the top of the tube.

STEP 3: Place one chlorine test tablet in the comparator and allow it to dissolve.

STEP 4: Hold the color comparator at eye level and toward a good light source.

STEP 5: Compare the color of the water with the color disc on the opposite side of the color comparator.

- The water is safe to use if the color of the water is the same shade or darker than the required color for the chlorine residual.
- The water must be chlorinated if the color is lighter than the required residual.

TASK 8: Chlorinate water supplies.

EQUIPMENT NEEDED: Field chlorination kit, a 6-ounce jar of calcium hypochlorite (HTH) (70 percent chlorine), or a container of 5- to 6-percent household bleach. Chlorinate the water when—

- The water supply has no chlorine residual.

- The chlorine residual is below required level.
- A raw (untreated) or unapproved water supply must be used.

STEPS OF PERFORMANCE:

STEP 1: Before adding chlorine, check the chlorine residual following the procedures in Task 7.

STEP 2: If the chlorine residual is less than the desired level, add enough chlorine to raise the residual to the required level. Use Table A-1 to determine the amount to add to untreated water. If a 10 mg/L chlorine residual is required, double these amounts. To increase the residual in treated water, smaller quantities of chlorine will be needed.

STEP 3: Wait 10 minutes, then check the chlorine residual.

STEP 4: If the residual is less than 5 mg/L, repeat steps 2 and 3 using a smaller amount of chlorine.

STEP 5: If the residual is at least 5 mg/L, wait an additional 20 minutes before drinking.

*Table A-1. Amounts of HTH and Bleach Equivalent to a 5 mg/L Dose in Various Volumes of Water Volume**

VOLUME	AMPULES	HTH		5% BLEACH	
		MRE SPOON	MESSKIT SPOON	MRE SPOON	MESSKIT SPOON

* THE QUANTITIES DEPICTED IN THIS TABLE ARE GENERAL GUIDELINES, ACTUAL AMOUNTS MAY VARY BASED ON WATER QUALITY.

TASK 9: Set up, construct, and maintain field waste disposal devices.

EQUIPMENT NEEDED:

- Set up required number of chemical toilets.
- Collect material for type of improvised facilities to be constructed, if required.
- Establish a detail to set up or construct the devices.

DISPOSAL METHODS THAT MAY BE USED IN THE FIELD:

NOTE

Local, state, federal, and host-nation regulations or laws may prohibit burning or burial of waste. The garbage, rubbish, and other such material may have to be transported to a waste disposal facility. Chemical toilets are the required human waste disposal devices for use during field exercises or missions. Improvised devices may be used under emergency conditions; the burn-out latrine is the preferred method for improvised devices.

- Garbage/rubbish disposal.
 - Collect and transport to approved disposal facilities.

- Expedient devices.
 - Burial—Less than 1 week.
 - Incineration—Longer than a week.
- Liquid kitchen or bathing waste disposal.
 - Grease trap.
 - Soakage pits.
 - Evaporation beds.
- Human waste disposal.
- Chemical toilets. Urinals should be provided in these facilities to prevent soiling the toilet seats, if possible.
 - Individual waste collection bags on the march or for small groups in isolated areas.
 - Cat-hole latrine for marches if individual waste collection bags are not available.

- Field expedients when individual waste collection bags are not available—
 - Burn-out latrine.
 - Pail latrine when chemical toilets are not available, the ground is too hard, or the water table is too high (soil is very wet).
 - Straddle trench for 1 to 3 day bivouac sites when burn-out or pail latrine are not available.
 - Deep pit latrine for temporary camps.
 - Soakage pits for urinals at temporary camps.
 - Trough urinal.
 - Pipe urinal.
 - Urinoil. (See page A-44 for further information on the urinoil.)

STEPS OF PERFORMANCE:

STEP 1: Use the following chart to determine disposal requirements.

INDIVIDUAL WASTE COLLECTION BAGS

Dispose of with regular waste.

CHEMICAL TOILETS

The preferred field device. Add urinals to protect seats in latrines.

CAT-HOLE

Cover with dirt after use.

STRADDLE TRENCH

Enough for 6 percent of the soldiers. Cover with dirt after each use.

DEEP PIT

Enough for 6 percent of the soldiers. Add urinals to protect seats in male latrines.

GARBAGE PIT

Locate near dining facility, but not closer than 100 feet. One pit per 100 soldiers served per day. Cover with dirt after each meal; close daily.

SOAKAGE PITS (FOOD SERVICE)

Locate near dining facility; need at least two. Fill with loose rocks. Add grease trap for dining facility waste. Alternate daily use.

SOAKAGE PIT (OTHER)

Provide soakage pit for urinals, shower, Lyster bag, or other locations where water collects.

MESS KIT LAUNDRY/SANITATION CENTER

Dig soakage pit to provide good drainage.

HANDWASHING DEVICES

Dig shallow soakage pit. Collocate with latrines and food facilities.

SHOWERS

Dig soakage pit.

URINALS

Trough
Pipe
Urinoil

STEP 2: Select site of construction.

- Garbage and soakage pits should be at least 30 meters from food service.
- Latrine should be as far as possible from food service (100 meters or more is best).
- Latrine should be located on level ground. Never uphill from the campsite or water supplies.

STEP 3: Construct disposal facility.

- **Garbage pit**—Used to prevent accumulation of garbage in the unit area.

NOTE

Garbage and rubbish should be transported to an approved landfill or must be buried or burned. If buried for short stays, cover daily. For longer periods, garbage and rubbish may have to be burned; however, the ashes should be buried. (Reader should consult the note on page A-32.)

- **Soakage pit/trench**—Used to prevent accumulation of liquid waste (water from showers, sinks, and field kitchens).

- **Grease trap**—Used with both soakage pit and trench to prevent clogging of soil.

- **Cat-hole latrine**—Used only on the march (if individual waste collection bags are not available) and covered immediately after use.

- **Chemical toilets**—Used as the standard field latrine.

**BRIEF RELIEF
(INDIVIDUAL)**

DISPOSA-JOHN

**INDIVIDUAL SERVICE
MEMBER FIELD TOILET**

DROP-BOX TOILET

INDIVIDUAL TENT LATRINE

SCREEN LATRINE

- **Straddle trench latrine**—Used on short bivouacs and field training exercises. Two trenches per 100 males and three trenches per 100 females.

- **Deep pit latrine**—Used for longer periods of time and in built-up areas. Collapsible two-seat boxes are available in the supply system.

NOTE

If ground is too hard for digging, or if the water table is too high, use a pail latrine or a burn-out latrine.

- **Pail latrine**—Use where water table is too close to the surface of the ground for digging a deep pit latrine.

- **Burn-out latrine**—Use where water table is too close to the surface of the ground for digging a pit latrine, or stay is for an extended period.

- **Urinals**—For male latrines, construct one of the following urinals: trough urinal, pipe urinal, or urinoil.

URINOIL

STEP 4: Inspect daily to make sure that the following is done:

- Waste is collected and transported to an approved disposal facility.
- Straddle trench latrines and garbage pits are covered with dirt daily.
- Pail latrines are emptied and cleaned daily.
- Burn-out latrine containers are rotated and contents burned daily. • Facilities (not the contents) are sprayed with insecticide for fly control when other control techniques fail.

STEP 5: Close improvised latrines and garbage pits when filled to within 1 foot of the ground surface. Have chemical toilet contents removed daily.

Close out by—

- Spraying with residual insecticide.
- Packing earth in successive 3-inch layers until mounded 1 foot above ground level. Spraying again with residual insecticide.
- Posting a sign stating, “Closed latrine/garbage pit and date” (except in combat).

TASK 10: Construct and maintain field handwashing and shower devices.

EQUIPMENT NEEDED: Personnel detailed to construct and maintain field handwashing and shower devices. Material as required for type of facilities to be constructed.

STEPS OF PERFORMANCE:

STEP 1: Select device to be constructed.

- Handwashing devices.

- Shower devices.

STEP 2: Construct devices.

- Collocate handwashing devices at food service and latrine locations.

NOTE

A soakage pit should be provided for all handwashing and shower facilities.

STEP 3: Maintain devices. A supply of soap and water must be available at all times.

STEP 4: Close devices.

Regulation to Amend Ontario Regulation 229/74	
TABLE I. Unsewered Toilets: An Aid to Decision	34

FOREWORD

There are about 300,000 cottages in Ontario, occupied generally by well over 1.2 million people for part of the year. One of the main problems all cottagers have in common is that of the disposal of human waste.

Where the toilet facilities can be connected to a municipal sewage system, the solution is obvious. In the majority of cases, however, municipal services are not provided, and the alternative, a good septic tank system, is either expensive or, in many cases, not suitable because of the nature of the terrain.

Ontario regulations, especially Regulation 229/74 under The Environmental Protection Act, 1971, and its amendments, require the approval of all sewage disposal installations, with the exception of systems of Class I. These systems comprise various types of unsewered toilets, known as earth or pit privies, vault privies, removable

pail privies, chemical toilets, incinerating toilets, and composting toilets.

Toilets of Class I are widely used because of their simplicity and their low cost of installation. If properly installed, used, and maintained, they can give good service without damaging the environment.

This booklet provides all the information necessary for proper installation, use, and maintenance of Class I toilet systems. It explains the limitations of the various systems, their advantages and disadvantages, and their possible effect on the environment if they are misused or not properly maintained.

A separate chapter describes in detail the principle, the operation, the advantages and disadvantages, the installation, the use, and the maintenance of the new composting toilets.

I. INTRODUCTION

The ideal toilet system must reliably dispose of human wastes in a way that neither spreads disease nor offends civilized sensibilities. The standard flush toilet, with its smooth, white surface, self-cleansing flush, water seal against odours, and access to sewers that are someone else's responsibility, is the best choice from the standpoint of health and aesthetics, but it's not always available. It typically runs through three or four gallons of water every time it is flushed. It thus needs an ample supply of water, electricity to run the water pump, and a place to dispose of a lot of wastewater.

Where the standard toilet won't do, you must make other arrangements. As you cast about for alternatives, you will discover human ingenuity at its most diverse: you'll discover privies and chemical toilets, incinerating toilets, variations on the standard flush, indoor compost toilets, and small activated-sludge plants, in fascinating profusion. None of these can be pointed out as the best: all have good points and bad. The "best" choice will depend upon the facilities at your site, the convenience you want, and the money you are willing to spend. In Ontario, it will also be influenced by The Environmental Protection Act.

Sewage is potentially dangerous, even deadly. The microorganisms responsible for many grave diseases—cholera, typhoid fever, hepatitis, and polio, to mention only a few—swarm in the feces of

the sick. If these organisms reach the water supply, hundreds more may sicken. A major concern in the design of any sewage disposal system must be to ensure that the public is at no time exposed to the danger of sewage-borne disease, either indirectly, through their drinking water, or directly, by way of rats, flies, or curious children. For this reason, as well as to safeguard the environment from the unpleasant effects of careless sewage disposal, Ontario law regulates sewage disposal closely.

The disposal methods described in this booklet are not equally acceptable everywhere in Ontario. Local bylaws as well as shallow soil on a steep lot, for instance, may rule out some methods, and sandy soil may favor a system that wouldn't work in clay. To find out which forms of sewage disposal are approved in your area, see the local representative of the Ontario Ministry of the Environment.

Not every toilet unit is a sewage disposal system. A good pit privy is, since the wastes decompose where they fall and enrich their surroundings with no further disturbance, but a modern flush toilet is not. A flush toilet does no more than send the wastes upon their way. In the city, the way leads to the municipal sewage treatment plant, a subject in which we need take no further interest than pleases us. In the country, the owner must choose the destination.

II. THE SEPTIC TANK SYSTEM

A. What Does It Do?

Where you can't hook onto the municipal sewers, your best choice in waste disposal is usually a septic tank system, which consists of a septic tank and an underground leaching bed. The big advantage of this system over most of the others is that it will accept all of the household wastewater: the bath water, the dishwater, and the laundry water, as well as what the toilet sends. If treated with reasonable consideration, it will accept all of them without complaint for several years, until it is time to pump the accumulated sludge out of the tank.

Most installations need no machinery, no power, and, apart from pumping out the tank occasionally, no maintenance.

B. How Does It Work?

The only way to get rid of sewage, as distinguished from merely sending it somewhere else, is to prepare a comfortable home for the microorganisms that eat it. Many strains perform this useful function. For simplicity, they can be divided into two groups: the aerobic ones, which need oxygen, and the anaerobic ones, which can't abide it.

1. The Tank: Anaerobic bacteria live and work in the septic tank, which is just that: a tank. It's usually big enough to hold several days' worth of sewage and shaped so that the flow is slow and reasonably uniform. Sewage from the house enters the tank, settles down, gets partly decomposed by the anaerobic bacteria, and flows out of the tank. By this time, if the system is working well, the sewage is a clearish liquid that still stinks and may still carry disease. It should not go anywhere but into the leaching bed or some equivalent treatment facility: by no means directly into a ditch or watercourse.

2. The Leaching Bed: A leaching bed consists of one or more rows of buried distribution pipe, each of which is a series of "tiles" laid end-to-end in a bed of crushed stone in a trench. A "tile", in turn, is a length of pipe, typically made of ceramic or plastic. Ceramic tiles are spaced about $\frac{1}{2}$ inch apart to allow the sewage to flow into the crushed stone. The longer plastic tile is usually perforated by small holes along its length. The

crushed stone acts as a reservoir, from which the sewage can seep slowly into the soil. The dimensions of the trench and the details of how it should be filled in, the characteristics of the soil, the required length of the distribution pipe, and other particulars of the burial are important and are specified under The Environmental Protection Act*, but they need not concern us further here.

Sewage leaving the septic tank flows down the rows of tiles, leaking continuously into the soil by way of the holes or gaps. In the soil it encounters a flourishing population of aerobic bacteria, who finish the good work begun in the tank by their anaerobic cousins. The

whole subject is decently hidden from view by a fresh, green lawn which rarely needs fertilizer.

C. Disadvantages?

There are few disadvantages to the septic tank system, apart from its cost — and even that may not compare too badly with the cost of other units, considering that the system handles **all** the household wastes.

Its major drawback is simply that it can't be used everywhere. An impermeable soil, such as clay, won't let the liquid flow through it; a shallow soil hasn't the necessary capacity; and a very cold climate may not suit the indispensable bacteria. Consult your local Environment staff.

* See the Ministry of the Environment's Booklet **Septic Tank Systems** (Information Services Branch, 135 St. Clair Avenue West, Toronto).

III. PRIVIES

A. Pit Privy

1. **Construction:** A pit privy is a hole in the ground, fitted with a seat for comfort and a shed for privacy. It is justly popular for the simplicity of its concept, and it is widely used.

Despite its simplicity, a privy must be planned. To begin with, the pit should be big enough to last a while — at least five years, say, before it fills up and you have to dig a new one. For year-round family use in well-drained soil, estimate two cubic feet per person per year, but bear in mind that this figure may not apply to camping conventions or busy resorts, where the pit may fill too fast for normal drainage and decomposition. Build the shed stoutly, include a window, and put screens where they're needed, to keep out flies, rodents, and other carriers of filth. Porcupines show little interest in the pit but may eat the privy, and where they abound metal sheathing on the outside walls may help.

Don't neglect to vent the pit — not the shed, but the pit — and vent it well. Fresh air and foul will balance themselves some-

how, and you will be happier in your work if they do so through a good-sized vent pipe, rather than by way of the seat. A screen

on the top of the vent pipe will discourage flies, and a little raised roof (not a lid) will keep out the rain. The Ministry of the Environment supplies a working drawing on request.

Well-vented and considerably used, a privy is reasonably inoffensive; but a light sprinkling with chloride of lime every couple of days, or a nodding acquaintance with commercial privy deodorants, will help to keep it habitable.

While hunting for your spade, consider the soil in which the pit will be dug. There must be enough of it to surround the pit with two feet of earth in all directions, around it as well as below it, and it must have the right composition. If it's too sandy, the walls of the pit will have to be shored to prevent cave-ins. If it's solid clay, the liquids will just sit there, perpetually with you; you might as well use a holding tank to begin with, and have it pumped out when it's full. (But ask the Environment office about any local restrictions on holding tanks.)

Ideally, the soil should be porous enough to permit liquid to seep through it, tight enough to keep liquids from running through too fast, and deep enough to shield the groundwater from pollution. It should also slope away from the hole on all sides: do not dig your pit in the centre of a drainage basin, and build a low mound around it to keep out rainwater runoff.

(The "groundwater", incidentally, is the water which saturates the ground beneath the surface, the water which feeds springs and is tapped by wells. The "water table" is the tap level of the groundwater.)

When checking the water table, to be sure you stop digging the pit two feet above it, remember that it varies during the year; it's higher in wet weather and lower in droughts. Check the level shortly after the spring thaw.

A final safety note: don't let a little child use the privy unattended, especially if there's no child-size hole. Occasionally an unfortunate youngster falls in.

2. Pro and Con: A good privy is safe, and it does the complete job as far as toilet wastes are concerned. You may have to dig a new hole now and then, but you don't have to clean out the old one as, in effect, you may have to do with more elegant systems. It also is cheap.

On the negative side, the privy is, for reasons of health, located at a distance from the house. This point gains in importance after dark or in winter. In some northern areas health officers frown on privies because their users fail to bundle up: the absence of warm clothing can be as unhealthy as its presence is inconvenient. A chamber-pot emptied periodically into the privy solves one problem by introducing a worse one: the presence of a thoroughly unaesthe-

tic and potentially dangerous pot of human wastes in the house.

B. Pail and Vault Privies

Variations on the privy theme include the pail privy and the vault privy. These differ from the self-contained pit privy in that neither of them ultimately gets rid of the wastes. They merely collect them and postpone the problem for a while. The pail privy substitutes a pail for the pit, while the vault privy uses a small holding tank, the "vault". (The latter, in lightweight plastic, is often encountered at construction sites and club-houses.) The pail must be taken away from time to time and dumped, probably by you; and the vault must be pumped out and the contents taken away and dumped, probably by a contractor but at your expense.

The contractor will need a dumping permit from the Ministry of the Environment. You need no permit to bury your pailful on your own property, but you are obliged to make certain it causes no pollution and creates no public health nuisance. After a while, if you begin to get tired of the squashy places

in your woods, you may wish to consider a cesspool. A cesspool is basically the pit of a pit privy, with a lid instead of a shed. It must meet all the design requirements of the privy pit, and it requires a permit. Unless suitable soil is a long walk from the house, you'll be better off with the pit privy.

If you opt for one of these, the vault is the better choice. The pail is cheaper, but you may not enjoy carrying it. Besides, it's a health hazard.

IV. CHEMICAL TOILETS

A The Basic Chemistry

The simplest chemical toilet is a bucket with a seat. The "chemical" part is a small amount of solution poured into the bucket before use. It can act in one of three ways: as a caustic, as a preservative, or as a dye. Accordingly, it may decompose the wastes, preserve them, or merely improve their appearance.

The first two kinds of chemicals make the wastes harmless. The caustic, usually caustic soda or lye, liquifies and partly decomposes the wastes, at the same time killing any bacteria present and destroying the eggs of parasites, a significant feature in controlling the spread of disease. A chemical preservative such as formaldehyde also destroys any bacteria present; however, it then prevents the wastes from decomposing: it kills the bacteria which would otherwise bring about biological decomposition, but lacks the chemical decomposing power of the caustic.

Killing bacteria present reduces the odours typical of the wash-room. To further the good work, many chemical charges also contain a perfume, and possibly

a blue or green dye to mask the yellow-brown colour imparted by nature. As an additional advantage, killing the bacteria means that a chemical toilet using either a caustic or a preservative may safely be located in the house. The whole situation begins to seem more like home.

If the chemical charge consists of only dye and perfume, and lacks either kind of bactericide, the improvement in appearance is deceptive. If a bactericide is not present, the bacteria are not killed; this kind of toilet is a pail privy with interior decoration. It is no more appropriate in the house than any other privy would be.

B. Pro and Con

The chief disadvantage of the chemical toilet is that, like the pail and vault privies, it does not solve the problem; it merely gives you time to think about it. Using a chemical disinfectant is also a coin with two sides. The same chemical that so conveniently inhibits decomposition during use continues to inhibit it afterwards; and getting rid of the wastes, you recall, must ultimately take place through bacterial decomposition. For this reason, buried wastes are likely

**CHEMICAL TOILET
— DROP TYPE**

to hang around far longer than one would wish, and wastes pumped into a septic tank are likely to stop the operation of the entire system. If you dump them into a lake, so as to dilute the preservative, you will succeed; the result is equivalent to using a chamber pot in the first place and emptying it overboard.

A solution which Environment officials will sometimes approve, especially where people are few and the high water table is low, is a cesspool. In crowded vacation spots, where the soil is thin and the water table high, you might as well build a privy on the end of your dock, for all the pollution a cesspool will spare your lake. (Perhaps it should be mentioned without delay that a privy on the end of dock is not an approved method of sewage disposal.)

The best solution to the problem may be to discharge the chemical wastes to a municipal sewage plant, provided the plant is big and the chemical toilets few. A big plant, with other contributions pouring in, can dilute the chemical mix to the equivalent of raw sewage and then treat it along with the rest. If too many people get the same idea, however, the chemicals could stop the bacterial action of the whole sewage works, with implications one might prefer not to pursue.

C. Variations

1. Bucket: The most basic version of the chemical toilet is a simple bucket, nowadays often

fitted with a removable plastic liner, placed in a small, vented, metal cabinet in the bathroom. The approach is simple, and the unit is odourless when properly installed and operated. On the debit side, the contents of the bucket are open to view at all times, which is generally not very pleasing. Furthermore, when the bucket is more than half full, there is likely to be a splash on the user: the water is cold, the preservative may contain caustic, which burns, and the dye can stain clothing.

And then there is the problem of the full bags. They must be removed at the proper time, and their capacity is limited. If their owner gives a party, for instance, they may not last the evening. They must be taken to an approved dumping place, and they must be treated until arrival there with sufficient respect to prevent a puncture.

2. Improvements: Splash Pan and Drop Pipe:

Other models of the chemical toilet offer various degrees of refinement to the basic concept. A splash pan is available, shaped like the bowl of the standard flush toilet, which prevents all but a rare splash on the user. To allow room for the splash pan, though, the bucket containing the charge becomes a small tank, the plastic bag is no longer used, and the contents of the tank must be drained at intervals to a suitable point of disposal. The installation is subject to all the local restrictions on holding tanks.

Another version locates the toilet over a tank buried in the ground beneath the house. The connection is usually made by a drop pipe, and the drop is usually sufficient to eliminate the need for a splash pan. The tank must be pumped out at suitable intervals, and the contents disposed of according to local custom.

3. Recirculating: The recirculating chemical toilet is much like the splash-pan toilet, except that it uses the contents of the tank to flush the bowl. The contents are liquified and dyed blue by the chemical charge, the construction quite eliminates splashing, and the unit is aesthetically much like the standard flush toilet (This is the familiar toilet of the airplane washroom). The need for a recirculating pump, however, increases the cost of this unit; it also limits its use to areas where electricity is available. The chief disadvantage of this model is that it cannot be used if the electricity fails or the pump breaks down.

4. Portable: A useful final variant on the chemical toilet is the portable model. This is much like the basic bucket model, though it may have a splash pan, and is fitted with a fairly tight lid and a carrying handle. It must be

PORTABLE CHEMICAL TOILET

carried with some care to avoid splashing or spilling. Its capacity is, of course, limited by the need for portability, and the usual requirement for safe disposal of the contents remains. These units may be drained into a standard toilet and flushed to municipal sewers, but not to a private septic tank.

Incidentally, while looking at portable toilets, consider weight and stability. By the time it's ready for emptying, the toilet may weigh 70 to 80 pounds; for many people, that's a lot to lift. Also, some models are tippy, and may need a frame for convenient use by children or older people.

V. INCINERATING TOILETS

This unit consists of a toilet bowl above a small incinerating tank. In the tank, which may be heated by either gas or electricity, the wastes are burned to a dry, sterile ash which may be discarded with no special precautions.

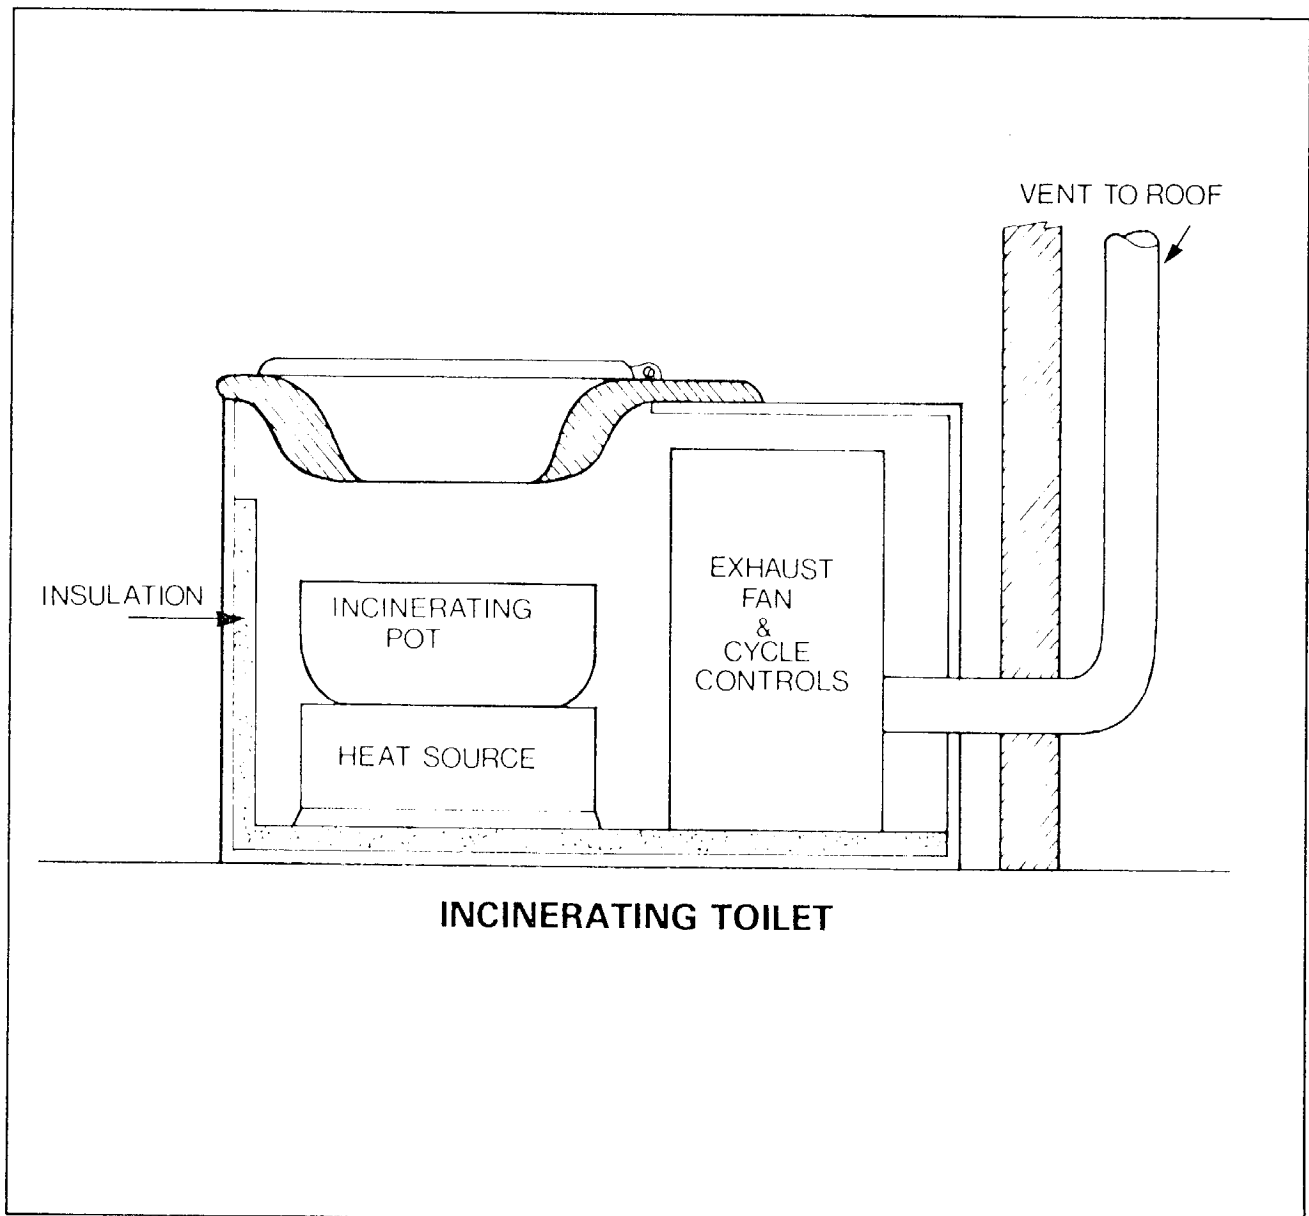

The toilet is thus a self-contained unit requiring no further equipment for disposing of the wastes committed to its keeping. Unfortunately, the approach, excellent in concept, may have certain drawbacks in practice. Consider some of these points as you compare models.

1. Toilet wastes are chiefly composed of water. Consequently, before they can be burned, they must be dried. The drying process is one of boiling; and this, as well as the actual burning, creates a notable stench. Good design, including high combustion temperatures, can give you an odourless gas, but these temperatures may not be reached in small, household units. If the neighbours complain, the unit can be closed
2. The toilet, naturally, grows hot during the incinerating cycle, and requires time to cool. In some models, the seat grows hot, too, and the cooling period may be as long as 40 minutes. The possible inconvenience of this delay is obvious, as is the peril of trying to reduce it.
3. Some models are designed so that the seat does not heat up during the combustion cycle, and the cycle itself can be interrupted at any time for further use, a far more practical arrangement. Too many interruptions, however, can lead to trouble, as the incinerating tank is usually small. If it is not emptied by a complete combustion cycle after two or three uses, it may overflow. The only remedy then is to spoon out the contents down to the "fire line" (saving

them, of course, for future cycles), and start over.

4. The incinerator unit, the necessary insulation, and the stack to lead combustion products away, all add up to an expensive installation. In addition, whether the incinerator uses propane gas or electricity, the operating costs can be high.

5. The high-salt liquid which develops during incineration tends to corrode valves and other moving parts. Further, though some models reduce the wastes to a light ash which can easily be vacuumed out or dumped, others have been known to reduce them to a clinker which can only be removed with a hammer.

VI. COMPOSTING TOILETS

A. Introduction

1. What Composting Is: A comparative newcomer to North America, the composting toilet has been available for some years in Scandinavia. Its principle is simple. Like the compost heap in the garden or the manure pile beside the barn, the composting toilet allows organic materials to decompose in the presence of air to an inoffensive material much esteemed as fertilizer.

The results differ significantly from what happens in the pit of a pit privy. The packed mass in a pit privy is airless except at its surface. Most of it must, therefore, decompose anaerobically, like the material in a septic tank. The products of anaerobic decomposition are such gases as hydrogen sulphide and methane. The former is the gas which gives the characteristic odour to eggs rotting anaerobically in their shells; the latter, "marsh gas", bubbles up from the bottom of stagnant lakes where dead plants rot.

A compost heap is kept loose by the grass cuttings, twigs, and leaves of which it is composed,

and its interior is always in contact with air. The same is true of a manure pile, where the straw of the animals' bedding keeps other residues from packing too closely. The result of this happy state of affairs is aerobic decomposition, which produces carbon dioxide and water vapour, both odourless. The difference between the two processes in nature is illustrated by the difference between leaf-mould on the well-aerated forest floor and swamp-muck.

The composting toilet attempts to introduce aerobic decomposition to the disposal of human wastes in reasonably pleasant circumstances. Different models achieve different degrees of success. These are described below.

Three topics are relevant to all composting toilets: the effect of temperature, the breeding of flies, and the safety of the final compost.

2. Low Temperature, Flies, and the Vegetable Garden

a Composting May Stop in Winter: Like most microor-

ganisms, those which cause aerobic decomposition work best when they are comfortably warm. They slow down as they cool and become dormant at low temperatures. A composting tank kept outdoors or in an unheated basement cannot be expected to operate well in winter. The chilled bacteria wait for spring, and the tank serves primarily as a holding tank. If the winter is short and the summer is hot, and if your unit is sized to allow for these fluctuations, all may be well.

- b Flies Thrive in Compost:** The warmth and nutrients in composting manure make it ideal for raising fly larvae; similarly, flies prosper in the tank of a composting toilet.

The mild down-draft at the toilet and garbage chute may or may not be enough to contain the swelling population. A well-designed vent pipe comes complete with a fine-mesh fly-screen which will probably prevent these insects from entering the tank by this route, but there are other ways.

Because the well-being of the bacteria in the composting mass is so important, you cannot attack the flies with disinfectants or chloride of lime left over from your privy days. Fortunately, however, biodegradable insecticides are available from the manufacturers of some of the

composting toilets. When applied as directed (sparingly), these will kill both flies and larvae, without interfering with the essential bacteria.

- c Is Compost Safe?** As every gardener knows, compost made of dead leaves, lawn cuttings, twigs, and vegetable scraps supplies excellent natural enrichment when dug well into the soil. Manure and human wastes have long been used for the same purpose and in some places still are. Unfortunately, however, bacteria and viruses responsible for many serious human diseases pass out of the body with the faeces. Should these microorganisms enter another person's body, that person may fall gravely ill. One of the commonest modes of entry is through food prepared by unwashed hands, or on which a contaminated fly may have walked.

Most of the microorganisms which cause disease cannot live under conditions very different from those found in the human body. In a compost heap they will die from the lower temperatures, the drier conditions, and the competition of the natural (and harmless) bacteria of the soil. Compost which has spent enough time in a composting toilet will usually contain only the microorganisms commonly found in garden soil.

If the residence time was too short or if all was not well within the toilet, matters may be different. The makers of composting toilets generally recommend using the unit's product freely to nourish shrubs and flowers. They recommend it for vegetables, too, but suggest not bringing it directly into contact with that part of the vegetable which you intend to eat. Possibly you should use some other fertilizer around the roots of root vegetables or in the soil through which the leaves of salad vegetables must push their way before you pick them.

B. Large and Small Units

Composting toilets can be divided into two major groups: large units and small ones. The first put the composting tank in the basement, because it is too big to fit in the bathroom. (Some of these tanks are, in fact, bigger than some bathrooms: one of them measures about seven or eight feet high by nine feet long by four feet wide.) In the smaller units, the toilet and a small compost box form a single unit, which can be installed readily in most bathrooms.

The large units are expensive: up to \$1,500 - 2,000 installed.

Small ones cost considerably less, about \$600 - 700 (in 1976).

1. Large Units

a. **The Design Principles:** The toilet of a large unit is pleasantly indoors, in the bathroom of the house. It is connected by a drop pipe to the tank directly below, in the basement. If the house (or cottage) does not have a basement, particularly if the house is also built upon thin soil, you have a problem. Some units provide a screw-type conveyor to move the wastes from their point of deposition to a composting tank located outdoors, but this introduces a complex

piece of electrically driven machinery, and much of the simplicity of the concept is lost. The lower ambient temperatures outdoors may also affect the composting.

The drop pipe from the toilet has to have a large diameter to avoid fouling in use and must, therefore, pass through a large hole in the bathroom floor. But the distance from the toilet down to the tank's interior, which is not illuminated, essentially removes the contents of the tank from view.

Odour is eliminated, in principle, by an insulated vent pipe connecting the interior of the tank

with the out-of-doors. When all goes well, this vent is not merely a passive conduit, but a chimney. The composting material in the tank is warm, as are the water vapor and carbon dioxide rising from it. As warm air rises, the column of warm gases in the vent pipe flows out the top of the pipe.

This creates a partial vacuum within the composting tank. This partial vacuum draws replacement air into the tank from two sources: an air intake designed to flow air through the wastes and keep them aerobic, and the toilet seat when the lid is up. The slight downdraft through the toilet seat prevents odours from reaching the bathroom.

b. The Problems: So much for theory. With some units practice may be different. A unit which consists of a simple tank accepting only toilet wastes, for instance, resembles the pit of a privy. The packed wastes admit no air and eventually form a dry crust of aerobically decomposed material covering a liquid mass slowly decomposing anaerobically. The owner of such a tank is advised to stir the contents frequently, with a paddle of some sort. Not all owners will relish the task.

Some units attempt to overcome this unpleasantness by mounting the tank at a slight angle to the floor: 20° to 30° or

so. The wastes are supposed to slide slowly down the slope, composting as they go. They are supposed to reach the retrieval door at the bottom in a fit condition to be shoveled out without distressing the shoveler.

Of the units that fail, some permit the interior mass to slide too quickly, so that it reaches the exit while still too near its original state. Others that fail manage to hold back the mass by means of baffles but cannot prevent the somewhat muddy urine which drains from the mass from forming a puddle at the exit door.

c. Garbage Disposal, Too? The problem with the above units is aeration — or, rather, the lack of aeration. Toilet wastes alone, even if mixed with toilet paper, tend to pack so tightly that it is very difficult to pass air through the mass. To overcome this difficulty some units use special aerating pipes. Others follow more closely the principles of the compost heap by accepting some of the household garbage in addition to the toilet wastes. Such units will digest basically organic food scraps: meat scraps, bones, and grease, as well as vegetable scraps and parings.

They will also accept a fair amount of cellulose in some of its familiar household forms: paper towels, kleenex and toilet paper of course, sanitary nap-

kins and disposable diapers (minus the plastic part), and even floor sweepings and the contents of the vacuum cleaner bag.*

Like the straw in the manure pile, this vegetable material prevents the mass in the compost tank from packing too closely to admit air. In addition, the paper and the compost, when true compost begins to form, are dryish and absorb the urine. The latter, retained in a warm, open medium through which air is flowing, soon evaporates. More precisely, the water content evaporates while the salt content remains behind as nitrogen compounds for the eventual benefit of the owner's garden.

d. Orientation and Quiet Days:

A unit which accepts the household garbage and other cellulosic materials along with the toilet wastes tends to work considerably better than one which accepts only toilet wastes, but nothing is perfect. To begin with, since garbage and toilet wastes have to enter the same subterranean tank, the kitchen and the bathroom have to be

adjacent — the house may have to be designed around the disposal unit. A large unit also takes a long time to reach its steady-state condition, in which the nearly full tank continuously accepts wastes and emits a continuous supply of compost. Filling the tank takes longer than one might expect, as nearly 90% of the original volume goes up the vent in the form of gases. For the first couple of years, while the tank is filling, there may be too little compost to hold back liquids until they evaporate. A few sacks of peat moss judiciously applied will help. Indeed, they may solve the problem; but the unit cannot be ignored during its first years.

Finally, the venting system may be vulnerable to hot weather. On a hot day, when the surrounding air is as warm as the air in the pipe, the column in the vent pipe will not rise and the odour of the uncomposted contents of the tank may seep throughout the house. A small exhaust fan greatly reduces the likelihood of this distressing occurrence. Purists will point out that installing a fan in a unit which prides itself upon avoiding all artificial contrivances makes the whole process less natural, but others may be willing to compromise.

2. Small Units: The smaller composting toilets consist essentially of a box with a comfortable seat on top. The size of the box varies but it will fit into most bathrooms. No hole in the floor is needed, but a two-inch to

* NOTE: Ontario regulations permit the addition of small quantities of vegetable matter only to composting systems, specifically designed for the biological decomposition of such waste or that require small quantities of vegetable matter to improve the decomposition of human body waste. See also the excerpts from the revisions to Ontario Regulation 229/74 applicable to private sewage systems under Part VII of The Environmental Protection Act, 1971, reprinted in the Appendix.

four-inch vent-pipe must be led out-of-doors.

a. No Longer Wholly Natural: Composting depends on the activity of a multitude of microorganisms. It is not a chemical or mechanical process which can proceed at any speed convenient to the user. The little box of the smaller units demands some concessions to biology.

The first of these is that the smaller composting mass can no longer be left to find its own operating temperature. The contents of a small unit must be heated to tropical temperatures.

The heater is commonly a small, low-temperature electric resistance unit fitted at the bottom of the composting wastes. This makes the small composting toilet unsuitable for a cottage lacking electricity. In addition, a small fan in the vent pipe is also essential, both to draw air through the contents and to prevent odours from emerging when the lid over the seat is raised. The unit will not consume much power, but some it must have.

b. Removing the Compost: In due course, the matured compost must be removed from the toilet. This task should not be necessary more often than every six months to a year. In most units, the contents of the box rest above the heater. At the proper time, the owner, using some mechanical device sup-

plied with the unit, disturbs the bottom layers so that the material drops through the heater into a collecting bin, which can be removed and emptied. This chore should be neither unpleasant nor frequent in a unit operating as it should, but the nature of the mechanical device deserves some study before the unit is chosen. Does it seem sturdy? Is using it according to instructions likely to be a disagreeable task? Is the full bin likely to be heavy? Can the bin be removed easily and without conspicuous danger of spilling its contents?

c. Achieving Aeration: Because of their size, small units are designed to accept only toilet wastes. Here many of them encounter the same problem as their larger counterparts; the wet and close-packed wastes resist all efforts to draw air through them and set up their own unsavoury anaerobic system. If the urine can drain away or evaporate quickly, the solid residue can set into a firm block.

Several units come with an internal device for stirring (and thus aerating) the mass, usually operated by a handle projecting outside the unit. Unfortunately, the stirrers supplied tend to be no match for the dry mass. The handles may break off, and the interior parts may remain immovably imbedded. Since what they are imbedded in is not compost, this situation may not be very satisfactory.

The manufacturers of some units recommend adding some cellulose to keep the mass open enough to be aerated. Their units welcome toilet paper, kleenex, and vegetable scraps and trimmings, but not many: as small units they can spare only so much volume. And meat trimmings, cooking liquids, and grease are out. These act to dampen and compact the mass, rather than aerate it. In effect, the smaller composting toilets are toilets only. Some may accept and profit from the kitchen's vegetable scraps, but none can be used for complete garbage disposal.

d. Design, Aesthetics, Flies, and Parties: Most of the considerations affecting the purchase of a small composting toilet centre around the size of the composting box.

To begin with, the smaller the box, the more certain you may wish to be that complete composting will occur within a short time. Temperature and good aeration matter here.

To make the most of their small size, most small composting toilets reach their steady state when nearly full. Some manufacturers supply a distributor for evening matters out, lest the user's work rise to meet him. As a result, the contents do not rest in a dim void eight feet or so below the bathroom, but are offered prominently to view whenever the toilet lid is raised. One manufacturer suggests

sprucing things up when necessary by strewing a few handfuls of grass cuttings over the surface.

Small units, like large ones, can become infested with flies. These insects can be dealt with by the biodegradable insecticides recommended by the manufacturers.

Basic to the small size of the small units is the fact that they cannot cope readily with fluctuations in use — a party, for example. Solids introduced into the toilet remain on top of what they find; liquids seep into the mass. A little liquid in a full toilet evaporates fast. A lot of liquid may penetrate the mass completely and drip through the bottom into the collecting bin.

During a well attended celebration the collecting bin may fill and even overflow. The owner surprised by these consequences of social success can do little more than get out the mop.

C. Summary: Composting May Be Right For You

The small composting toilet is not the only unsewered toilet unable to handle unexpectedly heavy loads. The bucket and chemical toilets are also sharply limited by their size, the incinerating toilet must empty itself regularly, and even a privy has only a limited capacity. A major advantage of the composting toilet — if it is working as intended — is that it reduces the volume of the wastes it receives

— in due time — to about a tenth of their original volume and delivers that final tenth in a form that is not disagreeable to handle (even literally). The cottage owner who is not a gardener can dispose of his compost by simply burying it, without concern over chemicals or excessive liquid content.

The main disadvantage to this type of toilet is that a biological system is not a mechanical contrivance and cannot be treated mechanically. A composting toilet works because a population of healthy microorganisms prospers under choice conditions of warmth and moisture. A householder concerned about his own comfort must be ever mindful of theirs.

An aeration unit is not a machine. It is a balanced ecological system, the home of living beings, which depend for their well-being and effective function on correct temperature, proper air flow, good mixing, and all the other variables which govern life and health. If one of these fails, the aerobic bacteria may die off. Their place may

then be taken by anaerobic bacteria, bacteria which function without air. The sewage then turns "septic", putrefies, and stinks. This sorry situation could result if the aeration unit were shut off: if the cottager wished to go home after the weekend, for instance, or the year-round occupant to take a holiday, or if the pump broke down in some idyllic spot far from the nearest spare-parts depot. These units are not approved unless the owner has a written servicing agreement, either with the manufacturer or with a person licensed by the Ministry of the Environment to service them.

Some aeration units, particularly where water is scarce, economize by using the aerated wastewater to flush the bowl. The principle is that of the recirculating chemical toilet, but the results differ. The flush-water is not a cheerful blue, but an unappealing natural brown, and it may not be odourless. Unless aeration has completed the job of decomposition, what recirculates is merely what went in, homogenized.

VII. SOME OF THE OTHERS

A. Septic Toilet

The septic toilet is a toilet seat above a buried tank. Wastes fall directly into this tank through a drop pipe, followed once a day by a pailful of water. Since the tank is always full, a pailful of wastes is displaced by the water and flows out of the tank into an adjacent leaching bed or cess-pool. This arrangement recalls the standard septic tank system, but there are some important differences.

1. The septic tank system disposes of all the household wastewater, while the septic toilet handles only toilet wastes.
2. The septic tank system is usually associated with a flush toilet and other standard bathroom fixtures. The septic toilet is a bucket privy with a drop pipe. The contents of the tank are in view; the inner wall of the drop pipe can become fouled and require cleaning; the bottom end of the drop pipe, if it reaches below the water surface in the tank, can become plugged with what floats; and the pipe itself is a first-rate conduit for odours.

In spite of this, the septic privy is a great improvement over the bucket toilet. Its leaching bed **does** ultimately dispose of the wastes; you don't have to take them somewhere else to get rid of them.

3. The leaching bed of a septic toilet is often very small compared with that of the septic tank system, because the volume of the wastes is smaller. The organic load from the toilet, however, is not changed by the design of the toilet or the volume of transport water. A relatively heavy organic load can clog the soil of the leaching bed, preventing effective operation. These leaching beds are subject to many of the same controls as those of septic tank systems. Ask the local Environment office before you dig.

B. Low-Volume (Minimum-Flush) Toilets

In a sense, these systems are a half-way house between the septic toilet and the septic tank system. The toilet itself closely resembles the standard flush

toilet, except for the reduction in water use. Where the standard toilet typically requires three to four gallons per flush, the low-volume toilet uses an economical one to two quarts.

The fixed model is mounted over a buried septic tank, which drains in the usual way to a buried leaching bed. The toilet is connected to the tank by a drop pipe, which normally extends below the level of the septic tank liquid — so far, much like the septic toilet. To avoid odour, some models are designed with a water seal: a spring-loaded plate presses upward against a gasket and retains a portion of the clean flush-water after each use. A foot-pedal tilts the plate down after use, permitting wastes and flush-water to drop into the septic tank. As an additional advantage, in areas lacking pumped water, the unit can be flushed manually by pouring a quart or so of water into the bowl.

The disadvantages tend to centre around the seal. A bit of toilet paper can prevent the plate from seating properly, so that the water seal is lost, and with it the odour protection. Repeated use can distort the plate or gasket slightly, with the same result. And don't let your foot slip off the pedal controlling that spring-loaded plate. The plate has been known to snap back into place with such vigour that the contents hit the ceiling.

The leaching bed for the minimum-flush system, like that for the septic toilet, is often shorter than it should be for the organic loading. If the legal requirements point to a longer leaching bed, you may want to consider sizing it to take care of the rest of the wastewater, too. In effect, you might be well off to consider a standard septic tank system with a water-saving minimum-flush toilet. Check your soil and the local prices, as well as the local Environment requirements, before you decide.

C. Portable Low-Volume Toilets

This convenient unit has a sealed top to prevent spilling or splashing while carrying. Otherwise, like the portable chemical toilet, it is a small tank surmounted by a seat.

A hand pump flushes the unit after use, and there is a water seal against odours. These units can be emptied into any fixed flush toilet, whether it is connected to sewers or to a septic tank: since no bactericidal chemicals are present, the contents will not affect the bacterial operation of the septic tank. Consider, however, the stability and the full weight of the unit. The absence of bactericidal chemicals also means that the contents may be a health hazard. Handle the unit like a privy pail, with care.

D. Continuous Aeration Systems

This waste-treatment method, usually an expensive one, features an aerated tank, and can accept all of the household wastewater, not just the toilet wastes. The system is in effect a small activated sludge plant, similar to the secondary treatment plant of many municipal sewage works: air, vigorously stirred or bubbled into the wastes, nourishes aerobic bacteria, which break down the complex organic compounds of the wastes into simpler, inoffensive ones. The products of their labour are a reasonably clear liquid and a sludge. The liquid is

usually discharged to a leaching bed or to a watercourse — both alternatives require approvals — while the sludge, like the sludge from a septic tank, must be pumped out periodically and disposed of as the law permits.

Though an effective treatment method, an aeration plant is usually better suited to towns or small communities than to individual use. For one thing, such a unit needs electricity to run the aeration pump; but even where electricity is available, operating the plant can offer the novice disagreeable surprises.

For the reader's convenience in comparing the toilet systems described in this booklet, the position of the toilet in relation to other structures is listed in Tables 4 and 5, as shown in the regulations.

APPENDIX I

EXTRACT FROM THE REGULATION TO AMEND ONTARIO REGULATION 229/74 MADE UNDER THE ENVIRONMENTAL PROTECTION ACT, 1971

1. Clause a of section 2 of Ontario Regulation 229/74 is revoked and the following substituted therefor:

- (a) Class 1— a chemical toilet, an incinerating toilet, a recirculating toilet and all forms of privy including an earth pit privy, a pail privy, a privy vault and a composting toilet system;

2. Section 7 of the said Regulation, as amended by section 2 of Ontario Regulation 944/74 and section 1 of Ontario Regulation 956/75, is revoked and the following substituted therefor:

7.- (1) The following are prescribed as standards for the construction of any tank used in a sewage system for collecting, holding or storing sewage, whether or not it is part of a Class 5 sewage system, or used for treating sewage:

- (a) the tank shall be constructed of concrete, steel, fibreglass, reinforced plastic or such other material as may be approved by the Minister;
- (b) the tank installed, assembled or constructed shall,
- (i) be carefully made, exhibit craftsmanship and true quality, be sound, durable and thoroughly capable of satisfactory and troublefree service,
- (ii) have such wall thickness, reinforcing and strength as is necessary to meet the requirements of use in service and any stresses to which it may be subjected prior to or during installation, and
- (iii) be of watertight construction;

- (c) materials used in the construction of the tank shall be in conformance with the standards prescribed in this Regulation and where no such standard is prescribed, shall meet the appropriate industry standards and codes applicable to such materials;
- (d) a prefabricated tank, including, subject to subclause i of class i, multiple piece units assembled on site, shall conform to the requirements of Canadian Standards Association Standard B66 except as otherwise prescribed herein;
- (e) only those provisions of Canadian Standards Association Standard B66 and this section relating to material standards, access, workmanship and construction methods and practices apply to a tank other than a septic tank in a Class 4 sewage system or a holding tank in a Class 5 sewage system;
- (f) the tank shall be constructed or installed on site according to good construction practice or, where specified, the manufacturer's recommendations, and in a manner that will ensure against,
 - (i) subsequent settlement of the tank or subsequent uplift due to groundwater pressure, that will be disruptive to the sewage system of which the tank is a part,
 - (ii) damage to the tank or any protective coating during handling and back-filling, and
 - (iii) damage to the tank due to weather or frost;
- (g) a prefabricated septic or holding tank shall be constructed so as to meet the requirements for certification by either the Canadian Standards Association or Underwriters' Laboratories of Canada and shall bear the certification mark of either the Canadian Standards Association or Underwriters' Laboratories of Canada and the marking required on a

tank by Canadian Standards Association Standard B66, on the upper surface of the tank at such location that it can be seen after installation is complete by exposing the manhole access that is nearest to the inlet pipe;

- (h) a tank constructed on site of concrete shall be poured-in-place and shall,
 - (i) comply with the requirements of Canadian Standards Association Standard A23.1.
 - (ii) have a balanced design of steel reinforcing sufficient to meet the requirements of clause **b**.
 - (iii) have bar or wire reinforcement in accordance with the requirements of Canadian Standards Association Standard A23.3,
 - (iv) conform to the general requirements appearing in clause 3 of Canadian Standards Association Standard B66 except as otherwise provided herein,
 - (v) have top and bottom slabs of a thickness of at least ten centimetres in the case of a tank having a capacity of 9,000 litres or less and at least fifteen centimetres for a tank having a capacity in excess of 9,000 litres,
 - (vi) have sides and ends with a thickness of at least fifteen centimetres in the case of a tank having a capacity of 27,000 litres or less and at least twenty centimetres for a tank having a capacity in excess of 27,000 litres, and
 - (vii) have an inlet and outlet of such size as required to accommodate the sewage flows;
- (i) a steel tank shall not be,
 - (i) constructed or assembled on site,
 - (ii) coated on the outside with coating method "B" described in clause 4.1.7.1 of Canadian Standards Association Standard B66, or

(iii) coated on the inside with coating method "B" described in Canadian Standards Association Standard B66 if the metal is thinner than 10 gauge.

(2) Subsection 1, except clause **g**, comes into force on the 31st day of December, 1976.

(3) Clause **g** of subsection 1 comes into force on the 1st day of July, 1977.

3. Section 15 of the said Regulation is revoked and the following substituted therefor:

15. The following are prescribed as standards for the operation of a Class 1 sewage system:

(a) subject to clause **b**, a Class 1 sewage system shall receive or be used only for the disposal of human body waste; and

(b) a Class 1 sewage system that has been specifically designed for the biological decomposition of non-waterborne biodegradable kitchen wastes, or that requires the addition of small quantities of vegetable matter to improve the decomposition of human body waste, may receive such wastes in addition to human body waste.

4. Section 19 of the said Regulation is revoked and the following substituted therefor:

19. A sewage system of a type set out in Column 1 of Table 5 shall be located so that no part thereof is closer to an item described in the heading of Column 2, Column 3 or Column 4 of Table 5, than the horizontal distance set opposite the name of such type of sewage system in such column.

TABLE 4

Column 1	Column 2
Spring or well other than a well referred to in the next item	100 feet
Well with watertight casing to a depth of 20 feet	50 feet
Building or structure where the bottom of the distribution pipe is below the level of the lowest floor in the building or structure	10 feet
Building or structure where the bottom of the distribution pipe is on the same level or above the level of the lowest floor in the building or structure	25 feet
Property boundary	10 feet
Lake, river, pond, spring, stream, reservoir	50 feet

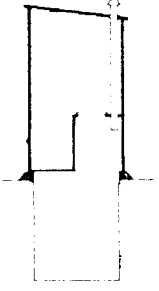

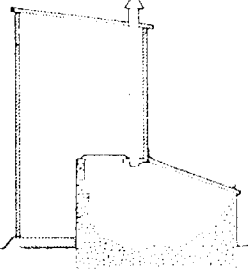

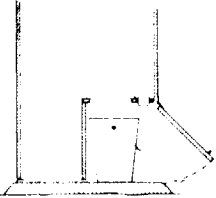

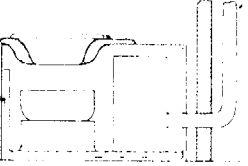

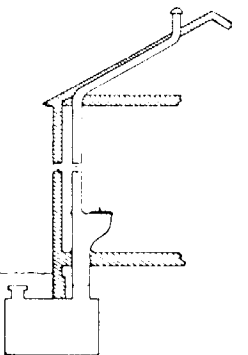

TABLE 5

Column 1	Column 2	Column 3	Column 4
	Well with watertight casing to a depth of 20 feet	Spring or well other than a well with watertight casing to a depth of 20 feet	Lake, river, pond, stream, reservoir
Pit Privy	50 feet	100 feet	50 feet
Privy Vault Pail Privy	25 feet	50 feet	25 feet
Cesspool	100 feet	200 feet	50 feet
Leaching Pit	25 feet	50 feet	50 feet

CLASS 1 SEWAGE DISPOSAL SYSTEMS

Class 1 systems are used only for the disposal of human body wastes and provision must be made to dispose of waste water to a separate sewage system. The conditions under which Class 1 systems are usually permitted are:

- 1) Where the installation of a standard septic tank and tile bed is not possible due to lot conditions
- 2) Where provision is made for the adequate disposal of the waste water to a completely separate system. Class 1 systems are not usually permitted if a premises is served by a pressure water system, as seepage pits usually can not adequately handle large flows.

FACILITY	SUITABILITY	LOCATION	CONSTRUCTION	MAINTENANCE
<p>Earth or Pit Privy</p> 	<p>Where soil available and ground water not encountered. Bottom of pit should be 3' above water table, rock or impermeable soil.</p>	<p>Minimum distances: 50' from cased well 100' from dug well 50' from river, stream, lake, pond, etc. Should be located downgrade from well.</p>	<p>Deep pit, insect and rodent proof. Earth mounted to prevent infiltration of surface water. Pit ventilated.</p>	<p>Good housekeeping required. Natural decomposition of waste should be relatively odourless.</p>
<p>Vault Privy</p> 	<p>Where adequate soil not available for pit privy and protection of ground water is required.</p>	<p>Minimum distances: 25' from cased well 50' from dug well 25' from river, stream, lake, pond, etc. Should be located downgrade from well.</p>	<p>Watertight concrete vault. Flytight building. Ventilated vault and building. 6 cu. ft. / person / year.</p>	<p>Keep clean, flytight. Clean pit when contents approach within 18" of door. Disposal of contents to a Class 3 or 7 system.</p>
<p>Removable Pail Privy</p> 	<p>A temporary facility to protect water supply. Where pit privy is impractical.</p>	<p>Minimum distances as per vault privy.</p>	<p>As per vault privy. Provide easily-cleaned pails.</p>	<p>Provide regular collection service and cleaning facilities, including hot water, long-handled brushes, detergent, drained concrete floor. Disposal of contents to Class 3 or 7 system.</p>
<p>Incinerating Toilets & Composting Toilets</p> 	<p>To protect ground water and surface water supplies.</p>	<p>Indoors or adjoining main residence. Should not be used in close proximity to neighbours.</p>	<p>Unit requires a power source. Incinerating toilets also have a cycle time during which it can not be used.</p>	<p>Incinerated ash or dry compost may be disposed of easily, on garden, or buried.</p>
<p>Chemical Toilet</p> 	<p>To protect underground and surface water supplies.</p>	<p>Indoors or adjoining main residence.</p>	<p>As for masonry vault privy. Tank may be heavy gauge metal with protective coating. Capacity 125-250 gallons.</p>	<p>Use 1/4 lb. lye for each cu. ft. of vault capacity. Made up to 6" liquid depth in vault or 25 lbs. caustic soda per seat in 15 gal. water. Maintain chemical solution proper strength to keep odours down and agitate after each use. Clean vault when 2/3 - 3/4 full. Avoid splashing as solution causes burns.</p>

Further information on the installation of toilets, their siting on the lot, the condition of the soil and other details are available from the following regional and district offices of the Ontario Ministry of the Environment:

Death

Associated with large disasters and catastrophes there is often the problem of disposal of large numbers of corpses and dismembered body parts. While it might seem a benefit to have the assistance of those experienced in mortician services their skills may be largely inapplicable to a holocaust situation. Indeed, even disaster specialists will find new challenges perhaps not to be found in other disasters.

The niceties of mortuary services in embalming, funerary practices and such will have to be dispensed with. While for ethical/religious reasons some may be inclined towards either burial or incineration the exigencies of the time may dictate the actual methods used.

In certain areas the disposal of human bodies may pale in the face of need for disposal of large herds of cattle and/or other livestock. In past disasters where resources were available, perhaps from elsewhere, and there was large heavy machinery, and fuel to operate it, then a solution was in using bulldozers and backhoes to dig pits and move the carcasses. This may be difficult to achieve.

The burning of carcasses may be even more problematical, given the demand for fuel and facilities, but the best guidelines that I have found so far are in state instructions for animal disposal. Here is one example:

[Dead Animal Disposal](#)

Nuclear war would add an additional catastrophic challenge to body disposal in that while it is desirable to dispose of dead bodies as quickly as possible, ideally within 72 hours maximum even in cooler climates, the circumstances of radioactive fallout may not permit initial attention to the problem for two or three weeks and then the immensity of the problem may require many weeks or even months to complete.

This is a task that will require the dedication of such resources and personnel as are available and necessary. Because of the very serious health threat in handling aging corpses particular concern will need to be paid to selecting and supporting the required personnel. Even after the task is completed, the personnel involved may need to be isolated and quarantined from the rest of the population - perhaps for some substantial period of time. (A minimum of six weeks is usually recommended - while in the past some authorities have recommended 6 months where graves were being moved where the cadavers had been exposed to things like the plague).

Inoculation of the personnel involved would be a nicety if available, however, other matters of hygiene need to be rigidly observed. Special garments resistant to contaminations (rubberized would be excellent) - along with good regular cleaning and decontamination of those garments. Use of gloves and masks.

Good shower facilities with scrub brushes that are used after each shift. Special diet and not overly exhaustive shifts so as to not weaken the physical stamina of the personnel as that would weaken their immune systems.

Particular attention needs to be given to air masks - both for reduction of the stench involved and to reduce the inhalation of contaminants. Personnel should rapidly gain some expertise in learning to work from an upwind position as much as possible and in using tools and equipment to handle the remains without having to touch them directly.

Here are two pamphlets as how to make air masks:

[How To Make A Fumigating Mask](#)

This 847 KB 3 page pamphlet explains making a simple mask.

[How To Make An Emergency Gas Mask.pdf](#)

This 0898 KB 3 page pamphlet explains how to make an emergency gas mask.

Below, I am making available a test case that may somewhat demonstrate the expected severity of the problem. This was the 2001 FMD (Foot and Mouth Disease) epidemic in Britain, during the peak of which there were slaughtered a half million animals *each* week for several weeks. One must remember that this was but a fraction of the animal population and did not include many types.

The other deficiency in this model is that there was a healthy human population with extensive mechanical and energy resources to handle the disposal. The numbers of personnel during the peak weeks numbered about 1500 veterinary personnel and 2000 military personnel for a total of 3500 total personnel. Consider this in relation to holocaust situation where there may be about 20% of the population left to bury 80% of the human population and almost 100% of the animal population.

Even the poultry population presently out numbers the human population about three to one. The catastrophe may be of such a nature that there may be large segments with no remains left to bury but, nevertheless, without extensive resources of machinery and fuel, it is going to be a daunting initial task.

The following article discusses a number of critical issues such as transportation, decontamination, the used of burning pyres, land fills and burial pits and concerns about water table contamination. Because large cows are the most difficult common carcass requiring disposal - the principles involved here, by extension, have the broadest overall application.

[Animal Disposal During an Epidemic](#)

Here is another thought. Those animals that are not killed - may try to kill us. You may wish to consider the following:

[Rendering](#)

[Alternative Methods](#)

The Board of Animal Health investigates complaints from the public concerning the disposal of dead livestock. Agricultural Regulatory Specialists visit the premises to ensure disposal of carcasses complies with Board of Animal Health rules.

BEST MANAGEMENT PRACTICES - CARCASS DISPOSAL

GENERAL OVERVIEW: There are always losses (mortality) in animal production.

Proper disposal of carcasses is important both to prevent livestock disease transmission, and to protect air and water quality. This document provides options for disposal with associated advantages, disadvantages and rule requirements.

Carcass Disposal is Regulated by: *

Minnesota Statutes 35.82**Minnesota Board of Animal Health Rules - 1719.0100 - 1719.4600****Minnesota Pollution Control Agency Rules****Minnesota Department of Natural Resources Rules**

*** These are summarized in the following Best Management Practices.**

LEGAL METHODS OF DISPOSAL (As of January 1996)

SPECIES	METHOD						
	BURY	INCINERATE	RENDER	COMPOST	EXEMPT BY LAW	FUR FARM CONSUMPTION	PET FOOD
Poultry	○	○	○	○		○	○
Swine	○	○	○	○		○	○
Cattle	○	○	○			○	○
Horses	○	○	○			○	○

Sheep/goats	○	○	○*	○			○
Household Pets					○		
Wild Anim.					○		
Game Farm/ Exotic Animals	○	○	○				

*** Allowed by Law, but at this time Minnesota renderers will not process sheep or goats.**

Definition of Carcass: The body or a part of a domestic animal or fowl that has died or has been killed otherwise than by being slaughtered for human or animal consumption.

Definition of Discarded Animal Parts: All or a part of animals, fish, or poultry that have been killed for human or animal consumption and not used for that purpose.

GENERAL RULE SUMMARY:

- 1. Carcass must be disposed of as soon as reasonably possible, ie; within 48-72 hours.**
- 2. Burying a carcass requires that the carcass be 5 feet above the high water level and covered with 3 feet of dirt. Sandy or gravelly areas or areas within 10 feet of bedrock should be avoided.**
- 3. Incineration must be in an incinerator that is approved by the Minnesota Pollution Control Agency.**
- 4. Hauling over the road. Carcasses or discarded animal parts must be in vehicles or containers that are leakproof and covered. The vehicles also need to be inspected and have a permit, unless the vehicle belongs to the owner of the animal before it died.**
- 5. Composting must use the protocol set forth in Board rules. These are explained on the page about composting.**
- 6. Fur farms need a permit and inspected vehicle to haul carcasses or discarded animal parts over the road.**
- 7. Each carcass used as pet food must pass an inspection by a veterinarian and must be processed under clean and sanitary conditions.**
- 8. Carcasses left at an off-site pickup point must be in an animal-proof enclosed area that is at least 200 yards from a neighbor's buildings. Carcasses must be picked up within 72 hours, except if the enclosed area is refrigerated to less than 45E F, the carcasses must be picked up within 7 days.**

BEST MANAGEMENT PRACTICES - CARCASS DISPOSAL

COMPOSTING

Composting is the process of placing carcasses in layers with a carbon source and manure to allow the natural heating process to break down the carcass and reduce its mass. As of January, 1996, composting is allowed for swine, sheep, goats and poultry.

ADVANTAGES

+ Biosecurity.

+ Year-round use.

+ Inexpensive

+ Environmentally sound.

+ Value - added product to

sell or
us

+ Best and recommended

Method to handle
catastrophic

losses.

- + Heat of composting process

kills pathogens and insect larvae.

DISADVANTAGES

- + May be more labor intensive.

- + Requires impervious pad,

rot resistant walls and cover

to repel rain.

- + Takes some practice to

develop the "art".

- + Requires carbon source

(straw, sawdust, cornstalks, etc)

RECOMMENDATIONS.

—

! Composting is an "art" that must be practiced because of the variety in materials, weather conditions and number of carcasses. It is best to have the same person doing the composting to consistently read the pile.

DO:

+ Follow protocol as specified in Board of Animal Health rules.

- Process mortality daily.

- Keep carcasses covered and at least 6" from sides.

- Take and record temperature daily (must reach 130E F).

- Start with a base of carbon source material.

- Put carcasses, litter and carbon source in layers.

- Mix pile at least 1 time when the temperature starts to decline; this will generate a new heat cycle after each mixing.

DON'T:

+ Use frozen carcasses for composting.

+ Store carcasses before processing.

PUBLIC RELATIONS.

Build composter out of sight and away from neighbors. While a compost pile that is working right will have no smell and no insects, it may bother neighbors to see carcasses going into it on a daily basis. Convince your neighbors to use the finished compost for their gardens (before you tell them what is in it).

[Top of page](#)

BEST MANAGEMENT PRACTICES - CARCASS DISPOSAL

I N C I N E R A T I O N

Incineration is an effective but more costly method, working well as a cold weather alternative.

ADVANTAGES

- + Can use year-round.
- + Biosecurity (No trucks coming from other farms to pick up

carcasses).

DISADVANTAGES

- + Incinerator cost._
- + Fuel cost - expensive.
- + Odor._
- + Very expensive for larger size carcasses._

—

RECOMMENDATIONS.

! Place your incinerator out of sight or enclosed with a decorative screen

.

! Consider the wind direction and time of the day, so as to least effect your neighbors.

DO:

- + Purchase MPCA Approved incinerator.
- + Purchase unit large enough to handle each day's mortality.

- + Properly maintain unit.
- + Incinerate mortality daily.

DON'T:

- + Accumulate carcasses for days before incinerating.
- + Incinerate when down wind neighbor is having a barbecue, etc.
- + Forget to pay your gas bill.

PUBLIC RELATIONS.

Most problems from incineration come from the odor of burning hair or feathers that interferes with a neighbor's outdoor activities.

[Top of page](#)

***BEST MANAGEMENT PRACTICES - CARCASS
DISPOSAL***

BURIAL

Burial requires great care in site selection because as carcasses decompose, they release materials that can pollute ground water, particularly if large volumes are buried. This practice is most suitable for small amounts of material (e.g. less than 2000 lb./burial pit/acre).

ADVANTAGES

+ Inexpensive (if own equipment).

+ Biosecurity (No trucks coming

from other farms to pick up carcasses).

DISADVANTAGES

+ Difficult in winter._

+ Can cause groundwater pollution._

- + Cannot bury where water table is within 10' of surface.

RECOMMENDATIONS:

! Should not be used by large facilities or with catastrophic losses because the volume of carcasses may lead to groundwater pollution.

! Examine other alternatives for dead livestock disposal.

DO:

- + Cover with three feet of dirt and stay five feet above the water table.
- + Cover each day's deposits with a layer of dirt.
- + Identify sites for worker safety.
- + Bury immediately.

DO NOT:

DON'T:

- + Place in or near lakes, ponds, rivers, streams, wetlands, ditches or wells.
- + Use as a dump for other farm garbage.
- + Bury in areas with a high seasonal water table.
- + Bury in "karst" or sandy areas.
- + Bury in areas subject to surface water flooding.

PUBLIC RELATIONS.

Problems arise when using burial pits and from burying a carcass too near to a neighbor's well. The neighbors complain about burial pits when any smell comes from the farm; they assume it is from the pit or when carcasses are not properly covered each day and dogs or wild animals drag off parts of the carcasses.

[Top of page](#)

BEST MANAGEMENT PRACTICES - CARCASS DISPOSAL

R E N D E R I N G

Rendering offers the grower the chance to create a recyclable feed product if it is submitted to the renderer with proper handling.

ADVANTAGES

- + Recyclable resources
- + Can use year-round.

DISADVANTAGES

-
- + Lack of biosecurity with pickup of carcasses._
- + Cost._
- + Not available in all areas._
- + Not available for all species._
-

RECOMMENDATIONS.

! Get on an annual contract with the renderer rather than a "per call" charge.

! If large enough farm, get on a scheduled weekly or twice weekly pick-up route.

! Use "off-site" pickup points for biosecurity purposes.

! Consider refrigerated "off-site" pickup points.

DO:

+ Know what substances the animals were exposed to, to avoid residue problems in the rendered product.

+ Follow Board of Animal Health Rules for "off-site pickup point".

- Must be animal-proof enclosure at least 200 yards from neighbor's buildings.

- Carcasses may not be left for more than 72 hrs. unless refrigerated -

then 7 days.

- + Be aware of potential disease spread from a rendering truck.
- + Vehicles or containers must be leakproof and covered to haul carcasses over the road. (Contracted vehicles also need a permit from the Board of Animal Health.)

DON'T:

- + Delay calling for carcass pickup.
- + Leave carcasses where other animals can drag them off.

- + Leave carcasses in public view.

PUBLIC RELATIONS.

—
What upsets neighbors the most are carcasses left where other animals can drag them into their yards or where the carcasses can be seen from the road. "Off-site" pickup points are required to be animal-proof enclosures.

[Top of page](#)

BEST MANAGEMENT PRACTICES - CARCASS

DISPOSAL

ALTERNATIVE METHODS

The Board of Animal Health may permit alternative methods of carcass disposal that are effective for the protection of public health and the control of livestock diseases.

**ALL ALTERNATIVE METHODS REQUIRE A PERMIT FROM
THE BOARD OF ANIMAL HEALTH.**

(651) 296-2942

SOME ALTERNATIVE METHODS:

1. PET FOOD PROCESSING

- Requires permit, veterinary inspection of each carcass, facilities and equipment that meet Board of Animal Health specifications.

2. FUR FARM CONSUMPTION.

- Fur farm is required to have a permit and to keep the farm in a sanitary condition.
- Permits allow only the feeding to fur bearing animals that do not re-enter the food chain.
- Owner assumes the risk of a disease or condition in the carcass that could be detrimental to the fur animals.

3. GRINDING AND INJECTING INTO THE MANURE PIT

- A permit was granted to the University of Minnesota for an experimental project.
- Field trials are being conducted in 1996.
- A disadvantage may be neighbors' perception that the smell from the manure pit is worse because of the carcasses in it.

4. LACTIC FERMENTATION.

Lactic fermentation utilizes a mixture of ground carcasses and a carbohydrate source to produce a "silage" type product for refeeding.

5. EXTRUSION.

Extrusion is a method whereby ground carcasses and a carrier such as soybean meal are cooked under pressure and moisture, generating steam and a product with 12% moisture for refeeding.

6. EMERGENCY, COMMERCIAL OR EXPERIMENTAL COMPOSTING.

- In emergency or catastrophic loss - call the Board of Animal Health for a permit and advice on composting the losses.
- Experimental composting must be in conjunction with a University and requires a permit.
- Cattle and other species may be experimentally composted if the protocol is approved.

Preparing for Disaster

Carcass Disposal Challenges During UK's FMD Outbreak

By Dr. Heidi J. Hamlen

California Department of Food and Agriculture, Animal Health Branch Emergency Program

In collaboration with G.A.W. Hickman, Department of Environment, Food, and Rural Affairs, FMD Joint Coordination Centre, London, UK; G.M. Trevelyan; M.V. Tas; and E.M. Varley.

As we pass the anniversary of the beginning of the foot and mouth disease (FMD) outbreak that devastated the United Kingdom (UK) and captured the world's attention, it's important to look at the lessons learned. These lessons are valuable to all countries as they make contingency plans to cope with a potential outbreak. Carcass disposal posed a monumental challenge.

FMD is a highly infectious, rapidly spreading viral infection that affects cloven-footed livestock including cattle, sheep, and pigs. The UK, like many developed countries with a large export market for animals and animal products, practiced the "stamping out" method of disease control. This strategy calls for the humane destruction of infected and exposed livestock as quickly as possible to stop the further spread of FMD. The goal is to eradicate the disease, and thus preserve the remaining, uninfected livestock. At the onset of an outbreak, it is difficult to foresee the overall magnitude. A critical factor contributing to the extent of the 2001 UK outbreak was that FMD had already spread across many parts of the country due to the movement of inapparently infected sheep prior to disease detection. From the outset, animal health officials were

racing against time to control further spread (see Figure 1). An international call for assistance mobilized veterinarians and animal health technicians from around the world to assist in the control effort.

As a result of aggressive disease control measures, nearly four million animals were slaughtered and destroyed (see Chart 1), and another 2.5 million were taken for welfare reasons (i.e., they could not be marketed due to international trade restrictions or moved to other pastures because of national movement controls).

Infected and exposed animals were quickly killed, but disposal was more difficult. Decisions had to balance the interests of animal health officials whose primary goal was to quickly eradicate the disease with those charged with environmental protection and safeguarding public health. Officials then had to gain acceptance from the public for these complex decisions and policies.

Traditionally, animal health officials have been hesitant to remove carcasses from the farm for disposal for fear that it would spread infection, so they immediately began employing disposal options that had been used successfully during the 1967 FMD outbreak: on-farm burial and on-farm

Table 1. Weekly Statistics of FMD Outbreak, February 25-June 10, 2001

Week number	Week ending	Animals vets deployed	Military personnel deployed	Number of animals slaughtered	Number of animals disposed	Number of animals awaiting slaughter	Number of animals awaiting disposal

pyre burning. As the extent of the rapidly escalating outbreak became clear, the constraints on the two disposal methods also became apparent. The Environmental Agency and the Ministry for Agriculture, Foods, and Fisheries (MAFF) issued detailed guidance on steps to be taken prior to on-farm burning or burial of carcasses. Guidance highlighted the need to protect the environment, and, in particular, the ground water, and summarized environmental protection regulations. Many of the regulations had not been

atmosphere or watercourses. As a result, procedures needed to be put in place urgently to utilize rendering capacity, but at the same time provide the necessary disease security to minimize the risk of disease spread through the collection and transport of carcasses to plants. With UKRA assistance, plans were developed and put in place to dedicate six of the UK's 20 rendering plants to processing FMD infected or potentially exposed livestock, with priority placed on rendering cattle. The potential weekly capacity was about 15,000 tons of carcasses.

Figure 1. Cumulative Number of Animals Condemned, Slaughtered, and Disposed of During the 2001 FMD Outbreak in the UK

in place during the 1967 outbreak and placed major limitations to on-farm burial in many areas. Public health officials, the public, and the media raised concerns regarding the potential contamination of ground water from on-farm burial and air quality issues from pyres. While these concerns were being voiced, the outbreak continued to escalate. Carcass disposal could not keep pace with the rate that infected and exposed animals were being killed and farmers coped with the trauma of seeing the carcasses of their livestock for days, or in some cases weeks, prior to disposal (see Table 1). Officials needed to quickly develop alternative disposal options. These options included rendering, use of licensed commercial landfill sites, and the creation of mass burial sites – all new strategies for carcass disposal developed in the face of an escalating outbreak (see Figure 2).

Rendering

As soon as the first outbreaks were confirmed, Alan Lawrence, director general of the United Kingdom Renderers Association (UKRA), wrote to MAFF and offered the industry's assistance. At that stage it seemed that burial or burning on open pyres were to be the methods of disposal, but MAFF indicated that rendering might be used as a contingency. However, as already described, it soon became clear that mass burial pits and open pyres were unacceptable to the public, for environmental and health reasons. In the latter case, concerns were raised about bovine spongiform encephalopathy (BSE), or "mad cow" disease, and the possibility of the prion agent entering the

these routes were closely monitored for any possible spread of disease.

One of the unanticipated problems with moving animals to rendering did not involve disease containment, but the extremely narrow drives that made entrance of the large articulated trucks to the farms next to impossible. In some cases, this could be overcome by removing fencing or stone walls, but in other instances, smaller trucks or alternative disposal methods had to be used.

Due to the use of other disposal options during the 2001 outbreak, and technical and logistical problems, overall, the dedicated rendering plants were only used at 50 percent capacity. Discussions are currently taking place to utilize maximal rendering capacity should the UK have the misfortune to experience a future outbreak of this magnitude.

Chart 1. UK Animals Slaughtered for Disease Control

Continued on page 20

Licensed Commercial Landfill Sites

As part of ongoing contingency plans, the Environmental Agency identified potential landfill sites suitable for carcass disposal. Existing protocol limits carcass disposal usually to five percent of the currently permitted disposal inputs of waste. In theory, landfill capacity could have absorbed comfortably all the stock slaughtered both in the FMD outbreak and the concurrent welfare disposal scheme; however, few landfill operators were prepared to accept carcasses, and then only sheep and pigs. To develop sufficient capacity to meet the peak demands of the outbreak would have required the government to direct the licensed landfill holders to take carcasses. The regulations that enable directions to be issued could not be applied to cattle born before August 1996 because of the higher BSE risk. However, directions were not issued and the voluntary use of landfill sites for carcass disposal was met with considerable opposition from local public, local authorities, special-interest groups, and farmers located near the landfill site. Therefore, it proved difficult to fully utilize this disposal option.

Mass Burial Sites

Mass burial sites were developed in the UK as a novel option to cope with carcass disposal from an FMD outbreak. Large sites were procured (five in England, one in Wales, and one in Scotland) in which multiple pits each capable of

These mass burial sites were used together with rendering and licensed landfills to meet the peak demands for disposal and are regarded as national assets. Plans are currently in place to restore these sites and remediate environmental impacts.

All agreed that rendering and incineration were the preferred disposal methods.

Carcass Disposal Hierarchy

Early in the course of the outbreak, all stakeholders committed to developing a hierarchy of carcass disposal options that would balance the need to protect public health, protect the environment, and ensure FMD control and eradication. All agreed that rendering and incineration were the preferred disposal methods, but it was clear from the outset that these resources were not immediately available and even when fully exploited, could only partially meet the disposal needs. It cannot be stressed too highly that the disposal problem posed by the 2001 UK outbreak could not have been contained if on-farm burial and mass burial had not been available to the degree and at the time they were needed. That said, the agreed disposal hierarchy for carcasses, reflecting the input of all stakeholders, was

published by the Department of Health on April 24, 2001, two months after the outbreak was first detected: 1) rendering; 2) incineration; 3) licensed landfill; 4) pyre burning; 5) mass burial or on-farm burial.

Conclusions

The valuable lessons learned during this outbreak include the serious public health and environmental impacts of the various carcass disposal options, the ability of the public to accept these options, and the substantial challenges faced by the government in implementing

Figure 2. Quantity of Carcasses Disposed of Through Various Disposal Routes

holding between 10,000 and 60,000 carcasses were engineered. At the start, there were no proven designs for mass burial sites and the design features underwent rapid development and change over four to six weeks at the peak of the outbreak. Increasingly sophisticated liners and leachate collection systems were employed to minimize risk to groundwater. The extreme nature of the emergency with regards to delays in carcass disposal required that these sites be made operational with little advance consultation of stakeholders and environmental bodies if a public health or animal health disaster were to be avoided.

successful carcass disposal strategies in the face of a rapidly spreading outbreak of this magnitude. Unlike the 1967 FMD outbreak where virtually all carcasses were disposed of on-farm, in 2001 the majority of carcasses were disposed of off-farm under conditions of strict biosecurity.

The valuable role that rendering played in this outbreak should be a call to action for all renderers to work closely with animal health officials to develop and expand contingency plans. By working together, we can safeguard animal, public, and environmental health during an animal disease crisis. ❖

Wild Dogs Pose Post-TEOTWAWKI Danger

I was in a chat room tonight and we were discussing dogs. I said "If TEOTWAWKI (the end of the world as we know it) happens, then 100 millions dog will be a major problem." Then we got to talking about the Great Depression and how the land was almost hunted dry.

First, before we accept that as fact, here was the argument. One person stated that when the great depression happened there was half the population, then there is now. So, if a great world collapse was to happen today, his premise was there wouldn't be anything left in the forest. I have to disagree. My biggest point was during the G.D., 40 percent of the population came from farms, most knew how to hunt and a fair percentage knew how to trap. Then it makes senses that the game would disappear. But even then, there were a percentage of trappers all over this country that fed their families and saved their farms with the fur money. See the value of trapping?

My premise is we have 90 percent of the U.S. population in the cities. Most are soft and would rather steal what you have then work at hunting or trapping. I believe most will never get out of the cities and will die in a hail of gunfire, rioting and fires. When all this is going on, they will let their pets go free, thinking at least they can survive on their own. This is why at 4:00 am I'm writing this article. I could not sleep. I know city people will do this and we will have 100 million dogs and 80 million cats released to go wild.

Now what I have to say next is not for the weak hearted, if for any reason you have a weak stomach or can't handle a cold hard reality check, then [go back to my home page](#) and choose another article.

OK, for those that are still with me, these animals will be a major problem and must be dealt with. Period. This isn't Disney, where you can talk to the poor dog and cat and the world is all fuzzy and warm. This is reality. If you own animals never, ever, EVER, release them to go wild. If you don't have the stomach for putting them down, have someone else do it. If you have to put dog food away at your camp, cache, whatever, great. I think a dog is invaluable then. A cat in the wild in this crisis is your greatest enemy. One study in Wisconsin found that the best predator against small game was the house cat. The common house cat killed more small game than all other predators in the study.

Now the reason I'm up this late and can't sleep is the dogs. I understand pack mentality and a pack of dogs scares me more than a pack of wolves. I have been studying the woods and wildlife my whole life. This is how the dogs will form packs, an alpha male will take control of the pack with a beta male as second in command, the packs will range from 6 to 100 dogs depending on the food supply.

This scenario, I read years ago of a pack like this had 45 dogs and this was how they attacked people. The alpha picked a friendly looking female like a collie. This is the decoy dog. As you are walking in the woods, the collie approaches and draws your attention, as the packs circle you for the kill. When the pack sneaks up to striking distance, they will attack and so will the decoy. I'm talking lightning fast 45 dogs coming at you. How many rounds does your clip have?

You see when the riots and the death in the city is happening the dogs will learn to feed on the bodies then in turn will acquire the taste for humans. Now you have a pack of wild dogs who consider you and your loved ones as food. They have no fear of man and will kill you to insure their own survival. Now, I'm not trying to scare you and sell fear. I am telling you that this will happen if the chaos of TEOTWAWKI occurs. You'll have to learn to kill dogs and cats on sight. Period. This is not an option.

If you want to insure your own survival, then listen to me. This is no game. If you think I'm just stating this to sell you trapping equipment then click off this article and go take a poll of the people you know, ask the following question, "What would you do with your dog and cat if you lost your job and could not afford to feed them?" I have lived in the country most of my life and I have had to deal with these animals that people let go on their own.

I have talked to the people who have told me that they still believe their Ralphy boy is probably still out there hunting with the best of the coyotes. Dreamy like and with pride in

there voice! Or I know my cat is still alive because he was the best hunter in the neighborhood, he killed more birds then any other cat!

I'm not selling anything but reality! I'll tell you another dog story that happened to me. I was trapping on this farm years ago and I caught a black mangy, scaly looking black lab mixed mongrel. I have caught lots of dogs over the years and I can let most go with out a problem, unharmed. Anyway, I approached this dog and started talking to him and slowly moving closer. The dog stood up, wagged his tail and appeared happy to see me. When this happens, 99% percent of the time I can release the dog and place

him in my truck to take to the farmhouse and explain what happened. Most dogs are fine and have a sore foot for a couple of days, then they're back to normal. Not this dog he lured me in with his friendly attitude until he thought I was in striking distance, then turned into attack mode. Lucky, I was prepared for the reaction and quickly jumped back. I never will forget that lighting fast change and the snarling teeth just missing my hand. The dog misjudged his strike range, if I had been a little closer this would be a different story.

So I walk back to truck truck, found the farmer and told him I caught his dog. The farmer says I don't own a dog and what color is it, because some black mongrel attacked his wife yesterday. To make long story short, the dog was turned over to the humane department and tested positive for rabies. Now this was back in the early eighties when a lot of people were getting laid-off. People were letting their dogs go in the farmers' fields and without proper care, and the dogs picked up all kinds of diseases. Someone has to deal with these dogs. There is no such thing as a dog or cat that is better off let go to fend for themselves. I have seen them all and most of the time you would never recognize them after 6 months on there own.

If a TEOTWAWKI does happen then someone in your group preferably everyone should trap, hunt and kill every dog and cat that has gone wild in your area. Period! I'm writing this early in the morning because I couldn't sleep at the thought of that many wild dogs and cats free in America.

The best defense to protect your garden and livestock or game animals would be snares. I would have 10 dozens coyote grade snares and enough heavy wire to set all of them at once.

Here is another theory: Starving people will kill the dogs for food. I say sure some will become food, but the average household that has guns has less then 50 rounds, although most survivalists will have much more. So, I think after the first week most people will be

out of ammo. Then the packs will rule.

Let me know what you think, am I way off base? I just keep thinking of all the people in the cities and their "My dogs are my children" attitude. Dog and cat food is a huge business. I mean, they have pet psychiatrist for Christ sakes. Think about all the movies and shows like 911 where people risk their lives to save animals. I'm not saying that this is wrong, all I'm pointing out is people's attitude toward pets, and I guarantee they will let them go to fend for themselves when the food runs out. Make sure you are ready to face this threat.

Medical Rorganization

In the immediate aftermath of a world-wide nuclear war, any medical facilities that survive will be completely overwhelmed and there will be little capability to replace any supplies. Those that they have will soon be exhausted. Trauma and triage will be the order of the day. Medicine will almost immediately be thrown back a couple of hundred years. Any surviving surgeons will have to quickly learn how to perform amputations without benefit of anaesthesia.

Any surviving medical and nursing staff will have to act largely as supervision to newly recruited personnel. Sanitary procedures will be a challenge and the facilities will tend to have the odors and noises of centuries ago. It will be a quite different place than people associate with hospitals today. They will mainly be a place to take people to die.

There will also be many more psychiatric problems because portions of the surviving medicated population will become irrational and the ensuing events are likely to induce traumatic and pathological behavior in others.

Safety procedures should be even more rigidly enforced because the traumatic penalty for accidents will be ever more serious. Diagnostic procedures will be largely nil and surgical remedies that would have been commonplace will be undoable. Alternate older time remedies and procedures will have to be implemented where possible until pharmaceutical production can be reinstated - which for most items will be months and years and for some possibly decades.

Listed here are two resources which may be useful in some locales.

Entitlement in Local Economy Trading Systems (LETS) (for post-cataclysmic recovery) A Blueprint by Bruce Beach

Version 3 - December 24, 2000
changes as of June 3, 2001

Prologue

The purpose of this essay is to describe ENTITLEMENT in LETS (Local Economy Trading Systems) that might be established after a nuclear holocaust or other world-wide catastrophe that seriously disrupts society. LETS are the most highly recommended systems, for post nuclear recovery, to have come out of the Final Report of the US Federal Emergency Management Agency study (RR-31 / Reprinted March 1990) on "Markets, Distribution, and Exchange After Societal Cataclysm" (pp. 94-95). The details presented here are the results of decades of study and contemplation, by the author, a university trained Institutional Economist and at one time a college professor of economics. The author has been acquainted and involved with LETS for many years, over a decade ago developing a video presentation for which he arranged booths at fairs for its presentation.

In this essay we will be discussing the meaning of "entitlement" and how it should be implemented, along with a description and examples of the operation of LETS. The intention is that this essay should be used as a blueprint, a "How To" manual, in a post-cataclysmic recovery period by those who will be working to reconstruct society. In stable times, most members of society will not bother to examine the justifications or reasons for why things are done the way they are done. But at the time of social collapse and reconstruction these subjects must be addressed so that in rebuilding we do not simply reimplement portions of the structure that may have contributed to the collapse, or that were previously irritating and that we simply accepted along with the entire previous structure. For this reason we will seek to remove some of the veils regarding money and show the justification for redefining the rules for entitlement.

The Meaning of Entitlement

A Just Economic System is about entitlement. WHO is entitled to WHAT. All persons, in an abundant society, are entitled to subsistence. That is to say, to sufficient food, shelter, clothing and basic health care, that they will not die. In a less than abundant society, decisions sometimes have to be made between those who can contribute to the survival of society and those who can't or won't. An abundant society that is humane will meet the needs of the handicapped, incapacitated and elderly. Any society should be

particularly concerned about the health, welfare and education of its children who are the future. A society of true abundance and justice will provide to ALL its members the opportunity to not only fulfill their material needs, but also the opportunity to develop to the utmost their spiritual capacities.

Some persons feel that in recent decades the term “entitlement” has attained the connotation that the unproductive and irresponsible members of society have a claim on the wealth of those who do produce and exercise personal responsibility. They use the emotional word “irresponsible” where often the word “non-responsible” would be better. Children are non-productive and non-responsible. Likewise the very elderly may be non-productive and non-responsible. The same can be said for mentally retarded and other categories. But, aside from that, the idea of entitlement that is our concern here, is more concerned with production than consumption. It is mainly concerned with who (which entrepreneurs) are entitled to the factors of production (land, labor, capital). The purpose, concern and thrust is to increase production as quickly and efficiently as possible, through the encouragement and support of entrepreneurship, so that there will be an abundant society in which everyone gets cared for, to a standard that allows for personal growth and development to their full potential. It is necessary that distribution of resources will be based upon value judgements as to the future possibilities present in the person and on value judgements regarding the moral quality of their behavior.

JUST Economic Systems

A Just Economic System in this world is RELATIVE, that is to say - less than absolutely just. Only God can dispense ABSOLUTE Justice. All human decisions in this world will remain relative because of the frailty of human wisdom and character. The ONLY choice is through LAW and ORDER. The alternative - anarchy - is lawlessness and disorder, and is not a choice for a society that seeks JUSTICE, harmony, security, and abundance. The natural order of life is interdependence and a Just Economic System is a part of a Just Society. It must be a part of a just society. It cannot exist separately from a just society, nor can a society be just - without a just economic system.

A JUST economic system is based upon the Pillars of Reward and Punishment. The carrot and the stick. It should be organized in such a way, (as should society itself) as to:

Encourage the Saints,
Direct (Guide) the Sinners, and
Restrain the Satans.

and assure that they all contribute to society.

The Need for LETS

LETS are an intermediate step between "household economics" and "national (or international) economics". No claim is made here that LETS should be the only economic system, or that they should replace "traditional monetary systems" at the national and international levels. But they do fill a gap that has been previously ignored. LETS have not had overwhelming success or acceptance (which amounts to

the same thing), in the few decades since their inception although there are many hundreds of them. Part of the problem has been the exhaustive missionary and educative process that would be needed to gain acceptance in a culture that has become almost completely identified with the "traditional monetary systems". There have been other problems also, such as the necessity for an initial critical mass of participation for a system to reach a "kindling point" of usefulness and efficiency.

After a societal cataclysm, LETS can be a key factor in the RESTORATION of SOCIETY. In economically underdeveloped societies, and as a matter of lifestyle among some individuals, independence and self-reliance has been a necessary or desired way of life. Recession, depression, and stagnation in large economies have often meant that individual households have had to independently produce what they have not been able to obtain from the larger economy about them. Independence and self-reliance have both their advantages and disadvantages. As an advantage, those who are able to function independently can sometimes use their own resources that would otherwise be idle. As a disadvantage, where there is no cash or exchangeable assets they are often cut off from the larger community and are forced to live without many of the advantages of specialized technologies and services such as advanced medical care. On the whole, independence is at a disadvantage as compared to interdependence, because interdependence generally allows for very great efficiencies of specialization and much more appropriate use of each resource available.

In a money based economy, the only alternative to self-production has been possession of the required currency. Independent barter is generally inefficient because it is difficult to find others willing to exchange the exact goods that one desires, (and in the exact quantity desired) for goods that one has available to exchange. Local trade fairs offer little additional advantage. While they permit one to exhibit their goods to a broader audience, still the medium of acceptable exchange is usually based upon the broader recognized currency. LETS provide an intermediary step, permitting a community to efficiently exchange goods on services on a broader basis than that of an individual household, and thereby more extensively and efficiently utilizing the resources of the entire community.

The Need for Entrepreneurship

In the final analysis, all goods are created by what economists recognize as the four factors of production:

Land
Labor
Capital and
Entrepreneurship

It is the fourth factor that is the most necessary to reduce the idleness of the other three resources, and to assure their most efficient use, and it is the fourth factor that LETS most enhances over both "household" and "national" economies. Value of goods and services is based upon factors besides the four factors of production. These can be such factors as scarcity, necessity, perceived intrinsic value, and others, but an exchange system accommodates these subjective values in its pricing and exchange rates, as a part of the mechanism of what is called "supply and demand". Still, the relative values of the various factors of

production are often determined by tradition, established power structures, and other external factors that are not necessarily determined by technical factors. It is these historical methods of determination of entitlement, that arose from culture, custom and tradition of the preceding mode of socio-political organization, that we must often directly replace with new determinations of entitlement in order to jump start society, and to once again get production going.

The theory is, that the more local that motivated entrepreneurship can be, that is to say that the further down the productive system or chain that we can press it, then the greater the efficiency that there will be attained. What we are talking about is the power of the motivated decisions of the individual in a free economy. Because it is an exchange economy we obtain the efficiency of “relative advantage” that arises out of the differences of land, labor, capital and entrepreneurship, and those which are contributable to specialization and division of labor. Socialists argue that a controlled economy is more efficient, because it eliminates the redundancy of competition and assigns resources on the basis of social need rather than on the basis of individual selfish desires. There must of course be a balance between individual selfish desires and collective social need. Finding a balance between these two philosophies will achieve the benefits of both worlds ... and eliminate the tragedy inherent alone in each. To find this balance there must be a new revelation in the thought processes of those participating in the rebirth of the economy. Those in authority must avoid the pitfalls of the past without endangering the future with socio-economic fallacy.

The Establishment of Authority

The purpose of this essay, in describing how Entitlement may be determined in LETS, is an entirely practical one. While grand philosophical issues might be discussed, analyzed, and debated, what is presented here is a practical suggestion of how local communities may go forward and recover economically from a cataclysmic upheaval. Indeed, because there can be such difference of opinion as to what is the best course, and because circumstances can vary greatly both through time and from location to location, what is key to determination of Entitlement, is the establishment of THE AUTHORITY to determine the Entitlement. Anyone who comprehends what will be presented here will understand that the two go hand in hand or, better yet, hand in glove, for the one - Entitlement- is clothed with the other, Authority.

Simply put, it is Authority that determines Entitlement. The underlying principle is that the authority of the governors arises from the governed. That the authority of the highest levels ultimately rests in the lowest level groups, through their selection of delegates to the next highest level, and the repeat of that process through to the highest levels. The legitimacy of the authority of the higher levels therefore comes from the right of the governed at the lower levels to choose their governors. I have redundantly expressed this in three ways, so that there can be no doubt about the matter.

The governors, during their terms, need not refer back to any historical documents, no matter how previously revered. They need take into account no previous customs, no matter how long established. So long as there are no established operative authorities above them they need not limit in any way their own

actions. Hopefully, at all levels, those implementing policies and rules will be guided by the higher wisdom that has been communicated to mankind in the past by the highest spiritual sources such as the Prophets and other leaders in moral thought. The concern with morals and ethics in economics has a long history. Adam Smith, considered by many as being the father of economics, was a professor of Moral Philosophy and until more recent times the study of economics was always referred to as “Political Economy”.

Justice and Law

The success of LETS has a lot to do with the success of the re-establishment or replacement of what is currently considered law and order. Entrepreneurs must have some stability, some assurance that their work will not vanish to either an officially sanctioned or a rogue raid. The higher administrative levels will have to curtail the power of those from within the administrative structure who try to unduly use either their influence as well as those from without who seek by violence to achieve their own ends. Practically, the administrators will have to deal with the specifics when they meet them. The remedies will depend both upon the specifics and their resources for dealing with them.

Both revolutionaries and the establishments justify their actions on the basis that they are the more just and that therefore they are justified in any means to obtain their ends. For this reason the educative process is essential in instilling a sense of high moral value, justice, fair play and so forth. This educative process must be of a higher mentality, emotionality, and spirituality than has ever existed in mankind previously, or the pattern of errors plaguing the past will quickly reverberate all over again. It is a long and difficult process because the veneer of society is very thin and the task is most delicate, but nevertheless it is essential. Unless there is a broad consensus as to what is fair and just, then the entrepreneurs have no principles to play by and no surety that others will be expected to play by the principles. Without such guiding principles there is no justification for hope of reward for taking the risk that is part of being an entrepreneur.

Justice and Rights.

There does not need to be the burdening mass of laws, rules and bureaucracy that shackle the present day social innovators in order to preserve the inherited status quo. The decisions in LETS can be made by responsible individuals with souls, rather than by soulless corporations and government bureaucracies guarded and guided by minions of legalists dedicated to specific ends rather than to common sense, readily recognized justice. In the final analysis, despite the existence of laws, that in their printed form occupy hundreds of feet of shelf space, the decision of what is right or wrong comes down to the minds of the judges. Substantiating precedence can be found for most any position by anyone with enough funds to have expensive and capable talent search what are many miles of printed previous decisions. It is seen as excellent justice for the wealthy and often meaningless unfairness for the poor. Often the procedure is just delay until a matter becomes irrelevant. Thus justice delayed is justice denied.

The operation of any system is dependent upon the good will, wisdom and spiritual enlightenment of its

administrators. It is incumbent upon the members of groups to select administrators with those qualities. The administrators must in turn seek to assign delegates, with the same qualities, to the higher levels. These individuals can then dispense justice on the basis of Principles of Recognized Rights and Freedoms rather than interpretative arguments regarding syntax in written statements of law. Since economic actions (as well as social ones) will be the responsibility of real persons with souls, rather than the fictitious persons of soulless corporations, the interaction of dialogue can be between the individuals, and the administrators, and any aggrieved parties, on those principles. Educated descendants of the original indigenous inhabitants of North America, and other such native peoples through out the world pointed out how the lack of such commitment to justice in the Western systems was a major shortcoming.

At every level, from the lowest groups, through each level to the highest, there must be the recognition of the responsibility to educate all participants in the need for honesty, trustworthiness, integrity, fair play, equality, tolerance, commitment to freedom, and justice. We need only look about the world at the moment to see how intolerance, fraud, bribes, collusion, arbitrary power, exclusionary interests and such, wreck the opportunity for progress, security, and the benefit of all. A system of intelligence, morality, and spirituality greater than any inspired people before, must be instilled in the survivors of the disasters - or the disaster begins again.

Money.

John Maynard Keynes supposedly said, "Money is a veil", although I have not been able to locate the source. In any case, to most people, its nature is a mystery. Money is more than currency or coin. More than cash and checks and the balance that one has in the bank. The line between liquid and non-liquid assets blurs as does that between debt and credit. Various definitions of money exist, such as a medium of exchange, or a store of wealth, but none of that concerns us here. We each have enough sense of the meaning of the term money, to have a notion of what we are talking about.

One of the main issues of ENTITLEMENT is WHO is authorized to create money. In the traditional systems of the 20th century, in many people's minds, it was the government. They saw the printing of currency or coinage as being the creation of money. Gradually most knowledgeable people became aware that cash (i.e. currency and coin) was a very small part of money and that it was actually the banks that created money through loans. Still, some felt that this was controlled through the government through its National Bank, or as in the US, The Federal Reserve (an actual, probably intentional, misnomer). In most capitalistic countries, including the US and Canada, the money creation system was owned and operated by private capital organizations. It was the purview of persons of great wealth and power who were truly hidden behind a veil. Unelected. Uncontrolled. Unaccountable. Unresponsible. And Unresponsive to many of the legitimate needs and concerns of the lower classes of society. .

Neither the history, morality, nor the mechanism of the creation of money in the past need concern us here. What LETS does is put the control of the creation of money in the hands of the individual to a greater degree than in the past. In actuality, it rested there to a degree already, to the extent that

individuals were willing to create debt by borrowing or lending money. Sometimes referred to as consumer confidence. Every person who had a credit card was authorized to create money within the limit set on the card. The real issue then becomes, who has the authority (or is entitled) to set the limits on credit cards or to refuse loans. It is not done by the legislatures of a country. It is done by the banks, and the lending, and other, financial institutions. Under the LETS proposed here, we are therefore concerned with establishing the Authority for Setting Limits to Entitlement.

-----added June 03, 2001----->

More than the issue of the quantity of money is that of the quality of money. There will be those who advocate a return to gold and silver or at least 100% metal backed certificates. The thesis here is that there is room for a variety of currencies. The key concept behind LETS is that the mere lack of existing certificates should not be a limiting factor when there is value to be exchanged. There needs only to be authorized entitlement to issue further certification. Should some levels or types of certification come to be more highly appreciated, then in accordance with what is called Gresham's Law, but which is in reality a centuries old principle, the poorer currency will drive out the better. That is to say the less honored currency will be offered first, and the more honored will be hoarded. Under the LETS system, this problem is self rectified by the capacity of traders to issue their own in accordance with their entitlement while the dilligent seeking of more honored currencies will simply be to the enhancement of industry.

<-----

Authority to Set Entitlement.

Theoretically, in capitalistic countries, the chartered banks got their authority from the government, and the government got its authority from the legislatures and elected representatives of the people, so that ultimately the control of money supposedly rested in the people. In practicality, as most people came to realize, it was the large concentrations of wealth (and consequently power) that actually controlled the programs of the political parties. While immense emotional furor existed regarding the various programs most people realized that there was little difference in their basic tenets and that control ultimately remained with those who controlled (usually inherited) the great concentrations of wealth. For this reason, most people never bothered to devote any great amount of time or personal financial resources in involvement in those processes. Some few did, out of emotional attachment to some philosophy, and some few others because by working within the systems they were able to achieve personal gains. But as stated, most were alienated, because they recognized that they had already been effectively disenfranchised from the centers of power that actually controlled their entitlements.

What is presented here, as an alternative, would under any other circumstance, other than in that of restoration of society after a societal cataclysm, be seen as mere Utopian Daydreaming. But in this particular circumstance people have not only the opportunity, but the necessity, to create a system that will fulfill their needs. They will be well advised in the process to create a JUST system. All authority eventually rests with God. Those who would implement human systems should keep foremost in their minds the objective of being in accordance with God's command for Justice. That being said, and

hopefully being conformed to, to the best of human ability, there still exists a wide spectrum of approaches that one might legitimately undertake. There may be a need to paint a house, but one can paint it attractively in any one of a number of different colors or combinations of colors. And likewise, the system presented here is not the only possible system, but is a well thought out and practical one. .

LETS are, as its name says, LOCAL. Families are free to implement within their own families such policies and practices of economic production, sharing, or restraint as they wish, and at the other end of the spectrum there may be international and national economic organization that is very different in policy and practice. LETS are meant to fill the gap in between. And there is a gap. It cannot be filled by individual family activity, and in the past has often not been filled by national or global activity as evidenced by the numerous and widespread pockets of poverty among a world of plenty, and the numerous times that even locales of affluence have become stagnant.

The Mechanics of LETS

The mechanics of LETS have been well established through actual usage and practice by many tens of thousands of individuals in hundreds of LETS associations.

Basically one issues to anyone in the system, credits (that is to say - LETS dollars) for having delivered goods or having performed services. One can give (create) these credits to the combined extent that they have received these credits from others for having delivered goods and services to other members, and that they have them in their entitlement.

The facility for tracking LETS transactions has been greatly enhanced by the availability of personal computers. The availability of computers, however, will not be a determining factor of whether or not LETS systems can be implemented because they can even be implemented with a pencil bookkeeping method. While there are specialized LETS accounting programs available, they have no real advantage over any very simple bookkeeping or even spreadsheet program.

Practical experience is the best guide, and it is practice that will give experience. The procedure can be as simple as creating and exchanging checks like most everyone is familiar with in the current banking system. The checks can then be hand cleared and accounts credited or debited at the central LETS office. Just as technology assisted the current banking system in printing, numbering, sorting by account number, and so forth of checks, and the keeping of accounts on computers, so could it benefit LETS if it is, or becomes available.

Very advanced techniques of electronic debit cards can be used, once that technology again becomes available. Yet, simple is as simple does. To avoid security issues such as counterfeiting, forgery, uttering, kiting and other such deviousness, a LETS may need both an internal and external system of checks balances to accompany its authority for overseeing entitlement. These systems, however, should not be over burdensome and should simply meet the practical necessity of the milieu and level of activity of any particular LETS.

What will need to be done in practice, is that those with some skill in these matters, will need to establish the local mechanics and procedures. Hopefully, then, they will be willing to share their art with others in nearby localities where others are also trying to establish LETS. As the popular saying is today - this isn't rocket science that we are talking about.

Creating Entitlement

Entitlement is the real key to the system. It is the ability to create credit or debt. The limit of entitlement is determined by the administrators of the individual LETS, and by the higher levels of administrators, by whatever rules of community standard they wish to apply. Theoretically, they might establish no limits. But then, rather than continually growing in value and usefulness, the credits could become debased and useless by their being over issued by non-producers. Or, for that matter, an entrepreneur of the very best intentions might issue too many credits relative to the resources of the LETS and swamp the system, or worse yet, that entrepreneur might fail and take the LETS with him or her.

At the other extreme, if the administrators are overly conservative, or even if the members of the Groups are overly conservative, and are not willing to take any risk in taking debt and issuing credits, for fear of loss, then the system will collapse equally or more rapidly. One must apply their talents, (as in the Biblical parable) to the best of their ability. Many arrows will miss the target. Numerous seeds won't sprout. But that is the nature of life. As an analogy, there must be tolerance for those who have a bad or failed crop, whether due to external situations such as the weather or pestilence, or whether due to bad management. In the latter case, it is responsibility of the Groups to share in educating, assisting, and encouraging their members in better management techniques. Sometimes in restraining their members in the use of credits and other times (perhaps oftentimes) encouraging them to use and employ even more. The administrators at the higher levels need to particularly exhibit guidance in these matters.

LETS has never been used anywhere, to this writer's knowledge, as a primary system. Using it in this way will present new challenges, and also new opportunities. Properly instituted it may be able to provide full employment, and much greater efficiencies, along with better opportunities for social and economic justice, and a more fulfilling approach to life and spiritual growth. While that seems a lot to hope for - it must nevertheless be the goal. LETS as the primary economic structure can provide the higher levels of the accompanying social structure, as described previously, with the resources to fulfill many of these social goals. And, it should be mentioned, without the need for interest or taxes. Once more there must be a cautionary note - LETS, as its name implies, is a LOCAL system. Its principles do not necessarily apply to national and international systems. There, others may see advantages in retaining such institutions as interest and taxes.

Risk and Fraud

Once again, let me stress, there must be an appropriate degree of tolerance for failures, and where needed they must be written off without penalty or reflection on those responsible for them. Developing

entrepreneurial skills is a learning process and experience, including failure, is often the best teacher. The nature of the world is that it in GREAT abundance rewards the proper combinations of land, labor, and capital. In the financial/industrial world of the past, there were often very great failures, even under the skilled hands of highly trained, motivated and capable managers. That too is part of the nature of the real world. What is needed is the appropriate development of entrepreneurial skills. In a well functioning economy there will be an increasing amount of abundance to risk (I do not wish to say waste) on entrepreneurial training and experimentation.

LETS are rife with the potential for fraud, but so are all other exchange systems. Properly implemented there is less probability of fraud with LETS because at each level, and within each group, there will be numbers of independent and unbiased monitors. Indeed, as compared to the traditional system LETS can be thought of as being almost fraud free, if one comprehends how the old system worked to the advantage of a small privileged class and to the disadvantage of the masses. There is an old saying that he who stole the goose from the commons was caught and punished while he who stole the common from goose was let free. With LETS there may be more opportunity for goose stealing less opportunity for commons stealing. This may be only an idealistic hope, and one will have to wait and see if events actually bear this out. It is prudent to be tolerant of the occasional missing goose, and be thankful if one retains the common.

The Limits of LETS

How broad a local community to which one may apply LETS, also has not been determined. The basic LETS unit, as described here, would consist of 10 groups having a total of 500 to 2000 members among them. Small enough to be personal, but large enough to have some efficiency. On the other hand, the overall structure allows higher administrative levels to control interaction between these individual LETS. A fourth or fifth level of combined activity could involve millions of people, but the basic building block would remain LOCAL, just as the basic economic and social unit in society remains the family.

At some higher level, LETS would cease to be local and would become national or international in nature. There may then be a different set of problems, such as the need for national or international currency. Coordination of International Exchange. Matters of jurisdiction over a plethora of international matters such as air waves, air travel, and shipping. Rules, conventions, and standards for measurement, safety, and security. The control of international resources, water, air pollution, and use of the sea. These subjects of national and international commerce are all far beyond the purview of this essay.

Examples of LETS Activity

The Farmer Comes First

The farmer comes first in the construction of society. The farmer comes first in the re-construction of

society, and the farmer should come first in LETS. The first need of the farmer will be security, to protect any current inventory, to protect his farm and equipment, and to protect his family.

Because there may be less mechanization available after a societal cataclysm (because of lack of fuel or power), farm operation may become more labor intensive and the farmer will need access to more labor. In rationing, the farmer will have a very high priority to any fuel or energy available. Alternate sources may have to be developed.

All of this resolves down to entitlement and the farmer will have to have explained to him that he has the entitlement, right and responsibility to issue LETS dollars for these services. His production is the basis of the survival of society. Agriculture must have the necessary resources allocated to it and is the first place where we wish to put to work any idle resources such as labor.

Social Services Come Second

The maintainers of order (police, fire, military), health services (doctors, hospitals, community health), infrastructure reconstruction (mail, public transportation, power, telephone, gas), basic reconstruction (roads, rail, bridges, sewers, heavy equipment operators, truck drivers, etc.) and essential industries (food processing, refineries, paper mills, etc.) need to be returned to service as soon as possible. If the existing institutions survive they may be able to do this in several ways. By use of force, etc. However, if they do not survive sufficiently, or are sufficiently flexible, this could and should be achieved by the issuing of LETS dollars by the Higher Administrative Levels as described above.

Scavengers and Entrepreneurs

One of the first strategies of recovery and reconstruction will be scavenging. This is an activity that will need to be both encouraged and controlled. The tradition has been Martial Law and the shooting of looters. While that applies to a local tragedy it is not suitable for a universal cataclysm. Scavengers too, need resources and outlets. Authorization by LETS Level and Higher can give them the authority and also the outlet in the way of LETS dollars for delivering their goods. The key to organizing such enterprises lies with entrepreneurs. These need to be identified, recognized and authorized by LETS and higher administrative levels. These levels need to authorize, entitle and legitimize entrepreneurs, the fourth and often the most essential factor of production. The vitality of non-centralized economic systems, and particularly of LETS lies in the development and release of the entrepreneurial talents and spirit. Indeed, the free entrepreneurial spirit is the single most significant distinction between decentralized and centralized economies, and the demonstrated efficiency of the former. It is for this reason that LETS Higher Level Administrators must authorize and encourage entrepreneurship.

New Production

Scavenging is only a temporary solution and possible for a short duration. Eventually new production

will be necessary. Establishing new production should then become the prime objective of the Administrative Levels. For this purpose, special accounts with appropriate levels of entitlement may need to be established for individuals who appear to have the necessary qualities and capabilities. In the traditional system this was the function of bank managers. When one looks beyond the veil, they will see that this is also the way in which banks created money. Entitlement to money creation is only one of the forms of entitlement that will be needed by the entrepreneurs. They will also need entitlement to land, and capital (meaning, in the terms of economists - plant, machinery, equipment, etc.). The traditional forms of entitlement being inoperative, the method of entitlement will have to be developed on the fly by the founders of the LETS. This writer's personal preference is to invest it in individuals, rather than in "soulless" corporations.

New production may begin in cottage industries, even by the re-invocation of some older technologies. There should be considerable liberality in supporting every effort. Repeated failure in such difficult times should not be unexpected and should not be subjectively penalized but should be objectively redirected with love and encouragement. As conditions stabilize then higher standards of performance can be imposed. Experience and increasing maturity will eventually be gained at all levels. Once again, the most beneficial path is to educate and encourage as many as possible in the entrepreneurial skills and spirit. The benefit of LETS is that these skills, as well as the other factors of production, need not lie idle because of external factors outside of the LETS control, as is the situation with local economies at the time of this writing.

In the past there has been a trend towards both vertical and horizontal integration and conglomeration of industry. There are undoubtedly some technological efficiencies to be obtained in such a process. On the other hand a large part of the activity was motivated by the need for access to money capital, or simply the control that was influenced by money capital. This type of control is counter-productive to the initiatives of individual entrepreneurship and it will probably be beneficial, especially in the time of social reorganization, to achieve as much as possible the benefits of that prime factor of production, through as much decentralization as possible. Even in large production facilities, there should be the ability to implement schemes of individualized control, or at least profit sharing, so as encourage individual incentive and entrepreneurship for efficient management.

Other LETS Functions

Besides providing entitlement to money and factors of production, the LETS can facilitate the local economy in many ways. It can provide inventories of the skills, services and goods available. It can establish acceptable rates of remuneration. It can witness contracts. It can adjudicate disputes. It can control and prevent abuses.

LETS Administrators should rise above the pedestrian view of being mere bookkeepers or adjudicators within the standards of the current traditional system. They should view themselves as facilitators and educators, servants within a new spirit of economics. Whatever idealistic and philosophical views they may initiate there are many improvements that can be made over the current system. To reiterate, the

current writer's view is that they should seek to encourage saints, guide sinners, and restrain satans. The distribution of such personalities, in every society, follows a Bell Curve. There are few saints and few satans. Most of us are sinners. The curve can shift up or down some ideal spectrum line. If the society improves, the standard for being a saint will be higher. If the society becomes decadent (or continues in its present decadence) the standard of sainthood will be lower. The inverse is true of satanhood.

While economic sainthood is desirable, (defined by this writer as a willingness to devote one's life in complete service to God and others) one must realize that it will be rare. This station is not some merely abstract form of life where one is living on some spiritual high and not making any real economic contribution to society. The real saints enter the struggle of daily life and wrestle with problems of relative good and evil found in the market place. On the other extreme is the satan who seeks only his personal advantage, to the disadvantage of others. These too, under proper control can serve society. But the ideal remains those who are instrumental in producing great wealth, and then use those same talents in assuring that the wealth is used to the benefit of society.

It may be noted that, in what I shall call the prototype LETS systems of the past, there has been a philosophical objection to both interest and taxes. Theoretically and technically, neither is necessary in a LETS. There are other issues such as inheritance, transference (especially in the case of what are presently large corporations, but which this writer has proposed should be under the entitlement of individuals), and still other matters of entitlement that will have to be dealt with in actual experience.

Some Imagined Examples

One of the first things that a LETS might do is to establish a Scavenging Store or Storehouse. Anyone may bring goods to the store and the LETS Administrators could appoint store management with the responsibility of either paying for the goods outright with LETS dollars or taking them on assignment. Goods could be inventoried or Dutch Auctioned to assure rapid turnover and reduce the space needed for inventory. In a Dutch auction the prices are repetitively reduced over some time period until they clear. Individual Entrepreneurs could use their Entitlements to acquire the goods and retail them for LETS dollars. The scavengers would then have been rewarded on a wholesale basis and the retailers would give value added by specializing in particular lines of products. Thus one might know and stock culinary tools and another children's clothing, just as we see in present day malls. Those seeking something would have the advantage of being able to find it in a specific location and having someone knowledgeable about the products to assist them. It is this type of creative entrepreneurial activity that creates efficiency and value.

Another activity that should be undertaken by LETS is to insure full employment. The LETS or the Administrators at the higher levels should be the employers of last resort. That is to say they should guarantee that everyone has a job. While it is their function to assure that tasks of social purpose, such as fire departments, are staffed with capable people at attractive rates, they should be able to find many social tasks, such as the removal of destruction and waste, that do not require a high level of skill. The latter can be filled, if necessary, at a somewhat lower wage rate, so that those accepting such employment will have incentive to independently find better employment.

The success, or current performance of an economy, can be measured by the FEWNESS of individuals willing to accept the guaranteed low paid positions. One of the major functions of the LETS and the higher level administrators is to educate the members of Groups in how to develop better opportunities and how to become self reliant and capable of managing economic activities on their own. Still, acceptance of guaranteed employment should not be denigrated and where there is a large demand for this type of employment that in itself is indicative that the overall economy is not functioning well.

At the other extreme, if there are too few participants in the offered guaranteed employment, it may be indicative that the higher levels of administration are creating too great a demand for labor resources by over utilizing the labor in activities that they pay directly. Opinion as to the degree to which direct or collective community goals should have priority over the independent entrepreneurial demand for resources is one that will have to be expressed through the collective process of consultation in the groups. Groups can directly express their opinions (but not as a decision) through resolutions publicly or privately directed to any level of administration. However, the power of decision would still remain with the appropriate administration.

With this approach, of workfare rather than welfare, there should be a much reduced need for welfare to those cases which are absolutely physically or emotionally handicapped to the point where they cannot function productively. Even those with severe handicaps should be provided opportunities to contribute to the society in what we presently call “sheltered workshops” because the ability to make positive contribution to society is a part of human dignity and a human right.

There are other extreme situations, such as sociopaths, with which a LETS and the higher levels may have to deal. In an affluent society, such as we have today, there may be the luxury of dealing with such persons in ways that require extensive and expensive use of society’s resources. During the reorganization of society that is recovering from societal cataclysm that luxury may not exist and the methods of dealing with such problems may seem very harsh by today’s standards. Technical details for the application of this principle will have to be left to the time and circumstance.

Appendix

The Principles of Group and LETS Organization

The LETS get their authority from the groups, who get their authority from the individual members of the groups. The problem of organizing and creating LETS is really one of organizing and creating the groups. There is no one way in which the groups must be formed but the following appears to me to be a practical way.

Individual groups can be formed in a variety of ways. Church groups. Neighborhood or village groups. Former employees of a large concern. Prior merchant and other associations. People known to each other

through sports clubs or almost any social organization where people have had, or have the desire to meet and cooperate together.

In practicality, in the process of recovery from a societal-cataclysmic situation, it may be necessary that the founders have access to any surviving stocks of food, fuel, or other necessities, and that they use these as the incentive to encourage organization and to establish the acceptance of debt and the creation of credit. Initial issuance's of entitlement may be relatively limited, but on the other hand, in some locales there may be a surfeit of capital resources or other factors of production that should be immediately employed through qualified entrepreneurs, and those individuals should be given the entitlements to do so.

Group size

The founders of a LETS may designate the initial minimum and maximum acceptable group size. Some large organizations, such as a large church might provide several groups. Once the groups have formed and have designated their delegates, then the LETS administration can take over the founders' functions. Once a LETS is operating, there should be little difficulty in attracting additional members to the groups, and additional groups so as to support higher levels.

The remedy for alienation is active participation. The remedy for disenfranchisement is active participation. The path to entitlement is through active participation. The key to active participation is the size of the group. Too large a group and the individual is lost in the crowd. Too small a group and there is not sufficient dynamic. I recommend a group size of between 50 and 200. Any group over 100 should be allowed to autonomously split. Any group over 200 should be required to split.

Group membership

LETS may form in locales where there is a remnant of the previous establishment. This can be beneficial or detrimental depending upon how flexible and amicable that remnant is to the establishment of a new way of doing things. Where there is outward opposition to the LETS, or the majority of the citizenry are psychologically attached to conformity to the established system, then there may be little likelihood of success for a LETS.

However, in those locales where LETS are involved in the reconstruction of society, from the ground up, then they may become the basis of general social organization and the group structure on which they are based will become the primary social structure. In that case every individual in the locale, over the age of 15, should be required to belong to a group. If they don't voluntarily join one of their choosing then they should be assigned to one by some level of administrators in the area.

Groups would be very autonomous over their own memberships. From the acceptance of individuals (except for those assigned to them) to their choice of internal rules. An individual can belong to only one group, but an individual may apply for membership to any group and an individual may apply to change

membership from one group to another group. Aside from assigned individuals - group administrators are free to create a group identity with regards to religion, sexual orientation, race, age or any other discrimination they wish.

There can be many groups that I would consider to have a high degree of dysfunctionality because of ignorance, superstition, religious customs, and other causes, but these variations appear in a free society and are even a part of free will. In the relative world there will always be a scale from the least functional to the most functional groups. Function itself, will certainly be defined in various ways by various groups. This variety, in my opinion, is not only something that is to be tolerated, but is something that should be appreciated.

Individual Rights and Responsibilities of group membership

All group members shall have the right and responsibility to vote by secret ballot for group administrators, and to be voted for as a group administrator or delegate to the LETS at times designated by the LETS. Eventually, there should be some designated time for annual elections, and in the case of vacancies there should be by-elections within a designated length of time.

All group members shall have the right and responsibility to attend their group's general meetings and functions. There should be informative reporting available from every administrative level. The method of consultation is one that needs to be developed in a manner such that while there should be full and frank discussion on the reports. The meetings must be conducted with courtesy, and without rancor, and there should be the opportunity for everyone to participate.

All group members, age of fifteen and over, shall be assigned by the LETS a LETS identification number, and a limit of Entitlement in creating LETS dollars. Individuals who feel that their designated level of entitlement is inadequate should have the right to appeal to the LETS and if not satisfied there, to the higher administrative levels. In those areas where the LETS structure also provides the basic social structure the individual would also have the same right of appeal regarding any other administrative decisions.

Rights and Responsibilities of the Group

To elect in Group meeting and by secret ballot 10 administrators at a time designated by the LETS. The recommended process of election is as follows: The members should be presented with a list of the names and numbers of all the members in the group. Each member should write down on a secret ballot the name and number of as many individuals as they wish to nominate for administrator. The ballots should be publicly tallied before the whole group and each person receiving one or more nominations should be placed on the ballot. Each nominated person should address the group up to a maximum time agreed upon by the group. Each member should write on a secret ballot the names of 10 different individuals from among those nominated. Any nominee receiving over 50% of the number of ballots cast shall be considered elected. The number of votes for the remaining candidates shall be announced, and

those receiving at least one vote on the previous ballot should be voted for in a new secret ballot cast for the remaining number of vacant positions. Again, any nominee receiving over 50% of the number of ballots cast shall be considered elected, and the process reiterated until all ten positions have been filled. While I have not gone into further detail, I do prefer an "open" counting of the ballots. Selecting tellers by lot, or some other suitable method would also be well, but as noted earlier, many of these details are left to the group, and the group may choose a whole different process than what I have described here.

To hold regular group meetings as scheduled by Group Administrators. I would recommend meeting at least weekly but these meetings can be held more or less frequently as the Group Administrators may decide.

To hold group consultation and make recommendations that are non-binding on the Group Administrators.

To execute collectively and individually decisions of the Group Administrators.

Rights and Responsibilities of the Group Administrators.

To elect from among themselves a delegate to the LETS. The delegate can thereafter attend the Group Administrator meetings but will not have a vote. It is the responsibility of the delegate to communicate the views of the Group Administration to the LETS and LETS directives and views to the Group Administration.

To educate and encourage the members of the Group in taking advantage of the LETS.

To judge disputes among Group members.

To administer awards and punishments to Group members.

The degree to which the Group will be involved in social policies shall be determined by the Group.

The LETS

The LETS is the ESSENTIAL level of the LETS structure.

----->The span of 7 to 15 is a revision made June 03, 2001 <-----

Each LETS shall be composed of 7 to 15 Groups. When a LETS with 15 Groups wishes to admit another group it must split into two separate LETS. LETS may voluntarily accept new Groups or have new Groups assigned to them by the next higher level.

The members of the LETS shall by secret ballot assign one of their members to the next higher administrative level.

The LETS shall assign ENTITLEMENT levels to individuals in its groups.

The LETS shall provide the mechanics of the trading system.

Higher Administrative Levels

Each higher administrative level is comprised of 7 to 15 delegates consisting of one from each member of the immediately lower level. The number of members of each higher level is determined in the same manner as that for the lower levels. The flexibility of there being between 7 and 15 members at each level is a tolerance to permit the implementation, functioning, and replication at each level, through a process of natural growth, units of approximately the same size without being rigid about what comprises a functioning unit.

Each level selects by secret ballot one delegate to assign to the next higher level. That delegate can, and should, then continue to meet with the electing level to communicate to it information from the next higher level, but the delegate will no longer have a vote in the electing level.

Summary of the Principles of Organization

The first principle is that of PARTICIPATION, in that those individuals at the lowest level, are few enough in number to be intimately acquainted with each other.

The second principle is that the Administration is selected directly by SECRET ballot, without influence or subterfuge.

The third principle is that the administrative officers are then independent in their decision making. They are supposed to be committed to universal justice rather than some element that voted for them.

At each level, the officers at that level select a delegate to the next higher level. This individual is NOT there to represent the group that elected them to the higher level, but to simply through consultation with the other officers at that level to determine that which is most beneficial and just.

In each case the rules, guidance and where necessary judgement, come from the next higher level. Also disputes can be resolved or appealed to the next higher level.

The degree that this structure intertwines with non-economic activities, will be dependent upon the degree to which other social institutions are available.

The overall social structure is in part the determiner of the economic system and the economic system is in part the determiner of the overall social structure. The two are so intertwined that it is impossible to divorce one from the other. It is for this reason that in describing the mechanics and examples of variations in using the LETS that we needed to discuss a sample governing structure.

I might have dealt with a great variety of issues. Such as the re-establishment of complicated industrial processes, the location and development of the necessary elements and talents for highly technical methods of production, and the need for the rationing of scarce resources. I will not belabor those subjects because at this point it would largely be just a matter of imaginative literature. What will be needed, when the reality arises, is creative and flexible response, unfettered by past convention, to deal with circumstances as they present themselves. What I have presented here is a structure, rather than detail, for how we may deal with those circumstances.

I, Pencil

My Family Tree as told to Leonard E. Read

I am a lead pencil—the ordinary wooden pencil familiar to all boys and girls and adults who can read and write.*

RP.1

Writing is both my vocation and my avocation; that's all I do.

RP.2

You may wonder why I should write a genealogy. Well, to begin with, my story is interesting. And, next, I am a mystery—more so than a tree or a sunset or even a flash of lightning. But, sadly, I am taken for granted by those who use me, as if I were a mere incident and without background. This supercilious attitude relegates me to the level of the commonplace. This is a species of the grievous error in which mankind cannot too long persist without peril. For, the wise G. K. Chesterton observed, "We are perishing for want of wonder, not for want of wonders."

RP.3

I, Pencil, simple though I appear to be, merit your wonder and awe, a claim I shall attempt to prove. In fact, if you can understand me—no, that's too much to ask of anyone—if you can become aware of the miraculousness which I symbolize, you can help save the freedom mankind is so unhappily losing. I have a profound lesson to teach. And I can teach this lesson better than can an automobile or an airplane or a mechanical dishwasher because—well, because I am seemingly so simple.

RP.4

Simple? Yet, *not a single person on the face of this earth knows how to make me.* This sounds fantastic, doesn't it? Especially when it is realized that there are about one and one-half billion of my kind produced in the U.S.A. each year.

RP.5

Pick me up and look me over. What do you see? Not much meets the eye—there's some wood, lacquer, the printed labeling, graphite lead, a bit of metal, and an eraser.

RP.6

Innumerable Antecedents

Just as you cannot trace your family tree back very far, so is it impossible for me to name and explain all my antecedents. But I would like to suggest enough of them to impress upon you the richness and complexity of my background.

RP.7

My family tree begins with what in fact is a tree, a cedar of straight grain that grows in Northern California and Oregon. Now contemplate all the saws and trucks and rope and the countless other gear used in harvesting and carting the cedar logs to the railroad siding. Think of all the persons and the numberless skills that went into their fabrication: the mining of ore, the making of steel and its refinement into saws, axes, motors; the growing of hemp and bringing it through all the stages to heavy and strong rope; the logging camps with their beds and mess halls, the cookery and the raising of all the foods. Why, untold thousands of persons had a hand in every cup of coffee the loggers drink!

RP.8

The logs are shipped to a mill in San Leandro, California. Can you imagine the individuals who make flat cars and rails and railroad engines and who construct and install the communication systems incidental thereto? These legions are among my antecedents.

RP.9

Consider the millwork in San Leandro. The cedar logs are cut into small, pencil-length slats less than one-fourth of an inch in thickness. These are kiln dried and then tinted for the same reason women put rouge on their faces. People prefer that I look pretty, not a pallid white. The slats are waxed and kiln dried again. How many skills went into the making of the tint and the kilns, into supplying the heat, the light and power, the belts, motors, and all the other things a mill requires? Sweepers in the mill among my ancestors? Yes, and included are the men who poured the concrete for the dam of a Pacific Gas & Electric Company hydroplant which supplies the mill's power!

RP.10

Don't overlook the ancestors present and distant who have a hand in transporting sixty carloads of slats across the nation.

RP.11

Once in the pencil factory—\$4,000,000 in machinery and building, all capital accumulated by thrifty and saving parents of mine—each slat is given eight grooves by a complex machine, after which another machine lays leads in every other slat, applies glue, and places another slat atop—a lead sandwich, so to speak. Seven brothers and I are mechanically carved from this "wood-clinched" sandwich.

RP.12

My "lead" itself—it contains no lead at all—is complex. The graphite is mined in Ceylon. Consider these miners and those who make their many tools and the makers of the paper sacks in which the graphite is shipped and those who make the string that ties the sacks and those who put them aboard ships and those who make the ships. Even the lighthouse keepers along the way assisted in my birth—and the harbor pilots.

RP.13

The graphite is mixed with clay from Mississippi in which ammonium hydroxide is used in the refining process. Then wetting agents are added such as sulfonated tallow—animal fats chemically reacted with sulfuric acid. After passing through numerous machines, the mixture finally appears as endless extrusions—as from a sausage grinder-cut to size, dried, and baked for several hours at 1,850 degrees Fahrenheit. To increase their strength and smoothness the leads are then treated with a hot mixture which includes candelilla wax from Mexico, paraffin wax, and hydrogenated natural fats.

RP.14

My cedar receives six coats of lacquer. Do you know all the ingredients of lacquer? Who would think that the growers of castor beans and the refiners of castor oil are a part of it? They are. Why, even the processes by which the lacquer is made a beautiful yellow involve the skills of more persons than one can enumerate!

RP.15

Observe the labeling. That's a film formed by applying heat to carbon black mixed with resins. How do you make resins and what, pray, is carbon black?

RP.16

My bit of metal—the ferrule—is brass. Think of all the persons who mine zinc and copper and those who have the skills to make shiny sheet brass from these products of nature. Those black rings on my ferrule are black nickel. What is black nickel and how is it applied? The complete story of why the center of my ferrule has no black nickel on it would take pages to explain.

RP.17

Then there's my crowning glory, inelegantly referred to in the trade as "the plug," the part man uses to erase the errors he makes with me. An ingredient called "factice" is what does the erasing. It is a rubber-like product made by reacting rape-seed oil from the Dutch East Indies with sulfur chloride. Rubber, contrary to the common notion, is only for binding purposes. Then, too, there are numerous vulcanizing and accelerating agents. The pumice comes from Italy; and the pigment which gives "the plug" its color is cadmium sulfide.

RP.18

No One Knows

Does anyone wish to challenge my earlier assertion that no single person on the face of this earth knows how to make me?

RP.19

Actually, millions of human beings have had a hand in my creation, no one of whom even knows more than a very few of the others. Now, you may say that I go too far in relating the picker of a coffee berry in far off Brazil and food growers elsewhere to my creation; that this is an extreme position. I shall stand by my claim. There isn't a single person in all these millions, including the president of the pencil company, who contributes more than a tiny, infinitesimal bit of know-how. From the standpoint of know-how the only difference between the miner of graphite in Ceylon and the logger in Oregon is in the *type* of know-how. Neither the miner nor the logger can be dispensed with, any more than can the chemist at the factory or the worker in the oil field—paraffin being a by-product of petroleum.

Here is an astounding fact: Neither the worker in the oil field nor the chemist nor the digger of graphite or clay nor any who mans or makes the ships or trains or trucks nor the one who runs the machine that does the knurling on my bit of metal nor the president of the company performs his singular task because he wants me. Each one wants me less, perhaps, than does a child in the first grade. Indeed, there are some among this vast multitude who never saw a pencil nor would they know how to use one. Their motivation is other than me. Perhaps it is something like this: Each of these millions sees that he can thus exchange his tiny know-how for the goods and services he needs or wants. I may or may not be among these items.

No Master Mind

There is a fact still more astounding: the absence of a master mind, of anyone dictating or forcibly directing these countless actions which bring me into being. No trace of such a person can be found. Instead, we find the Invisible Hand at work. This is the mystery to which I earlier referred.

It has been said that "only God can make a tree." Why do we agree with this? Isn't it because we realize that we ourselves could not make one? Indeed, can we even describe a tree? We cannot, except in superficial terms. We can say, for instance, that a certain molecular configuration manifests itself as a tree. But what mind is there among men that could even record, let alone direct, the constant changes in molecules that transpire in the life span of a tree? Such a feat is utterly unthinkable!

I, Pencil, am a complex combination of miracles: a tree, zinc, copper, graphite, and so on. But to these miracles which manifest themselves in Nature an even more extraordinary miracle has been added: the configuration of creative human energies—millions of tiny know-hows configuring naturally and spontaneously in response to human necessity and desire and *in the absence of any human master-minding!* Since only God can make a tree, I insist that only God could make me. Man can no more direct these millions of know-hows to bring me into being than he can put molecules together to create a tree.

The above is what I meant when writing, "If you can become aware of the miraculousness which I symbolize, you can help save the freedom mankind is so unhappily losing." For, if one is aware that these know-hows will naturally, yes, automatically, arrange themselves into creative and productive patterns in response to human necessity and demand—that is, in the absence of governmental or any other coercive masterminding—then one will possess an absolutely essential ingredient for freedom: *a faith in free people*. Freedom is impossible without this faith.

Once government has had a monopoly of a creative activity such, for instance, as the delivery of the mails, most individuals will believe that the mails could not be efficiently delivered by men acting freely. And here is the reason: Each one acknowledges that he himself doesn't know how to do all the things incident to mail delivery. He also recognizes that no other individual could do it. These assumptions are correct. No individual possesses enough know-how to perform a nation's mail delivery any more than any individual possesses enough know-how to make a pencil. Now, in the absence of faith in free people—in the unawareness that millions of tiny know-hows would naturally and miraculously form and cooperate to satisfy this necessity—the individual cannot help but reach the erroneous conclusion that mail can be delivered only by governmental "master-minding."

Testimony Galore

If I, Pencil, were the only item that could offer testimony on what men and women can accomplish when free to try, then those with little faith would have a fair case. However, there is testimony galore; it's all about us and on every hand. Mail delivery is exceedingly simple when compared, for instance, to the making of an automobile or a calculating machine or a grain combine or a milling machine or to tens of thousands of other things. Delivery? Why, in this area where men have been left free to try, they deliver the human voice around the world in less than one second; they deliver an event visually and in motion to any person's home when it is happening; they deliver 150 passengers from Seattle to Baltimore in less than four hours; they deliver gas from Texas to one's range or furnace in New York at unbelievably low rates and without subsidy; they deliver each four pounds of oil from the Persian Gulf to our Eastern Seaboard—halfway around the world—for less money than the government charges for delivering a one-ounce letter across the street!

The lesson I have to teach is this: *Leave all creative energies uninhibited*. Merely organize society to act in harmony with this lesson. Let society's legal apparatus remove all obstacles the best it can. Permit these creative know-hows freely to flow. Have faith that free men and women will respond to the Invisible Hand. This faith will be confirmed. I, Pencil, seemingly simple though I am, offer the miracle of my creation as testimony that this is a practical faith, as practical as the sun, the rain, a cedar tree, the good earth.

Leonard E. Read (1898-1983) founded FEE in 1946 and served as its president until his death.

"I, Pencil," his most famous essay, was first published in the December 1958 issue of The Freeman. Although a few of the manufacturing details and place names have changed over the past forty years, the principles are unchanged.

* My official name is "Mongol 482." My many ingredients are assembled, fabricated, and finished by Eberhard Faber Pencil Company.

[Introduction, by Milton Friedman](#)

[Afterword, by Donald J. Boudreaux](#)

Introduction,

by Milton Friedman

Leonard Read's delightful story, "I, Pencil," has become a classic, and deservedly so. I know of no other piece of literature that so succinctly, persuasively, and effectively illustrates the meaning of both Adam Smith's invisible hand—the possibility of cooperation without coercion—and Friedrich Hayek's emphasis on the importance of dispersed knowledge and the role of the price system in communicating information that "will make the individuals do the desirable things without anyone having to tell them what to do."

I.1

We used Leonard's story in our television show, "Free to Choose," and in the accompanying book of the same title to illustrate "the power of the market" (the title of both the first segment of the TV show and of chapter one of the book). We summarized the story and then went on to say:

I.2

"None of the thousands of persons involved in producing the pencil performed his task because he wanted a pencil. Some among them never saw a pencil and would not know what it is for. Each saw his work as a way to get the goods and services he wanted—goods and services we produced in order to get the pencil we wanted. Every time we go to the store and buy a pencil, we are exchanging a little bit of our services for the infinitesimal amount of services that each of the thousands contributed toward producing the pencil.

I.3

"It is even more astounding that the pencil was ever produced. No one sitting in a central office gave orders to these thousands of people. No military police enforced the orders that were not given. These people live in many lands, speak different languages, practice different religions, may even hate one another—yet none of these differences prevented them from cooperating to produce a pencil. How did it happen? Adam Smith gave us the answer two hundred years ago."

I.4

"I, Pencil" is a typical Leonard Read product: imaginative, simple yet subtle, breathing the love of freedom that imbued everything Leonard wrote or did. As in the rest of his work, he was not trying to tell people what to do or how to conduct themselves. He was simply trying to enhance individuals' understanding of themselves and of the system they live in.

I.5

That was his basic credo and one that he stuck to consistently during his long period of service to the public—not public service in the sense of government service. Whatever the pressure, he stuck to his guns, refusing to compromise his principles. That was why he was so effective in keeping alive, in the early days, and then spreading the basic idea that human freedom required private property, free competition, and severely limited government.

I.6

Professor Friedman, the 1976 Nobel Prize in Economic Science, is Senior Research Fellow at the Hoover Institution, Stanford, California.

I.7

[Top of File](#)

[Introduction, by Milton Friedman](#)

[Afterword, by Donald J. Boudreaux](#)

Afterword,

by Donald J. Boudreaux

There are two kinds of thinking: simplistic and subtle. Simplistic thinkers cannot understand how complex and useful social orders arise from any source other than conscious planning by a purposeful mind. Subtle thinkers, in contrast, understand that individual actions often occur within settings that encourage individuals to coordinate their actions with one another independent of any overarching plan. F. A. Hayek called such unplanned but harmonious coordination "spontaneous order."

A.1

The mark of the subtle mind is not only its ability to grasp the idea of spontaneous orders but also to understand that conscious attempts to improve or to mimic these orders are doomed to fail. "Why so?" asks the simplistic thinker. "How can happenstance generate complex order superior to what a conscious mind can conceive and implement?" In responding to this question, a subtle thinker points out that spontaneous orders do not arise from happenstance: the continual adjustments by each individual within spontaneous orders follow a very strict logic—the logic of mutual accommodation. Because no central planner can possibly know all of the details of each individual's unique situation, no central planner can know how best to arrange each and every action of each and every individual with that of the multitudes of other individuals.

A.2

In the eighteenth century, a handful of scholars—most notably David Hume and Adam Smith—developed a subtle understanding of how private property rights encourage self-regarding producers and consumers to act in mutually beneficial ways. Spontaneous ordering forces were thus discovered, and with this discovery modern economics began to take shape.

A.3

Over the next two centuries economics achieved enormous success in furthering our understanding not only of industry and commerce, but of society itself. Modern economics—that is to say, economics that explores the emergence of spontaneous orders—is a sure-fire inoculant against the simplistic notion that conscious direction by the state can improve upon the pattern of mutual adjustments that people make within a system of secure private property rights.

A.4

But learning modern economics requires some effort—in the same way that breaking free of any simplistic mindset requires effort. It isn't surprising, then, that those economists who've contributed most to a widespread understanding of the subject have been clear and vivid writers, skillful in using analogies and everyday observations to lubricate the mind's transition away from superficial thinking and toward a grasp of subtle insights. The best economic writers cause oncesimplistic thinkers to say "Aha! *Now I get it!*" Skillfully tutored, a simplistic mind becomes a subtle mind.

A.5

For its sheer power to display in just a few pages the astounding fact that free markets successfully coordinate the actions of literally millions of people from around the world into a productive whole, nothing else written in economics compares to Leonard Read's celebrated essay, "I, Pencil." This essay's power derives from Read's drawing from such a prosaic item an undeniable, profound, and spectacular conclusion: it takes the knowledge of countless people to produce a single pencil. No newcomer to economics who reads "I, Pencil" can fail to have a simplistic belief in the superiority of central planning or regulation deeply shaken. If I could choose one essay or book that everyone in the world would read, I would unhesitatingly choose "I, Pencil." Among these readers, simplistic notions about the economy would be permanently transformed into a new and vastly more subtle—and correct—understanding.

A Baha'i's Perspective on The Gospel of Wealth

bruce@webpal.org

[Bruce M. Beach](#)

Prolog

There comes a time in the thread of civilization when it is necessary to re-examine and reconstruct its institutions. Such a time is fast approaching when the present thread of civilization will have snapped in a world-wide catastrophe. The mountains on the present landscape of civilization consisting of anarchistic national governments, gigantic international soulless corporations, beyond huge resource gobbling militaries, power hungry political systems of self-interest, secret consortiums of financial affluence and influence, dogmatic and fanatic movements of religion, unjust legal systems based upon archaic statements of law that perpetually let the wealthy go free and are unaffordable by the poor, media and educational systems that propagandize the missions of the establishments, no matter in what part of the world they

may be - these and many other ills and immoralities of the present society will have been momentarily crushed to dust in the face of the catastrophe. Such catastrophe demonstrates the necessity of restoring civilization on a basis that will remove the seeds of its own destruction and prevent the reoccurrence of that which will have just occurred.

The study presented here consists of three strands of dialog for bringing forth a new thread of civilization. First there is the practical advice of a man recognized to be one of the most successful businessmen and the greatest philanthropist the world has ever known. Secondly there is the organization of the presentation by a trained institutional economist. And thirdly, and most importantly, there is the philosophical and moral underpinnings of a recognized Prophet to this day and age.

Dialog

These web pages are meant to be a dialog. Those who are willing to participate are invited to do so by writing to Bruce Beach at the above email address. Appropriate critiques, comments and contributions will be embodied in future uploads of the page to the Internet. It will be appreciated if all contributors will boldly state, as I have, as to who are their lights of guidance.

History of this Web Site

Some decades ago, I first read mention of Carnegie's *The Gospel of Wealth*, (first printed as a complete volume in 1900) and now referenced in *Selections from the Writings of 'Abdu'l-Bahá* (compiled by the

Research Department of the Universal House of Justice, Baha'i World Centre, Haifa - printed in Great Britain by W & J Mackay Limited, Chatham 1978). It was several years later that I managed to acquire through a rare book source a copy of the then out of print, "*The Gospel of Wealth and Other Timely Essays* by Andrew Carnegie", edited by Edward C. Kirkland and published by The Belknap Press of Harvard University Press in 1962.

As one trained in Institutional Economics I was greatly impressed with the work and it was my desire to make the work more readily known and available to others who, after coming across the reference by 'Abdu'l-Bahá, might be similarly interested. For many years this has remained on my list of things to do. Recently, with the popularity of the Internet, family and friends hearing me mention the work, asked why I did not put it on the Internet. This struck me as an excellent suggestion and my son and wife started the process of scanning in my copy for me.

Amidst this activity, and some arduous editing and repair, (my copy having been severely underlined by the original owner) my wife asked me if the book were not already on the Internet. Until this point I had neglected to search and mind my astonishment that I found many hundreds of references. I spent many hours checking them all and while I found many copies of the first half of "The Gospel of Wealth" essay, I did not find either that complete essay or any of the other dozen essays in the work. I therefore decided to proceed and to put the complete work on the Internet.

As a contemporary work, in the time of 'Abdu'l-Bahá, the book and essays were quite well known. In the interim it became so obscure that I could not find a reference in the public library, but now once again it has amazingly returned to some considerable popularity, at least in a certain venue of college courses. I can only say that I am most gratified.

More than merely increasing the availability of this work and encouraging its occasional reading, it is my goal to use it as a vehicle to develop a dialog regarding Baha'i Principles of Economics.

Andrew Carnegie

Andrew Carnegie (1835-1919), was considered in his day as being the richest man in America, if not the world. He has also been recognized as one of the leading philanthropists that the world has ever known, although he has not been universally admired for this quality by some socialists and others.

"No one ever considered Carnegie libraries steeped in the blood of the Homestead steelworkers, but they are. We do not remember that the Rockefeller Foundation is founded on the dead miners of the Colorado Fuel and Iron Company and a dozen other performances."

Harry Truman, 1937 speech to the Senate.

I am a great admirer of "Give 'em hell, Harry", who always called them - as he saw them. Many of the modern day university courses treat the "Wealth of Nations", as an example of Social Darwinism

(usually considered an epithet). Names and titles and opinions of other's aside, it should be our purpose to examine, as openly and as honestly as we can, the ideas expressed therein.

While I now have in my library other books by and about Andrew Carnegie, I shall not belabor a biography here, other than the [chronology](#) included with the the source edition, but will allow the interested reader to seek such information elsewhere. However, to enliven the atmosphere, I will share one anecdote.

Andrew Carnegie was a generous supporter of the New York Philharmonic Society, meeting its annual deficits in its early years. One year the society's secretary came as usual to Carnegie's mansion, this time requesting \$60,000. Carnegie was just about to sign the check when he paused and said, "No, I've changed my mind. Surely there are other people who like music enough to help with their own money." He then told the secretary to go out and raise half the necessary amount, promising to match it with the other half when this had been done.

The following day the secretary was back at the Carnegie mansion, announcing that he had raised the requisite money. Carnegie commended the man's enterprise and wrote out and signed his check for \$30,000. As he handed it over he said, "Would you mind telling me who gave you the other half?" "Not at all. Mrs. Carnegie."

The Baha'i Connection to the Work

Andrew Carnegie actually met 'Abdu'l-Bahá in America in 1912 and gave two copies of his publications to 'Abdu'l-Bahá. Since the "The Gospel of Wealth and Other Timely Essays" was published in 1900, it is quite possible (I would think probable) that the original version of the entire book presented here, were among the works give by Andrew Carnegie to 'Abdu'l-Bahá. Whether this was before or after the famous quote, by 'Abdu'l-Bahá, I do not know, and have not been sufficiently historically inclined to seek the answer out. There are numerous other ways in which 'Abdu'l-Bahá, might have seen the essays because they were widely printed at the time, in a variety of sources. The original letter from 'Abdu'l-Bahá (the date of which I have not been able to determine), is reported to still be extant in the Carnegie Trust in the town of Dunfermline, which was the ancient capital of Scotland.

The Famous Quote as from Selections From the Writings of `Abdu'l-Bahá pp114-115

O respected personage! I have read your work "The Gospel of Wealth" and noted therein truly apposite and sound recommendations for easing the lot of humankind.

To state the matter briefly, the Teachings of Bahá'u'lláh advocate voluntary sharing, and this is a greater thing than the equalization of wealth. For equalization must be imposed

from without, while sharing is a matter of free choice.

Man reacheth perfection through good deeds, voluntarily performed, not through good deeds, the doing of which was forced upon him. And sharing is a personally chosen righteous act: that is, the rich should expend their substance for the poor, but of their own free will, and not because the poor have attained this end through force. For the harvest of force is turmoil and the ruin of social order. On the other hand, voluntary sharing, the freely-chosen expending of one's substance, leadeth to society's comfort and peace. It lighteth up the world: It bestoweth honour upon humankind.

I have seen the good effects of your own philanthropy in America, in various universities, peace gatherings and associations for the promotion of learning, as I travelled from city to city. Wherefore do I pray on your behalf that you shall ever be encompassed by the bounties and blessings of heaven, and shall perform many philanthropic deeds in the East and West. Thus may you gleam as a lighted taper in the Kingdom of God, may attain honour and everlasting life, and shine out as a bright star on the horizon of eternity.

There has been sent to me from Baha'i sources, a further reference reference regarding Carnegie.

"Star of the West" IX:3, 28 April 1918, page 35:

'Abdu'l-Bahá said: "His aim is good and a service to the world of humanity. O how I wish that all of the leaders of the people would spend their energy for unity and peace among all nations and sects!" At that moment, letters and newspapers arrived from the occident and Persia, bearing the glad-tidings of the harmony and purpose of the believers in teaching the Cause. 'Abdu'l-Bahá became exceedingly happy and prayed for confirmation from the Kingdom of Abhá and for the protection of the believers. He said: "They must step with steadfast feet into this field and must think of naught else save the unity of the people and the elevation of the Word of God."

The Work At Hand

Without further ado then - I shall leave the reader to the original baker's dozen essays. At the time of this update, and since my initial statement here, Bruce Barrick has thoroughly edited all the essays for scanning errors and Bob Haugen has provided annotation for about half of the essays.

With the help of you the reader, I hope to enlarge upon what has been done here, for all the essays. The paragraphs were not numbered in the original, but I have numbered them here for your ease in making commentary. Your help in this sizable project will be greatly appreciated.

THE GOSPEL OF WEALTH AND OTHER TIMELY ESSAYS

---Page xxii. The Gospel of Wealth - Editor's Introduction---

Chronology of Carnegie's Life

1835 Born November 25 at Dunfermline, Scotland, son of Margaret (Morrison) and William Carnegie.

1848 Brought to the United States. Family settled in Allegheny, Pennsylvania.
Began work immediately as bobbin-boy in cotton factory.

1849 First messenger, then operator at Pittsburgh telegraph office.

1853 Position with Pennsylvania Railroad.

1861 Accompanied Scott to Washington at outbreak of Civil War.

1865 Resigned from railroad to organize own firm, Keystone Bridge Company.

1873 Travel to Europe and association with British steel makers, especially Bessemer. Began concentration on steel here.

1882 Joined forces with Henry Clay Frick, acquiring vast coke properties.

1883 Published *An American Four-in-Hand* in Britain. Began contributions to magazines, notably *North American Review* and *Nineteenth Century*.

1886 Published *Triumphant Democracy*.

1887 Married Louise Whitfield.

1889 "Wealth" published in *North American Review*.

1892 Break with Frick; Homestead Strike.

1901 Sold out to United States Steel. Gave \$5,000,000 to employees for pension and benefit fund. Began major philanthropies.

1907 Built Peace Palace at The Hague.

1919 August 11, died at "Shadowbrook," in Massachusetts.

---Page vii. The Gospel of Wealth - Editor's Introduction---

Editor's Introduction

1. FEW men wanted more intensely to win than Andrew Carnegie; none was more certain his destiny was success. In 1868, at the age of thirty-three, he wrote in a famous introspective note a sentence of self-analysis: "Whatever I engage in I must push inordinately." Thirty years later he was trumpeting his triumphs in golf. "I am beating my friends at golf so all goes well. I played eighteen holes today with Taylor. Beat him. Beat Murray Butler Saturday. Beat Franks the day before."

[Baha'i Comment](#)

2. Though he occasionally expressed a misgiving about success in business, his most genuine, his greatest achievement was as a businessman. The autobiographical fragment, hereafter published as the first essay, is correct in describing the Carnegie family's migration from Scotland when Andrew was young and his start in this country at the bottom of the industrial ladder. Later he found employment on the Pennsylvania Railroad and rose from telegrapher to a divisional superintendent. Meanwhile he was acquiring a fortune by saving and borrowing money and investing it in railroads and in firms supplying railroad equipment, in petroleum, and in various iron works. By 1868, when he penned the note already cited, he could expect an annual income of \$50,000. Still pushing "inordinately," he transferred in the seventies his abilities and wealth to metallurgy. A business principle guided him: "Put all your eggs in one basket, and then watch that basket," and the financial strains of the panic of 1873 compelled him to concentrate his funds if he were to complete and operate The Edgar Thomson Steel Works near Pittsburgh. The plant

[Baha'i Comment](#)

made steel in Bessemer converters.

---Page viii. The Gospel of Wealth - Editor's Introduction--

-

Though Carnegie was not the leader who introduced this revolutionary process to America, he was among the first to employ it on a large scale. In the years which followed he acquired coal and iron-ore properties and built mills to manufacture finished steel products. By the nineties Carnegie's was the most advanced and the most powerful unit in the American steel and iron industry. At the end of the century he sold out to the financiers and industrialists who were putting together the United States Steel Corporation. In 1901 after the sale he had a fortune of about \$300,000,000.

3. Though he retired from business, he did not disown it. Instead of being its apologist, at a time when critics and reformers were detecting and exposing its flaws, he remained its celebrant. As he informed the undergraduates of Cornell University, "I can confidently recommend to you the business career as one in which there is abundant room for the exercise of man's

[Baha'i Comment](#)

highest power, and of every good quality in human nature. I believe the career of the great merchant, or banker, or captain of industry, to be favourable to the development of the powers of the mind, and to the ripening of the judgment upon a wide range of general subjects; to freedom from prejudice, and to the keeping of an open mind.... If without sound, all-round judgment, he must fail. The business career is thus a stern school of all the virtues...." Commendation of this sort was, however, reserved for businessmen of a certain definition. "A man to be in business must be at least part owner of the enterprise which he manages," and be "chiefly dependent for his revenues upon its profits." "The business man, pure and simple plunges into and tosses upon the waves of human affairs without a life-preserver in the shape of salary; he risks all. ... The business man pursues fortune." This attitude set Carnegie a little apart from the business currents of his period. At a time when business was increasingly professionalized and bureaucratized, he excluded from the ranks of businessmen all salary receivers; when businessmen were

---Page ix. The Gospel of
Wealth - Editor's Introduction--

-

consolidating their organizations into trusts, holding companies, and corporations, Carnegie remained the anarchic individualist, a reluctant participator in pools and agreements and a man who held his big business within the confines of the partnership form of organization until the nineties. But these anachronisms, if such they were, delighted Carnegie. In so far as they made him unique, they tickled his vanity.

4. Carnegie was fundamentally different, too, in his realization that there were in the world other values than those of a business culture and other goals than that of business success. His background mostly explained this. Radicals who admired the French Revolution and eloquently cursed social inequality and the unjust operation of the economy clustered along both sides of Carnegie's family tree. Indeed one of Andrew's uncles had been arrested for sedition after delivering a lecture on Chartism. For by this time the family's reforming impulse had channelized into

[Baha'i Comment](#)

supporting the political reform program which the working class had stated in the People's Charter. This document demanded universal manhood suffrage, voting by ballot, abolition of property qualifications for membership in Parliament and salaries for members, annual Parliaments, and equal electoral districts. Chartism, however, had fizzled out in 1848. But the circumstances which drove Andrew's immediate family to migrate to this country in that year were economic rather than political.

5. Whether defeated or not, a career of agitation developed in the Carnegies an ability at exposition, discussion, argument, public address, and newspaper writing. They were devoted to books. One ancestor, indeed, was nicknamed "Professor" and Carnegie's father was "an awfu' man to read." Carnegie never shook off this inheritance. Perhaps the Scottish admiration for the things of the mind and of the spirit reinforced the family's learned tradition. Nonetheless he was not sure later that the professions had as desirable an

---Page x. The Gospel of Wealth - Editor's Introduction--

-

[Baha'i Comment](#)

effect upon their practitioners as did business. The professional mind, occupied with fame rather than dollar getting, was "clear but narrow."

6. Yet it would be a mistake to ascribe Carnegie's non-business interests and concerns solely to a family or national background. Carnegie liked to be different. In business he loved to depart from the traditional paths of the ironmasters, "Fathers-in-Israel," as he derisively christened them. One of his favorite exhortations to young men was "Attract attention." He followed his own advice. At a time when such businessmen as John D. Rockefeller and Elbert H. Gary (1846-1927) were supposed to be without an intellectual attainment larger than the ability to lead a Sunday-school class, he was the friend of literary men, those characteristically successful like Mark Twain and Richard Watson Gilder (1844-1909) of the Century, who acted as a recruiter of the "gods" of the literary world that attended Carnegie's "literary dinners" at his home on upper Fifth Avenue. Carnegie loved to drop names - "My dear friend, Matthew Arnold," - and hobnob with college presidents and statesmen,

[Baha'i Comment](#)

particularly if British. In one mail he received letters from Gladstone, Spencer, and John Morley. "I am quite set up as no other can say this." There was a strong streak of the show-off in Carnegie; he sought to startle and perplex. This trait, combined with the fact that his attitudes were often formulated for an occasion, prevented his thought from attaining system or consistency. It was often contradictory and impish.

7. Nonetheless, the essays in this volume reveal certain underlying patterns of thought. The details, of course, were not all Carnegie's own. In the post-Civil War years books rather than preachers frequently converted American businessmen and made the tangle and perplexity of this world literally clear to them. Edward Atkinson (1827-1905), New England cotton manufacturer, insurance man and publicist, one of the most perceptive commentators on America's economic structure in the post-Civil War era, owed his intellectual emanci-

---Page xi. The Gospel of Wealth - Editor's Introduction--

pation to Carlyle's *Sartor Resartus*. Charles Francis

[Baha'i Comment](#)

Adams, Jr. (1835-1915), later President of the Union Pacific Railroad, found his road to Damascus in England when in 1865 he read John Stuart Mill's essay on Auguste Comte, which "revolutionized in a single morning my whole mental attitude." Andrew Carnegie records in his Autobiography how he chanced to read Darwin and certain works of Herbert Spencer. "I remember that light came as in a flood and all was clear. Not only had I got rid of theology and the supernatural, but I had found the truth of evolution. 'All is well since all grows better' became my motto, my true source of comfort." Carnegie became one of Spencer's greatest American friends and through a lifetime of association showered him with kindnesses and admiration. Over the years in book and essay Spencer wrote on many topics; whether Carnegie was acquainted with the whole body of Spencer's work or was influenced by it at every point it is quite impossible to tell. A discussion in the second of these essays, "The Problem of Wealth," uses Spencerian-Darwinian phrases and concepts to justify the regime of competition. But long before the "survival of the fittest" gained fashionable currency in the vocabulary of

business and other men, it was believed that the race and prizes belonged to the swift. Carnegie was as apt to quote the biblical parable of the talents as a justification for wealth as to cite evolution, and it is notable that his original acknowledgment of Spencerian influence was in religious and theological matters. Actually his secularism and skepticism, uncharacteristic of his business generation, owed quite as much to the beliefs of his immediate forebears as they did to natural and social science.

8. With his family background of Chartist reform it was not surprising that Carnegie was a passionate believer in democracy. Almost as soon as he reached the United States he was writing back to the homeland that he had found the fulfillment of his dreams - no royal family, no aristocracy, no established church. "We have the Charter which you have

---Page xii. The Gospel of Wealth - Editor's Introduction--

-

been fighting for for years as the Panacea for all Britain's woes." In 1886 he wrote *Triumphant Democracy*, as extravagant an example of

[Baha'i Comment](#)

booster or promotional literature as was ever penned by a public relations expert. In words which are touching for their sincerity and simplicity he dedicated the volume "To the Beloved Republic, under whose Equal Laws I am made the peer of any man, although denied political equality by my native land." Like his definition of the businessman, this statement is as remarkable for its emphasis as for its omissions. Its stress is social and political; its "equality" is political equality. On another occasion he defined democracy as not meaning "equality of conditions, physical or mental, or equality as to property. It does mean political equality and the equality of opportunity."

9. On nearly every count this was exactly the creed of American business in the decades of the late nineteenth century. Though there were doubters among them, American businessmen, even sophisticated ones, accepted the open-ended character of American society and its institutions -- universal manhood suffrage, the free public school, the right of the laborer to choose his occupation and of the receiver of income, whether of salary, wages, or profits, to spend it

[Baha'i Comment](#)

as he chose. These were the cornerstones of the faith of a generation which, like Carnegie, was exceptionally sanguine, self-reliant and masculine. In some respects Carnegie carried the creed to more logical and more extreme positions than his business contemporaries. Most of them would hardly have seconded his approval of labor organization as an expression of self-reliance and as commendable striving by associated individuals for self-betterment. Carnegie here spoke for himself and a powerful minority of businessmen. If it had not been for these dissenters among employers, the task of labor unions would have been even more onerous.

10. *Triumphant Democracy* was more than an effusive love letter to the United States; it recommended a good example which England might well imitate. For one of Carnegie's

---Page xiii. The Gospel of Wealth - Editor's Introduction--

-

boyhood dreams had been "to grow up to kill a king" and, more soberly, to transform Britain into a republic. In the early eighties he purchased a string of newspapers in Great

[Baha'i Comment](#)

Britain and through them and in other ways began to push his campaign. By the middle of the decade his movement petered out, failing to topple the House of Lords or abolish the monarchy and other traces of political privilege. Triumphant Democracy was therefore not an opening salvo but a valedictory. The theme of transforming Britain remained, however, a persistent one - if only wistfully. In 1890 Carnegie was writing to William Ewart Gladstone about the comforts and conveniences of the Pennsylvania Limited -- "all of them free of charge" - between Chicago and New York. He concluded his letter, "What a quickening of the British mind we may get when the British Republic comes."

11. Though turned back from ultimate objectives, Carnegie maintained a deep interest in the course of British domestic politics, as the last four essays in this volume demonstrate. He was on friendly terms with English statesmen and did not refrain from lecturing or instructing them-and frequently baffling them. The body of British political doctrine that most appealed to him was Gladstonian liberalism. Its evangelical overtones must have left him cold, but in the later part of

[Baha'i Comment](#)

his career Gladstone at least supported the broadening of the suffrage and a series of measures culminating in Home Rule to allay or remove the age-old bitterness between Ireland and England. Of course the Carnegie-Gladstone relationship was not based solely upon the mutuality of political outlook. Gladstone was a success, a person who counted; for him Carnegie's admiration approached the idolatrous. When Gladstone commented in print on *The Gospel of Wealth*, the happy author wrote, "It seems like a dream that you who was to the little Scotch lad, something beyond human - should be attracted by anything he has promulgated and that he should really know you in the flesh. Always with reverence, Andrew Carnegie." Other leading

---Page xiv. *The Gospel of Wealth* - Editor's Introduction--

-

British exponents of liberalism, Lord Rosebery (1847-1929), for example, he tried to turn in a Gladstonian direction.

12. With a "native land" on one side of the Atlantic and an "adopted country" on the other, Carnegie perforce went beyond mere nationalism. We reinforced this dualism by taking long annual vacations in England and Scotland, the "fairyland," either in coach-and-four or on Scottish estates. Eventually he became the owner of Skibo, an estate of 30,000 acres and a castle with American improvements. At its flag-staff flew "the United flag ... the Stars and Stripes and the Union Jack sewn together - the first of that kind of flag ever seen." Carnegie was naturally the apostle of a federation of England and the United States (in which the more numerous American inhabitants would outvote their transatlantic cousins), and of the annexation of Canada.

[Baha'i Comment](#)

13. "I tell you," he wrote in 1898, "that race is the potent factor." His letters are replete with references to "The Race" or "Our Race." If he wanted a rationalization for the Anglo-Saxon supremacy which was largely instinctive with him, the context of his times would have provided it. The pastor and the professor alike were bursting from their studies to proclaim the glad tidings that the Teutonic or Anglo-Saxon races were "the political

[Baha'i Comment](#)

nations par excellence" and were authorized "in the economy of the world to assume the leadership in the establishment and administration of states." Of such moonshine the logical corollary was imperialism, and Admiral Alfred Thayer Mahan (1840-1914) in his discussions of sea power and historical greatness (*The Influence of Sea Power upon History*, 1890) became its spokesman. But Carnegie had too much common sense; he pulled back. Though the Spanish-American War gave the possibility of realizing imperial visions, such a program appalled Carnegie as a defiance of American principles. Two essays, "Distant Possessions" and "Americanism versus Imperialism," state his reservations to racism thus operating. He joined with other Americans to forestall a peace treaty consummating

---Page xv. The Gospel of Wealth - Editor's Introduction---

-

this betrayal, he helped finance the Anti-Imperialist League, and he tried to influence public men with such zeal as to elicit from one of them the observation that "Andrew Carnegie seems to be off his head." In 1900,

however, he refused to finance a third party movement against William McKinley. The ineptitude of this proposal is perhaps enough to justify Carnegie's decision, but his withdrawal question whether, as in his campaign for a British Republic he was genuinely interested in following through reforms which were not a success in the short run.

14. Of course he could elevate a specific issue to a broader basis. He could take comfort for the failure of his British campaign in the thought of an Anglo-Saxon, English speaking federation and the consequent democratic political changes forced upon his native land. For the failure of federation to materialize and for the collapse of true Americanism, perhaps a campaign for world peace through some other devices could be some counterweight. Soon after his arrival as a youth in this country he wrote an essay against the Crimean War in which he maintained that the machines of war deserve the execration given to the scaffold or guillotine. Later he was drawn into the Peace Society of Great Britain and he dates from the late eighties his preoccupation with the abolition of war. At first he was apparently sanguine

[Baha'i Comment](#)

enough to believe a hatred of war was enough to abolish it; later he saw in arbitration an alternative to conflict.

Eventually Carnegie financed at the construction at The Hague of a "Temple of Peace - the most holy building in the world because it has the holiest end in view. I do not even except St. Peter's or any other building erected to the Glory of God..." And in 1910 he gave \$10,000,000 for the Carnegie endowment for International Peace.

Carnegie's commitment to the peace movement had the incidental advantages of personal association with statesmen and scholars at international conferences to which he was frequently appointed a delegate and of the award of foreign decorations.

---Page xvi. The Gospel of Wealth - Editor's Introduction--

-

15. In the area of war and peace Carnegie was not a deviant from the accepted canon of business thought. In the writings of the business press and of businessmen few themes are more frequent and more persistent than the realization that America's position and policy by conducting to peace gave the nation an immense competitive advantage. It avoided the wasteful expenditure of public funds on armament and the crushing burden of high taxes; it directed our manpower to production rather than military purposes. On the contrary, our European competitors had to shoulder these burdens much to our advantage. War upset the rationality and order which business was trying to introduce into economic operations.

[Baha'i Comment](#)

16. As I have indicated, it is impossible to treat Carnegie's non-business interests without mentioning his benefactions. The most significant essays in this volume are those which contribute its title. The philosophy there set forth had been succinctly anticipated in 1868 in Carnegie's famous memorandum to himself: "Beyond this [\$50,000 a year] never earn -make no effort to increase fortune, but spend

[Baha'i Comment](#)

the surplus each year for benevolent purposes.... Man must have an idol - the amassing of wealth is one of the worst species of idolatry - no idol more debasing than the worship of money. To continue much longer ... with most of my thoughts wholly upon the way to make more money in the shortest possible time, must degrade me beyond hopes of permanent recovery." As a declaration of personal allegiance to a program this avowal and the later "Gospel of Wealth" are revealing. But historically they have little novelty. For centuries Christ had exalted and consecrated individual generosity and benevolence; charity was a Christian virtue and Christ had answered the rich young_ man's question, "What shall I do to inherit eternal life?" by the directive, "Sell all that thou hast and distribute unto the poor." Through the ages men and women had followed an ideal of the Christian stewardship of wealth.

---Page xvii. The Gospel of Wealth - Editor's Introduction--

-

17. That Carnegie should take this path was startling, for his tone had been secular, and he believed there was truth in all religions. Since clerics have a keen scent for heresy and a sharp eye for danger, the hostility or moderation with which they greeted Carnegie's "Gospel of Wealth" had significance. While granting that his statement was "interesting," they generally went on to celebrate the virtues and achievements of Christian charity or wandered off into irrelevancies like the tariff. One eminent Methodist divine in England chose to discuss the "Gospel of Wealth" as a therapy for social ills -- Carnegie had certainly invited discussion on this level and concluded that a millionaire of the Carnegie class was "an anti-christian phenomenon, a social monstrosity, and a grave political peril!" To grant that Carnegie contributed a secular tone to giving is not to assert that he was a pioneer in this respect. In America the note goes back at least Franklin; and Stephen Girard, another Philadelphian, had in his endowment for Girard College expressly stipulated "no ecclesiastic, missionary, or minister of any sort

[Baha'i Comment](#)

whatever, shall ever hold or exercise any station or duty whatever in the said College; nor shall any such person be admitted for any purpose, or as a visitor, within the premises appropriated to the purposes of the said College.”

18. While it has been demonstrated that American public opinion expected rich men to give at least part of their fortunes for public purposes, it did not follow that such generosity was a path to popularity. Carnegie did not find it so. When he first, offered Pittsburgh \$250,000 for a library building, the City Council rejected it. Later, when the City changed its mind, Carnegie gave \$1,000,000 and went on to give, as well as a library, an art museum and music hall. Smaller places showed the same reluctance to accept a Carnegie gift. It was said he insisted that the building bear his name; this was untrue. Others apparently suspected that acceptance was an endorsement of the methods by which Carnegie had acquired his fortune. A more important and

---Page xviii. The Gospel of Wealth - Editor's Introduction---

-

concrete objection was

[Baha'i Comment](#)

Carnegie's insistence that communities appropriate an amount, usually a percentage of his gift, for the support of the buildings he gave them; communities bristled at dictation from the steel king. Nor did Carnegie find it easy to dispense his fortune wisely. Begging letters poured in by the thousands. For his benefactions Carnegie sought out expert advisors; in the field of education the presidents of Cornell and Johns Hopkins played this role. In cases he handled on his own he often exhibited extraordinary sensitivity and patience. Anyone who reads the interchange of letters about the purchase of Lord Acton's library -- the terms stipulated that Acton could continue without embarrassment to use it -- will be impressed by the delicacy and tact of the philanthropist. Nonetheless, the evolving forms in the administration of his bequests reflected Carnegie's experiences as a giver and his fatigue as a merely personal administrator.

19. In the last analysis Carnegie's achievement as a philanthropist lay in doing what he wrote he ought: to do; or, phrased in another way, he had an intellectual rather than a purely impulsive formula for his giving. This always over-impresses intellectuals. Be that as it may, he built 2,507 libraries - the free public library) was to his mind the people's university. In the more formal educational field he financed technical training at the Carnegie Institute of Technology, encouraged research in basic science by the Carnegie Institution of Washington, and through the Carnegie Foundation for the Advancement of Teaching established a pension fund for college teachers. Only institutions without denominational connections could apply for inclusion. Finally in 1911 he created the Carnegie Corporation of New York, a separate foundation as large as all his other trusts combined. In simplified spelling, the Corporation was enjoined "to promote the advancement and diffusion of knowledge and understanding among the people of the United States, by aiding technical schools, institutions of higher learning, libraries, scientific

[Baha'i Comment](#)

---Page xix. The Gospel of Wealth - Editor's Introduction--

-

research, hero funds, useful publications, and by such other agencies and means as shall from time to time be found appropriate therefor." Before his death in 1919 he gave away \$311,000,000.

20. It does not impugn the noble integrity of this achievement to point out that Carnegie's program of philanthropy ministered to his exhibitionism. Though he modestly forbade the specific memorialization of his name, the essay, "Gospel of Wealth," enabled him to be a distinctive rich man, to select among his "dear fellow millionaires" - past and present - those he could commend or, by inference, censure. As he roamed about cracking heads or dispensing bouquets, he could play the congenial role of the maverick, a role J. P. Morgan found so disturbing in him. He could startle. On the stage of attention and influence, where he loved to stride, he could toss about once again the "Fathers-in-Israel."

[Baha'i Comment](#)

21. For some reason literateness in businessmen arouses popular and occasionally scholarly suspicion. They are thought not to possess the brains to think abstractly and summon thought or the ability to write the works to which their names are signed. Although Carnegie lived before the days when ghost-writing was standard operating procedure for businessmen and politicians (and occasionally candidates for the Ph.D.), he has not escaped the stigma. In the folklore of possible authorship the most common name given to the "faceless one" is that of James Howard Bridge. Carnegie once referred to him as "my clever secretary." Undoubtedly Bridge was of great assistance in the compilation of *Triumphant Democracy*, and he wrote a book on his own to prove that Carnegie had little to do with the accumulation of his fortune - this was the work of others. An examination of the private papers of Carnegie in the Library of Congress is enough to refute the notion that Carnegie could not express himself. The essays in this volume are authentic Carnegie.

[Baha'i Comment](#)

22. Nor was he the only literate or articulate man of business in a notable business generation. John D. Rockefeller col-

---Page xx. The Gospel of Wealth - Editor's Introduction--

lected in a volume his *Random Reminiscences of Men and Events* (1909); in spite of later scholarship, the volume retains a usefulness. Of business essayists contemporary with Carnegie, Edward Atkinson, the economist David A. Wells (1828-1898), the railroad journalist and economist Henry Varnum Poor (1812-1905), to mention no others, were all penetrating observers. Like Carnegie, they felt writing was a way to influence, and they sought quite consciously so to write and so to publish as to shape public opinion and policy. When due attention has been given to these business writers and to the media in which their work appeared, the business literature of the age will compare favorably in bulk and in force with that of reformists and critics.

[Baha'i Comment](#)

23. Carnegie wrote of events of course as he saw them in his own time, and it is scarcely to his discredit that he could not foresee the ironies subsequent events of twentieth-century history have produced-the two world wars despite his "Temple of Peace" at the Hague; revolution in Cuba and alignment with a foreign power despite the Monroe Doctrine; decline of empire and emergence of new nations on the African continent, then the arena of fierce new imperialistic rivalries; the vast American commitments all over the world; permanent conscription; continuing frustrations of international "co-operation"; the rise in power of Soviet Russia, no longer "one of our best friends." Nevertheless, typical spokesman of business as Carnegie was, he remains unique in the variety of his interests, the fecundity of his writing, and in my estimation, in the impression he made. The republication of these essays should remove once and for all the commonplace notion that the whole business generation was one of "robber barons" and that its members were all either crooks or clowns, dunces or hypocrites.

A Note on the Text

The first edition of **THE GOSPEL OF WEALTH** *And Other Timely Essays* came out in 1900, when the Century Company adapted and assembled in one volume twelve articles of topical interest written by Carnegie between 1886 and 1899. Acknowledgement of the original sources was made in the following statement: "The various articles in this volume are reprinted by permission of the publishers of the periodicals in which they originally appeared. The autobiographical fragment which precedes the essays proper was written for the 'Youth's Companion'; the other papers were first published in the 'Century Magazine,' the 'North American Review,' the 'Forum,' the 'Contemporary Review,' the 'Fortnightly Review,' and 'Nineteenth Century,' and the 'Scottish Leader.'" Curiously enough, although the edition carefully identified each essay by periodical and year, none is attributed to the *Fortnightly Review*. The present text follows that of 1900. A

[Baha'i Comment](#)

subsequent edition (1906) includes an additional essay entitled "British Pessimism," which had appeared in the *Nineteenth Century and After* in 1901.

I

Introduction: How I Served My Apprenticeship

(1) Published in the Youth's Companion, April 23, 1896.

1. IT is a great pleasure to tell how I served my apprenticeship as a business man. But there seems to be a question preceding this: Why did I become a business man? I am sure that I should never have selected a business career if I had been permitted to choose.

[Baha'i Comment](#)

2. The eldest son of parents who were themselves poor, I had, fortunately, to begin to perform some useful work in the world while still very young in order to earn an honest livelihood, and was thus shown even in early boyhood that my duty was to assist my parents and, like them, become, as soon as possible, a bread-winner in the family. What I could get to do, not what I desired, was the question.

[Baha'i Comment](#)

3. When I was born my father was a well-to-do master weaver in Dunfermline, Scotland. He owned no less than four damask-looms and employed apprentices. This was before the days of steam-factories for the manufacture of linen. A few large merchants took orders, and employed master weavers, such as my father, to weave the cloth, the merchants supplying the materials.

[Baha'i Comment](#)

4. As the factory system developed hand-loom weaving naturally declined, and my father was one of the sufferers by the change. The first serious lesson of my life came to me one day when he had taken in the last of his work to the merchant, and returned to our little home greatly distressed because there was no more work for him to do. I was then just about

---Page 04 The Gospel of Wealth - How I Served My Apprenticeship---

ten years of age, but the lesson burned into my heart, and I resolved then that the wolf of poverty should be driven from our door some day, if I could do it.

[Baha'i Comment](#)

5. The question of selling the old looms and starting for the United States came up in the family council, and I heard it discussed from day to day. It was finally resolved to take the plunge and join relatives already in Pittsburg. I well remember that neither father nor mother thought the change would be otherwise than a great sacrifice for them, but that "it would be better for the two boys."

[Baha'i Comment](#)

6. In after life, if you can look back as I do and wonder at the complete surrender of their own desires which parents make for the good of their children, you must reverence their memories with feelings akin to worship.

[Baha'i Comment](#)

7. On arriving in Allegheny City (there were four of us: father, mother, my younger brother, and myself), my father entered a cotton factory. I soon followed, and served as a "bobbin-boy," and this is how I began my preparation for subsequent apprenticeship as a business man. I received one dollar and twenty cents a week, and was then just about twelve years old.

[Baha'i Comment](#)

8. I cannot tell you how proud I was when I received my first week's own earnings. One dollar and twenty cents made by myself and given to me because I had been of some use in the world! No longer entirely dependent upon my parents, but at last admitted to the family partnership as a contributing member and able to help them! I think this makes a man out of a boy sooner than anything else, and a real man, too, if there be any germ of true manhood in him. It is everything to feel

[partnership](#) - Asserting that women and men share similar "station and rank" and "are equally the recipients of powers and endowments from God," the Baha'i teachings offer a model of equality based on the concept of partnership. Only when women become full participants in all domains of life and enter the important arenas of decision-making will humanity be prepared to embark on the next stage of its collective development. (Two Wings, paragraph 12, Baha'u'llah, Tablet translated from the Persian and Arabic, quoted in Women, no. 2; 'Abdu'l-Baha, Promulgation, p. 300.)

that you are useful.

9. I have had to deal with great sums. Many millions of dollars have since passed through my hands. But the genuine satisfaction I had from that one dollar and twenty cents outweighs any subsequent pleasure in money-getting. It was the direct reward of honest, manual labor; it represented a week

---Page 05 The Gospel of Wealth - How I Served My Apprenticeship---

of very hard work - so hard that, but for the aim and end which sanctified it, slavery might not be much too strong a term to describe it.

10. For a lad of twelve to rise and breakfast every morning, except the blessed Sunday morning, and go into the streets and find his way to the factory and begin to work while it was still dark outside, and not be released until after darkness came again in the evening, forty minutes' interval only being allowed at noon, was a terrible task.

slavery - How much of the energy employed in the business world of today is expended simply in canceling and neutralizing the efforts of other people--in useless strife and competition! And how much in ways that are still more injurious! Were all to work, and were all work, whether of brain or hand, of a nature profitable to mankind, as Baha'u'llah commands, then the supplies of everything necessary for a healthy, comfortable and noble life would amply suffice for all. There need be no slums, no starvation, no destitution, no industrial slavery, no health-destroying drudgery. (Baha'u'llah and New Era, page 143)

From the day it was born the United States embraced a set of contradictory values. The founding fathers proclaimed their devotion to the highest principles of equality and justice yet enshrined slavery in the Constitution. Slavery poisoned the mind and heart of the nation and would not be abolished without a bloody civil war that nearly destroyed the young republic. The evil consequences of slavery are still visible in this land. They continue to affect the behavior of both Black and White Americans and prevent the healing of old wounds. (Vision of Race Unity, page 111)

Baha'i Comment

11. But I was young and had my dreams, and something within always told me that this would not, could not, should not last - I should some day get into a better position. Besides this, I felt myself no longer a mere boy, but quite a little man, and this made me happy.

happy - I hope that the people of the West may be illumined by the light of God; that the Kingdom may come to them, that they may find eternal Life, that the Spirit of God may spread like a fire among them, that they may be baptized with the Water of Life and may find a new birth.

This is my desire; I hope by the will of God, He will cause you to receive it, and will make you happy. ('Abdu'l-Baha in London, page 49)

12. A change soon came, for a kind old Scotsman, who knew some of our relatives, made bobbins, and took me into his factory before I was thirteen, but here for a time it was even worse than in the cotton factory, because I was set to fire a boiler in the cellar, and actually to run the small steam engine which drove the machinery. The firing of the boiler was all right, for fortunately we did not use coal, but the refuse wooden chips; and I always liked to work in wood. But the responsibility of keeping the water right and of running the engine, and the danger of my making a mistake and blowing the whole factory to pieces, caused too great a strain, and. I often awoke and found myself sitting up in bed through the night, trying the steam-gauges. But I never told them at home that I was having a hard tussle. No, no! everything must be bright to them.

Baha'i Comment

13. This was a point of honor, for every member of the family was working hard, except, of course, my little brother, who was then a child, and we were telling each other only all the bright things. Besides this, no man would whine and give up - he would die first.

[Baha'i Comment](#)

14. There was no servant in our family, and several dollars per

---Page 06 The Gospel of Wealth - How I Served My Apprenticeship---

week were earned by the mother by binding shoes after her daily work was done! Father was also hard at work in the factory. And could I complain?

[factory](#) - It would be well, with regard to the common rights of manufacturers, workmen and artisans, that laws be established, giving moderate profits to manufacturers, and to workmen the necessary means of existence and security for the future. Thus when they become feeble and cease working, get old and helpless, or leave behind children under age, they and their children will not be annihilated by excess of poverty. And it is from the income of the factory itself, to which they have a right, that they will derive a share, however small, toward their livelihood. ('Abdu'l-Baha, Some Answered Questions, page 275)

15. My kind employer, John Hay, -peace to his ashes!- soon relieved me of the undue strain, for he needed some one to make out bills and keep his accounts, and finding that I could write a plain school-boy hand and could "cipher," he made me his only clerk. But still I had to work hard upstairs in the factory, for the clerking took but little time.

[Baha'i Comment](#)

16. You know how people moan about poverty as being a great evil, and it seems to be accepted that if people had only plenty of money and were rich, they would be happy and more useful, and get more out of life.

poverty - A financier with colossal wealth should not exist whilst near him is a poor man in dire necessity. When we see poverty allowed to reach a condition of starvation it is a sure sign that somewhere we shall find tyranny. Men must bestir themselves in this matter, and no longer delay in altering conditions which bring the misery of grinding poverty to a very large number of the people. The rich must give of their abundance, they must soften their hearts and cultivate a compassionate intelligence, taking thought for those sad ones who are suffering from lack of the very necessities of life.

There must be special laws made, dealing with these extremes of riches and of want. The members of the Government should consider the laws of God when they are framing plans for the ruling of the people. The general rights of mankind must be guarded and preserved. ('Abdu'l-Baha, Paris Talks, pages 153-154)

17. As a rule, there is more genuine satisfaction, a truer life and more obtained from life in the humble cottages of the poor than in the palaces of the rich. I always pity the sons and daughters of rich men, who are attended by servants, and have governesses at a later age, but am glad to remember that they do not know what they have missed.

poor - Difference of capacity in human individuals is fundamental. It is impossible for all to be alike, all to be equal, all to be wise. Baha'u'llah has revealed principles and laws which will accomplish the adjustment of varying human capacities. He has said that whatsoever is possible of accomplishment in human government will be effected through these principles. When the laws he has instituted are carried out there will be no millionaires possible in the community and likewise no extremely poor. This will be effected and regulated by adjusting the different degrees of human capacity. The fundamental basis of the community is agriculture, tillage of the soil. All must be producers. Each person in the community whose income is equal to his individual producing capacity shall be exempt from taxation. But if his income is greater than his needs he must pay a tax until an adjustment is effected. That is to say, a man's capacity for production and his needs will be equalized and reconciled through taxation. If his production exceeds he will pay no tax; if his necessities exceed his production he shall receive an amount sufficient to equalize or adjust. Therefore taxation will be proportionate to capacity and production and there will be no poor in the community. (Foundations of World Unity, page 37)

18. They have kind fathers and mothers, too, and think that they enjoy the sweetness of these blessings to the fullest: but this they cannot do; for the poor boy who has in his father his constant companion, tutor, and model, and in his mother - holy name! - his nurse, teacher, guardian angel, saint, all in one, has a richer, more precious fortune in life any rich man's son who is not so favored can know, and compared with which all other fortunes count for little.

rich - How often do we see a man, poor, sick, miserably clad, and with no means of support, yet spiritually strong. Whatever his body has to suffer, his spirit is free and well! Again, how often do we see a rich man, physically strong and healthy, but with a soul sick unto death. (Paris Talks, page 65)

19. It is because I know how sweet and happy and pure the home of honest poverty is, how free from perplexing care, from social envies and emulations, how loving and how united its members may be in the common interest of supporting the family, that I sympathize with the rich man's boy and congratulate the poor man's boy; and it is for these reasons that from the ranks of the poor so many strong,

poverty - The realm of Divinity is an indivisible oneness, wholly sanctified above human comprehension; for intellectual knowledge of creation is finite, whereas comprehension of Divinity is infinite. How can the finite comprehend the infinite? We are utter poverty, whereas the reality of Divinity is absolute wealth. How can utter poverty understand absolute wealth? We are utter weakness, whereas the reality of Divinity is absolute power... . (Promulgation of Universal Peace, page 172)

---Page 07 The Gospel of Wealth - How I Served My Apprenticeship---

eminent, self-reliant men have always sprung and always must spring.

20. If you will read the list of the immortals who "were not born to die," you will find that most of them were born to the precious heritage of poverty.

poverty - ... But the poor are especially beloved of God. Their lives are full of difficulties, their trials continual, their hopes are in God alone. Therefore, you must assist the poor as much as possible, even by sacrifice of yourself. No deed of man is greater before God than helping the poor. Spiritual conditions are not dependent upon the possession of worldly treasures or the absence of them. When one is physically destitute, spiritual thoughts are more likely. Poverty is a stimulus toward God.... (Promulgation of Universal Peace, page 216)

21. It seems nowadays a matter of universal desire that poverty should be abolished. We should be quite willing to abolish luxury, but to abolish honest, industrious, self-denying poverty would be to destroy the soil upon which mankind produces the virtues which enables our race to reach a still higher civilization than it now possesses.

poverty - While thousands are considering these questions, we have more essential purposes. The fundamentals of the whole economic condition are divine in nature and are associated with the world of the heart and spirit. This is fully explained in the Baha'i teaching, and without knowledge of its principles no improvement in the economic state can be realized. The Baha'is will bring about this improvement and betterment but not through sedition and appeal to physical force--not through warfare, but welfare. Hearts must be so cemented together, love must become so dominant that the rich shall most willingly extend assistance to the poor and take steps to establish these economic adjustments permanently. If it is accomplished in this way, it will be most praiseworthy because then it will be for the sake of God and in the pathway of His service. For example, it will be as if the rich inhabitants of a city should say, "It is neither just nor lawful that we should possess great wealth while there is abject poverty in this community," and then willingly give their wealth to the poor, retaining only as much as will enable them to live comfortably. (Promulgation of Universal Peace, page 238-239)

22. I come now to the third step in my apprenticeship, for I had already taken two, as you see - the cotton factory and then the bobbin factory; and with the third - the third time is the chance, you know - deliverance came. I obtained a situation as messenger boy in the telegraph office of Pittsburg when I was fourteen. Here I entered a new world.

new world - The gift of God to this enlightened age is the knowledge of the oneness of mankind and of the fundamental oneness of religion. War shall cease between nations, and by the will of God the Most Great Peace shall come; the world will be seen as a new world, and all men will live as brothers. (Century of Light, page 21)

23. Amid books, newspapers, pencils, pens and ink and writing-pads, and a clean office, bright windows, and the literary atmosphere, I was the happiest boy alive.

[Baha'i Comment](#)

24. My only dread was that I should some day be dismissed because I did not know the city; for it is necessary that a messenger boy should know all the firms and addresses of men who are in the habit of receiving telegrams. But I was a stranger in Pittsburg. However, I made up my mind that I would learn to repeat successively each business house in the principal streets, and was soon able to shut my eyes and begin at one side of Wood Street, and call every firm successively to the top, then pass to the other side and call every firm to the bottom. Before long I was able to do this with the business streets generally. My mind was then at rest upon that point.

[Baha'i Comment](#)

25. Of course every messenger boy wants to become an operator, and before the operators arrive in the early mornings the boys slipped up to the instruments and practised. This I

---Page 08 The Gospel of Wealth - How I Served My Apprenticeship---

did, and was soon able to talk to the boys in the other offices along the line, who were also practising.

[Baha'i Comment](#)

26. One morning I heard Philadelphia calling Pittsburg and giving the signal, "Death message." Great attention was then paid to "death messages," and I thought I ought to try to take this one. I answered and did so, and went off and delivered it before the operator came. After that the operators sometimes used to ask me to work for them.

[Baha'i Comment](#)

27. Having a sensitive ear for sound, I soon learned to take messages by the ear, which was then very uncommon - I think only two persons in the United States could then do it. Now every operator takes by ear, so easy it is to follow and do what any other boy can-if you only have to. This brought me into notice, and finally I became an operator, and received the, to me, enormous recompense of twenty-five dollars per month - three hundred dollars a year!

[recompense](#) - STATION OF TRUSTWORTHINESS 'O inmates of earth and heaven! Behold ye My beauty, and My radiance, and My revelation, and My effulgence. By God, the True One! I am Trustworthiness and the revelation thereof, and the beauty thereof. I will recompense whosoever will cleave unto Me, and recognize My rank and station, and hold fast unto My hem. I am the most great ornament of the people of Baha, and the vesture of glory unto all who are in the kingdom of creation. I am the supreme instrument for the prosperity of the world, and the horizon of assurance unto all beings.' (Baha'u'llah: Epistle to the Son of the Wolf, pages 136-137)

28. This was a fortune - the very sum that I had fixed when I was a factory-worker as the fortune I wished to possess, because the family could live on three hundred dollars a year and be almost or quite independent. Here it was at last! But I was soon to be in receipt of extra compensation for extra work.

[Baha'i Comment](#)

29. The six newspapers of Pittsburg received telegraphic news in common. Six copies of each despatch were made by a gentleman who received six dollars per week for the work, and he offered me a gold dollar every week if I would do it, of which I was very glad indeed, because I always liked to work with news and scribble for

[newspapers](#) - In this Day the secrets of the earth are laid bare before the eyes of men. The pages of swiftly-appearing newspapers are indeed the mirror of the world. They reflect the deeds and the pursuits of divers peoples and kindreds. They both reflect them and make them known. They are a mirror endowed with hearing, sight and speech. This is an amazing and potent phenomenon. However, it behoveth the writers thereof to be purged from the promptings of evil passions and desires and to be attired with the raiment of justice and equity. They should enquire into situations as much as possible and ascertain the facts, then set them down in writing. (Tablets of Baha'u'llah, pages 39-40)

newspapers.

30. The reporters came to a room every evening for the news which I had prepared, and this brought me into most pleasant intercourse with these clever fellows, and besides, I got a dollar a week as pocket-money, for this was not considered family revenue by me.

[Baha'i Comment](#)

31. I think this last step of doing something beyond one's task is fully entitled to be considered "business". The other revenue, you see, was just salary obtained for regular work;

[Baha'i Comment](#)

---Page 09 The Gospel of Wealth - How I Served My Apprenticeship---

but here was a little business operation upon my own account, and I was very proud indeed of my gold dollar every week.

32. The Pennsylvania Railroad shortly after this was completed to Pittsburg, and that genius, Thomas A. Scott,

(2) Scott (1823-1881) was the railroad executive who warned Lincoln not to proceed directly to Washington for his inauguration and who served the Union cause significantly during the Civil War as supervisor and adviser on problems of transportation of men and supplies.

was its superintendent. He often came to the telegraph office to talk to his chief, the general superintendent, at Altoona, and I became known to him in this way.

[Baha'i Comment](#)

33. When that great railway system put up a wire of its own, he asked me to be his clerk and operator; so I left the telegraph office - in which there is great danger that a young man may be permanently buried, as it were - and became connected with the railways.

[Baha'i Comment](#)

34. The new appointment was accompanied by what was, to me, a tremendous increase of salary. It jumped from twenty-five to thirty-five dollars per month. Mr. Scott was then receiving one hundred and twenty-five dollars per month, and I used to wonder what on earth he could do with so much money.

[Baha'i Comment](#)

35. I remained for thirteen years in the service of the Pennsylvania Railroad Company, and was at last superintendent of the Pittsburg division of the road, successor to Mr. Scott, who had in the meantime risen to the office of vice-president of the company.

[Baha'i Comment](#)

36. One day Mr. Scott, who was the kindest of men, and had taken a great fancy to me, asked if I had or could find five hundred dollars to invest.

37. Here the business instinct came into play. I felt that as the door was opened for a business investment with my chief, it would be wilful flying in the face of providence if I did not jump at it; so I answered promptly:

"Yes, sir; I think I can."

"Very well," he said, "get it; a man has just died who owns

---Page 10 The Gospel of Wealth - How I Served My Apprenticeship---

ten shares in the Adams Express Company which I want you to buy. It will cost you fifty dollars per share, and I can help you with a little balance if you cannot raise it all."

[Baha'i Comment](#)

38. Here was a queer position. The available assets of the whole family were not five hundred dollars. But there was one member of the family whose ability, pluck, and resource never failed us, and I felt sure the money could be raised somehow or other by my mother.

[Baha'i Comment](#)

39. Indeed, had Mr. Scott known our position he would have advanced it himself; but the last thing in the world the proud Scot will do is to reveal his poverty and rely upon others. The family had managed by this time to purchase a small house and pay for it in order to save rent. My recollection is that it was worth eight hundred dollars.

[Baha'i Comment](#)

40. The matter was laid before the council of three that night, and the oracle spoke: "Must be done. Mortgage our house. I will take the steamer in the morning for Ohio, and see uncle, and ask him to arrange it. I am sure he can." This was done. Of course her visit was successful -- where did she ever fail?

[Baha'i Comment](#)

41. The money was procured, paid over; ten shares of Adams Express Company stock was mine; but no one knew our little home had been mortgaged "to give our boy a start."

[Baha'i Comment](#)

42. Adams Express stock then paid monthly dividends of one percent, and the first check for five dollars arrived. I can see it now, and I well remember the signature of "J. C. Babcock, Cashier," who wrote a big "John Hancock" hand.

[Baha'i Comment](#)

43. The next day being Sunday, we boys - myself and my ever-constant companions - took our usual Sunday afternoon stroll in the country, and sitting down in the woods, I showed them this check, saying, "Eureka! We have found it.

[Baha'i Comment](#)

44. Here was something new to all of us, for none of us had ever received anything but from toil. A return from capital was something strange and new.

[Baha'i Comment](#)

45. How money could make money, how, without any attention from me, this mysterious golden visitor should come,

---Page 11 The Gospel of Wealth - How I Served My Apprenticeship---

led to much speculation upon the part of the young fellows, and I was for the first time hailed as a "capitalist".

[capitalist](#) - Certainly, some being enormously rich and others lamentably poor, an organization is necessary to control and improve this state of affairs. It is important to limit riches, as it is also of importance to limit poverty. Either extreme is not good. To be seated in the mean is most desirable. If it be right for a capitalist to possess a large fortune, it is equally just that his workman should have a sufficient means of existence. ('Abdu'l-Bahá, Paris Talks, page 153)

46. You see, I was beginning to serve my apprenticeship as a business man in a satisfactory manner.

[Baha'i Comment](#)

47. A very important incident in my life occurred when, one day in a train, a nice, farmer-looking gentleman approached me, saying that the conductor had told him I was connected with the Pennsylvania Railroad, and he would like to show me something. He pulled from a small green bag the model of the first sleeping-car. This was Mr. Woodruff, the inventor.

(3) Theodore Tuttle Woodruff (1811-1892), whose idea for sleeping cars dated from as early as 1830, produced his first model in 1857.

[Baha'i Comment](#)

48. Its value struck me like a flash. I asked him to come to Altoona the following week, and he did so. Mr. Scott, with his usual quickness, grasped the idea. A contract was made with Mr. Woodruff to put two trial cars on the Pennsylvania Railroad. Before leaving Altoona Mr. Woodruff came and offered an interest in the venture, which I promptly accepted. But how I was to make my payments rather troubled me, for the cars were to be paid for in monthly instalments after delivery, and

[Baha'i Comment](#)

my first monthly payment was to be two hundred and seventeen dollars and a half.

49. I had not the money, and I did not see any way of getting it. But I finally decided to visit the local banker and ask him for loan, pledging myself to repay at the rate of fifteen dollars per month. He promptly granted it. Never shall I forget his putting his arm over my shoulder, saying, "Oh, yes, Andy; you are all right!"

[Baha'i Comment](#)

50. I then and there signed my first note. Proud day this; and surely now no one will dispute that I was becoming a "business man." I had signed my first note, and, most important of all, - for any fellow can sign a note, - I had found a banker willing to take it as "good."

[Baha'i Comment](#)

51. My subsequent payments were made by the receipts from the sleeping-cars, and I really made my first considerable

[Baha'i Comment](#)

---Page 12. The Gospel of Wealth - How I Served My Apprenticeship---

sum from this investment in the Woodruff Sleeping Car

Company, which was afterward absorbed by Mr. Pullman a remarkable man whose name is now known over all the world.

52. Shortly after this I was appointed superintendent of the Pittsburg division, and returned to my dear old home, smoky Pittsburg. Wooden bridges were then used exclusively upon the railways, and the Pennsylvania Railroad was experimenting with a bridge built of cast-iron. I saw that wooden bridges would not do for the future, and organized a company in Pittsburg to build iron bridges.

[Baha'i Comment](#)

53. Here again I had recourse to the bank, because my share of the capital was twelve hundred and fifty dollars, and I had not the money; but the bank lent it to me, and we began the Keystone 1 which proved a great success. This company built the first great bridge over the Ohio River, three hundred feet span, and has built many of the most important structures since.

[Baha'i Comment](#)

54. This was my beginning in manufacturing; and from that start all our other works have grown, the profits of one building the other. My "apprenticeship" as a business man soon ended, for I resigned my position as an officer of the Pennsylvania Railroad Company to give exclusive attention to business.

[Baha'i Comment](#)

55. I was no longer merely an official working for others upon a salary, but a full-fledged business man working upon my own account.

[Baha'i Comment](#)

56. I never was quite reconciled to working for other people. At the most, the railway officer has to look forward to the enjoyment of a stated salary, and he has a great many people to please; even if he gets to be president, he has sometimes a board of directors who cannot know what is best to be done; and even if this board be satisfied, he has a board of stockholders to criticize him, and as the property is not his own he cannot manage it as he pleases.

[salary - 1476. If One Abuses His Position with the Government Through Corrupt or Mercenary Behavior...](#) "If one of the friends ... be appointed to a high administrative office, he should strive diligently, to perform the duties committed to his charge with perfect honesty, integrity, sincerity, rectitude and uprightness. If, however, he abuse his position through corrupt or mercenary behaviour, he will be held in detestation at the Threshold of Grandeur and incur the wrath of the Abha Beauty--nay, he shall be forsaken by the One True God and all who adore Him. So far from acting thus, he should content himself with his salary and allowance, seek out the way of righteousness, and dedicate his life to the service of state and people. Such must be the conduct and bearing of the Baha'is. Whoso transgresseth these bounds shall fall at length into manifest loss." (Lights of Guidance, page 454)

57. I always liked the idea of being my own master, of manufacturing

---Page 13. The Gospel of Wealth - How I Served My Apprenticeship---

something and giving employment to many men. There is only one thing to think of manufacturing if you are a Pittsburger, for Pittsburg even then had asserted her supremacy as the "Iron City," the leading iron-and-steel-manufacturing city in America.

[Baha'i Comment](#)

58. So my indispensable and clever partners, who had been my boy companions, I am delighted. to say, - some of the very boys who had met in the grove to wonder at the five dollar check, - began business, and still continue extending it to meet the ever-growing and ever-changing wants of our most progressive country, year after year.

[Baha'i Comment](#)

59. Always we are hoping that we need. expand no farther; yet ever we are finding that to stop expanding would be to fall behind; and even to-day the successive improvements and inventions follow each other so rapidly that we see just as much yet to be done as ever.

[Baha'i Comment](#)

60. When the manufacturer of steel ceases to grow he begins to decay, so we must keep on extending. The result of all these developments is that three pounds of finished steel are now bought in Pittsburg for two cents, which is cheaper than anywhere else on the earth, and that our country has become the greatest producer of iron in the world.

[Baha'i Comment](#)

61. And so ends the story of my apprenticeship and graduation as a business man.

[Baha'i Comment](#)

---Page 14 The Gospel of Wealth - II Administration of Wealth---

PART I: THE PROBLEM OF THE ADMINISTRATION OF WEALTH

(1) Published originally in the North American Review, CXLVIII (June 1889), 653-664, and CXLIX (December 1889), 682-698. Carnegie did not devise the appropriate and fetching title this essay now bears. He called it "Wealth." William T. Stead, editor of the Pall Mall Gazette, supplied the heading "The Gospel of Wealth." The personally dramatic circumstances under which the editor of the North American Review accepted the original article highly appealed to Carnegie's vanity and bent for personal excitement. He reported the circumstances in the first two paragraphs of his second periodical article, "The Best Fields for Philanthropy," which appeared in the Review in December 1889. As the latter article is here reprinted, Carnegie omitted this episode and began with the third paragraph of the original. There were also other minor changes from the original essay.

1. The problem of our age is the proper administration of wealth, that the ties of brotherhood may still bind together the rich and poor in harmonious relationship.

Some might say the problem of our age is the need for PEACE!
Others might say the problem in our materialistic age is the lack of spirituality. Nevertheless, as the old saying goes - money appears to be the root of all evil - and so while Carnegie lived at a time when the struggle between labor and capital was the predominant concern of the day, still it is a proper thesis from which to begin our study of the reorganization of society.

Be anxiously concerned with the needs of the age ye live in, and centre your deliberations on its exigencies and requirements.
(Baha'u'llah: Proclamation of Baha'u'llah, page 116)

Is it not a fact - and this is the central idea I desire to emphasize -

that the fundamental cause of this world unrest is attributable, not so much to the consequences of what must sooner or later come to be regarded as a transitory dislocation in the affairs of a continually changing world, but rather to the failure of those into whose hands the immediate destinies of peoples and nations have been committed, to adjust their system of economic and political institutions to the imperative needs of a rapidly evolving age? Are not these intermittent crises that convulse present-day society due primarily to the lamentable inability of the world's recognized leaders to read aright the signs of the times, to rid themselves once for all of their preconceived ideas and fettering creeds, and to reshape the machinery of their respective governments according to those standards that are implicit in Baha'u'llah's supreme declaration of the Oneness of Mankind - the chief and distinguishing feature of the Faith He proclaimed? For the principle of the Oneness of Mankind, the cornerstone of Baha'u'llah's world-embracing dominion, implies nothing more nor less than the enforcement of His scheme for the unification of the world - the scheme to which we have already referred. "In every Dispensation," writes Abdu'l-Baha, "the light of Divine Guidance has been focussed upon one central theme.... In this wondrous Revelation, this glorious century, the foundation of the Faith of God and the distinguishing feature of His Law is the consciousness of the Oneness of Mankind." (Shoghi Effendi: World Order of Baha'u'llah, page 36)

"Nevertheless a greater and greater number of thoughtful and fair-minded men and women are recognizing in the clamour of contention, grief and destruction, now reaching such horrendous proportions, the evidences of Divine chastisement, and, turning their faces towards God, are becoming increasingly receptive to His Word. Doubtless the present circumstances, though tragic and awful in their immediate consequences, are serving to sharpen the focus on the indispensability of the Teachings of Baha'u'llah to the needs of the present age, and will provide many opportunities to reach countless waiting souls, hungry and thirsty for Divine guidance." (From a letter of the Universal House of Justice to the Baha'is of the World, November 16, 1969: Messages from the Universal House of Justice, pp. 33-34) (Multiple Authors: Lights of Guidance, pages 132-133)

"The inordinate disparity between rich and poor, a source of acute suffering, keeps the world in a state of instability, virtually on the brink of war. Few societies have dealt effectively with this situation. The solution calls for the combined application of spiritual, moral and practical approaches. A fresh look at the problem is required, entailing consultation with experts from a wide spectrum of disciplines, devoid of economic and ideological polemics, and involving the people directly affected in the decisions that must urgently be made. It is an issue that is bound up not only with the necessity for eliminating extremes of wealth and poverty but also

with those spiritual verities the understanding of which can produce a new universal attitude. Fostering such an attitude is itself a major part of the solution." (The Universal House of Justice: The Promise of World Peace, pp. 10-11, Haifa, 1985)

The conditions of human life have not only been changed, but revolutionized, within the past few hundred years. In former days there was little difference between the dwelling, dress, food, and environment of the chief and those of his retainers. The Indians are today where civilized man then was. When visiting the Sioux, I was led to the wigwam of the chief. It was like the others in external appearance, and even within the difference was trifling between it and those of the poorest of his braves. The contrast between the palace of the millionaire and the cottage of the laborer with us today measures the change which has come with civilization.

Be a treasure to the poor, an admonisher to the rich, an answerer to the cry of the needy, a preserver of the sanctity of thy pledge. (Baha'u'llah: Epistle to the Son of the Wolf, page 93)

O YE RICH ONES ON EARTH! The poor in your midst are My trust; guard ye My trust, and be not intent only on your own ease. (Baha'u'llah: Persian Hidden Words, page 54)

Certainly, some being enormously rich and others lamentably poor, an organization is necessary to control and improve this state of affairs. It is important to limit riches, as it is also of importance to limit poverty. Either extreme is not good. To be seated in the mean(1) is most desirable. If it be right for a capitalist to possess a large fortune, it is equally just that his workman should have a sufficient means of existence. A financier with colossal wealth should not exist whilst near him is a poor man in dire necessity. When we see poverty allowed to reach a condition of starvation it is a sure sign that somewhere we shall find tyranny. Men must bestir themselves in this matter, and no longer delay in altering conditions which bring the misery of grinding poverty to a very large number of the people. The rich must give of their abundance, they must soften their hearts and cultivate a compassionate intelligence, taking thought for those sad ones who are suffering from lack of the very necessities of life. There must be special laws made, dealing with these extremes of riches and of want. The members of the Government should consider the laws of God when they are framing plans for the ruling of the people. The general rights of mankind must be guarded and preserved. The government of the countries should conform to the Divine Law which gives equal justice to all. This is the only way in which the deplorable superfluity of great wealth and miserable, demoralizing, degrading poverty can be abolished. Not until this is done will the Law of God be obeyed. (Abdu'l-Baha: Paris Talks*, pages 153-154)

---Page 15 The Gospel of
Wealth - II Administration of
Wealth---

This change, however, is not to be deplored, but welcomed as highly beneficial. It is well, nay, essential, for the progress of the race that the houses of some should be homes for all that is highest and best in literature and the arts, and for all the refinements of civilization, rather than that none should be so. Much better this great irregularity than universal squalor. Without wealth there can be no Maecenas. The "good old times" were not good old times. Neither master nor servant was as well situated then as today. A relapse to old conditions would be disastrous to both -- not the least so to him who serves -- and would sweep away civilization with it. But whether the change be for good or ill, it is upon us, beyond our power to alter, and, therefore, to be accepted and made the best of. It is a waste of time to criticize the inevitable.

King Lycurgus, the philosopher, made a great plan to equalize the subjects of Sparta; with self-sacrifice and wisdom was the experiment begun. Then the king called the people of his kingdom, and made them swear a great oath to maintain the same order of government if he should leave the country, also that nothing should make them alter it until his return. Having secured this oath, he left his kingdom of Sparta and never returned. Lycurgus abandoned the situation, renouncing his high position, thinking to achieve the permanent good of his country by the equalization of the property and of the conditions of life in his kingdom. All the self-sacrifice of the king was in vain. The great experiment failed. After a time all was destroyed; his carefully thought-out constitution came to an end. The futility of attempting such a scheme was shown and the impossibility of attaining equal conditions of existence was proclaimed in the ancient kingdom of Sparta. In our day any such attempt would be equally doomed to failure. (Abdu'l-Baha: Paris Talks*, pages 152-153)

Among the results of the manifestation of spiritual forces will be that the human world will adapt itself to a new social form, the justice of God will become manifest throughout human affairs, and human equality will be universally established. The poor will receive a great bestowal, and the rich attain eternal happiness. For although at the present time the rich enjoy the greatest luxury and comfort, they are nevertheless deprived of eternal happiness; for eternal happiness is contingent upon giving, and the poor are everywhere in the state of abject need. Through the manifestation of God's great equity the poor of the world will be rewarded and assisted fully, and there will be a readjustment in the economic conditions of mankind so that in the future there will not be the abnormally rich nor the abject poor. The rich will enjoy the privilege of this new economic condition as well as the poor, for owing to certain provisions and restrictions they will not be able to accumulate so much as to be burdened by its management, while the poor will be relieved from the stress of want and misery. The rich will enjoy his palace, and the poor will have his comfortable cottage. The essence of the matter is that divine justice will become manifest in human conditions and affairs, and all mankind will find comfort and enjoyment in life. It is not meant that all will be equal, for inequality in degree and capacity is a property of nature. Necessarily there will be rich people and also those who will be in want of their livelihood, but in the aggregate community there will be equalization and readjustment of values and interests. In the future there will be no very rich nor extremely poor. There will be an equilibrium of interests, and a condition will be established which will make both rich and poor comfortable and content. This will be an eternal and blessed outcome of the glorious twentieth century which will be realized universally. The significance of it is that the glad tidings of great joy revealed in the promises of the Holy Books will be fulfilled. (Abdu'l-Baha:

2. It is easy to see how the change has come. One illustration will serve for almost every phase of the cause. In the manufacture of products we have the whole story. It applies to all combinations of human industry, as stimulated and enlarged by the inventions of this scientific age. Formerly, articles were manufactured at the domestic hearth, or in small shops which formed part of the household. The master and his apprentices worked side by side, the latter living with the master, and therefore subject to the same conditions. When these apprentices rose to be masters, there was little or no change in their mode of life, and they, in turn, educated succeeding apprentices in the same routine. There was, substantially, social equality, and even political equality, for those engaged in industrial pursuits had then little or no voice in the State.

This is a century of life and renewal. Sciences and arts, industry and invention have been reformed. Law and ethics have been reconstituted, reorganized. The world of thought has been regenerated. Sciences of former ages and philosophies of the past are useless today. Present exigencies demand new methods of solution; world problems are without precedent. Old ideas and modes of thought are fast becoming obsolete. Ancient laws and archaic ethical systems will not meet the requirements of modern conditions, for this is clearly the century of a new life, the century of the revelation of reality and, therefore, the greatest of all centuries. Consider how the scientific developments of fifty years have surpassed and eclipsed the knowledge and achievements of all the former ages combined. Would the announcements and theories of ancient astronomers explain our present knowledge of the suns and planetary systems? Would the mask of obscurity which beclouded medieval centuries meet the demand for clear-eyed vision and understanding which characterizes the world today? Will the despotism of former governments answer the call for freedom which has risen from the heart of humanity in this cycle of illumination? It is evident that no vital results are now forthcoming from the customs, institutions and standpoints of the past. In view of this, shall blind imitations of ancestral forms and theological interpretations continue to guide and control the religious life and spiritual development of humanity today? Shall man, gifted with the power of reason, unthinkingly follow and adhere to dogma, creeds and hereditary beliefs which will not bear the analysis of reason in this century of effulgent reality? Unquestionably this will not satisfy men of science, for when they find premise or conclusion contrary to present standards of proof and without real foundation, they reject that which has been formerly accepted as standard and correct and move forward from new foundations. (Abdu'l-Baha: Promulgation of Universal Peace*, pages 140-141)

3. The inevitable result of such a mode of manufacture was crude articles at high prices. Today the world obtains commodities of excellent quality at prices which even the preceding generation would have deemed incredible. In the commercial world similar causes have produced similar results, and the race is benefited thereby. The poor enjoy what

---Page 16 The Gospel of Wealth - II Administration of Wealth---

the rich could not before afford. What were the luxuries have become the necessities of life. The laborer has now more comforts than the farmer had a few generations ago. The farmer has more luxuries than the landlord had, and is more richly clad and better housed. The landlord has books and pictures rarer and appointments more artistic than the king could then obtain.

From every standpoint the world of humanity is undergoing a reformation. The laws of former governments and civilizations are in process of revision; scientific ideas and theories are developing and advancing to meet a new range of phenomena; invention and discovery are penetrating hitherto unknown fields, revealing new wonders and hidden secrets of the material universe; industries have vastly wider scope and production; everywhere the world of mankind is in the throes of evolutionary activity indicating the passing of the old conditions and advent of the new age of reformation. Old trees yield no fruitage; old ideas and methods are obsolete and worthless now. Old standards of ethics, moral codes and methods of living in the past will not suffice for the present age of advancement and progress. (`Abdu'l-Baha: Promulgation of Universal Peace*, page 439)

Man is always progressing. His circle of knowledge is ever widening, and his mental activity flows through many and varied channels. Look what man has accomplished in the field of science, consider his many discoveries and countless inventions and his profound understanding of natural law. In the world of art it is just the same, and this wonderful development of man's faculties becomes more and more rapid as time goes on. If the discoveries, inventions and material accomplishments of the last fifteen hundred years could be put together, you would see that there has been greater advancement during the last hundred years than in the previous fourteen centuries. For the rapidity with which man is progressing increases century by century. (`Abdu'l-Baha: Paris Talks*, pages 71-72)

In times gone by progress on the material plane was not so rapid, neither was there bloodshed in such profusion. In ancient warfare there were no cannons, no guns, no dynamite, no shells, no torpedo boats, no battleships, no submarines. Now, owing to material civilization, we have all these inventions, and war goes from bad to worse! Europe itself has become like one immense arsenal, full of explosives, and may God prevent its ignition - for, should this happen, the whole world would be involved. I want to make you understand that material progress and spiritual progress are two very different things, and that only if material progress goes hand in hand with spirituality can any real progress come about, and the Most Great Peace reign in the world. (`Abdu'l-Baha: Paris Talks*, pages 107-108)

4. The price we pay for this salutary change is, no doubt, great. We assemble thousands of operatives in the factory, and in the mine, of whom the employer can know little or nothing, and to whom he is little better than a myth. All intercourse between them is at an end. Rigid castes are formed, and, as usual, mutual ignorance breeds mutual distrust. Each caste is without sympathy with the other, and ready to credit anything disparaging in regard to it. Under the law of competition, the employer of thousands is forced into the strictest economies, among which the rates paid to labor figure prominently, and often there is friction between the employer and the employed, between capital and labor, between rich and poor. Human society loses homogeneity.

Then rules and laws should be established to regulate the excessive fortunes of certain private individuals and meet the needs of millions of the poor masses; thus a certain moderation would be obtained. However, absolute equality is just as impossible, for absolute equality in fortunes, honors, commerce, agriculture, industry would end in disorderliness, in chaos, in disorganization of the means of existence, and in universal disappointment: the order of the community would be quite destroyed. Thus difficulties will also arise when unjustified equality is imposed. It is, therefore, preferable for moderation to be established by means of laws and regulations to hinder the constitution of the excessive fortunes of certain individuals, and to protect the essential needs of the masses. For instance, the manufacturers and the industrialists heap up a treasure each day, and the poor artisans do not gain their daily sustenance: that is the height of iniquity, and no just man can accept it. Therefore, laws and regulations should be established which would permit the workmen to receive from the factory owner their wages and a share in the fourth or the fifth part of the profits, according to the capacity of the factory; or in some other way the body of workmen and the manufacturers should share equitably the profits and advantages. Indeed, the capital and management come from the owner of the factory, and the work and labor, from the body of the workmen. Either the workmen should receive wages which assure them an adequate support and, when they cease work, becoming feeble or helpless, they should have sufficient benefits from the income of the industry; or the wages should be high enough to satisfy the workmen with the amount they receive so that they may themselves be able to put a little aside for days of want and helplessness. When matters will be thus fixed, the owner of the factory will no longer put aside daily a treasure which he has absolutely no need of (for, if the fortune is disproportionate, the capitalist succumbs under a formidable burden and gets into the greatest difficulties and troubles; the administration of an excessive fortune is very difficult and exhausts man's natural strength). And the workmen and artisans will no longer be in the greatest misery and want; they will no longer be submitted to the worst privations at the end of their life. It is, then, clear and evident that the repartition of excessive fortunes among a small number of individuals, while the masses are in need, is an iniquity and an injustice.

5. The price which society pays for the law of competition, like the price it pays for cheap comforts and luxuries, is also great; but the advantages of this law are also greater still than its cost -- for it is to this law that we owe our wonderful material development, which brings improved conditions in its train. But, whether the law be benign or not, we must say of it, as we say of the change in the conditions of men to which we have referred: It is here; we cannot evade it; no substitutes for it have been found; and while the law may be sometimes hard for the individual, it is best for the race, because it insures the survival of the fittest in every department. We accept and welcome, therefore, as conditions to which we must accommodate ourselves, great inequality of environment; the concentration of business, industrial and commercial, in the hands of a few; and the law of competition between these, as being not only beneficial, but

---Page 17 The Gospel of Wealth - II Administration of Wealth---

essential to the future progress of the race. Having accepted these, it follows that

competition - How much of the energy employed in the business world of today is expended simply in canceling and neutralizing the efforts of other people--in useless strife and competition! And how much in ways that are still more injurious! Were all to work, and were all work, whether of brain or hand, of a nature profitable to mankind, as Baha'u'llah commands, then the supplies of everything necessary for a healthy, comfortable and noble life would amply suffice for all. There need be no slums, no starvation, no destitution, no industrial slavery, no health-destroying drudgery. (Bahá'u'lláh & New Era, page 143)

The Ethics of Wealth - According to the Baha'i teachings, riches rightly acquired and rightly used are honorable and praiseworthy. Services rendered should be adequately rewarded. Baha'u'llah says in the Tablet of Tarazat:--"The people of Baha must not refuse to discharge the due reward of anyone, and must respect possessors of talent,... One must speak with justice and recognize the worth of benefits." (Bahá'u'lláh & New Era, page 143)

essential - The implications for social and economic development are profound. Concern for justice protects the task of defining progress from the temptation to sacrifice the well-being of the generality of humankind -- and even of the planet itself -- to the advantages which technological breakthroughs can make available to privileged minorities. In design and planning, it ensures that limited resources are not diverted to the pursuit of projects extraneous to a community's essential social or economic priorities. Above all, only development programs that are perceived as meeting their needs and as being just and equitable in objective can hope to engage the commitment of the masses of humanity, upon whom implementation depends. The relevant human qualities such as honesty, a willingness to work, and a spirit of cooperation are successfully harnessed to the accomplishment of enormously demanding collective goals when every member of society -- indeed every component group within society -- can trust that they are protected by standards and assured of benefits that apply equally to all.

At the heart of the discussion of a strategy of social and economic development, therefore, lies the issue of human rights. The shaping of such a strategy calls for the promotion of human rights to be freed from the grip of the false dichotomies that have for so long held it hostage. Concern that each human being should enjoy the freedom of thought and action conducive to his or her personal growth does not justify devotion to the cult of individualism that so deeply corrupts many areas of contemporary life. Nor does concern to ensure the welfare of society as a whole require a deification of the state as the supposed source of humanity's well-being. Far otherwise: the history of the present century shows all too clearly that such ideologies and the partisan agendas to which they give rise have

there must be great scope for the exercise of special ability in the merchant and in the manufacturer who has to conduct affairs upon a great scale. That this talent for organization and management is rare among men is proved by the fact that it invariably secures enormous rewards for its possessor, no matter where or under what laws or conditions. The experienced in affairs always rate the MAN whose services can be obtained as a partner as not only the first consideration, but such as render the question of his capital scarcely worth considering: for able men soon create capital; in the hands of those without the special talent required, capital soon takes wings. Such men become interested in firms or corporations using millions; and, estimating only simple interest to be made upon the capital invested, it is inevitable that their income must exceed their expenditure and that they must, therefore, accumulate wealth. Nor is there any middle ground which such men can occupy, because the great manufacturing or commercial concern which does not earn at least interest upon its capital soon becomes bankrupt. It must either go forward or fall behind; to stand still is impossible. It is a

been themselves the principal enemies of the interests they purport to serve. Only in a consultative framework made possible by the consciousness of the organic unity of humankind can all aspects of the concern for human rights find legitimate and creative expression. (Prosperity of Humankind, pages 5-6)

revenue - His Holiness Baha'u'llah has given instructions regarding every one of the questions confronting humanity. He has given teachings and instructions with regard to every one of the problems with which man struggles. Among them are (the teachings) concerning the question of economics that all the members of the body politic may enjoy through the working out of this solution the greatest happiness, welfare and comfort without any harm or injury attacking the general order of things. Thereby no difference or dissension will occur. No sedition or contention will take place. This solution is this:

First and foremost is the principle that to all the members of the body politic shall be given the greatest achievements of the world of humanity. Each one shall have the utmost welfare and well-being. To solve this problem we must begin with the farmer; there will we lay a foundation for system and order because the peasant class and the agricultural class exceed other classes in the importance of their service. In every village there must be established a general storehouse which will have a number of revenues. (Foundations of World Unity, page 39)

condition essential to its successful operation that it should be thus far profitable, and even that, in addition to interest on capital, it should make profit. It is a law, as certain as any of the others named, that men possessed of this peculiar talent for affairs, under the free play of economic forces must, of necessity, soon be in receipt of more revenue than can be judiciously expended upon themselves; and this law is as beneficial for the race as the others.

6. Objections to the foundations upon which society is based are not in order, because the condition of the race is better with these than it has been with any other which has been tried. Of the effect of any new substitutes proposed we cannot be sure. The Socialist or Anarchist who seeks to overturn present conditions is to be regarded as attacking the

---Page 18 The Gospel of Wealth - II Administration of Wealth---

foundation upon which civilization itself rests, for civilization took its start from the day when the capable, industrious workman said to

society - The institutions of society will succeed in eliciting and directing the potentialities latent in the consciousness of the world's peoples to the extent that the exercise of authority is governed by principles that are in harmony with the evolving interests of a rapidly maturing human race. Such principles include the obligation of those in authority to win the confidence, respect, and genuine support of those whose actions they seek to govern; to consult openly and to the fullest extent possible with all whose interests are affected by decisions being arrived at; to assess in an objective manner both the real needs and the aspirations of the communities they serve; to benefit from scientific and moral advancement in order to make appropriate use of the community's resources, including the energies of its members. No single principle of effective authority is so important as giving priority to building and maintaining unity among the members of a society and the members of its administrative institutions. Reference has already been made to the intimately associated issue of commitment to the search for justice in all matters.

Clearly, such principles can operate only within a culture that is essentially democratic in spirit and method. To say this, however, is not to endorse the ideology of partisanship that has everywhere boldly assumed democracy's name and which, despite impressive contributions to human progress in the past, today finds itself mired in the cynicism, apathy, and corruption to which it has given rise. In selecting those who are to take collective decisions on its behalf, society does not need and is not well served by the political theater of nominations, candidature, electioneering, and solicitation. It lies

his incompetent and lazy fellow, "If thou dost not sow, thou shalt not reap," and thus ended primitive Communism by separating the drones from the bees. One who studies this subject will soon be brought face to face with the conclusion that upon the sacredness of property civilization itself depends -- the right of the laborer to his hundred dollars in the savings-bank, and equally the legal right of the millionaire to his millions. Every man must be allowed "to sit under his own vine and fig-tree, with none to make afraid," if human society is to advance, or even to remain so far advanced as it is. To those who propose to substitute Communism for this intense Individualism, the answer therefore is: The race has tried that. All progress from that barbarous day to the present time has resulted from its displacement. Not evil, but good, has come to the race from the accumulation of wealth by those who have had the ability and energy to produce it. But even if we admit for a moment that it might be better for the race to discard its present foundation, Individualism, -- that it is a nobler ideal that man should labor, not for himself alone, but in and for a brotherhood of his fellows, and share with

within the capacity of all people, as they become progressively educated and convinced that their real development interests are being served by programs proposed to them, to adopt electoral procedures that will gradually refine the selection of their decision-making bodies. As the integration of humanity gains momentum, those who are thus selected will increasingly have to see all their efforts in a global perspective. Not only at the national, but also at the local level, the elected governors of human affairs should, in Baha'u'llah's view, consider themselves responsible for the welfare of all of humankind.

The tasks entailed in the development of a global society call for levels of capacity far beyond anything the human race has so far been able to muster. Reaching these levels will require an enormous expansion in access to knowledge, on the part of individuals and social organizations alike. Universal education will be an indispensable contributor to this process of capacity building, but the effort will succeed only as human affairs are so reorganized as to enable both individuals and groups in every sector of society to acquire knowledge and apply it to the shaping of human affairs. (Prosperity of Humankind, page 8,14 &15)

O my friend! In all circumstances one should seize upon every means which will promote security and tranquillity among the peoples of the world. The Great Being saith: In this glorious Day whatever will purge you from corruption and will lead you towards peace and composure, is indeed the Straight Path.

Please God, the peoples of the world may be led, as the result of the high endeavours exerted by their rulers and the wise and learned amongst men, to recognize their best interests. How long will humanity persist in its waywardness? How long will injustice continue? How long is chaos and confusion to reign amongst men? How long will discord agitate the face of society? (Tablets of Bahá'u'lláh, page171)

them all in common, realizing Swedenborg's idea of heaven

(2) Carnegie is referring to Emanuel Swedenborg's (1688-1772) mystic theology expressed in his work Heaven and Hell.

where, as he says, the angels derive their happiness, not from laboring for self, but for each other, -- even admit all this, and a sufficient answer is, This is not evolution, but revolution. It necessitates the changing of human nature itself -- a work of eons, even if it were good to change it, which we cannot know.

7. It is not practicable in our day or in our age. Even if desirable theoretically, it belongs to another and long-succeeding sociological stratum. Our duty is with what is practicable now -- with the next step possible in our day and generation. It is criminal to waste our energies in endeavoring to uproot,

---Page 19 The Gospel of Wealth - II Administration of Wealth---

when all we can profitably accomplish is to bend the universal tree of humanity a little in the direction most favorable to the production of good fruit under existing circumstances. We might as

society - ..."The maturity of the gift of understanding is made manifest through consultation." The standard of truth seeking this process demands is far beyond the patterns of negotiation and compromise that tend to characterize the present-day discussion of human affairs. It cannot be achieved -- indeed, its attainment is severely handicapped -- by the culture of protest that is another widely prevailing feature of contemporary society. Debate, propaganda, the adversarial method, the entire apparatus of partisanship that have long been such familiar features of collective action are all fundamentally harmful to its purpose: that is, arriving at a consensus about the truth of a given situation and the wisest choice of action among the options open at any given moment.

What Baha'u'llah is calling for is a consultative process in which the individual participants strive to transcend their respective points of view, in order to function as members of a body with its own interests and goals. In such an atmosphere, characterized by both candor and courtesy, ideas belong not to the individual to whom they occur during the discussion but to the group as a whole, to take up, discard, or revise as seems to best serve the goal pursued. Consultation succeeds to the extent that all participants support the decisions arrived at, regardless of the individual opinions with which they entered the discussion. Under such circumstances an earlier decision can be readily reconsidered if experience exposes any shortcomings. (Prosperity of Humankind, page 8)

well urge the destruction of the highest existing type of man because he failed to reach our ideal as to favor the destruction of Individualism, Private Property, the Law of Accumulation of Wealth, and the Law of Competition; for these are the highest result of human experience, the soil in which society, so far, has produced the best fruit. Unequally or unjustly, perhaps, as these laws sometimes operate, and imperfect as they appear to the Idealist, they are, nevertheless, like the highest type of man, the best and most valuable of all that humanity has yet accomplished.

8. We start, then, with a condition of affairs under which the best interests of the race are promoted, but which inevitably gives wealth to the few. Thus far, accepting conditions as they exist, the situation can be surveyed and pronounced good. The question then arises, -- and if the foregoing be correct, it is the only question with which we have to deal, -- What is the proper mode of administering wealth after the laws upon which civilization is founded have thrown it into the hands of the few? And it is of this great question that I

administering wealth - Certainly, some being enormously rich and others lamentably poor, an organization is necessary to control and improve this state of affairs. It is important to limit riches, as it is also of importance to limit poverty. Either extreme is not good. To be seated in the mean is most desirable. If it be right for a capitalist to possess a large fortune, it is equally just that his workman should have a sufficient means of existence.

A financier with colossal wealth should not exist whilst near him is a poor man in dire necessity. When we see poverty allowed to reach a condition of starvation it is a sure sign that somewhere we shall find tyranny. Men must bestir themselves in this matter, and no longer delay in altering conditions which bring the misery of grinding poverty to a very large number of the people. The rich must give of their abundance, they must soften their hearts and cultivate a compassionate intelligence, taking thought for those sad ones who are suffering from lack of the very necessities of life.

There must be special laws made, dealing with these extremes of riches and of want. The members of the Government should consider the laws of God when they are framing plans for the ruling of the people. The general rights of mankind must be guarded and

believe I offer the true solution. It will be understood that fortunes are here spoken of, not moderate sums saved by many years of effort, the returns from which are required for the comfortable maintenance and education of families. This is not wealth, but only competence, which it should be the aim of all to acquire, and which it is for the best interests of society should be acquired.

9. There are but three modes in which surplus wealth can be disposed of. It can be left to the families of the decedents; or it can be bequeathed for public purposes; or, finally, it can be administered by its possessors during their lives. Under the first and second modes most of the wealth of the world that has reached the few has hitherto been applied. Let us in turn consider each of these modes. The first is the most

---Page 20 The Gospel of Wealth - II Administration of Wealth---

injudicious. In monarchical countries, the estates and the greatest portion of the wealth are left to the first son, that the vanity of the parent may be gratified by the thought that his name and title are to

preserved.

The government of the countries should conform to the Divine Law which gives equal justice to all. This is the only way in which the deplorable superfluity of great wealth and miserable, demoralizing, degrading poverty can be abolished. Not until this is done will the Law of God be obeyed. (Abdu'l-Bahá, Paris Talks, page 153-154)

inheritance - We have divided inheritance into seven categories

The Baha'i laws of inheritance apply only in case of intestacy, that is, when the individual dies without leaving a will. In the Kitab-i-Aqdas (#109), Baha'u'llah instructs every believer to write a will. He elsewhere clearly states that the individual has full jurisdiction over his property and is free to determine the manner in which his or her estate is to be divided and to designate, in the will, those, whether Baha'i or non-Baha'i, who should inherit (Q and A 69). In this connection, a letter written on behalf of Shoghi Effendi explains that:

...even though a Baha'i is permitted in his will to dispose of his wealth in the way he wishes, yet he is morally and conscientiously bound to always bear in mind, while writing his will, the necessity of his upholding the principle of Baha'u'llah regarding the social function of wealth, and the consequent necessity of avoiding its over-accumulation and concentration in a few individuals or groups of individuals.

This verse of the Aqdas introduces a lengthy passage in which Baha'u'llah elaborates the Baha'i law of inheritance. In reading this passage one should bear in mind that the law is formulated with the presumption that the deceased is a man; its provisions apply, mutatis mutandis, when the deceased is a woman.

The system of inheritance which provides for distribution of the deceased's estate among seven categories of heirs (children, spouse, father, mother, brothers, sisters, and teachers) is based on the provisions set out by the Báb in the Bayan. The major features of the

descend unimpaired to succeeding generations. The condition of this class in Europe to-day teaches the failure of such hopes or ambitions. The successors have become impoverished through their follies, or from the fall in the value of land. Even in Great Britain the strict law of entail has been found inadequate to maintain an hereditary class. Its soil is rapidly passing into the hands of the stranger. Under republican institutions the division of property among the children is much fairer; but the question which forces itself upon thoughtful men in all lands is, Why should men leave great fortunes to their children? If this is done from affection, is it not misguided affection? Observation teaches that, generally speaking, it is not well for the children that they should be so burdened. Neither is it well for the State. Beyond providing for the wife and daughters moderate sources of income, and very moderate allowances indeed, if any, for the sons, men may well hesitate; for it is no longer questionable that great sums bequeathed often work more for the injury than for the good of the recipients. Wise men will soon conclude that, for the best interests of the members of their families, and of the State, such

Baha'i laws of inheritance in the case of intestacy are:

1. If the deceased is a father and his estate includes a personal residence, such residence passes to the eldest son (Q and A 34).
2. If the deceased has no male descendants, two thirds of the residence pass to his female descendants and the remaining third passes to the House of Justice (Q and A 41, 72). See note 42 concerning the levels of the institution of the House of Justice to which this law applies. (See also note 44.)
3. The remainder of the estate is divided among the seven categories of heirs. For details of the number of shares to be received by each group, see Questions and Answers, number 5, and Synopsis and Codification, section IV.C.3.a.
4. In case there is more than one heir in any category the share allotted to that class should be divided between them equally, be they male or female. (Bahá'u'lláh, Kitáb-i-Aqdás, page 182-183)

bequests are an improper use of their means.

10. It is not suggested that men who have failed to educate their sons to earn a livelihood shall cast them adrift in poverty. If any man has seen fit to rear his sons with a view to their living idle lives, or, what is highly commendable, has instilled in them the sentiment that they are in a position to labor for public ends without reference to pecuniary considerations, then, of course, the duty of the parent is to see that such are provided for in moderation. There are instances of millionaires' sons unspoiled by wealth, who, being rich, still perform great services to the community. Such are the very salt of the earth, as valuable as, unfortunately, they are

---Page 21 The Gospel of Wealth - II Administration of Wealth---

rare. It is not the exception, however, but the rule, that men must regard; and, looking at the usual result of enormous sums conferred upon legatees, the thoughtful man must shortly say, "I would as soon leave to my son a curse as the almighty dollar," and admit to himself

livelihood - O MY SERVANT! The best of men are they that earn a livelihood by their calling and spend upon themselves and upon their kindred for the love of God, the Lord of all worlds. (Baha'u'llah: The Hidden Words, Persian #82)

Blessed are those who have fixed their gaze on the realm of glory and have followed the commandments of the Lord of Names. Blessed is he who in the days of God will engage in handicrafts. This is a bounty from God, for in this Most Great Dispensation it is acceptable in the sight of God for man to occupy himself in a trade which relieveth him of depending upon charity. The craft of every craftsman is regarded as worship. (Bahá'u'lláh, The Arts, Compilation of Compilations, vol. I, number 1)

10. The purpose of learning should be the promotion of the welfare of the people, and this can be achieved through crafts. It hath been revealed and is now repeated that the true worth of artists and craftsmen should be appreciated, for they advance the affairs of mankind. Just as the foundations of religion are made firm through the Law of God, the means of livelihood depend upon those who are engaged in arts and crafts. True learning is that which is conducive to the well-being of the world, not to pride and self-conceit, or to tyranny, violence and pillage.

II. From the Writings and Utterances of 'Abdu'l-Baha

11. Every person must have an occupation, a trade or a craft, so that he may carry other people's burdens, and not himself be a burden to others. (The Arts, Compilation of Compilations, vol. I, number 10 & 11)

It would be well, with regard to the common rights of manufacturers, workmen and artisans, that laws be established, giving moderate profits to manufacturers, and to workmen the necessary means of existence and security for the future. Thus when they become feeble and cease working, get old and helpless, or leave behind children under age, they and their children will not be annihilated by excess of poverty. And it is from the income of the factory itself, to which they have a right, that they will derive a share, however small, toward their livelihood. (Abdu'l-Bahá, Some Answered Questions, page 275)

that it is not the welfare of the children, but family pride, which inspires these legacies.

11. As to the second mode, that of leaving wealth at death for public uses, it may be said that this is only a means for the disposal of wealth, provided a man is content to wait until he is dead before he becomes of much good in the world. Knowledge of the results of legacies bequeathed is not calculated to inspire the brightest hopes of much posthumous good being accomplished by them. The cases are not few in which the real object sought by the testator is not attained, nor are they few in which his real wishes are thwarted. In many cases the bequests are so used as to become only monuments of his folly. It is well to remember that it requires the exercise of not less ability than that which acquires it, to use wealth so as to be really beneficial to the community. Besides this, it may fairly be said that no man is to be extolled for doing what he cannot help doing, nor is he to be thanked by the community to which he only leaves wealth at death. Men who leave vast sums in this way may fairly be thought men who would not have left it at all had they been able to

Bequests - "If a wealthy man at the time of his death bequeaths a gift to the poor and miserable, and gives a part of his wealth to be spent for them, perhaps this action may be the cause of his pardon and forgiveness, and of his progress in the divine Kingdom.

"Also a father and mother endure the greatest troubles and hardships for their children; and often when the children have reached the age of maturity, the parents pass on to the other world. Rarely does it happen that a father and mother in this world see the reward of the care and trouble they have undergone for their children. Therefore, children, in return for this care and trouble, must show forth charity and beneficence, and must implore pardon and forgiveness for their parents. So you ought, in return for the love and kindness shown you by your father, to give to the poor for his sake, with greatest submission and humility implore pardon and remission of sins, and ask for the supreme mercy." (Lights of Guidance, number 685)

90. Great is the recompense that God has ordained for the true and devoted souls, the pure and detached beings who have spontaneously bequeathed a portion of their earthly possessions to the Cause of God, either during their own lifetimes or through their wills, and have had the privilege and honour of discharging their obligations to Huququ'llah.

Give assurance on my behalf to the donors and to the survivors of those who have ascended unto God, affirming that these efforts and donations are bound to attract divine confirmations, heavenly blessings and incalculable favours, and to promote the manifold interests of the International Baha'i Community. Well is it with them, inasmuch as God has enabled them to fulfil that which shall elevate their stations in this world and in the world to come. (23 June 1945--translated from the Persian) (Bahá'u'lláh, Huququ'llah, page 31)

take it with them. The memories of such cannot be held in grateful remembrance, for there is no grace in their gifts. It is not to be wondered at that such bequests seem so generally to lack the blessing.

12. The growing disposition to tax more and more heavily large estates left at death is a cheering indication of the growth of a salutary change in public opinion. The State of Pennsylvania now takes -- subject to some exceptions -- one tenth of the property left by its citizens. The budget presented in the British Parliament the other day proposes

---Page 22 The Gospel of Wealth - II Administration of Wealth---

to increase the death duties; and, most significant of all, the new tax is to be a graduated one. Of all forms of taxation this seems the wisest

(3) Inheritance taxes have historically taken many forms. They may be progressively heavier depending on the size of the transferred estate; they may vary with the relationship of the beneficiary to the testator; they may be levied upon different kinds of property. By the late eighties, England had carried the system of "death duties," purportedly a Gladstonian designation, farther than any other nation. By 1890 only six American states levied

Inheritance - Baha'u'llah states that a person should be free to dispose of his possessions during his lifetime in any way he chooses, and it is incumbent on everyone to write a will stating how his property is to be disposed of after his death. When a person dies without leaving a will, the value of the property should be estimated and divided in certain stated proportions among seven classes of inheritors, namely, children, wife or husband, father, mother, brothers, sisters and teachers, the share of each diminishing from the first to the last. In the absence of one or more of these classes, the share which would belong to them goes to the public treasury, to be expended on the poor, the fatherless and the widows, or on useful public works. If the deceased has no heirs, then all his property goes to the public treasury.

There is nothing in the law of Baha'u'llah to prevent a man from leaving all his property to one individual if he pleases, but Baha'is will naturally be influenced, in making their wills, by the model Baha'u'llah has laid down for the case of intestate estates, which ensures distribution of property among a considerable number of heirs. (Bahá'u'lláh & New Era, page 146)

taxes of one sort or another on inheritances; and federal resort to inheritance taxation had been generally a temporary feature of emergency war financing. By 1900 twenty-one states had inheritance taxes.

Men who continue hoarding great sums all their lives, the proper use of which for public ends would work good to the community from which it chiefly came, should be made to feel that the community, in the form of the State, cannot thus be deprived of its proper share. By taxing estates heavily at death the State marks its condemnation of the selfish millionaire's unworthy life.

13. It is desirable that nations should go much further in this direction. Indeed, it is difficult to set bounds to the share of a rich man's estate which should go at his death to the public through the agency of the State, and by all means such taxes should be graduated, beginning at nothing upon moderate sums to dependents, and increasing rapidly as the amounts swell, until of the millionaire's hoard, as of Shylock's, at least

*The other

coffer of the State*

tax - Difference of capacity in human individuals is fundamental. It is impossible for all to be alike, all to be equal, all to be wise. Baha'u'llah has revealed principles and laws which will accomplish the adjustment of varying human capacities. He has said that whatsoever is possible of accomplishment in human government will be effected through these principles. When the laws he has instituted are carried out there will be no millionaires possible in the community and likewise no extremely poor. This will be effected and regulated by adjusting the different degrees of human capacity. The fundamental basis of the community is agriculture, tillage of the soil. All must be producers. Each person in the community whose income is equal to his individual producing capacity shall be exempt from taxation. But if his income is greater than his needs he must pay a tax until an adjustment is effected. That is to say, a man's capacity for production and his needs will be equalized and reconciled through taxation. If his production exceeds he will pay no tax; if his necessities exceed his production he shall receive an amount sufficient to equalize or adjust. Therefore taxation will be proportionate to capacity and production and there will be no poor in the community. (Foundations of World Unity, page 37)

(4) Portia's judgment in Merchant of Venice, Act IV, scene 1.

This policy would work powerfully to induce the rich man to attend to the administration of wealth during his life, which is the end that society should always have in view, as being by far the most fruitful for the people. Nor need it be feared that this policy would sap the root of enterprise and render men less anxious to accumulate, for, to the class whose ambition it is to leave great fortunes and to be talked about after their death, it will attract even more attention, and, indeed, be a somewhat nobler ambition, to have enormous sums paid over to the State from their fortunes.

---Page 23 The Gospel of Wealth - II Administration of Wealth---

14. There remains, then, only one mode of using great fortunes; but in this we have the true antidote for the temporary unequal distribution of wealth, the reconciliation of the rich and the poor -- a reign of harmony, another ideal, differing, indeed, from that of the Communist in requiring only the further evolution of

Public Finance - 'Abdu'l-Baha suggests that each town and village or district should be entrusted as far as possible with the administration of fiscal matters within its own area and should contribute its due proportion for the expenses of the general government. One of the principal sources of revenue should be a graduated income tax. If a man's income does not exceed his necessary expenditure he should not be required to pay any tax, but in all cases where income exceeds the necessary expenditure a tax should be levied, the percentage of tax increasing as the surplus of income over necessary expenditure increases.

On the other hand, if a person, through illness, poor crops, or other cause for which he is not responsible, is unable to earn an income sufficient to meet his necessary expenses for the year, then what he

existing conditions, not the total overthrow of our civilization. It is founded upon the present most intense Individualism, and the race is prepared to put it in practice by degrees whenever it pleases. Under its sway we shall have an ideal State, in which the surplus wealth of the few will become, in the best sense, the property of the many, because administered for the common good; and this wealth, passing through the hands of the few, can be made a much more potent force for the elevation of our race than if distributed in small sums to the people themselves. Even the poorest can be made to see this, and to agree that great sums gathered by some of their fellow-citizens and spent for public purposes, from which the masses reap the principal benefit, are more valuable to them than if scattered among themselves in trifling amounts through the course of many years.

lacks for the maintenance of himself and his family should be supplied out of public funds.

There will also be other sources of public revenue, e.g. from intestate estates, mines, treasure trove and voluntary contributions; while among the expenditures will be grants for the support of the infirm, of orphans, of schools, of the deaf and blind, and for the maintenance of public health. Thus the welfare and comfort of all will be provided for. (Bahá'u'lláh & New Era, page 141-142)

15. If we consider the results which flow from the Cooper Institute, for instance, to the best portion of the race in New York not possessed of means, and compare these with those which would have ensued for the good of the masses from an equal sum distributed by Mr. Cooper in his lifetime in the form of wages, which is the highest form of distribution, being for work done and not for charity, we can form some estimate of the possibilities for the improvement of the race which lie embedded in the present law of the accumulation of wealth. Much of this sum, if distributed in small quantities among the people, would have been wasted in the indulgence of appetite, some of it in excess, and it may be doubted whether even the part put to the best use, that of adding to the comforts of the home, would have yielded results for the race, as a race, at all comparable to those

---Page 24 The Gospel of Wealth - II Administration of Wealth---

which are flowing and are to flow from the Cooper Institute from generation to generation.

Income - Difference of capacity in human individuals is fundamental. It is impossible for all to be alike, all to be equal, all to be wise. Baha'u'llah has revealed principles and laws which will accomplish the adjustment of varying human capacities. He has said that whatsoever is possible of accomplishment in human government will be effected through these principles. When the laws he has instituted are carried out there will be no millionaires possible in the community and likewise no extremely poor. This will be effected and regulated by adjusting the different degrees of human capacity. The fundamental basis of the community is agriculture, tillage of the soil. All must be producers. Each person in the community whose income is equal to his individual producing capacity shall be exempt from taxation. But if his income is greater than his needs he must pay a tax until an adjustment is effected. That is to say, a man's capacity for production and his needs will be equalized and reconciled through taxation. If his production exceeds he will pay no tax; if his necessities exceed his production he shall receive an amount sufficient to equalize or adjust. Therefore taxation will be proportionate to capacity and production and there will be no poor in the community. (Foundations of World Unity, page 37)

The question of socialization is very important. It will not be solved by strikes for wages. All the governments of the world must be united and organize an assembly the members of which should be elected from the parliaments and the nobles of the nations. These must plan with utmost wisdom and power so that neither the capitalist suffer from enormous losses nor the laborers become needy. In the utmost moderation they should make the law; then announce to the public that the rights of the working people are to be strongly preserved. Also the rights of the capitalists are to be protected. When such a general plan is adopted by the will of both sides, should a strike occur, all the governments of the world collectively should resist it. Other-wise, the labor problem will lead to much destruction, especially in Europe. Terrible things will take place.

For instance, the owners of properties, mines and factories should share their incomes with their employees and give a fairly certain percentage of their products to their workingmen in order that the employees may receive, beside their wages, some of the general income of the factory so that the employee may strive with his soul in the work.

No more trusts will remain in the future. The question of the trusts will be wiped away entirely. Also, every factory that has ten thousand shares will give two thousand shares of these ten thousand to its employees and will write the shares in their names, so that they may have them, and the rest will belong to the capitalists. Then at the end of the month or year whatever they may earn after the

(5) Cooper Union, which celebrated in 1959 the centenary of its opening, was the chief philanthropic undertaking of Peter Cooper (1791-1883). A resident of New York, whose main iron mills were in New Jersey, Cooper was moved to establish an institution providing for those of little means an education in pure and applied science. The Union, though its activities soon embraced a wide variety of intellectual interests, stressed contributions "to the useful purposes of life" and adult education. The Union's building at 3rd Avenue and 7th Street appropriately embodied many structural innovations. Before his death Cooper had given the Union up-wards of \$900,000. In 1902 Carnegie gave \$600,000 to its endowment.

Let the advocate of violent or radical change ponder well this thought.

expenses and wages are paid, according to the number of shares, should be divided among both. In reality, so far great injustice has befallen the common people. Laws must be made because it is impossible for the laborers to be satisfied with the present system. They will strike every month and every year. Finally, the capitalists will lose. In ancient times a strike occurred among the Turkish soldiers. They said to the government: "Our wages are very small and they should be increased." The government was forced to give them their demands. Shortly afterwards they struck again. Finally all the incomes went to the pockets of the soldiers to the extent that they killed the king, saying: "Why didst thou not increase the income so that we might have received more?"

It is impossible for a country to live properly without laws. To solve this problem rigorous laws must be made, so that all the governments of the world will be the protectors thereof. (Foundations of World Unity, pages 43-44)

16. We might even go so far as to take another instance -- that of Mr. Tilden's bequest of five millions of dollars for a free library in the city of New York; but in referring to this one cannot help saying involuntarily: How much better if Mr. Tilden had devoted the last years of his own life to the proper administration of this immense sum; in which case neither legal contest nor any other cause of delay could have interfered with his aims. But let us assume that Mr. Tilden's millions finally become the means of giving to this city a noble public library, where the treasures of the world contained in books will be open to all forever, without money and without price.

[Baha'i Comment](#)

(6) Samuel J. Tilden (1814-1886), New Yorker, able corporation lawyer, loser of the disputed presidential election of 1876, bequeathed a considerable share of his large estate "to establish and maintain a free public library and reading room in the City of New York." To accomplish this end his executors were to incorporate a Tilden Trust. Family heirs contested the will, and in a series of decisions -- possibly animated by political considerations -- various New York courts upset the testator's instructions. Though the Tilden Trust was incorporated in 1887 and the executors settled with the heirs in 1892, the estate was formally in the hands of executors until 1930. With about \$2,250,000 in hand for a library, the Tilden Trust amalgamated in

1901 with the Astor and Lenox Libraries to form the New York Public Library. The present classical building on Fifth Avenue, housing the library, was the fruit of this settlement.

Considering the good of that part of the race which congregates in and around Manhattan Island, would its permanent benefit have been better promoted had these millions been allowed to circulate in small sums through the hands of the masses? Even the most strenuous advocate of Communism must entertain a doubt upon this subject.

---Page 25 The Gospel of Wealth - II Administration of Wealth---

Most of those who think will probably entertain no doubt whatever.

17. Poor and restricted are our opportunities in this life, narrow our horizon, our best work most imperfect; but rich men should be thankful for one inestimable boon. They have it in their power during their lives to busy themselves in organizing benefactions from which the masses of their fellows will derive lasting advantage, and thus dignify their own lives. The highest life is probably to be reached,

[Baha'i Comment](#)

not by such imitation of the life of Christ as Count Tolstoi gives us, but, while animated by Christ's spirit, by recognizing the changed conditions of this age, and adopting modes of expressing this spirit suitable to the changed conditions under which we live, still laboring for the good of our fellows, which was the essence of his life and teaching, but laboring in a different manner.

18. This, then, is held to be the duty of the man of wealth: To set an example of modest, unostentatious living, shunning display or extravagance; to provide moderately for the legitimate wants of those dependent upon him; and, after doing so, to consider all surplus revenues which come to him simply as trust funds, which he is called upon to administer, and strictly bound as a matter of duty to administer in the manner which, in his judgment, is best calculated to produce the most beneficial results for the community -- the man of wealth thus becoming the mere trustee and agent for his poorer brethren, bringing to their service his superior wisdom, experience, and ability to administer, doing for them better than they would

Rich - This is the Book of Generosity which hath been revealed by the King of Eternity. Whoso adorneth himself with this virtue hath distinguished himself and will be blessed by the All-Merciful from His exalted Kingdom of Glory. However, despite his high rank and prominent position, were he to pass beyond the limits, he would be regarded among the prodigal by the All-Knowing, the All-Wise. Cling ye unto moderation. This is the commandment that He Who is the All-Possessing, the Most High hath enjoined upon you in His Generous Book. O ye that are the exponents of generosity and the manifestations thereof! Be generous unto them whom ye find in manifest poverty. Oh ye that are possessed of riches! Take heed lest outward appearance deter you from benevolent deeds in the path of God, the Lord of all mankind.

Say: I swear by God! No one is despised in the sight of the Almighty for being poor. Rather is he exalted, if he is found to be of them who are patient. Blessed are the poor that are steadfast in patience, and woe betide the rich that hold back Huququ'lláh and fail to observe that which is enjoined upon them in His Preserved Tablet.

Say: Pride not yourselves on earthly riches ye possess. Reflect upon your end and upon the recompense for your works that hath been ordained in the Book of God, the Exalted, the Mighty. Blessed is the rich man whom earthly possessions have been powerless to hinder from turning unto God, the Lord of all names.

Verily he is accounted among the most distinguished of men before God, the Gracious, the All-Knowing. (Bahá'u'lláh, Huququ'llah, page 8-9)

or could do for themselves.

19. We are met here with the difficulty of determining what are moderate sums to leave to members of the family; what is modest, unostentatious living; what is the test of extravagance. There must be different standards for different conditions. The answer is that it is as impossible to name exact amounts or actions as it is to define good manners, good taste, or the rules of propriety; but, nevertheless, these are verities,

---Page 26 The Gospel of Wealth - II Administration of Wealth---

well known, although indefinable. Public sentiment is quick to know and to feel what offends these. So in the case of wealth. The rule in regard to good taste in dress of men or women applies here. Whatever makes one conspicuous offends the canon. If any family be chiefly known for display, for extravagance in home, table, or equipage, for enormous sums ostentatiously spent in any form upon itself -- if these be its chief distinctions, we have no difficulty in estimating its nature or culture. So likewise in regard

Distribution of wealth by wills - We have divided inheritance into seven categories

The Baha'i laws of inheritance apply only in case of intestacy, that is, when the individual dies without leaving a will. In the Kitab-i-Aqdas (#109), Baha'u'llah instructs every believer to write a will. He elsewhere clearly states that the individual has full jurisdiction over his property and is free to determine the manner in which his or her estate is to be divided and to designate, in the will, those, whether Baha'i or non-Baha'i, who should inherit (Q and A 69). In this connection, a letter written on behalf of Shoghi Effendi explains that:

...even though a Baha'i is permitted in his will to dispose of his wealth in the way he wishes, yet he is morally and conscientiously bound to always bear in mind, while writing his will, the necessity of his upholding the principle of Baha'u'llah regarding the social function of wealth, and the consequent necessity of avoiding its over-accumulation and concentration in a few individuals or groups of individuals.

This verse of the Aqdas introduces a lengthy passage in which Baha'u'llah elaborates the Baha'i law of inheritance. In reading this passage one should bear in mind that the law is formulated with the presumption that the deceased is a man; its provisions apply, mutatis mutandis, when the deceased is a woman.

The system of inheritance which provides for distribution of the deceased's estate among seven categories of heirs (children, spouse, father, mother, brothers, sisters, and teachers) is based on the provisions set out by the Báb in the Bayan. The major features of the Baha'i laws of inheritance in the case of intestacy are:

1. If the deceased is a father and his estate includes a personal residence, such residence passes to the eldest son (Q and A 34).
2. If the deceased has no male descendants, two thirds of the residence pass to his female descendants and the remaining third passes to the House of Justice (Q and A 41, 72). See note 42 concerning the levels of the institution of the House of Justice to which this law applies. (See also note 44.)
3. The remainder of the estate is divided among the seven categories of heirs. For details of the number of shares to be received by each group, see Questions and Answers, number 5, and Synopsis and

to the use or abuse of its surplus wealth, or to generous, free-handed cooperation in good public uses, or to unabated efforts to accumulate and hoard to the last, or whether they administer or bequeath. The verdict rests with the best and most enlightened public sentiment. The community will surely judge, and its judgments will not often be wrong.

Codification, section IV.C.3.a.

4. In case there is more than one heir in any category the share allotted to that class should be divided between them equally, be they male or female. (Bahá'u'lláh, Kitáb-i-Aqdas, page 182-183)

20. The best uses to which surplus wealth can be put have already been indicated. Those who would administer wisely must, indeed, be wise; for one of the serious obstacles to the improvement of our race is indiscriminate charity. It were better for mankind that the millions of the rich were thrown into the sea than so spent as to encourage the slothful, the drunken, the unworthy. Of every thousand dollars spent in so-called charity today, it is probable that nine hundred and fifty dollars is unwisely spent -- so spent, indeed, as to produce the very evils which it hopes to mitigate or cure. A well-known writer of philosophic books admitted the other day that he had given a quarter of a dollar to a man who approached him as he was coming to visit the

charity - One demonstration of the excellent character of the Christians in those days was their dedication to charity and good works, and the fact that they founded hospitals and philanthropic institutions. For example, the first person to establish public clinics throughout the Roman Empire where the poor, the injured and the helpless received medical care, was the Emperor Constantine. This great king was the first Roman ruler to champion the Cause of Christ. He spared no efforts, dedicating his life to the promotion of the principles of the Gospel, and he solidly established the Roman government, which in reality had been nothing but a system of unrelieved oppression, on moderation and justice. His blessed name shines out across the dawn of history like the morning star, and his rank and fame among the world's noblest and most highly civilized is still on the tongues of Christians of all denominations.

What a firm foundation of excellent character was laid down in those days, thanks to the training of holy souls who arose to promote the teachings of the Gospel. How many primary schools, colleges, hospitals, were established, and institutions where fatherless and indigent children received their education. How many were the individuals who sacrificed their own personal advantages and "out of desire to please the Lord" devoted the days of their lives to teaching the masses. (Secret of Divine Civilization, page 85)

house of his friend. He knew nothing of the habits of this beggar, knew not the use that would be made of this money, although he had every reason to suspect that it would be spent improperly. This man professed to be a disciple of Herbert Spencer; yet the quarter-dollar given that night will probably work more injury than all the money will do good which its thoughtless donor will ever be able to give in true charity. He only gratified his own feelings, saved himself from

---Page 27 The Gospel of Wealth - II Administration of Wealth---

annoyance -- and this was probably one of the most selfish and very worst actions of his life, for in all respects he is most worthy.

21. In bestowing charity, the main consideration should be to help those who will help themselves; to provide part of the means by which those who desire to improve may do so; to give those who desire to rise the aids by which they may rise; to assist, but rarely or never to do all. Neither the individual nor the race is improved by almsgiving. Those worthy of assistance, except in rare cases, seldom

[charity](#) - "The divine ideals are humility, submissiveness, annihilation of self, perfect evanescence, charity and loving-kindness. You must die to self and live in God. You must be exceedingly compassionate to one another and to all the people of the world. Love and serve mankind just for the sake of God and not for anything else. The foundation of your love toward humanity must be spiritual faith and divine assurance. (Lights of Guidance, page 214)

require assistance. The really valuable men of the race never do, except in case of accident or sudden change. Every one has, of course, cases of individuals brought to his own knowledge where temporary assistance can do genuine good, and these he will not overlook. But the amount which can be wisely given by the individual for individuals is necessarily limited by his lack of knowledge of the circumstances connected with each. He is the only true reformer who is as careful and as anxious not to aid the unworthy as he is to aid the worthy, and, perhaps, even more so, for in almsgiving more injury is probably done by rewarding vice than by relieving virtue.

22. The rich man is thus almost restricted to following the examples of Peter Cooper, Enoch Pratt of Baltimore, Mr. Pratt of Brooklyn, Senator Stanford,

(7) Of this cluster of philanthropists, Enoch Pratt (1808-1896) was a New Englander who moved to Baltimore and accumulated a fortune as a merchant of iron products and as a general investor. In the eighties he constructed a library building and gave it along with an endowment of over \$800,000 to the City of Baltimore. Carnegie once hailed Pratt as "my pioneer." Charles Pratt (1830-1891), also a New

Trades - It is enjoined upon every one of you to engage in some form of occupation, such as crafts, trades and the like. We have graciously exalted your engagement in such work to the rank of worship unto God, the True One. Ponder ye in your hearts the grace and the blessings of God and render thanks unto Him at eventide and at dawn. Waste not your time in idleness and sloth. Occupy yourselves with that which profiteth yourselves and others. Thus hath it been decreed in this Tablet from whose horizon the day-star of wisdom and utterance shineth resplendent.

The most despised of men in the sight of God are those who sit idly and beg. Hold ye fast unto the cord of material means, placing your whole trust in God, the Provider of all means. When anyone occupieth himself in a craft or trade, such occupation itself is regarded in the estimation of God as an act of worship; and this is naught but a token of His infinite and all-pervasive bounty. (Tablets of Bahá'u'lláh, page 26)

Englander, moved to New York and established a firm to deal in paints and oils. Sensing in the sixties the importance of petroleum, he was one of the founders of Charles Pratt and Company; the concern refined oil on Long Island. When the Rockefeller interests acquired this business in 1874, Pratt became a member of the high command in Standard Oil. In 1887 his funds and educational acumen led to the opening of the Pratt Institute in Brooklyn, a secondary school for training in the trades. He also established the Pratt Institute Free Library, "the first free public library in either Brooklyn or New York." Leland Stanford (1824-1893), a New Yorker, moved to California, prospered as a wholesale merchant in Sacramento, was Civil War Governor of the State, and one of the "Big Four" associated in promoting, organizing, financing, and building the Central Pacific, the western link of the first transcontinental railroad. Subsequently he became a pioneer in the Southern Pacific Railroad and a United States Senator. In 1884 the death of an only son at the age of fifteen shattered Stanford and his wife. After personal reflection and after seeking advice among educators, the parents founded Leland Stanford Junior University on their Palo Alto "farm." The new institution charged no tuition and emphasized preparation for the practical affairs of life. For many years the Stanford's concerned themselves with the details of university administration, whether in the architecture of the buildings or the character of appointments.

and others, who know

---Page 28 The Gospel of
Wealth - II Administration of
Wealth---

that the best means of

benefiting the community is to place within its reach the ladders upon which the aspiring can rise -- free libraries, parks, and means of recreation, by which men are helped in body and mind; works of art, certain to give pleasure and improve the public taste; and public institutions of various kinds, which will improve the general condition of the people; in this manner returning their surplus wealth to the mass of their fellows in the forms best calculated to do them lasting good.

23. Thus is the problem of rich and poor to be solved. The laws of accumulation will be left free, the laws of distribution free. Individualism will continue, but the millionaire will be but a trustee for the poor, intrusted for a season with a great part of the increased wealth of the community, but administering it for the community far better than it could or would have done for itself. The best minds will thus have reached a stage in the development of the race in which it is clearly seen that there is no mode of disposing of surplus wealth creditable to thoughtful and earnest men into whose hands it flows, save by using it year by year for the general good. This day

[Baha'i Comment](#)

already dawns. Men may die without incurring the pity of their fellows, still sharers in great business enterprises from which their capital cannot be or has not been withdrawn, and which is left chiefly at death for public uses; yet the day is not far distant when the man who dies leaving behind him millions of available wealth, which was free to him to administer during life, will pass away "unwept, unhonored, and unsung," no matter to what uses he leaves the dross which he cannot take with him. Of such as these

---Page 29 The Gospel of Wealth - II Administration of Wealth---

the public verdict will then be: "The man who dies thus rich dies disgraced."

24. Such, in my opinion is the true gospel concerning wealth, obedience to which is destined some day to solve the problem of the rich and the poor, and to bring "Peace on earth, among men good will."

Peace - O RESPECTED Assembly! O friends of Truth! The inherent nature of fire is to burn, the inherent nature of electricity is to give light, the inherent nature of the sun is to shine, and the inherent nature of the organic earth is the power of growth.

There is no separation between a thing and its inherent qualities.

It is the inherent nature of things on this earth to change, thus we see around us the change of the seasons. Every spring is followed by a summer and every autumn brings a winter--every day a night and every evening a morning. There is a sequence in all things.

Thus when hatred and animosity, fighting, slaughtering, and great coldness of heart were governing this world, and darkness had

overcome the nations, Baha'u'llah, like a bright star, rose from the horizon of Persia and shone with the great Light of Guidance, giving heavenly radiance and establishing the new Teaching.

He declared the most human virtues; He manifested the Spiritual powers, and put them into practice in the world around Him.

Firstly: He lays stress on the search for Truth. This is most important, because the people are too easily led by tradition. It is because of this that they are often antagonistic to each other, and dispute with one another.

But the manifesting of Truth discovers the darkness and becomes the cause of Oneness of faith and belief: because Truth cannot be two! That is not possible... .

Eighthly: Baha'u'llah declared the coming of the Most Great Peace. All the nations and peoples will come under the shadow of the Tent of the Great Peace and Harmony--that is to say, by general election a Great Board of Arbitration shall be established, to settle all differences and quarrels between the Powers; so that disputes shall not end in war. (`Abdu'l-Bahá in London, pages 26-30)

PART II: THE BEST FIELDS FOR PHILANTHROPY

25. While "The Gospel of Wealth" has met a cordial reception upon this side of the Atlantic, it is natural that in the motherland it should have attracted more attention, because the older civilization is at present brought more clearly face to face with socialistic questions. The contrast between the classes and the masses, between rich and poor, is not yet quite so sharp in this vast, fertile, and developing- continent, with less than twenty persons per square mile, as in crowded little Britain, with fifteen times that number and no territory

motherland - As to the patriotic prejudice, this is also due to absolute ignorance, for the surface of the earth is one native land. Every one can live in any spot on the terrestrial globe. Therefore all the world is man's birthplace. These boundaries and outlets have been devised by man. In the creation, such boundaries and outlets were not assigned. Europe is one continent, Asia is one continent, Africa is one continent, Australia is one continent, but some of the souls, from personal motives and selfish interests, have divided each one of these continents and considered a certain part as their own country. God has set up no frontier between France and Germany; they are continuous. Yea, in the first centuries, selfish souls, for the promotion of their own interests, have assigned boundaries and outlets and have, day by day, attached more importance to these, until this led to intense enmity, bloodshed and rapacity in subsequent centuries. In the same way this will continue indefinitely, and if this conception of patriotism remains limited within a certain circle, it will be the primary cause of the world's destruction. No wise and just person will acknowledge these imaginary distinctions. Every limited area which we call our native country we regard as our motherland, whereas the terrestrial globe is the motherland of all, and not any restricted area. In short, for a few days we live on this earth and eventually we are buried in it, it is our eternal tomb. Is it worth while that we should engage in bloodshed and tear one another to pieces

unoccupied. Perhaps the "Pall Mall Gazette" in its issue of September 5 puts most pithily the objections that have been raised to what the English have been pleased to call "The Gospel of Wealth." I quote: "Great fortunes, says Mr. Carnegie, are great blessings to a community, because such and such things may be done with them. Well, but they are also a great curse, for such and such things are done with them. Mr. Carnegie's preaching, in other words, is altogether vitiated by Mr. Benzon's practice.

(8)Ernest Benzon, commonly known as the "Jubilee plunger," was an English rogue of the fin-de-siecle variety. His career apparently came to grief on the Riviera when he was brought into court for forgery or obtaining money under false pretenses.

The gospel of wealth is killed by the acts."

26. To this the reply seems obvious: the gospel of Christianity is also killed by the acts. The same objection that is urged against the gospel of wealth lies against the commandment,

---Page 30 The Gospel of Wealth - II Administration of Wealth---

"Thou shalt not steal." It is no

for this eternal tomb? Nay, far from it, neither is God pleased with such conduct nor would any sane man approve of it. (Selections from the Writings of 'Abdu'l-Bahá, page 300-301)

fortunes - The highest station, the supreme sphere, the noblest, most sublime position in creation, whether visible or invisible, whether alpha or omega, is that of the Prophets of God, notwithstanding the fact that for the most part they have to outward seeming been possessed of nothing but their own poverty. In the same way, ineffable glory is set apart for the Holy Ones and those who are nearest to the Threshold of God, although such as these have never for a moment concerned themselves with material gain. Then comes the station of those just kings whose fame as protectors of the people and dispensers of Divine justice has filled the world, whose name as powerful champions of the people's rights has echoed through creation. These give no thought to amassing enormous fortunes for themselves; they believe, rather, that their own wealth lies in enriching their subjects. To them, if every individual citizen has affluence and ease, the royal coffers are full. They take no pride in gold and silver, but rather in their enlightenment and their determination to achieve the universal good.

Next in rank are those eminent and honorable ministers of state and representatives, who place the will of God above their own, and whose administrative skill and wisdom in the conduct of their office raises the science of government to new heights of perfection. They shine in the learned world like lamps of knowledge; their thinking, their attitudes and their acts demonstrate their patriotism and their concern for the country's advancement. (Secret of Divine Civilization, page 20-21)

fortunes - Those persons who are selected to serve the public, or are appointed to administrative positions, should perform their duties in a spirit of true servitude and ready compliance. That is to say, they should be distinguished by their goodly disposition and virtuous character, content themselves with their allotted remuneration, and act with trustworthiness in all their doings. They should keep themselves aloof from unworthy motives, and be far removed above covetous designs; for rectitude, probity and righteousness are among the most potent means for attracting the grace of God and securing both the prosperity of the country and the welfare of the people. Glory and honour for man are not to be found in fortunes and riches, least of all in those which have been unlawfully amassed through extortion, embezzlement and corruption practised at the expense of an exploited populace. Supreme honour, nobility and greatness in the human world, and true felicity in this life and the life to come--all

argument against a gospel that it is not lived up to; indeed, it is an argument in its favor, for a gospel must be higher than the prevailing standard. It is no argument against a law that it is broken: in that disobedience lies the reason for making and maintaining of the law; the law which is never to be broken is never required.

consist inequity and uprightness, sanctity and detachment. If a man would seek distinction, he should suffice himself with a frugal provision, seek to better the lot of the poor of the realm, choose the way of justice and fair-mindedness, and tread the path of high-spirited service. Such a one, needy though he be, shall win imperishable riches and attain unto everlasting honour. ('Abdu'l-Baha: Trustworthiness, section 2067, pages 342-343 of Compilation of Compilations)

27. Undoubtedly the most notable incident in regard to "The Gospel of Wealth" is that it was fortunate enough to attract the attention of Mr. Gladstone, and bring forth the following note from him: "I have asked Mr. Lloyd Bryce"

fortunes - It will not be possible in the future for men to amass great fortunes by the labors of others. The rich will willingly divide. They will come to this gradually, naturally, by their own volition. It will never be accomplished by war and bloodshed. (Bahá'u'lláh & New Era, page 145)

(9) Lloyd Stephens Bryce (1851-1917) was owner and editor of the North American Review beginning in 1889. He combined the diverse talents of man of wealth, bon vivant, merchant, and member of Congress.

[North American Review] kindly to allow the republication in this country of the extremely interesting article on 'Wealth' by Mr. Andrew Carnegie, which has just appeared in America." This resulted in the publication of the article in several newspapers and periodicals, and an enterprising publisher issued it in pamphlet form, dedicated by permission to Mr. Gladstone.

28. All this is most encouraging, proving as it does that society is alive to the great issue involved, and is in a receptive mood. Your request, Mr. Editor, that I should continue the subject and point out the best fields for the use of surplus wealth, may be taken as further proof that whether the ideas promulgated are to be received or rejected, they are at least certain to obtain a hearing.

present day Order - "Soon," Baha'u'llah's own words proclaim it, "will the present day Order be rolled up, and a new one spread out in its stead." ...

The Revelation of Baha'u'llah ... should ... be regarded as signaling through its advent the coming of age of the entire human race. It should be viewed not merely as yet another spiritual revival in the ever-changing fortunes of mankind, not only as a further stage in a chain of progressive Revelations, nor even as the culmination of one of a series of recurrent prophetic cycles, but rather as marking the last and highest stage in the stupendous evolution of man's collective life on this planet. The emergence of a world community, the consciousness of world citizenship, the founding of a world civilization and culture ... should ... be regarded, as far as this planetary life is concerned, as the furthestmost limits in the organization of human society, though man, as an individual, will, nay must indeed as a result of such a consummation, continue indefinitely to progress and develop.... (Bahá'u'lláh & New Era, page 279)

29. The first article held that there is but one right mode of using enormous fortunes - namely, that the possessors from time to time during their own lives should so administer these as to promote the permanent good of the communities from which they were gathered. It was held that public sentiment would soon say of one who died possessed of available wealth which he was free to administer: "The man who dies thus rich dies disgraced."

Wealth - To state the matter briefly, the Teachings of Baha'u'llah advocate voluntary sharing, and this is a greater thing than the equalization of wealth. For equalization must be imposed from without, while sharing is a matter of free choice.

Man reacheth perfection through good deeds, voluntarily performed, not through good deeds the doing of which was forced upon him. And sharing is a personally chosen righteous act: that is, the rich should extend assistance to the poor, they should expend their substance for the poor, but of their own free will, and not because the poor have gained this end by force. For the harvest of force is turmoil and the ruin of the social order. On the other hand voluntary sharing, the freely-chosen expending of one's substance, leadeth to society's comfort and peace. It lighteth up the world; it bestoweth honour upon humankind. (Selected Writings of 'Abdu'l-Bahá, Page 115)

---Page 31 The Gospel of
Wealth - II Administration of
Wealth---

[Baha'i Comment](#)

30. The purpose of this paper is to present some of the best methods of performing this duty of administering surplus wealth for the good of the people. The first requisite for a really good use of wealth by the millionaire who has accepted the gospel which proclaims him only a trustee of the surplus that come to him, is to take care that the purposes for which he spends it shall not have a degrading, pauperizing tendency upon its recipients, but that his trust shall be so administered as to stimulate the best and most aspiring poor of the community to further efforts for their own improvement. It is not the irreclaimably destitute, shiftless and worthless which it is truly beneficial or truly benevolent for the individual to attempt to reach and improve. For these there exists the refuge provided by the city or the State, where they can be sheltered, fed, clothed, and kept in comfortable existence, and -most important of all - where they can be isolated from the well-doing and, industrious poor, who are liable to be demoralized by contact with these unfortunates. One man or

women who succeeds in living comfortably by begging is more dangerous to society, and a greater obstacle to the progress of humanity, than a score of wordy Socialists. The individual administrator of surplus wealth has as his charge the industrious and ambitious; not those who need everything done for them, but those who, being most anxious and able to help themselves, deserve and will be benefited by help from others and by the extension of their opportunities by the aid of the philanthropic rich.

31. It is ever to be remembered that one of the chief obstacles which the philanthropist meets in his efforts to do real and permanent good in this world, is the practice of indiscriminate giving; and the duty of the millionaire is to resolve to cease giving to objects that are not clearly proved to his satisfaction to be deserving. He must remember Mr. Rice's

(10) Charles Alien Thorndike Rice (1851-1889), publisher of the North American Review, 1886-1889.

belief, that nine hundred and fifty out of every thousand dollars

Charity is pleasing and praiseworthy in the sight of God and is regarded as a prince among goodly deeds. Consider ye and call to mind that which the All-Merciful hath revealed in the Qur'an: 'They prefer them before themselves, though poverty be their own lot. And with such as are preserved from their own covetousness shall it be well.' Viewed in this light, the blessed utterance above is, in truth, the day-star of utterances. Blessed is he who preferreth his brother before himself. Verily, such a man is reckoned, by virtue of the Will of God, the All-Knowing, the All-Wise, with the people of Baha who dwell in the Crimson Ark. (Tablets of Bahá'u'lláh, page 71)

---Page 32 The Gospel of
Wealth - II Administration of
Wealth---

bestowed to-day upon so-called charity had better be thrown into the sea. As far as my experience of the wealthy extends, it is unnecessary to urge them to give of their superabundance in charity so called. Greater good for the race is to be achieved by inducing them to cease impulsive and injurious giving. As a rule, the sins of millionaires in this respect are not those of omission, but of commission, because they do not take time to think, and chiefly because it is much easier to give than to refuse. Those who have surplus wealth give millions every year which produce more evil than good, and really retard the progress of the people, because most of the forms in vogue to-day for benefiting mankind only tend to spread among the poor a spirit of dependence upon alms, when what is essential for progress is that they should be inspired to depend upon their own exertions. The miser millionaire who hoards his wealth does less injury to society than the careless millionaire who squanders his unwisely, even if he does so under cover of the mantle of sacred charity. The man who

gives to the individual beggar commits a grave offense, but there are many societies and institutions soliciting alms, to aid which is none the less injurious to the community. These are as corrupting as individual beggars. Plutarch's "Morals" contains this lesson: "A beggar asking an alms of a Lacedaemonian, he said: 'Well, should I give thee anything, thou wilt be the greater beggar, for he that first gave thee money made thee idle, and is the cause of this base and dishonorable way of living.'" As I know them, there are few millionaires, very few indeed, who are clear of the sin of having made beggars.

32. Bearing in mind these considerations, let us endeavor to present some of the best uses to which a millionaire can devote the surplus of which he should regard himself as only the trustee.

wealthy - In the Bolshevistic principles equality is effected through force. The masses who are opposed to the people of rank and to the wealthy class desire to partake of their advantages.

But in the divine teachings equality is brought about through a ready willingness to share. It is commanded as regards wealth that the rich among the people, and the aristocrats should, by their own free will and for the sake of their own happiness, concern themselves with and care for the poor. This equality is the result of the lofty characteristics and noble attributes of mankind. (Abdu'l-Baha: Foundations of World Unity, Page: 44)

33. *First.* Standing apart by itself there is the founding of a university by men enormously rich, such men as must necessarily be few in any country. Perhaps the greatest sum ever

---Page 33 The Gospel of Wealth - II Administration of Wealth---

given by an individual for any purpose is the gift of Senator Stanford, who undertakes to establish a complete university upon the Pacific coast, where he amassed his enormous fortune, which is said to involve the expenditure of ten millions of dollars, and upon which he may be expected to bestow twenty millions of his surplus. He is to be envied. A thousand years hence some orator, speaking his praise upon the then crowded shores of the Pacific, may thus adapt Griffith's eulogy of Wolsey:

**In bestowing,
madam,
He was most princely.
Ever witness for him
This seat of learning,...
 though unfinished,
 yet so famous.
So excellent in art, and
still so rising,
That Christendom shall
ever speak his virtue.**

enormously rich - It should not be imagined that the writer's earlier remarks constitute a denunciation of wealth or a commendation of poverty. Wealth is praiseworthy in the highest degree, if it is acquired by an individual's own efforts and the grace of God, in commerce, agriculture, art and industry, and if it be expended for philanthropic purposes. Above all, if a judicious and resourceful individual should initiate measures which would universally enrich the masses of the people, there could be no undertaking greater than this, and it would rank in the sight of God as the supreme achievement, for such a benefactor would supply the needs and insure the comfort and well-being of a great multitude. Wealth is most commendable, provided the entire population is wealthy. If, however, a few have inordinate riches while the rest are impoverished, and no fruit or benefit accrues from that wealth, then it is only a liability to its possessor. If, on the other hand, it is expended for the promotion of knowledge, the founding of elementary and other schools, the encouragement of art and industry, the training of orphans and the poor--in brief, if it is dedicated to the welfare of society--its possessor will stand out before God and man as the most excellent of all who live on earth and will be accounted as one of the people of paradise. ('Abdu'l-Bahá, Secret of Divine Civilization, page 24 & 25)

(11) Quoted inaccurately from Henry VIII, Act IV, scene 2, lines 51 ff.

34. Here is a noble use of wealth. We have many such institutions, - Johns Hopkins, Cornell, Packer, and others,

(12) In the founding of universities by private wealth in the post-Civil War era, the names of institutions perpetuate the donations and other assistance of Johns Hopkins (1795-1873), a Baltimore philanthropist, and Ezra Cornell (1807-1874), an upstate New Yorker who built a fortune from the telegraph. Asa Packer (1805-1879), a New England youth who emigrated to Pennsylvania, acquired his fortune from transporting and mining coal in the anthracite region. He was a judge and a politician. After the Civil War Packer donated money and land to a new institution, Lehigh University. He originally had in mind a technical institution, but when the school was opened in 1885 its scheme was more traditional. The total of Packer's donations in his lifetime gifts and bequests was over \$3,800,000.

-- but most of these have only been bequeathed, and it is impossible to extol any man greatly for simply leaving what he cannot take with him. Cooper and Pratt and Stanford, and others of this class, deserve credit and admiration as much for the time and attention given during their lives as for their expenditure upon their respective monuments.

bequeath - If a wealthy man at the time of his death bequeaths a gift to the poor and miserable, and gives a part of his wealth to be spent for them, perhaps this action may be the cause of his pardon and forgiveness, and of his progress in the Divine Kingdom. (Abdu'l-Baha: Some Answered Questions, Page: 231)

35. We cannot think of the Pacific coast without recalling another important work of a different character which has recently been established there - the Lick Observatory.

(13)James Lick (1796-1876), an eccentric who made a fortune from investments in San Francisco real estate and California land, was with difficulty guided by careful advisers to give \$700,000 for a telescope "superior to and more powerful than any telescope ever made." Previous to this decision he had never seen a telescope or looked through one and had not even an amateur's acquaintance with astronomy. Eventually the managers of the gift located the Lick observatory on Mt. Hamilton, a wilderness peak in Santa Clam County, and contracted for a 36-inch lens, the largest feasible under the technology of the eighties. The regents of the University of California became the trustees of the Lick observatory.

---Page 34 The Gospel of Wealth - II Administration of Wealth---

If any millionaire be interested in the ennobling study of astronomy, -and there should be and would be such if they but gave the subject the slightest attention, -here is an example which could well be followed, for the progress made in astronomical instruments and appliances is so great and continuous that every few years a new telescope might be judiciously given to one of the observatories upon this

University -

In brief, man through the possession of this ideal endowment of scientific investigation is the most noble product of creation, the governor of nature. He takes the sword from nature's hand and uses it upon nature's head. According to natural law night is a period of darkness and obscurity, but man by utilizing the power of electricity, by wielding this electric sword overcomes the darkness and dispels the gloom. Man is superior to nature and makes nature do his bidding. Man is a sensitive being; nature is without sensation. Man has memory and reason; nature lacks them. Man is nobler than nature. There are powers within him of which nature is devoid. It may be claimed that these powers are from nature itself and that man is a part of nature. In answer to this statement we will say that if nature is the whole and man is a part of that whole, how could it be possible for a part to possess qualities and virtues which are absent in the whole? Undoubtedly the part must be endowed with the same qualities and properties as the whole. For example, the hair is a part of the human anatomy. It cannot contain elements which are not found in other parts of the body, for in all cases the component elements of the body are the same. Therefore, it is manifest and evident that man, although in body a part of nature, nevertheless in spirit possesses a power transcending nature; for if he were simply a part of nature and limited to material laws, he could possess only the things which nature embodies. God has conferred upon and added to man a distinctive power - the faculty of intellectual investigation into the secrets of creation, the acquisition of higher knowledge - the greatest virtue of which is scientific enlightenment. This endowment is the most praiseworthy power of man, for through its employment and exercise the betterment of the human race is accomplished, the development of the virtues of mankind is made possible and the spirit and mysteries of God become manifest. Therefore, I am greatly pleased with my visit to this university. Praise be to God that this country abounds in such institutions of learning where the knowledge of sciences and arts may readily be acquired. As material and physical sciences are taught here and are constantly unfolding in wider vistas of attainment, I am hopeful that spiritual development may also follow and keep pace with these outer advantages. As material knowledge is illuminating those within the walls of this great temple of learning, so also may the light of the spirit, the inner and divine light of the real philosophy glorify this institution. The most important principle of divine philosophy is the oneness of the world of humanity, the unity of mankind, the bond conjoining East and West, the tie of love which blends human hearts. (Abdu'l-Baha: Promulgation of Universal Peace, Pages: 30-31)

continent, the last being always the largest and the best, and certain to carry further and further the knowledge of the universe and of our relation to it here upon the earth. As one among many of the good deeds of the late Mr. Thaw of Pittsburg, his constant support of the observatory there may be mentioned. This observatory enabled Professor Langley to make his wonderful discoveries. He is now at the head of the Smithsonian Institution, a worthy successor to Professor Henry. Connected with him was Mr. Braeshier of Pittsburg, whose instruments are in most of the principal observatories of the world. He was a common millwright, but Mr. Thaw recognized his genius and was his main support through trying days. This common workman has been made a professor by one of the foremost scientific bodies of the world. In applying part of his surplus in aiding these two now famous men, the millionaire Thaw did a noble work. Their joint labors have brought great credit, and are destined to bring still greater credit, upon their country in every scientific center throughout the world.

(14) Pittsburgh immediately after the Civil War became a center of astronomical activity and

scholarship. A popular subscription had raised funds to build in 1860 the old Allegheny observatory, and five years later it was transferred to the Western University of Pennsylvania (since 1908 the University of Pittsburgh). In 1867 Samuel P. Langley (1834-1906), a man of immense erudition and scientific originality, became director of the observatory and professor of physics and astronomy. Twenty years later Langley became the third secretary of the Smithsonian Institution. Meanwhile, John Alfred Brashear (1840-1920) -- one of many variant spellings -- a Pittsburgh machinist who in his youth had been inspired by a maternal grandfather with a love of the stars, had built his own telescope and had attracted the attention of Langley. William Thaw, who had acquired wealth as a freight forwarder and Pennsylvania Railroad official and investor, was a director of Western University. He financed Langley's researches--the observatory incidentally provided correct time for the railroad -- and enabled Brashear to set up in business as a maker of precision instruments and telescopes. Carnegie later selected him as one of three men to draw up plans for the Carnegie Institute of Technology founded in 1905.

---Page 35 The Gospel of Wealth - II Administration of Wealth---

36. It is reserved for very few to found universities, and, indeed, the use for many, or perhaps, any, new universities does not exist. More good is henceforth to be accomplished by adding to and extending those in existence. But in this department a wide field

universities - In these days there are new schools of philosophy blindly claiming that the world of nature is perfect. If this is true, why are children trained and educated in schools, and what is the need of extended courses in sciences, arts and letters in colleges and universities? What would be the result if humanity were left in its natural condition without education or training? All scientific discoveries and attainments are the outcomes of knowledge and education. The telegraph, phonograph, telephone were latent and potential in the world of nature but would never have come forth into the realm of visibility unless man through education had penetrated and discovered the laws which control them. All the marvelous developments and miracles of what we call civilization would have remained hidden, unknown and, so to speak, nonexistent, if man had remained in his natural condition, deprived of the bounties, blessings and benefits of education and mental culture. The intrinsic difference between the ignorant man and the

remains for the millionaire as distinguished from the Croesus among millionaires. The gifts to Yale University have been many, but there is plenty of room for others. The School of Fine Arts, founded by Mr. Street, the Sheffield Scientific School, endowed by Mr. Sheffield, and Professor Loomis's fund for the observatory, are fine examples. Mrs. C. J. Osborne's building for reading and recitation is to be regarded with especial pleasure as being the wise gift of a woman.

(15) A series of gifts enlarged the physical facilities and instructional offerings of Yale College. Just before the Civil War Joseph E. Sheffield (1793-1882), a Connecticut man who had made a fortune as a railroad contractor in the West and, out of personal and civic pride, spent some of it financing a needless New England railroad, gave the first of his donations to the Yale Scientific School, renamed the Sheffield Scientific School in 1861. After the War, Augustus R. Street (1791-1866), a New Haven-born Yale graduate, and his wife, a woman of wealth, financed a building for the Yale School of Fine Arts and endowed instruction in a number of areas at Yale. In the late eighties Elias Loomis (1811-1889), who had made a fortune as author of books in the field of natural science, bequeathed \$300,000 to Yale. Mrs. Miriam A. (C.J.) Osborn gave in the eighties a sum for a building for history. Its construction "resulted in the removal of the Fence."

astute philosopher is that the former has not been lifted out of his natural condition, while the latter has undergone systematic training and education in schools and colleges until his mind has awakened and unfolded to higher realms of thought and perception; otherwise, both are human and natural. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 309-310)

Harvard University has not

been forgotten; the Peabody Museum and the halls of Wells, Matthews, and Thayer may be cited. Sever Hall is worthy of special mention, as showing what a genius like Richardson could do with the small sum of a hundred thousand dollars.

(16)Mr. Carnegie's stroll through Harvard produced some inaccurate observations. George Peabody (1795-1869), an American banker in London, donated in 1866, at the suggestion of a Yale nephew, \$150,000 for a "Museum and professorship of American Archaeology and Ethnology." But there is not and never was a Wells Hall. This is a mistake for Weld Hall, given in 1872 by W. F. Weld, a Boston financier, in memory of his brother. Like Weld, the other "halls" were dormitories. Matthews Hall was the gift in 1872 of Nathan Matthews (1854-1927), a Boston merchant; Thayer Hall, of Nathaniel Thayer (1808-1883), a member of a Boston investment banking house, in memory of his brother. Colonel James W. Sever, a shoeman in southeastern Massachusetts, bequeathed \$100,000 for a hall to be named for the family. Sever Hall is a classroom building.

---Page 36 The Gospel of Wealth - II Administration of Wealth---

The Vanderbilt University, at Nashville, Tennessee, may be mentioned as a true product of the gospel of wealth. It was established by the members of the Vanderbilt family

(17) The first Vanderbilt gift to the Central University of the Methodist

Episcopal Church of the South at Nashville came from Cornelius ("The Commodore") Vanderbilt (1794-1877), veteran steamship tycoon and virtually a synonym for the New York Central Railroad. Since the Commodore became Vanderbilt's benefactor in a decidedly offhand manner, Carnegie's note of admiration is surprising. In time the Commodore's descendants generously supplemented his original benefaction.

during their lives - mark this vital feature, during their lives; for nothing counts for much that is left by a man at his death. Such funds are torn from him, not given by him. If any millionaire be at a loss to know how to accomplish great and indisputable good with his surplus, here is a field which can never be fully occupied, for the wants of our universities increase with the development of the country.

37. *Second* The result of my own study of the question. What is the best gift which can be given to a community? is that a free library occupies the first place, providing the community will accept and maintain it as a public institution, as much a part of the city property as its public schools, and indeed, an adjunct to these. It is, no doubt, possible that my own possible experience may have led me to value a free library beyond all other forms of

[Baha'i Comment](#)

beneficence. When I was a working-boy in Pittsburg, Colonel Anderson of Allegheny -a name I can never speak without feelings of devotional gratitude - opened his little library of four hundred books to boys. Every Saturday afternoon he was in attendance at his house to exchange books. No one but he who has felt it

---Page 37 The Gospel of Wealth - II Administration of Wealth---

can ever know the intense longing with which the arrival of Saturday was awaited, that a new book might be had. My brother and Mr. Phipps,

(18)Thomas M. Carnegie (1843-1886), a younger brother of Andrew, followed a somewhat similar career. Henry Phipps, Jr. (1839-1930), was a boyhood neighbor and chum of Andrew. Tom Carnegie and Phipps early entered the iron business. Tom died in 1886; Phipps stayed with the Carnegie firm until its acquisition by United States Steel in 1901. His money supported a wide variety of philanthropic undertakings from public baths to psychiatric institutes.

Whatever may have been done in these four years, it is my pleasure to acknowledge that much, very much, is due to the earnest interest, the wise counsels, and the practical suggestions of Mr. Pratt. He never seemed to feel that the mere donation of great wealth for the benefit of his fellow-citizens was all that would be asked of him, but he wisely

labored to make its application as comprehensive and effective as possible. Thus he constantly lightened burdens that were, at times, very heavy, brought good cheer and bright sunshine when clouds flitted across the sky, and made every officer and employee feel that good work was appreciated, and loyal devotion to duty would receive hearty commendation.

who have been my principal business partners through life, shared with me Colonel Anderson's precious generosity, and it was when reveling in the treasures which he opened to us that I resolved, if ever wealth came to me, that it should be used to establish free libraries, that other poor boys might receive opportunities similar to those for which we were indebted to that noble man.

38. Great Britain has been foremost in appreciating the value of free libraries for its people. Parliament passed an act permitting towns and cities to establish and maintain these as municipal institutions; whenever the people of any town or city voted to accept the provisions of the act, the authorities were authorized to tax the community to the extent of one penny in the pound valuation. Most of the towns already have free libraries under this act. Many of these

[Baha'i Comment](#)

are the gifts of rich men, whose funds have been used for the building, and in some cases for the books also, the communities being required to maintain and to develop the libraries. And to this feature I attribute most of their usefulness. An endowed institution is liable to become the prey of a clique. The public ceases to take interest in it, or rather, never acquires interest in it. The rule has been violated which requires the recipients to help themselves. Everything has been done for the community instead of its being only helped to help itself, and good results rarely ensue.

39. Many free libraries have been established in our country, but none that I know of with such wisdom as the Pratt Library in Baltimore. Mr. Pratt built and presented the library

---Page 38 The Gospel of Wealth - II Administration of Wealth---

to the city of Baltimore, with the balance of cash handed over; the total cost was one million dollars, upon which he required the city to pay five per cent, per annum, fifty thousand dollars per year, to trustees for the maintenance

[Baha'i Comment](#)

and development of the library and its branches. During 1888 430,217 books were distributed; 37,196 people of Baltimore are registered upon the books as readers. And it is safe to say that 37,000 frequenters of the Pratt Library are of more value to Baltimore, to the State, and to the country, than all the inert, lazy, and hopelessly poor in the whole nation. And it may further be safely said that, by placing books within the reach of 37,000 aspiring people which they were anxious to obtain, Mr. Pratt has done more for the genuine progress of the people than has been done by all the contributions of all the millionaires and rich people to help those who cannot or will not help themselves. The one wise administrator of his surplus has poured a fertilizing stream upon soil that was ready to receive it and return a hundred-fold. The many squanderers have not only poured their streams into sieves which can never be filled - they have done worse; they have poured them into stagnant sewers that breed the diseases which most afflict the body politic. And this is not all. The million dollars of which Mr. Pratt has made so grand a use are something, but there is something greater still. When the fifth branch

library was opened in Baltimore, the speaker said:

---Page 39 The Gospel of Wealth - II Administration of Wealth---

40. This is the finest picture I have ever seen of any of the millionaire class. As here depicted, Mr. Pratt is the ideal disciple of the gospel of wealth. We need have no fear that the mass of toilers will fail to recognize in such as he their best leaders and their most invaluable allies; for the problem of poverty and wealth, of employer and employed, will be practically solved whenever the time of the few is given, and their wealth is administered during their lives, for the best good of that portion of the community which has not been burdened with the responsibilities which attend the possession of wealth. We shall have no antagonism between classes when that day comes, for the high and the low, the rich and the poor, shall then indeed be brothers.

riches - Those persons who are selected to serve the public, or are appointed to administrative positions, should perform their duties in a spirit of true servitude and ready compliance. That is to say, they should be distinguished by their goodly disposition and virtuous character, content themselves with their allotted remuneration, and act with trustworthiness in all their doings. They should keep themselves aloof from unworthy motives, and be far removed above covetous designs; for rectitude, probity and righteousness are among the most potent means for attracting the grace of God and securing both the prosperity of the country and the welfare of the people. Glory and honour for man are not to be found in fortunes and riches, least of all in those which have been unlawfully amassed through extortion, embezzlement and corruption practised at the expense of an exploited populace. Supreme honour, nobility and greatness in the human world, and true felicity in this life and the life to come--all consist inequity and uprightnes, sanctity and detachment. If a man would seek distinction, he should suffice himself with a frugal provision, seek to better the lot of the poor of the realm, choose the way of justice and fair-mindedness, and tread the path of high-spirited service. Such a one, needy though he be, shall win imperishable riches and attain unto everlasting honour. ('Abdu'l-Baha: Cited in Trustworthiness, section 2067, pages 342-343 of Compilation of Compilations)

41. No millionaire will go far wrong in his search for one of the best forms for the use of his surplus who chooses to establish a free library in any community that is willing to maintain and develop it. John Bright's

(19) The noted British liberal statesman, reformer, and orator (1811-1889), who believed strongly in self-education.

words should ring in his ear: "It is impossible for any man to bestow a greater benefit upon a young man than to give him access to books in a free library." Closely allied to the library, and, where possible, attached to it, there should be rooms for an art gallery and museum, and a hall for such lectures and instruction as are provided in the Cooper Union. The traveler upon the Continent is surprised to find that every town of importance has its art-gallery and museum; these may be large or small, but each has a receptacle for the treasures of the locality, in which are constantly being placed valuable gifts and bequests. The Free Library and Art Gallery of Birmingham are remarkable among such institutions, and every now and then a rich man adds to their value by presenting books, fine pictures, or other works of art. All that our cities

bequeath - If a wealthy man at the time of his death bequeaths a gift to the poor and miserable, and gives a part of his wealth to be spent for them, perhaps this action may be the cause of his pardon and forgiveness, and of his progress in the Divine Kingdom. ('Abdu'l-Bahá, Some Answered Questions, page 231)

require, to begin with, is a proper fire-proof building. Their citizens who travel will send to it rare and costly things from every quarter of the globe they visit, while those who remain at

---Page 40 The Gospel of Wealth - II Administration of Wealth---

home will give or bequeath to it of their treasures. In this way collections will grow until our cities will ultimately be able to boast of permanent exhibitions from which their own citizens will derive incalculable benefit, and which they will be proud to show to visitors. In the Metropolitan Museum of Art in New York we have made an excellent beginning. Here is another avenue for the proper use of surplus wealth.

42. *Third* We have another most important department in which great sums can be worthily used - the founding or extension of hospitals, medical colleges, laboratories, and other institutions connected with the alleviation of human suffering, and especially with the prevention rather than cure of human ills. There is no danger of pauperizing a community in giving for such purposes,

[hospitals](#) - This Baha'i teaching of human fellowship and kindness implies that we must be always ready to extend every assistance and help we can to those who are in distress and suffering. Baha'i charity is of the very essence of the Teachings, and should therefore be developed in every Baha'i community. Charitable institutions such as orphanages, free schools and hospitals for the poor, constitute an indispensable part of the Mashriqu'l-Adhkar. It is the responsibility of every local Baha'i community to insure the welfare of its poor and needy members, through whatever means possible. (Lights of Guidance, page 120-121)

because such institutions relieve temporary ailments or shelter only those who are hopeless invalids. What better gift than a hospital can be given to a community that is without one? - the gift being conditioned upon its proper maintenance by the community in its corporate capacity. If hospital accommodation already exists, no better method for using surplus wealth can be found than in making additions to it. The late Mr. Vanderbilt's gift of half a million dollars to the Medical Department of Columbia College for a chemical laboratory was one of the wisest possible uses of wealth.

(20) Gifts from the Vanderbilts enabled Columbia's College of Physicians and Surgeons in the eighties to move to a new location and plant on West 59th Street. W. H. Vanderbilt (1821-1885), the son of the Commodore and an exceedingly able business man in his own right, was for the moment the chief of the Vanderbilt givers.

It strikes at the prevention of disease by penetrating into its causes. Several others have established such laboratories, but the need for them is still great.

43. If there be a millionaire in the land who is at a loss what to do with the surplus that has been committed to him as trustee, let him investigate the good that is flowing from these chemical laboratories. No medical college is complete

---Page 41 The Gospel of Wealth - II Administration of Wealth---

without its laboratory. As with universities, so with medical colleges: it is not new institutions that are required, but additional means for the more thorough equipment of those that exist. The forms that benefactions to these may wisely take are numerous, but probably none is more useful than that adopted by Mr. Osborne when he built a school for training female nurses at Bellevue College.

(21) William Henry Osborn (1820-1894), reorganizer and financial savior of the Illinois Central Railroad, after his retirement in 1882 became interested in aiding medical institutions, among which was the Bellevue Training School for Nurses in New York City.

If from all gifts there flows one half of the good that comes from this wise use of a millionaire's surplus, the most exacting may well be satisfied. Only those who have passed

millionaire - What could be better before God than thinking of the poor? For the poor are beloved by our heavenly Father. When Christ came upon the earth, those who believed in Him and followed Him were the poor and lowly, showing that the poor were near to God. When a rich man believes and follows the Manifestation of God, it is a proof that his wealth is not an obstacle and does not prevent him from attaining the pathway of salvation. After he has been tested and tried, it will be seen whether his possessions are a hindrance in his religious life. But the poor are especially beloved of God. Their lives are full of difficulties, their trials continual, their hopes are in God alone. Therefore, you must assist the poor as much as possible, even by sacrifice of yourself. No deed of man is greater before God than helping the poor. Spiritual conditions are not dependent upon the possession of worldly treasures or the absence of them. When one is physically destitute, spiritual thoughts are more likely. Poverty is a stimulus toward God. Each one of you must have great consideration for the poor and render them assistance. Organize in an effort to help them and prevent increase of poverty. The greatest means for prevention is that whereby the laws of the community will be so framed and enacted that it will not be possible for a few to be millionaires and many destitute. One of Baha'u'llah's teachings is the adjustment of means of livelihood in human society. Under this adjustment there can be no extremes in human conditions as regards wealth and sustenance. For the community needs financier, farmer, merchant and laborer just as an army must be composed of commander, officers and privates. All cannot be commanders; all cannot be officers or privates. Each in his station in the social fabric must be competent - each in his function according to ability but with justness of opportunity for all. (Abdu'l-Baha: Promulgation of Universal Peace, Page: 216)

through a lingering and dangerous illness can rate at their true value the care, skill, and attendance of trained female nurses. Their employment as nurses has enlarged the sphere and influence of woman. It is not to be wondered at that a senator of the United States, and a physician distinguished in this country for having received the highest distinctions abroad, should recently have found their wives in this class.

44. *Fourth* In the very front rank of benefactions public parks should be placed, always provided that the community undertakes to maintain, beautify and preserve them inviolate. No more useful or more beautiful monument can be left by any man than a park for the city in which he was born or in which he has long lived, nor can the community pay a more graceful tribute to the citizen who presents it than to give his name to the gift. Mrs. Schenley's gift last month of a large park to the city of Pittsburg deserves to be noted. This lady, although born in Pittsburg, married an English gentleman while yet in her teens. It is forty years and more since she took up her residence in London among

wealthy - Through the ingenuity and inventions of man it is possible to cross the wide oceans, fly through the air and travel in submarine depths. At any moment the Orient and Occident can communicate with each other. Trains speed across the continents. The human voice has been arrested and reproduced, and now man can speak at long distances from any point. These are some of the signs of this glorious century. The great progress mentioned has taken place in the material world. Remarkable signs and evidences have become manifest. Hidden realities and mysteries have been disclosed. This is the time for man to strive and put forth his greatest efforts in spiritual directions. Material civilization has reached an advanced plane, but now there is need of spiritual civilization. Material civilization alone will not satisfy; it cannot meet the conditions and requirements of the present age; its benefits are limited to the world of matter. There is no limitation to the spirit of man, for spirit in itself is progressive, and if the divine civilization be established, the spirit of man will advance. Every developed susceptibility will increase the effectiveness of man. Discoveries of the real will become more and more possible, and the influence of divine guidance will be increasingly recognized. All this is conducive to the divine form of civilization. This is what is meant in the Bible by the descent of the New Jerusalem. The heavenly Jerusalem is none other than divine civilization, and it is now ready. It is to be and shall be organized, and the oneness of humankind will be a visible fact. Humanity will then be brought together as one. The various religions will be united, and different races will be known as one kind. The Orient and Occident will be conjoined, and the banner of international peace will be unfurled. The world shall at last find peace, and the equalities and rights of men shall be established. The

the titled and the wealthy of the world's metropolis, but still she turns to the home of her childhood and by means of Schenley Park links her name with it forever.

(22) Pittsburgh advocates of parks induced Mrs. Mary E. Schenley to donate 300 acres for a park and the city purchased for \$200,000 an additional acreage. In addition to facilities for sports and beauty, Schenlev Park was the site of the Phipps conservatories, the first Carnegie Pittsburgh Library, and the Carnegie Institute.

---Page 42 The Gospel of Wealth - II Administration of Wealth---

A noble use this of great wealth by one who thus becomes her own administrator. If a park be already provided, there is still room for many judicious gifts in connection with it. Mr. Phipps of Allegheny has given conservatories to the park there, which are visited by many every day of the week, and crowded by thousands of working-people every Sunday; for, with rare wisdom, he has stipulated. as a condition of the gift that the conservatories shall be open on Sundays. The result of his experiment has been so gratifying that he finds himself justified in adding to them from his surplus, as he is doing largely this year. To lovers of flowers among the

capacity of humankind will be tested, and a degree shall be attained where equality is a reality.

All the peoples of the world will enjoy like interests, and the poor shall possess a portion of the comforts of life. Just as the rich are surrounded by their luxuries in palaces, the poor will have at least their comfortable and pleasant places of abode; and just as the wealthy enjoy a variety of food, the needy shall have their necessities and no longer live in poverty. In short, a readjustment of the economic order will come about, the divine Sonship will attract, the Sun of Reality will shine forth, and all phenomenal being will attain a portion. (Abdu'l-Baha: Promulgation of Universal Peace*, Pages: 101-102)

wealthy I commend a study of what is possible for them to do in the line of Mr. Phipps's example; and may they please note that Mr. Phipps is a wise as well as a liberal giver, for he requires the city to maintain these conservatories, and thus secures for them forever the public ownership, the public interest, and the public criticism of their management. Had he undertaken to manage and maintain them, it is probable that popular interest in the gift would never have been awakened.

45. The parks and pleasure-grounds of small towns throughout Europe are not less surprising than their libraries, museums, and art-galleries. I saw nothing more pleasing during my recent travels than the hill at Bergen, in Norway. It has been converted into one of the most picturesque of pleasure-grounds; fountains, cascades, waterfalls, delightful arbors, fine terraces, and statues adorn what was before a barren mountain-side. Here is a field worthy of study by the millionaire who would confer a lasting benefit upon his fellows. Another beautiful instance of the right use of wealth in the direction of making cities more and more

[Baha'i Comment](#)

attractive is to be found in Dresden. The owner of the leading paper there bequeathed its revenues forever to the city, to be used in

---Page 43 The Gospel of Wealth - II Administration of Wealth---

beautifying it. An art committee decides, from time to time, what new artistic feature is to be introduced, or what hideous feature is to be changed, and as the revenues accrue, they are expended in this direction. Thus, through the gift of this patriotic newspaper proprietor his native city of Dresden is fast becoming one of the most artistic places of residence in the whole world. A work having been completed, it devolves upon the city to maintain it forever. May I be excused if I commend to our millionaire newspaper proprietors the example of their colleague in the capital of Saxony?

46. Scarcely a city of any magnitude in the older countries is without many structures and features of great beauty. Much has been spent upon ornament, decoration, and architectural effect. We are still far behind in these things upon this side of the Atlantic. Our Republic is great in some things in material development unrivaled; but let us always remember that in art and in the finer touches we have scarcely yet taken a place. Had the exquisite Memorial Arch recently erected temporarily in New York been shown in Dresden, the art committee there would probably have been enabled, from the revenue of the newspaper given by its owner for just such purposes, to order its permanent erection to adorn the city forever.

Popular subscriptions have accomplished this result in the case referred to (the Washington Monument), and two other memorial arches have been designed and are to be erected here. -- ED. [Note in original edition.]

material development - Baha'u'llah has announced that no matter how far the world of humanity may advance in material civilization, it is nevertheless in need of spiritual virtues and the bounties of God. The spirit of man is not illumined and quickened through material sources. It is not resuscitated by investigating phenomena of the world of matter. The spirit of man is in need of the protection of the Holy Spirit. Just as he advances by progressive stages from the mere physical world of being into the intellectual realm, so must he develop upward in moral attributes and spiritual graces. In the process of this attainment he is ever in need of the bestowals of the Holy Spirit. Material development may be likened to the glass of a lamp whereas divine virtues and spiritual susceptibilities are the light within the glass. The lamp chimney is worthless without the light; likewise man in his material condition requires the radiance and vivification of the divine graces and merciful attributes. Without the presence of the Holy Spirit he is lifeless. Although physically and mentally alive he is spiritually dead. His Holiness Christ announced, "That which is born of flesh is flesh and that which is born of spirit is spirit," meaning that man must be born again. As the babe is born into the light of this physical world so must the physical and intellectual man be born into the light of the world of divinity. In the matrix of the mother the unborn child was deprived and unconscious of the world of material existence but after its birth it beheld the wonders and beauties of a new realm of life and being. In the world of the matrix it was utterly ignorant and unable to conceive of these new conditions but after its transformation it discovers the radiant sun, trees, flowers and an infinite range of blessings and bounties awaiting it. In the human plane and kingdom man is a captive of nature and ignorant of the divine world until born of the breaths of the Holy Spirit out of physical conditions of limitation and deprivation. Then he beholds the reality of the spiritual realm and kingdom, realizes the narrow restrictions of the mere human world of existence and becomes conscious of the unlimited and infinite glories of the world of God. Therefore no matter how man may advance upon the physical and intellectual plane he is ever in need of the boundless virtues of divinity, the protection of the Holy Spirit and the face of God. (Foundations of World Unity, Page 59)

47. While the bestowal of a park upon a community will be universally approved as one of the best uses for surplus wealth, in embracing such additions to it as conservatories, or in advocating the building of memorial arches and works of adornment, it is probable that many will think I go too far, and consider these somewhat fanciful. The material good to flow from them may not be so directly visible; but let not any practical mind, intent only upon material good, depreciate the value of wealth given for these or for kindred esthetic purposes as being useless as far as the mass

---Page 44 The Gospel of Wealth - II Administration of Wealth---

of the people and their needs are concerned. As with libraries and museums, so with these more distinctively artistic works: they perform their great use when they reach the best of the masses of the people. It is better to reach and touch the sentiment for beauty in the naturally bright minds of this class than to pander to those incapable of being so touched. For what the improver of the race must endeavor is to reach those who have the divine spark

[Baha'i Comment](#)

ever so feebly developed, that it may be strengthened and grow. For my part, I think Mr. Phipps put his money to better use in giving the working-men of Allegheny conservatories filled with beautiful flowers, orchids, and aquatic plants, which they, with their wives and children, can enjoy in their spare hours, and upon which they can feed their love for the beautiful, than if he had given his surplus money to furnish them with bread; for those in health who cannot earn their bread are scarcely worth considering by the individual giver, the care of such being the duty of the State. The man who erects in a city a conservatory or a truly artistic arch, statue, or fountain, makes a wise use of his surplus. "Man does not live by bread alone."

48. *Fifth.* We have another good use for surplus wealth in providing our cities with halls suitable for meetings of all kinds and for concerts of elevating music. Our cities are rarely possessed of halls for these purposes, being in this respect also very far behind European cities. Springer Hall, in Cincinnati, a valuable addition to the city, was largely the gift of Mr. Springer, who was not content to bequeath, funds from his

[Baha'i Comment](#)

estate at death, but gave during his life, and, in addition, gave - what was equally important - his time and business ability to insure the successful results which have been achieved.

(23) Reuben R. Springer (1800-1884), a successful investor in real estate and railroads, gave the major share of the money for the erection of the Cincinnati Music Hall. Opened in 1878, this red brick, semi-Gothic building housed the Cincinnati Music Festival and later the Cincinnati Symphony Orchestra. Perhaps inspired by this example, Andrew Carnegie in 1892 built the New York Music Hall on 57th Street. Since the latter name repelled European artists, who associated it with vaudeville, it was changed to Carnegie Hall.

The gift of a hall to any city lacking one is an

---Page 45 The Gospel of Wealth - II Administration of Wealth---

excellent use for surplus wealth for the good of a community. The reason why the people have only one instructive and elevating, or even amusing, entertainment when a dozen would be highly beneficial, is that the rent of a hall, even when a suitable hall exists, which is rare, is so great as to prevent managers from running the risk of financial failure. If every city in our land owned a hall which could be given or rented for a

small sum for such gatherings as a committee or the mayor of the city judged advantageous, the people could be furnished with proper lectures, amusements, and concerts at an exceedingly small cost. The town halls of European cities, many of which have organs, are of inestimable value to the people, utilized as they are in the manner suggested. Let no one underrate the influence of entertainments of an elevating or even of an amusing character, for these do much to make the lives of the people happier and their natures better. If any millionaire born in a small village which has now become a great city is prompted in the day of his success to do something for his birthplace with part of his surplus, his grateful remembrance cannot take a form more useful than that of a public hall with an organ, provided the city agrees to maintain and use it.

49. *Sixth.* In another respect we are still much behind Europe. A form of benevolence which is not uncommon there is providing swimming-baths for the people. The donors of these have been wise enough to require the city benefited to maintain them at its own expense, and as proof of the contention that everything should never be done for any one or for any community, but that the recipients should invariably be called upon to do a part, it is significant that it is found essential for the popular success of these healthful establishments to exact a nominal charge for their use. In many cities, however, the school-children are admitted free

---Page 46 The Gospel of Wealth - II Administration of Wealth---

at fixed hours upon certain days; different hours being fixed for the boys and the girls to use the great swimming-baths, hours or days being also fixed for the use of these baths by women. In addition to the highly beneficial effect of these institutions upon the public health in inland cities, the young of both sexes are thus taught to swim. Swimming clubs are

[Baha'i Comment](#)

organized, and matches are frequent, at which medals and prizes are given. The reports published by the various swimming-bath establishments throughout Great Britain are filled with instances of lives saved because those who fortunately escaped shipwreck had been taught to swim in the baths; and not a few instances are given in which the pupils of certain bathing establishments have saved the lives of others. If any disciple of the gospel of wealth gives his favorite city large swimming and private baths, provided the municipality undertakes their management as a city affair, he will never be called to account for an improper use of the funds intrusted to him.

50. *Seventh.* Churches as fields for the use of surplus wealth have purposely been reserved for the last, because, these being sectarian, every man will be governed in his action in regard to them by his own attachments; therefore gifts to churches, it may be said, are not, in one sense, gifts to the community at large, but to special classes. Nevertheless, every millionaire may know of a district where the little cheap, uncomfortable, and altogether unworthy wooden structure

[Baha'i Comment](#)

stands at the cross-roads, in which the whole neighborhood gathers on Sunday, and which, inside the form of the doctrines taught is the center of social life and the source of neighborly feeling. The administrator of wealth makes a good use of part of his surplus if he replaces that building with a permanent structure of brick, stone, or granite, up whose sides the honeysuckle and columbine may climb, and from whose tower the sweet-tolling bell may sound. The millionaire should not figure how cheaply this structure can be built, but how perfect it can be made.

---Page 47 The Gospel of Wealth - II Administration of Wealth---

If he has the money, it should be made a gem, for the educating influence of a pure and noble specimen of architecture, built, as the pyramids were built, to stand for ages, is not to be measured by dollars. Every farmer's home, heart, and mind in the district will be influenced by the beauty and grandeur of the church; and many a bright boy, gazing enraptured upon its richly colored windows and entranced by the celestial voice of the organ, will there receive his first message from

and in spirit be carried away to the beautiful and enchanting realm which lies far from the material and prosaic conditions which surround him in this workaday world - a real world, this new realm, vague and undefined though its boundaries be. Once within its magic circle, its denizens live there an inner life more precious than the external, and all their days and all their ways, their triumphs and their trials, and all they see, and all they hear, and all they think, and all they do, are hallowed by the radiance which shines from afar upon this inner life, glorifying everything, and keeping all right within. But having given the building, the donor should stop there; the support of the church should be upon its own people. There is not much genuine religion in the congregation or much good to come from the church which is not supported at home.

51. Many other avenues for the wise expenditure of surplus wealth might be indicated. I enumerate but a few -- a very few - of the many fields which are open, and only those in which great or considerable sums can be judiciously used. It is not the privilege, however, of millionaires alone to work for or aid measures which are certain to benefit the community. Every one who has but a small surplus above his moderate wants may share this privilege with his richer brothers, and those without surplus can give at least a part of their time, which is usually as important as funds, and often more so.

[Baha'i Comment](#)

52. It is not expected, neither is it desirable, that there should be general concurrence as to the best possible use of surplus

[Baha'i Comment](#)

---Page 48 The Gospel of Wealth - II Administration of Wealth---

wealth. For different men and different localities there are different uses. What commends itself most highly to the judgment of the administrator is the best use for him, for his heart should be in the work. It is as

important in administering wealth as it is in any other branch of a man's work that he should be enthusiastically devoted to it and feel that in the field selected his work lies.

53. Besides this, there is room and need for all kinds of wise benefactions for the common weal. The man who builds a university, library, or laboratory performs no more useful work than he who elects to devote himself and his surplus means to the adornment of a park, the gathering together of a collection of pictures for the public, or the building of a memorial arch. These are all true laborers in the vineyard. The only point required by the gospel of wealth is that the surplus which accrues from time to time in the hands of a man should be administered by him in his own lifetime for that purpose which is seen by him, as trustee, to be best for the good of the people. To leave at death what he cannot take away, and place upon others the burden of the work which it was his own duty to perform, is to do nothing worthy. This requires no sacrifice, nor any sense of duty to his fellows.

[Baha'i Comment](#)

54. Time was when the words concerning the rich man entering the kingdom of heaven were regarded as a hard saying. To-day, when all questions are probed to the bottom and the standards of faith receive the most liberal interpretations, the startling verse has been relegated to the rear, to await the next kindly revision as one of those things which cannot be quite understood, but which, meanwhile, it is carefully to be noted, are not to be understood literally. But is it so very improbable that the next stage of thought is to restore the doctrine in all its pristine purity and force, as being in perfect harmony with sound ideas upon the subject of wealth and poverty, the rich and the poor, and the contrasts everywhere seen and deplored? In Christ's day, it is

---Page 49 The Gospel of Wealth - II Administration of Wealth---

evident, reformers were against the wealthy. It is none the less evident that we are fast recurring to that position to-day; and there will be nothing to surprise the student of sociological development if society should soon approve the text which

[Baha'i Comment](#)

has caused so much anxiety: "It is easier for a camel to enter the eye of a needle than for a rich man to enter the kingdom of heaven." Even if the needle were the small casement at the gates, the words betoken serious difficulty for the rich. It will be but a step for the theologian from the doctrine that he who dies rich dies disgraced, to that which brings upon the man punishment or deprivation hereafter.

55. The gospel of wealth but echoes Christ's words. It calls upon the millionaire to sell all that he had and give it in the highest and best form to the poor by administering his estate himself for the good of his fellows, before he is called upon to lie down and rest upon the bosom of Mother Earth. So doing, he will approach his end no longer the ignoble hoarder of useless millions; poor, very poor indeed, in money, but rich, very rich, twenty times a millionaire still, in the affection, gratitude, and admiration of his fellow-men, and -sweeter far-soothed and sustained by the still, small voice within, which, whispering, tells him that, because he has lived, perhaps one small part of the great world has been bettered just a

Paradise - The man who thinks only of himself and is thoughtless of others is undoubtedly inferior to the animal because the animal is not possessed of the reasoning faculty. The animal is excused; but in man there is reason, the faculty of justice, the faculty of mercifulness. Possessing all these faculties he must not leave them unused. He who is so hard-hearted as to think only of his own comfort, such an one will not be called man. Man is he who forgets his own interests for the sake of others. His own comfort he forfeits for the well-being of all. Nay, rather, his own life must he be willing to forfeit for the life of mankind. Such a man is the honor of the world of humanity. Such a man is the glory of the world of mankind. Such a man is the one who wins eternal bliss. Such a man is near to the threshold of God. Such a man is the very manifestation of eternal happiness. Otherwise, men are like animals, exhibiting the same proclivities and propensities as the world of animals. What distinction is there? What prerogatives, what perfections? None whatever! Animals are better even--thinking only of themselves and negligent of the needs of others.

Consider how the greatest men in the world--whether among prophets or philosophers--all have forfeited their own comfort, have sacrificed their own pleasure for the well-being of humanity. They have sacrificed their own lives for the body politic. They have sacrificed their own wealth for that of the general welfare. They have forfeited their own honor for the honor of mankind. Therefore it becomes evident that this is the highest attainment for the world of humanity.

We ask God to endow human souls with justice so that they may be fair, and may strive to provide for the comfort of all, that each

little. This much is sure:
against such riches as these
no bar will be found at the
gates of Paradise.

member of humanity may pass his life in the utmost comfort and welfare. Then this material world will become the very paradise of the Kingdom, this elemental earth will be in a heavenly state and all the servants of God will live in the utmost joy, happiness and gladness. We must all strive and concentrate all our thoughts in order that such happiness may accrue to the world of humanity. (Foundations of World Unity, Page 42 & 43)

III

The Advantages of Poverty

(1) Published originally in the Nineteenth Century, XXIX (March 1891), 367-385; the same journal, XXVIII (November 1890), 677-694, published W. E. Gladstone, "Mr. Carnegie's 'Gospel of Wealth.' A Review and a Recommendation," which characteristically had something good to say about the advantages of inherited wealth. The review was of a pamphlet embodying Carnegie's articles which had received wide circulation here and abroad and had been issued in thousands of copies. A month later comments on "irresponsible Wealth" (XXVIII, 876-900) appeared by Cardinal Manning (1808-1892); Hermann Adler (1839-1911), chief rabbi of the United Hebrew Congregations of the British Empire (1891-1911); and Hugh Price Hughes (1817-1902), an influential Methodist divine. These three dwelt especially upon religious directives and motives which they thought Carnegie had brushed aside. Hughes was the most severe critic.

1. Two essays from my pen, published in the North American Review, have been doubly fortunate in Britain in being reprinted by the Pall Mall Gazette under the new and striking title of "The Gospel of Wealth," and in attracting the attention of the one man who, of all others, could bring them most prominently before thinking

[Baha'i Comment](#)

people. Mr. Gladstone's review and recommendation in the November number of this Review gave them the most illustrious of sponsors; he is followed in the December number by others of the highest eminence and authority. The discussion has taken a wide range, but I shall restrict myself to its bearings upon the ideas presented in "The Gospel of Wealth."

2. Mr. Gladstone first calls attention to the portentous growth of wealth. From every point of view this growth seems to me most beneficial; for we know that, rapid as is the increase of wealth, its distribution among the people in streams more and more numerous is still more rapid, the share of the joint product of capital and labor which has gone to

--- Page 51. The Gospel of Wealth - III The Advantages of Poverty ---

labor during this generation being much greater than in any generation preceding, and constantly increasing. Evidences, drawn from many independent sources, converge and prove this beyond question. A few enormous fortunes have been amassed during the present

[Baha'i Comment](#)

generation in this new and undeveloped continent, but under conditions which no longer exist. In our day, even in the United States, it is much easier to lose a great fortune than to make one, and more are being lost than made. It is rather surprising, therefore, that the Rev. Mr. Hugh Price Hughes should say: "Whatever may be thought of Mr. Henry George's doctrines and deductions, no one can deny that his facts are indisputable, and that Mr. Carnegie's 'progress' is accompanied by the growing 'poverty' of his less fortunate fellow-countrymen."

(2) Hughes's belief that "the rich were getting richer and the poor poorer" was a widely quoted aphorism of this period. It had little factual basis. Henry George (1882-1916), the American economist and author of Progress and Poverty (1879), justifying the "single tax," accepted the commonly held notion.

3. So far as I have observed, all writers of authority upon social and economic subjects have not only disputed Mr. George's statements, but pronounce their opposites to be the truth. Mr. George's "Progress and Poverty" is founded upon two statements: first, that the rich are growing richer, and the poor poorer; and second, that land is going more and more into the hands

[Baha'i Comment](#)

of the few. The truth is that the rich are growing poorer, and the poor growing richer, and that land is passing from the hands of the few into the hands of the many. A study of Mulhall's *Fifty Years of National Progress* (pages 23-27)

(3) Michael George Mulhall (1836-1900). His book, one of several on economic matters and statistics, appeared in England in 1887.

is strongly recommended to those desirous of learning the truth in regard to the distribution of wealth, upon which Mr. Mulhall says: "Nor does this wealth become congested among a small number of people; on the contrary, the rich grow less rich and more numerous every year, the poor fewer in ratio to population."

--- Page 52. The Gospel of Wealth - III The Advantages of Poverty ---

[Baha'i Comment](#)

(NUMBER OF FARMS) *

1,449,073	2,044,077	2,659,985	4,008,907

AVERAGE SIZE OF FARMS (ACRES)

1850	1860	1870	1880
203	199	153	134

** In 1890 the number of farms in the United States was 4,564,641 and the average size 136 and 1/2 acres. -- ED. [Note in original edition.]*

This tendency to more numerous and smaller holdings exists also in Britain, although hampered in its operation by repressive laws.

[Baha'i Comment](#)

5 I rejoice that Mr. Hughes quotes the well-known passage from Herbert Spencer,

(4) The passage is from Spencer's Study of Sociology, pp. 256-59.

which, as he says, "exposes the sad delusion that great wealth is a great blessing"- a passage which is throughout profoundly true; but is it possible that Mr. Hughes can be uninformed of the position Mr. George occupies in the wise mind of our mutual teacher? In speaking to me of Mr. George's book, Mr. Spencer said that he had read a few pages, and then thrown it down as "trash." I know of no writer or thinker of recognized authority, except Mr. Hughes, who differs with the philosopher in this judgment.

[Baha'i Comment](#)

6. So far as the reference to myself is concerned, -I understand, of course, it is in nowise personal, but only as the representative of a class, - I beg to assure Mr. Hughes that the indisputable fact I know is that my "progress" has inevitably carried with it not the "sowing poverty," but the growing riches of my fellow-countrymen, as the progress of every employer of labor must necessarily carry with it

--- Page 53. The Gospel of Wealth - III The Advantages of Poverty ---

the enrichment of the country and of the laborer. Imagine one speaking of "growing poverty" in the United States! The American, more than any other workman, spends his savings for the purchase of a home. The savings-banks are only one of several depositories used by him.

[Baha'i Comment](#)

7. Nevertheless, the returns just made for the year 1890, for all the New England and Middle States (where millionaires do most abound), comprising a population of 17,300,000 more than half the total population of Britain -
- show that the deposits are \$1,279,000,000 -- say £255,000,000, the increase for the year being £13,000,000. The number of depositors is 3,520,000, showing that about one out of every five men, women, and children has a bank-account, equal practically to one to each family. The amount of savings invested for homes far exceeds the savings-bank deposits.

[Baha'i Comment](#)

8. The United States census of 1880 shows only 88,665 public paupers in a population of 50,000,000, mainly aged and superannuated - one third being foreigners. There were more blind and idiotic people in the public charitable institutions than paupers, and half as many deaf-mutes, although the percentage of the "defective classes" is less than half that of Europe. The total number of all "dependent" persons cared for was less than five per thousand, as compared with thirty-three per thousand in the United Kingdom. This

[Baha'i Comment](#)

percentage for Britain is happily only about one fourth of what it has been, and its steady decrease is most encouraging. Good and charitable workers among the poor can best accelerate this decreasing process, until something like the American figure is reached, by instilling within the working classes of Britain those feelings of manly self-respect and those habits of sobriety and thrift which distinguish their race here, and keep it almost free, not only from pauperism, but from want or extreme poverty, except as the necessary result (accident and sickness excepted) of their own bad habits.

9. Mr. Hughes would not give currency knowingly to state-

--- Page 54. The Gospel of Wealth - III The Advantages of Poverty ---

ments that were the reverse of correct. I earnestly hope, therefore, that he will satisfy himself that every writer of authority is not deceived when he asserts that poverty, want, and pauperism are rapidly diminishing quantities; and most significantly so, not so much through almsgiving, or efforts of the rich, but because of an improvement

[Baha'i Comment](#)

through education in the habits of the people themselves - the only foundation upon which their continued progress can surely be built. Mr. Hughes can also readily learn another indisputable fact by inquiring at the shipyards of Glasgow, the iron and steel mills of Sheffield, the coal-mines of the Midlands, or at industrial establishments generally - namely, that the working-classes receive much greater compensation for their services than they ever did or now do for any other form of labor, and much greater than they could possibly receive, except for the establishment of great enterprises by men of wealth. In these days of excitement and exaggeration, let it always be borne in mind that at no period in the history of the English-speaking race, wherever that race resides, has it been so easy as it is to-day for the masses not only to earn comfortable livelihoods, but to save and have money in bank for a rainy day. When they fail to do so, the true reformer looks more to their habits than to existing conditions for a satisfactory explanation.

10. So far from its being a fact that "millionaires at one end of the scale mean paupers at the other," as Mr. Hughes says, the reverse is obviously true. In a country where the millionaire exists there is little excuse for pauperism; the condition of the masses is satisfactory just in proportion as a country is blessed with millionaires. There is not a great millionaire among the whole four hundred millions of China, nor one in Japan, nor in India; one or two perhaps in the whole of Russia; there are two or three in Germany, and not more than four or five in the whole of France, monarchs and hereditary nobles excepted. There are more millionaires upon the favored little isle of Britain than in the whole of

--- Page 55. The Gospel of Wealth - III The Advantages of Poverty ---

Europe, and in the United States still more, of recent origin, than in Britain; and the revenues of the masses are just in proportion to the ease with which millionaires grow. The British laborer receives more for one day's handling of the shovel than the blacksmith or carpenter of China, Russia, India, or Japan receives for a whole week's labor, and

[Baha'i Comment](#)

double that of his Continental fellow-workman. The skilled artisan of America receives more than twice as much as the artisan of Britain.

Millionaires can only grow amid general prosperity, and this very prosperity is largely promoted by their exertions. Their wealth is not made, as Mr. Hughes implies, at the expense of their fellow-countrymen. Millionaires make no money when compelled to pay low wages. Their profits accrue in periods when wages are high, and the higher the wages that have to be paid, the higher the revenues of the employer. It is true, and not false, therefore, that capital and labor are allies and not antagonistic forces, and that one cannot prosper when the other does not.

11. I feel as if I should apologize for taking so much space in stating truisms; but much of the prejudice and hostility which unnecessarily exist between capital and labor arise from such statements as those quoted.

[Baha'i Comment](#)

12. To return to Mr. Gladstone. Would that his adhesion to "The Gospel of Wealth" in its entirety could be obtained! Deeply gratifying is the favor which he accords in general to its scope and aim; but the destructive character of its criticism upon one vital point is important. He is quite right in saying that, "though partial, it is a serious difference." It arises from his fond, clinging affection for the principle of hereditary transmission of position and wealth, and of business, and for magnificence upon the part of those in station. We must treat this serious matter at the threshold.

[Baha'i Comment](#)

13. The fundamental idea of the gospel of wealth is that surplus wealth should be considered as a sacred trust to be administered by those into whose hands it falls, during their lives, for the good of the community. It predicts that the day

[Baha'i Comment](#)

--- Page 56. The Gospel of Wealth - III The Advantages of Poverty ---

is at hand when he who dies possessed of enormous sums, which were his and free to administer during his life, will

die disgraced, and holds that the aim of the millionaire should be to die poor. It likewise pleads for modesty of private expenditure

14. The most serious obstacle to the spread of such a gospel is Undoubtedly the prevailing desire of men to accumulate wealth for the express purpose of bequeathing it to their children, or to spend it in ostentatious living. I have therefore endeavored to prove that at the root of the desire to bequeath to children there lay the vanity of the parents, rather than a wise regard for the good of the children. That the parent who leaves his son enormous wealth generally deadens the talents and energies of the son, and tempts him to lead a less useful and less worthy life than he otherwise would, seems to me capable of proof which cannot be gainsaid. It is many years since I wrote in a rich lady's album, "I should as soon leave to my son a curse as the almighty dollar." Exceptions abound to every general rule, but I think not more exceptions to this rule than to others - namely, that "wealth is a curse to young men, and poverty a blessing"; but if these terms seem rather strong, let us state the proposition thus: that wealth

[Baha'i Comment](#)

left to young men, as a rule, is disadvantageous; that lives of poverty and struggle are advantageous.

15. Mr. Gladstone asks: "Is it too much to affirm that the hereditary transmission of wealth and position, in conjunction with the calls of occupation and of responsibility, is a good and not an evil thing? I rejoice to see it among our merchants, bankers, publishers; I wish it were commoner among our great manufacturing capitalists." He also says: "Even greater is the subject of hereditary transmission of land - more important and more difficult." Mr. Gladstone does not favor entails of money, but adds: "But is it another matter when in commerce, or in manufacture, or in other

--- Page 57. The Gospel of Wealth - III The Advantages of Poverty ---

forms of enterprise, such for example as the business of a great publishing house, the work of the father is propagated by his descendants?"

[Baha'i Comment](#)

16. These passages imply that the hereditary transmission of wealth and position and of business are not detrimental - as I think them - but desirable: a good and not an evil thing. Let us take the first form, that of sons following the occupations of their fathers. Little, I think, does one know, who is not in the whirl of business affairs, of the rarity of the combined qualities requisite for conducting the business enterprises of to-day. The time has passed when business once established can be considered almost permanently secure. Business methods have changed; good will counts for less and less. Success in business is held by the same tenure, nowadays, as the Premiership of Britain -- at the cost of a perpetual challenge to all comers. The fond parent who invests his son with imaginary business qualifications, and places him in charge of affairs - upon the successful management of which the incomes of thousands depend - incurs a grave responsibility. Most of the disastrous failures of the day arise from this very cause. It is as unjust to the son as to the community. Out of seven serious failures during a panic in New York, five were traced to this root. One of these sons is an exile

[Baha'i Comment](#)

to escape punishment for breaking a law which he did not clearly understand. I have joined with others in asking the President to pardon him - a step I have never taken before on behalf of any law-breaker, but in this case I consider the father, not the son, the guilty party. The duty of the head of a great enterprise is to interest capable assistants who are without capital, but who have shown aptitude for affairs, and raise these to membership and management. The banker who hands over his business to sons, because they are sons, is guilty of a great offense. The transmission of wealth and rank, without regard to merit or qualifications, may pass from one peer to another, not without

--- Page 58. The Gospel of Wealth - III The Advantages of Poverty ---

much, but without serious injury, since the duties matter of routine, seldom involving the welfare or of others; but the management of business, never.

17. But assuming that business enterprises can be handed over properly in deference to hereditary claims, is it wise or desirable that they should be? I think not. The millionaire business man rates his vocation higher than I, who sees in it the best or highest, or even a desirable career for his sons. The sons of the wealthy have a right instinct which tells them that to engage in work where the primary object is gain is unworthy of those who, relieved from the necessity of earning a livelihood, are in a position to devote themselves to any of the hundred pursuits in which their time and knowledge can be employed primarily for the good of the community. The sons of the millionaire are to be regarded with approval who cannot be induced to take the absorbing and incessant interest in their father's business which is necessary to save it from ruin. The day is over when even the richest can play at business, as rich men's sons almost invariably do. There are exceptions where the son shows tastes and decided ability which render him the natural successor; but these are rare, far too rare to take into account in estimating the value of a custom. This ability, moreover, should be proved in some other establishment

[Baha'i Comment](#)

than that of the father.

18. When we come to the hereditary transmission of land, Mr. Gladstone's words are most touching. He paints a lovely picture of the "wonderful diversity and closeness of the ties by which, when rightly used, the office of the landed proprietor binds together the whole structure of rural society,.... that cohesion, interdependence, and affection of the gens which is in its turn a fast-compacting bond of societies at large." But is this a picture of to-day? Has not that day passed also, except in a few instances such as that furnished by the late lamented Lord Tollemache,⁵ and upon

(5) Lord Tollemache (1805-1890) was the landlord of two estates, totaling 33,000 acres, in Suffolk and Cheshire. He contributed a phrase and a practice to land reform by giving each of his 250 cottage tenants "three acres and a cow," from the rectums of which they could supplement their wages on neighboring farms. At the same time he divided his own estates into farms of 200 acres as the most profitable unit of cultivation. He had the most advanced ideas about a landlord's responsibility and knew every tenant and his capabilities. On his death in 1890 the Times characterized him "as the finest practical agriculturist in the country."

--- Page 59. The Gospel of Wealth - III The Advantages of Poverty ---

[Baha'i Comment](#)

a smaller scale by Mr. Gladstone himself, in that earthly Paradise, Hawarden?"

(6) Gladstone's large private estate in Wales, site of an ancient castle.

Carnegie Text Goes Here

19. The cultivation of land is now a business conducted upon a commercial basis by independent men, whom the landed proprietor no longer leads, and who most fortunately can lead themselves. The American citizen, who is himself landlord, factor, tenant, and laborer, requiring from the land he owns and tills only the support of himself and family, has rendered impossible the maintenance of more than one class from the product of agricultural land anywhere in the world. Knowing the kind of citizen which this condition creates, and knowing also the character of the Scotch farmer, as evolved through the operation of long leases which make him practically independent, -although in his case the magic power of ownership, which counts for so much, is still lacking, - and estimating these classes as men and as citizens, I have no doubt that the balance of advantage, both to the individual and to the State, is largely in favor of the change. Should the abolition of primogeniture and entail come with the changes democracy is expected to inaugurate, large estates in Britain would probably be divided into farms and owned by the people. The history of Denmark in this particular might then be that of Britain; and the temptation which now exists to leave territorial domains to eldest sons would thus be removed, and with it one great obstacle to the adoption of the gospel of wealth - the desire, futile as vain, to found or maintain hereditary families.

20. Mr. Gladstone instances the Marquis of Salisbury 7 suc-

(7) Lord Salisbury was a Cecil. The family, one of the most distinguished in English history, attained eminence at least as early as the reign of Queen Elizabeth. Robert Cecil, the first Earl of Salisbury, younger son of William Lord Burghley, was Queen Elizabeth's famous Lord Treasurer. A lineal descendant, Robert Arthur Talbot Cascoyne-Cecil, third Marquis of Salisbury, was born in 1830. His father, disapproving of

Baha'i Comment

the young man's marriage, gave him only a limited income. Thereupon he became a contributor to magazines, notably Bentley's Quarterly Review and the Saturday Review. On the death of an older brother in 1865 he became his father's heir. Meanwhile in the Commons he had made a reputation as a conservative and a foe of Gladstone. After serving as Secretary of State for Foreign Affairs and in other positions, he became in 1885 prime minister for the first time. Through the next fifteen years he recurrently held this office as well as that for foreign affairs. He left office for the last time in 1902 and died the following year.

--- Page 60. The Gospel of Wealth - III The Advantages of Poverty ---

ceeding to the office of Prime Minister, which office ten generations ago was filled by one of his ancestors, and asks: "Is not this tie of lineage a link binding him to honor and to public virtue?" Is not Mr. Gladstone unfortunate in naming Lord Salisbury in support of his views? I have always regarded him as a striking instance of the advantage of not being born to hereditary wealth and position. Like the great founder of the Cecils, Lord Salisbury himself was born a commoner - a younger son with a younger son's portion; and with the promptings of decided ability within him, he did everything in his power to prevent being narrowed and

restricted by the smothering robes of rank and wealth. The laws of his country forced him to sink his individuality in a peerage, but for which English history might have told of a first and a second. Cecil, as it tells of a first and a second Pitt -- men too great to be obliterated as men by any title. It is a sad descent in historical rank from "Cecil" to the "Marquis" of anything. The highest title which a man can write upon the page of history is his own name. Mr.

Gladstone's will be there; Gladstone he is, Gladstone he will remain, even if he tried to make future generations lose his commanding personality in the "Dukedom of Clydesdale," or any title whatever. But who among his contemporaries in public life is to stand this supreme test of masterdom? There is room for one only in each generation. It is safe to predict that, whoever he be, he will resemble "Gladstone" in one essential feature: he will be of the people, free from the dis-

--- Page 61. The Gospel of Wealth - III The Advantages of Poverty ---

advantage of hereditary wealth and position, and stamp his name and personality upon the glittering scroll. "Disraeli" promised well

for a time, but he fades rapidly into Beaconsfield

(8) Benjamin Disraeli (1804-1881) became Earl of Beaconsfield in 1876 but did not exactly "fade" as statesman until 1880.

becoming a Shadow of a name. The title proves greater than the man.

21. As a "Saturday Reviewer," Robert Talbot Cecil (what a glorious name to lose!) had proved himself a power: it is a hundred to one that, had he been born to the hereditary title, he would have remained an obscure commonplace Marquis, resembling in this respect the many generations of Marquises of Salisbury which had followed each other, and whose noble history is comprised - and fully comprised - in "Burke's Peerage in the three letters, b, m, d. The only man of his family from whom he can derive inspiration "binding him to honor and to public virtue," is the great original Cecil, and the founder of his own branch of the house, who, like himself, was a younger son, and had neither wealth nor rank. He did not even reach knighthood till late in his career. The great Cecil sprung from the people, and had none of the advantages which Mr. Gladstone, as I think

[Baha'i Comment](#)

wrongly, attributes to hereditary wealth and position. Lineage is indeed, most important, but only the lineage of the immediate parents; for in each generation One half of the strain is changed. Fortunately for the high-placed ones of the earth, it is unnecessary for them to scrutinize the characters of their ancestors beyond the preceding generation. Happy for the royal children of Britain that they can dwell upon the virtues of father and mother, and stop there. Lord Salisbury, like many able men, perhaps, owes his commanding qualities to his mother, who was the daughter of a country gentleman - a commoner, secure from the disadvantages of the hereditary transmission of wealth and rank. It is curious that the present ruler of the other branch of the English race, our President, has the same good fortune Mr. Gladstone claims for the

--- Page 62. The Gospel of Wealth - III The Advantages of Poverty ---

Marquis of Salisbury, his grandfather having been President.

(9) Benjamin Harrison (1833-1901), twenty third President of the United States, was the

grandson of William Henry Harrison, the ninth.

But it is safe to say that the American ruler would never have occupied that high office had he received fortune and position from his grandfather, or had he himself acquired riches. No party is so foolish as to nominate for the Presidency a rich man, much less a millionaire. Democracy elects poor men. The man must have worked for his bread to be an available candidate; and if, like Lincoln, he has been so fortunate as to be compelled to split rails, or, like Garfield,

(10) James A. Garfield (1831-1881) reputedly was the last president to be born in a log cabin.

to drive mules upon a canal, and subsequently to clean the rooms and light the fires of the school in part payment for his tuition, or, like Blaine,

(11) James G. Blaine (1850-1893), Secretary of State in Garfield's administration (1880-81) and again in 1889-1902, taught school at Western Military Institute, Georgetown, Kentucky, and at an institution for the blind in Philadelphia.

to teach school, so much more successfully does he appeal to the people. This applies not only to the Presidency: one of the strongest aspirants for that office lost his

renomination to the Senate because a house that he erected in Washington was taken as an indication of tastes incompatible with republican simplicity of life.

22. Nothing is more fatal to the prospects of a public man in America than wealth, or the display of wealth. The dangers of a plutocracy that his Eminence Cardinal Manning fears are, I assure him, purely imaginary. There is no country in which wealth counts for so little as in the Republic The current is all the other way. Is the influence of lineage less upon the republican President, in binding him to honor and public virtue, because neither hereditary rank nor wealth was transmitted? Because he is poor and a commoner, is he less sensitive to the promptings of honor and virtue? I think it will be found that the best and greatest of Britain do not differ from the greatest and best of other lands. These have had a lineage which linked them to honor and to public virtue, but almost

--- Page 63. The Gospel of Wealth - III The Advantages of Poverty ---

without exception the lineage of honest poverty - of

[Baha'i Comment](#)

laborious, wage-receiving parents, leading lives of virtuous privation, sacrificing comforts that their sons might be kept at school - lineage from the cottage of poverty, not the palace of hereditary rank and position.

23. Mr. Gladstone himself has a lineage. Does it bind him less than Lord Salisbury is bound by his to honor and public virtue? His ancestors were Scotch farmers without wealth or rank, yet I doubt not that Mr. Gladstone's career has been as strongly and as nobly influenced by his knowledge or recollections of the poor and virtuous lives lived by his forefathers as that of any hereditary monarch or noble who ever lived could be by thoughts of his ancestors; and of one thing I am absolutely sure: he has reason to be much prouder of his lineage than nobles or monarchs in general can possibly be of theirs. Among many advantages arising, not from the transmission of hereditary wealth and position, but from the transmission of hereditary "poverty and health," there is one which, to my mind, overweighs all the others combined. It is not permitted the children of king, millionaire, or noble to have

[Baha'i Comment](#)

father and mother in the close and realizing sense of these sacred terms. The name of father, and the holier name of mother, are but names to the child of the rich and the noble. To the poor boy these are the words he conjures with - his guides, the anchors of his soul, the objects of his adoration. Neither nurse, servant, governess, nor tutor has come between him and his parents. In his father he has had tutor, companion, counselor, and judge. It is not given to the born millionaire, noble, or prince to dwell upon such a heritage as is his who has had in his mother nurse, seamstress, teacher, inspirer, saint - his all in all.

24. Hereditary wealth and position tend to rob father and mother of their children, and the children of father and mother. It cannot be long ere their disadvantages are felt more and more, and the advantages of plain and simple living more clearly seen.

[Baha'i Comment](#)

--- Page 64. The Gospel of
Wealth - III The Advantages
of Poverty ---

25. Poor boys reared thus directly by their parents possess such advantages over those watched and taught by hired strangers, and exposed to the temptations of wealth and position, that it is not surprising they become the leaders in every branch of human action. They appear upon the stage, athletes trained for the contest, with sinews braced, indomitable wills, resolved to do or die. Such boys always have marched, and always will march, straight to the front and lead the world; they are the epoch-makers. Let one select the three or four foremost names, the supremely great in every field of human triumph, and note how small is the contribution of hereditary rank and wealth to the short list of immortals who have lifted and advanced the race. It will, I think, be seen that the possession of these is almost fatal to greatness and goodness, and that the greatest and best of our race have necessarily been nurtured in the bracing school of poverty-the only school capable of producing the supremely great, the genius.

[Baha'i Comment](#)

26. Upon the plea made by "The Gospel of Wealth" for modesty of private expenditure, Mr. Gladstone says: "Among those whose station excuses or even requires magnificence, there are abundant opportunities and there are also beautiful and graceful examples of personal simplicity and restraint." This seems to me a branch from the upas-tree of hereditary transmission of wealth and position. Is it true that station requires magnificence, or true that true dignity of station is enhanced by simplicity?

[Baha'i Comment](#)

27. Here are some words of President Cleveland in his message to Congress upon this point: "We should never be ashamed of the simplicity and prudential economies which are best suited to the operation of a republican form of government and most compatible with the mission of the American people. Those who are selected for a limited time to manage public affairs are still of the people, and may do much by their example to encourage, consistently with the dignity of their official functions, that plain way of life which

[Baha'i Comment](#)

Wealth - III The Advantages of Poverty ---

among their fellow-citizens
aids integrity and promotes
thrift and prosperity."

28. President Cleveland only
follows the teachings and
examples of every American
President, and of all others in
official station. There are no
pecuniary prizes in the
Republic for judge, bishop, or
President; neither any
pensions,

*(12) On the other hand, Carnegie,
pained by the ingratitude of
republics, bequeathed in his will an
income of \$10,000 a year to ex-
President Taft and \$5,000 a year
each to Mrs. Grover Cleveland and
Mrs. Theodore Roosevelt.*

except that judges are retired
upon half-pay at seventy
years of age. The very
moderate salaries given to all
officials enforce modest
expenditure, and the influence
of this upon the nation is as
powerful as salutary. Were
some future King of Britain to
announce that the serious
consideration of the subject of
wealth and poverty had led
him to resolve to live as the
President of the United States
and his family live, upon ten
thousand pounds a year, and
to return to the nation, or
devote to public uses, the
hundreds of thousands of

[Baha'i Comment](#)

pounds spent for magnificence, and were he to live in accordance with this resolve, would it lessen or enhance the true dignity of his life and station? Would it lessen or enhance his influence? Is it reasonable to estimate that all the good that monarch could possibly do in his restricted position would equal that which would flow from setting the example of living a quiet, unostentatious, modest life -- administering his surplus not upon himself, but for others? The only objection that might be raised against such action is that it would render the king a personage far too powerful for the system of constitutional monarchy, which requires "king" to be but a word meaning the will of the Cabinet. The man capable of taking such action would be not only titular "king-," but a power ill the State. The Right Hon. John Morley,

(13) English statesman and author (1838-1923), Secretary of Ireland under Gladstone and Secretary for India, 1905-1910.

replying to a question asked by a constituent at a meeting in Newcastle, some time ago, bearing upon this very point of expend-

--- Page 66. The Gospel of Wealth - III The Advantages

of Poverty ---

iture and magnificence in the State, gave expression to the hope that the highly placed might learn that the truest dignity consisted in quiet and simple living. I do not quote his words but the sense of his reply. Mr. Gladstone himself will leave behind him many titles to the affection, gratitude, and admiration of his countrymen; but when the future eulogist says of him - as he will truly be able to say - what is said of Pitt upon his monument in G[u]ildhall, he will pay him the greatest of all tributes. These words are: "Dispensing for many years the favours of his sovereign, he lived without ostentation, and died poor." If we cannot have Mr. Gladstone preaching in favor of modest living upon the part of those in station, we rejoice that none excels him in the practice of that virtue. It is seldom we are permitted to extol the example beyond the precept of the sage.

29. Upon this subject I thank Mr. Hughes for the words he has written. He says: "The real question is not how much we ought to give away, but how much we dare retain for our own gratification." These words strike home to every man of wealth and station: "How much *dare we retain* for our own gratification?" This is a troublesome question which will not "down." Giving the one tenth - the tithe - is easy. The true disciple of the gospel of wealth has to pass far beyond that stage. His conscience may be quieted by arguing that he and his family are entitled to enjoy in moderation the best that the world affords. The earnest disciple can easily discover the efficacy of running in debt, as it were, by anticipating his expected surplus, and engaging in works for the general good before the cash is in hand, to an extent which really keeps him without available surplus, and even entails the necessity of figuring how to meet engagements. He can, when so situated, consider himself poor, and he will certainly feel himself so. The personal expenditure of the very rich forms so small a part of their income, provided the rule is obeyed which forbids such extravagance as would render them conspicuous, that they

[Baha'i Comment](#)

can, perhaps, also find refuge from self-

--- Page 67. The Gospel of Wealth - III The Advantages of Poverty ---

questioning in the thought of the much greater portion of their means which is being spent upon others. But I do not profess that this is entirely satisfactory, and I am glad to agree with Mr. Hughes in the very low estimate he places upon this partial treatment of the serious question he has raised: "*How much dare we retain for our own gratification?*"

30. Upon the subject of giving, Mr. Gladstone thinks that I am severe in my judgment of private charity when I estimate that of every thousand dollars spent in so-called charity nine hundred and fifty of them had better be thrown into the sea. The history of the Charity Organization Society of New York is here most instructive,

(14) The Charity Organization Society Of New York was established in 1881 to correlate the efforts and grants of the many private charity organizations "engaged in teaching and relieving the poor of the city in their own homes." It was an example of a general movement in the late nineteenth century to introduce more efficiency and less

[Baha'i Comment](#)

duplication in the bestowal of private charity.

Its confidential monthly bulletin recently gave the names of twenty-three bogus organizations which were soliciting contributions, many of them, unfortunately, with success. These have their printed annual reports, lists of distinguished contributors, - in many cases, alas! these are genuine, - their lady collectors, and all the other details. When the various charitable societies first combined and compared lists of those receiving aid, it was found that many names were upon seven or eight of the lists. Did my space permit, a story could be told that would upon every wealthy person that his duty is not to resolve to give, but to withhold until certain that his aid will not increase the area of what is called, in the stirring language of the day, the "hell of want and misery," which he longs to remove. The towns of Connecticut have recently been getting light upon almsgiving. A morning paper says: "The experience of Hartford with well-to-do public beggars may be duplicated in almost every town in Connecticut. A year or two ago, in Norwich, a town agent investigated the condition

--- Page 68. The Gospel of
Wealth - III The Advantages
of Poverty ---

of the numerous persons who were receiving town aid. In forty instances he found that the applicants for charity had from five hundred to three thousand dollars in the savings bank; in one case, that of a woman who had been drawing 'town money' for years, it was found she had nearly twenty thousand dollars in a local bank."

31. This is the least deplorable side of the matter, for the money given to prudent, saving people, even if they may not need it, cannot produce the serious consequences of that given to the much more numerous class who use it for the gratification of vice, and to enable them to live in idleness. Unless the individual giver knows the person or family in misfortune, their habits, conduct, and cause of distress, and knows that help given will aid them to help themselves, he cannot act properly; and if he does act to save his own feelings -which one is very apt to do -he will increase rather than diminish the distress which appeals to him. There is really no true charity except that which will

[Baha'i Comment](#)

help others to help themselves, and place within the reach of the aspiring the means to climb.

32. I notice a prevalent disposition to think only of the unfortunate wretches into whom the virtues necessary for improvement cannot be instilled. Common humanity impels us to provide for the actual wants of human beings - to see, through our poor laws, that none die of starvation, and to provide comfortable shelter, clothing, and instruction, which should, however, always be dependent upon work performed; but in doing this our thoughts should also turn to the benefits that are to accrue to those who are yet sound and industrious and, seeking through labor the means of betterment, by removing from their midst and placing under care of the State in workhouses the social lepers. Every drunken vagabond or lazy idler supported by alms bestowed by wealthy People is a source of moral infection to a neighborhood. It will not do to teach the hard-working, industrious man that there is an easier path by which his wants can be supplied.

--- Page 69. The Gospel of

[Baha'i Comment](#)

Wealth - III The Advantages of Poverty ---

The earnest reformer will think as much, if not more, of the preservation of the sound and valuable members among the poor, as of any real change which can be effected in those who seem hopelessly lost to temperance, industry, and thrift. He will labor more to prevent than to cure, feeling that it is necessary to remove the spoiled grape from the bunch, the spoiled apple from the barrel, mainly for the sake of the sound fruit that remains. He who would plunge the knife into the social cancer, if any good is to be effected thereby, must needs be a skilled surgeon with steady hand and calm judgment, with the feelings as much under control as possible; the less emotion the better.

33. One reads or hears everywhere of rash proposals, well meaning, no doubt, full of the innocence of the dove; but there is no task which more requires the wisdom of the serpent, which seems woefully lacking in these sensational schemes. The following from Rabbi Adler is sound to the core: "Giving, however, is an easy matter; it needs neither special training nor sustained

[Baha'i Comment](#)

thought. But the purpose and methods of charitable relief cannot be learned without a long and diligent apprenticeship, for which discipline in the painful school of personal experience is alone of any avail."

34. Sorry as I am to say it, the more attention I give to this subject, the greater the genuine knowledge obtained, the higher I am disposed to raise my estimate of the evil produced by indiscriminate giving.

[Baha'i Comment](#)

35. From the standpoint of "The Gospel of Wealth" Mr. Gladstone's criticisms are, indeed, serious - almost fatal; for it will be readily seen that if the hereditary transmission of wealth and position and of business concerns be not pernicious as a rule, as I hold, but advantageous to the individuals receiving these bequests, and to the nation as well, and if, instead of simplicity, as I think, station requires magnificence, it will be hard indeed, if not impossible, to teach the wealthy that surplus wealth should be regarded as a sacred trust to be administered during their lives for the public

[Baha'i Comment](#)

--- Page 70. The Gospel of
Wealth - III The Advantages
of Poverty ---

good; they will continue to gather and leave fortunes to their families or spend them for magnificence as hitherto. I turn, therefore, for support to the views of the other contributors.

36. His Eminence Cardinal Manning says:

Mr. Carnegie tells us plainly, first, that the accumulation of stagnant wealth to be bequeathed to heirs is a vainglory in the giver, and may be a ruin to the receiver; secondly, that the bequeathing of wealth for charities when the man is gone out of life is an empty way of making a name for generosity; thirdly, that to distribute all beyond the reasonable and temperate reserves due to kindred and their welfare, inter vivos, or now in life, with his own will, judgment, and hand to works of public and private beneficence and utility, is the highest and noblest use of wealth. This is a gospel, not according to capital, but

[Baha'i Comment](#)

according to the mind and life of the Founder of the Christian world. It is nothing new. It is no private opinion or exorbitant notion of a morbid prodigality, but the words of soberness and truth. If men so acted they would change the face of the world.

37. The Rev. Mr. Hughes writes:

In the long and arduous task of reconstructing society on a Christian basis, with due and careful regard to all legitimate existing interests, it would be an inestimable public service if every one whom Mr. Carnegie represents would follow the example of Mr. Carnegie in getting rid of his money as quickly as possible. Mr. Carnegie's gospel is the very thing for the transition period from social heathenism to social Christianity. If a man is so unfortunate as to have enormous wealth, he cannot do better than act upon Mr. Carnegie's distributive principles.

[Baha'i Comment](#)

38. I cannot but express the hope that further reflection upon the vital points may bring Mr. Gladstone into closer agreement with our colleagues in the discussion. In none of their articles is there a word in support of the advantages of the hereditary transmission of wealth and position, or of the necessity for magnificence upon the part of those in station. Their views seem to be in quite the other direction.

[Baha'i Comment](#)

39. Fortunately, from this point forward we have Mr. Gladstone's powerful and unreserved support. He says: "The accumulation of wealth has had adversaries, but it has been too

[Baha'i Comment](#)

--- Page 71. The Gospel of Wealth - III The Advantages of Poverty ---

strong for them all; it is the business of the world." "The Gospel of Wealth" advocates leaving free the operation of laws of accumulation. It accepts this condition as unassailable, and seeks to make the best of it by directing into new and better channels the streams of accumulated and accumulating wealth, which it is found impossible to prevent. But in this, while we

have Mr. Gladstone with us, we have regretfully lost Mr. Hughes, who rises in stern opposition and says: "If 'Lay not up for yourselves treasures upon the earth'

(15) Matt. 6:19.

does not forbid the accumulation of wealth, the New Testament was written on Talleyrand's principle and was intended to 'conceal thoughts.'

(16) Also attributed to Voltaire, Dialogue XIV, Le Chapon et la Poularde - "Men employ speech only to conceal their thoughts."

40. It is quite true, as Mr. Hughes says, "that expositors can prove anything, and that theologians can explain away anything." When applied to a rich man, his view of this very text only part of which is quoted by Mr. Hughes - was that he strictly complied with the injunction by always placing his treasures in the safety deposit company, where he was quite sure "neither moth nor rust could corrupt, nor thieves break through and steal." Mr. Hughes quotes the parable of the master of the vineyard, whose conduct is cited by Christ with approval. How came he master of a vineyard? Can he have sinned

[Baha'i Comment](#)

and 'accumulated wealth" for the payment of labor? Mr. Hughes says: "Christ distinctly prohibited the accumulation of wealth." But when Christ spoke, the revenues of a leading minister, even if divided among the whole twelve apostles, would have been accounted "wealth." It seems to me we have only to interpret literally, in this manner, a few parts of isolated texts to find warrant for the destruction of civilization. Five words spoken by Christ so interpreted, if strictly obeyed, would at one blow strike down all that distinguishes man from the beast. "Take no thought for tomorrow."

(17) Matt. 6:34

There is reason to believe that the

--- Page 72. The Gospel of Wealth - III The Advantages of Poverty ---

forces of Christianity are not thus to be successfully arrayed against the business of the world-the accumulation of wealth. The parable of the talents'

(18) Matt. 25:14-28.

bears in the other direction. It was: those who had

accumulated and even doubled their capital to whom the Lord said: "Well done, thou good and faithful servant: thou has been faithful over a few things, I will make thee ruler over many things: enter thou into the joy of thy Lord."

41. Those who had "laid up" their treasures and not increased them were reprimanded. Consider the millionaire who continues to use his capital actively in enterprises which give employment and develop the resources of the world. He who manages the ships, the mines, the factories, cannot withdraw his capital, for this is the tool with which he works such beneficent wonders; nor can he restrict his operations, for the cessation of growth and improvement in any industrial undertaking marks the beginning of decay. The demands of the world for new and better things are continuous, and existing establishments must supply these, or lose even the trade they now have. I hope Mr. Hughes will find good ground for an interpretation which justifies the belief that the text has no bearing upon him, but is intended solely for those who hoard realized capital, adding the interest

[Baha'i Comment](#)

obtained for its use to the principal, and dying with their treasures "laid up," which should have been used as they accrued during the life of the individual for public ends, as the gospel of wealth requires.

42. Acting in accordance with this advice, it becomes the duty of the millionaire to increase his revenues. The struggle for more is completely freed from selfish or ambitious taint and becomes a noble pursuit. Then he labors not for self, but for others; not to hoard, but to spend. The more he makes, the more the public gets. His whole life is changed from the moment that he resolves to become a disciple of the gospel of wealth, and henceforth he labors to acquire

--- Page 73. The Gospel of Wealth - III The Advantages of Poverty ---

that he may wisely administer for others good. His daily labor is a daily virtue. Instead of destroying, impairing, or disposing of the tree which yields such golden fruit, it does not degrade his life nor even his old age to continue guarding the capital from which alone he can obtain the

[Baha'i Comment](#)

means to do good. He may die leaving a sound business in which his capital remains, but beyond this die poor, possessed of no fortune which was free for him to distribute, and therefore, I submit, not justly chargeable with belonging to the class which "lay up their treasures upon earth."

43. In this connection I commend to my reverend colleague the sermon of the founder of his church (The Use of Money, American edition, vol. i. p. 44, Sermon 50). He says:

Gain all you can by honest industry. Use all possible diligence in your calling. Lose no time. Gain all you can by common sense, by using in your business all the understanding which God has given you. It is amazing to observe how few do this -- how men run on in the same dull track with their forefathers.

Having gained all you can by honest wisdom and unwearied diligence, the second rule of Christian prudence is, "Save all you can." Do not throw it away in idle

[Baha'i Comment](#)

expenses -- to gratify pride, etc. If you desire to be a good and faithful steward, out of that portion of your Lord's goods which he has for the present lodged in your hands, first provide things needful for yourself, food, raiment, etc.

Second, provide these for your wife, your children, your servants, and others who pertain to your household. If then you have an overplus, do good to them that are of the household of faith. If there be still an overplus, do good to all men.

(19) John Wesley (1703-1791), the "founder" of Methodism, Mr. Hughes's denomination, accumulated about \$250,000 by his writings. The quotations, as Carnegie cited them, are from the Works of John Wesley. There are several "first" American editions. The earliest to include this sermon, here numbered LIII, was published by J. & J. Harper (New York, 1826-1827), VI, 101. The sermon is numbered L in the First American Complete and Standard Edition from the Latest London Edition (New York: Emory & B. Waugh, 1831), I, 444.

44. Upon this sermon the gospel of wealth seems founded. Indeed, had I known of its existence before writing upon the subject, I should certainly have quoted it. I shall, therefore, not be shaken, even if a leading disciple of Wesley informs

--- Page 74. The Gospel of Wealth - III The Advantages of Poverty ---

us that Mr. Carnegie (as representing the millionaire class, of course) is an "anti-Christian phenomenon," a "social monstrosity," and a "grave political peril," and says that "in a really Christian country - that is, in a country constructed upon a Christian basis - a millionaire would be an economic impossibility." The millionaire class needs no defense, although Mr. Hughes thinks it no longer of use since joint stock companies provide the means for establishing industries upon the large scale now demanded. It is most significant that the business concerns which have given Britain supremacy are, with few or no exceptions, the creations of the individual millionaire - the Cunards, Ismays, Allens, Elders, Bessemers, Rothschilds, Barings, Clarks, Coatses, Crossleys, the Browns,

[Baha'i Comment](#)

Siemens, Cammels, Gillotts,
Whitworths, the Armstrongs,
Listers, the Salts, Bairds,
Samuelsons, Howards, Bells,

(20) These are families who established great 19th century British enterprises—shipping and ship-building, finance, manufacturing, metallurgy, chemicals, textiles, armaments, mining, etc. -- and who in many cases promoted philanthropic and educational projects in England.

and others. Joint-stock companies have not yet proven themselves equal to managing business properly after such men have created it. Where they have succeeded, it will be found that a very few individuals, and generally but one, have still control of affairs. Joint-stock companies cannot be credited with invention or enterprise. If it were not for the millionaire still in business, leading the way, a serious check would fall upon future improvement, and I believe business men generally will concur in the opinion, which I very firmly hold, that partnership - a very few, not more than two or three men - in any line of business will make full interest upon the capital invested; while a similar concern as a joint-stock company, owned by many in small amounts, will scarcely pay its way and is very likely to fail. Railroads

may occur to some as examples of joint-stock management, but the same rule applies to these. America has most of the railroads of the world, and it is found that whenever a few able men control a line and make

--- Page 75. The Gospel of Wealth - III The Advantages of Poverty ---

its management their personal affair, dividends are earned where before there were none. The railways of Britain being monopolies, and charging from two to three times higher rates for similar service than those of America, only manage to pay their shareholders a small return. It would be quite another story if these were the property of one or two able men and managed by them.

45. The "promotion" of an individual into a joint-stock concern is precisely what the promotion of the individual is from the House of Commons to the House of Lords. The push and masterfulness of the few owners who have created the business are replaced by the limited authority and regulation performance of routine duties by salaried officials, after promotion. While the career of both

[Baha'i Comment](#)

concern and individual may continue respectable, it is necessarily drill. They are no longer in the race; the great work of both is over. It would not be well for Britain's future if her commercial and manufacturing supremacy depended upon joint-stock companies. It is her individual millionaires who have created this supremacy, and upon them its maintenance still depends. Those who insure steady employment to thousands, at wages not lower than others pay, need not be ashamed of their record; for steady employment is after all, the one indispensable requisite for the welfare and the progress of the people. Still, I am neither concerned nor disposed to dispute Mr. Hughes's assertion that in a state under really Christian principles a millionaire would be an impossibility. He may be right; it is a far guess ahead. But the millionaire will not lack good company in making his exit; for surely nothing is clearer than that in the ideal day there can be no further use whatever for those of Mr. Hughes's profession. The millionaire and the preacher will alike have to find some other use for their talents, some other work to do that they may honorably earn and eat their daily bread. In this I doubt not both will continue to

be eminently successful. The successors of the Rev. Mr. Hughes and myself, arm in arm, will

--- Page 76. The Gospel of Wealth - III The Advantages of Poverty ---

make a pretty pair out in search of some light work with heavy pay.

46. Upon speculations as to the future of the race involving revolutionary change of existing conditions, it seems unwise to dwell. I think we have nothing whatever to do with what may come a thousand or a million years hence, and none of us can know what will come. Our duties lie with the present - with our day and generation; and even these are hard enough to discern. The race toils slowly upward step by step; it has even to create each successive step before it can stand upon it, for

[Yet] Nature is made better by no mean
But nature makes that mean.

*(21) Winter's Tale, Act IV,
scene 3, line 89.*

[Baha'i Comment](#)

47. If it attempts to bound over intervening space to any ideal, it will not rise, but fall to lower depths. I cannot, therefore, but regard such speculations a waste of time - of valuable time -- which is imperatively required for dealing with the next step possible in the path upward. And it is in this light that Mr. Gladstone's suggestion is of the greatest value. It accepts and builds upon present conditions - accommodates itself to our present environments. Mr. Gladstone has been engaged during his long public career in focusing, as it were, the various wishes of others, and so grouping them for a common end that practical results might follow. It has been his mission to restrain extremes, and to unite in common action the advance, the center, and the rear. He shows his rare constructive skill in suggesting that there should be formed a brotherhood of those who recognize their duties to their fellows less favored with this world's goods. This society will, no doubt, be so wide as to admit all, no limit being put to the amount of percentage of his surplus which each can secretly resolve to devote to others, nor any interference attempted with the wide field of its application. We may expect kindred societies to be

[Baha'i Comment](#)

formed throughout the

--- Page 77. The Gospel of
Wealth - III The Advantages
of Poverty ---

world, and, at intervals, delegates from these might meet together in one world-wide brotherhood, thereby strengthening each other in the desire and effort to do their best to improve the condition of the masses, and to bring rich and poor into closer union. Those who ask, "not how much we ought to give away, but how much we dare retain," would represent the advanced section. Passing from this through many gradations, those who still fondly plead for the continued hereditary transmission of wealth and position and for magnificence in station would constitute the other great wing of the army. All would be equally welcome, equally necessary, it being enough that members of the brotherhood feel that the duty of the day is that, intrusted as they are with surplus wealth beyond their wants, - as their conscience may determine these wants, - they should regularly set apart and expend all or a proportion, greater or less, of the remainder, for the good of their less fortunate fellows, in the manner which seems to each best calculated

to promote their genuine improvement. Should Mr. Gladstone's suggestion find the response which it deserves, he will have added much to the usefulness of his life in a sphere happily far removed from and far above the political; a field in which there can be room neither for strife, jealousy, gain, nor personal ambition; a cause so high, so holy, that all its surroundings must breathe of peace, good will, brotherhood!

48. Every earnest good man, anxious to leave the world a little better than he found it, will wish Mr. Gladstone Godspeed in his new, inspiring task - a task which is indeed "too great for haste, too high for rivalry."

IV

Popular Illusions About Trusts

(1) *Published originally in Century Magazine, LX (May 1900), 143-149.*

1. THE platforms of both parties in the coming Presidential contest are likely to ring with express or implied denunciation of trusts, in order to minister to the popular outcry against them, many of the people having been led to believe that great aggregations of capital must be inimical to the interests of the masses who have little or none. While this policy may be more or less successful for the moment, from a party point of view, it must be ephemeral, because, as the writer hopes

inimical - ...They are like selfish, brutal men who are inimical, cursing and killing each other. Better that man should resemble the domestic animals than the ferocious beasts of prey, for in the estimation of God love is acceptable, whereas hatred and animosity are rejected. Why should we act contrary to the good pleasure of God? Why should we be as ferocious animals, constantly shedding blood, pillaging and destroying? Because we belong to one race or family of humankind, why should we consider all others bad and inferior, deserving of death, pillage and invasion--people of darkness, worthy of hatred and detestation by God? We see that God is kind to all. Just as He loves us, He loves all others; just as He provides for us, He provides for the rest. He nurtures and trains all with equal solicitude. (Abdu'l-Baha, PUP, p. 264)

ephemeral - ...Hence, no matter how much man may advance in this world, he shall not attain to the station of this bird! Thus it becomes evident that in the matters of this world, however much man may strive and work to the point of death, he will be unable to earn the abundance, the freedom and the independent life of a small bird. This proves and establishes the fact that man is not created for the

to show, trusts cannot permanently thwart the laws of competition, and hence must prove beneficial agencies for the people.

life of this ephemeral world--nay, rather, is he created for the acquirement of infinite perfections, for the attainment to the sublimity of the world of humanity, to be drawn nigh unto the divine threshold, and to sit on the throne of everlasting sovereignty! (Abdu'l-Baha, Tablets of the Divine Plan, p. 45-46)

ephemeral - ...Thriving for a time through the devices which their scheming minds had conceived and supported by the ephemeral advantages which fame, ability or fortune can confer these notorious exponents of corruption and heresy have succeeded in protruding for a time their ugly features only to sink, as rapidly as they had risen, into the mire of an ignominious end. (World Order of Baha'u'llah, p. 90)

ephemeral - "In the midst of a civilization torn by strifes and enfeebled by materialism, the people of Baha are building a new world. We face at this time opportunities and responsibilities of vast magnitude and great urgency. Let each believer in his inmost heart resolve not to be seduced by the ephemeral allurements of the society around him, nor to be drawn into its feuds and short-lived enthusiasms, but instead to transfer all he can from the old world to that new one which is the vision of his longing and will be the fruit of his labours." (From a letter of the Universal House of Justice to the Baha'is of the East and West, December 18, 1963)

2. The world does not spin round any faster in our day than it has for ages past, but undoubtedly new ideas in the world come into view and flash past with a rapidity hitherto unknown. It seems as if, in our time, man were chiefly absorbed in obeying the injunction to try all things. Fortunately, we evolutionists know that in the end he must and will hold fast only to that which is good for the organism known as human society. His attitude hitherto toward new things or new ideas has been one of suspicion and hesitation. We see traces of this yet in the

revolutionists - How great the difference between the glory of Christ and the glory of an earthly conqueror! It is related by historians that Napoleon Bonaparte I embarked secretly by night from Egypt. His destination was France. During his campaign in Palestine revolution had broken out and grave difficulties had arisen in the home government. Christian worship had been forbidden by the revolutionists. The priests of Christianity had fled in terror. France had become atheistic; anarchy prevailed. The ship sailed out into a night brilliant with the light of the moon. Napoleon was pacing up and down the deck. His officers were sitting together, talking. One of them spoke of the similarity between Bonaparte and Christ. Napoleon stopped and said grimly, "Do you think I am going back to France to establish religion?"

Jesus Christ established the religion of God through love. His sovereignty is everlasting. Napoleon overthrew governments in war and bloodshed. His dominion passed away; he himself was dethroned. Bonaparte destroyed human life; Christ was a Savior. Bonaparte controlled the physical bodies of men; Christ was a conqueror of human hearts. None of the Prophets of God were famous men, but They were unique in spiritual power. Love is the eternal sovereignty. Love is the divine power. By it all the kings of earth are overthrown and conquered. (Abdu'l-Baha, PUP, p. 210-

older countries and older civilizations; but the bounding, irrepressible, "cocksure" spirit of Western civilization seems possessed by an entirely different tendency. It grasps everything new with avidity, and is sanguine beyond measure of its merits, ever ready to discard the old, and to see in any new thing the golden

211)

human society - ...What mankind needeth in this day is obedience unto them that are in authority, and a faithful adherence to the cord of wisdom. The instruments which are essential to the immediate protection, the security and assurance of the human race have been entrusted to the hands, and lie in the grasp, of the governors of human society. This is the wish of God and His decree.... We cherish the hope that one of the kings of the earth will, for the sake of God, arise for the triumph of this wronged, this oppressed people. Such a king will be eternally extolled and glorified. God hath prescribed unto this people the duty of aiding whosoever will aid them, of serving his best interests, and of demonstrating to him their abiding loyalty. They who follow Me must strive, under all circumstances, to promote the welfare of whosoever will arise for the triumph of My Cause, and must at all times prove their devotion and fidelity unto him. Happy is the man that hearkeneth and observeth My counsel. Woe unto him that faileth to fulfil My wish. (Baha'u'llah, Gleanings, p. 207)

human society - ...The ages of its infancy and childhood are past, never again to return, while the Great Age, the consummation of all ages, which must signalize the coming of age of the entire human race, is yet to come. The convulsions of this transitional and most turbulent period in the annals of humanity are the essential prerequisites, and herald the inevitable approach, of that Age of Ages, "the time of the end," in which the folly and tumult of strife that has, since the dawn of history, blackened the annals of mankind, will have been finally transmuted into the wisdom and the tranquility of an undisturbed, a universal, and lasting peace, in which the discord and separation of the children of men will have given way to the worldwide reconciliation, and the complete unification of the divers elements that constitute human society (`Abdu'l-Baha, Promised Day has Come, p. 117)

human society - IV Disunity is a danger that the nations and peoples of the earth can no longer endure; the consequences are too terrible to contemplate, too obvious to require any demonstration. "The well-being of mankind," Baha'u'llah wrote more than a century ago, "its peace and security, are observing that "mankind is groaning, is dying to be led to unity, and to terminate its age-long martyrdom", Shoghi Effendi further commented that: "Unification of the whole of mankind is the hall-mark of the stage which human society is now approaching. Unity of family, of tribe, of city- state, and nation have been successively attempted and fully established. World unity is the goal towards which a harassed humanity is striving. Nation-building has come to an end. The anarchy inherent in state sovereignty is moving towards a climax. A world, growing to maturity, must abandon this fetish, recognize the oneness and wholeness of human

relationships, and establish once for all the machinery that can best incarnate this fundamental principle of its life."

Page 14 All contemporary forces of change validate this view. The proofs can be discerned in the many examples already cited of the favourable signs towards world peace in current international movements and developments. The army of men and women, drawn from virtually every culture, race and nation on earth, who serve the multifarious agencies of the United Nations, represent a planetary "civil service" whose impressive accomplishments are indicative of the degree of co-operation that can be attained even under discouraging conditions. An urge towards unity, like a spiritual springtime, struggles to express itself through countless international congresses that bring together people from a vast array of disciplines. It motivates appeals for international projects involving children and youth. Indeed, it is the real source of the remarkable movement towards ecumenism by which members of historically antagonistic religions and sects seem irresistibly drawn towards one another. Together with the opposing tendency to warfare and self-aggrandizement against which it ceaselessly struggles, the drive towards world unity is one of the dominant, pervasive features of life on the planet during the closing years of the twentieth century. (Promise of World Peace)

--- Page 79. The Gospel of Wealth - IV Popular Illusions about Trusts

bow of promise. The American is the modern magician, ever exchanging old lamps for new. Panaceas for all the ills of life are more numerous than the ills. Not one doctor, but a hundred, arise, competent to cure every defect in the body politic, and none is without patients or-may we write? - dupes. We must all have our toys and our fads. It is natural for man to indulge in the delusions of hope.

delusions - Say, wretched indeed is your plight, O ye embodiments of delusion. Fear ye God and reject not the heavenly grace which hath shed radiance upon all regions. Say, He Who is the Exponent of the hidden Name hath appeared, did ye but know it. He Whose advent hath been foretold in the heavenly Scriptures is come, could ye but understand it. The world's horizon is illumined by the splendours of this Most Great Revelation. Haste ye with radiant hearts and be not of them that are bereft of understanding. The appointed Hour hath struck and mankind is laid low. Unto this bear witness the honoured servants of God. (Baha'u'llah, TOB, p. 244)

delusions - God created one earth and one mankind to people it. Man has no other habitation, but man himself has come forth and proclaimed imaginary boundary lines and territorial restrictions, naming them Germany, France, Russia, etc. And torrents of precious blood are spilled in defense of these imaginary divisions of our one human habitation, under the delusion of a fancied and limited patriotism.

After all, a claim and title to territory or native land is but a claim and attachment to the dust of earth. We live upon this earth for a few days and then rest beneath it forever. So it is our graveyard eternally. Shall man fight for the tomb which devours him, for his eternal sepulcher? What ignorance could be greater than this? To fight over his grave, to kill another for his grave! What heedlessness! What a

delusion! (‘Abdu'l-Baha, PUP, p. 355)

delusions - I also will choose their delusions, and will bring their fears upon them; because when I called, none did answer; when I spake, they did not hear: but they did evil before mine eyes, and chose that in which I delighted not. Hear the word of the LORD, ye that tremble at his word; Your brethren that hated you, that cast you out for my name's sake, said, Let the LORD be glorified: but he shall appear to your joy, and they shall be ashamed. (Isaiah 66:4-5)

Say: "Have ye seen (these) 'Partners' of yours whom ye call upon besides God? Show Me what it is they have created in the (wide) earth. Or have they a share in the heavens? Or have We given them a Book from which they (can derive) clear (evidence)?- Nay, the wrong-doers promise each other nothing but delusions. (Quran, 35.040)

3. The day is not far past when the industrial world saw its millennium in the joint-stock idea. Every department of industry was to be captured by it. Shares in every conceivable enterprise were to be distributed among the people en masse, thus insuring the much-needed redistribution of wealth, where every man was no longer a consumer only, but his own manufacturer, his own transporter, clothier, butcher, baker, and candlestick-maker. There was nothing to prevent him being in one sense his own undertaker through shares in the "Burial Company, Limited," or the "Crematorium Company," thus carrying out to his very end the grand joint-stock corporation panacea. Every employee in mill or factory, in railway or steamship service,

wealth - All praise be to God Who hath adorned the world with an ornament, and arrayed it with a vesture, of which it can be despoiled by no earthly power, however mighty its battalions, however vast its wealth, however profound its influence. Say: the essence of all power is God's, the highest and the last End of all creation. The source of all majesty is God's, the Object of the adoration of all that is in the heavens and all that is on the earth. Such forces as have their origin in this world of dust are, by their very nature, unworthy of consideration. (Bahá'u'lláh, GL, p. 341)

Wealth - is most commendable, provided the entire population is wealthy. If, however, a few have inordinate riches while the rest are impoverished, and no fruit or benefit accrues from that wealth, then it is only a liability to its possessor. If, on the other hand, it is expended for the promotion of knowledge, the founding of elementary and other schools, the encouragement of art and industry, the training of orphans and the poor--in brief, if it is dedicated to the welfare of society--its possessor will stand out before God and man as the most excellent of all who live on earth and will be accounted as one of the people of paradise. (‘Abdu'l-Baha, Secret Divine Civilization, p. 24-25)

...let your faces be more radiant with hope and heavenly determination to serve the Cause of God, to spread the pure fragrances of the divine rose garden of unity, to awaken spiritual susceptibilities in the hearts of mankind, to kindle anew the spirit of humanity with divine fires and to reflect the glory of heaven to this gloomy world of materialism. When you possess these divine susceptibilities, you will be able to awaken and develop them in others. We cannot give of our wealth to the poor unless we possess it. How can the poor give to the poor? How can the soul that is

was soon to become an owner, with a possible future seat on the board.

deprived of the heavenly bounties develop in other souls capacity to receive those bounties? (`Abdu'l-Bahá, PUP, p. 7)

...our weakness is an evidence that there is might; our ignorance proves the reality of knowledge; our need is an indication of supply and wealth. Were it not for wealth, this need would not exist; were it not for knowledge, ignorance would be unknown; were it not for power, there would be no impotence. In other words, demand and supply is the law, and undoubtedly all virtues have a center and source. That source is God, from Whom all these bounties emanate. (`Abdu'l-Bahá, PUP, p. 83)

4. Though all these over-sanguine expectations have not been realized through the laws establishing corporations, thus encouraging the massing of the innumerable small savings of the public in general, yet few new forms have been productive of so much benefit to the thrifty and aspiring people with small savings, who are the salt of the working millions and of the country, as the corporate idea.

expectations - The principle of collective trusteeship creates also the right of every person to expect that those cultural conditions essential to his or her identity enjoy the protection of national and international law. Much like the role played by the gene pool in the biological life of humankind and its environment, the immense wealth of cultural diversity achieved over thousands of years is vital to the social and economic development of a human race experiencing its collective coming-of-age. It represents a heritage that must be permitted to bear its fruit in a global civilization. On the one hand, cultural expressions need to be protected from suffocation by the materialistic influences currently holding sway. On the other, cultures must be enabled to interact with one another in ever-changing patterns of civilization, free of manipulation for partisan political ends.

"The light of men", Baha'u'llah says, "is Justice. Quench it not with the contrary winds of oppression and tyranny. The purpose of justice is the appearance of unity among men. The ocean of divine wisdom surgeth within this exalted word, while the books of the world cannot contain its inner significance." (Prosperity of Humankind, p. 6-7)

5. Another highly important step forward in this domain resulted from the authorization of limited partnerships, by which the undoubted advantages of individual over corporate management could be secured without danger of ruin to the members, whose liability is limited to the amount of the capital stock of the partnership. In the great corporation the shares are generally bought and sold upon the

--- Page 80. The Gospel of Wealth - IV Popular Illusions about Trusts

stock exchange, and the real owners are unknown. All depends upon salaried officials, who may or may not have a dollar in the enterprise. In the limited partnership, on the contrary, only shareholders can be members; the shares are not sold to outsiders, and thus is insured the eye of the master over all. With proper, but absolutely necessary, provisions, it is possible, under this system, to create owners from among exceptional but poor employees, from whom no capital is required, the partnership agreeing to permit the profits to pay for the

capitalistic - "Regarding your questions concerning the Baha'i attitude on various economic problems, such as the problem of ownership, control and distribution of capital, and of other means of production, the problem of trusts and monopolies, and such economic experiments as social cooperatives; the Teachings of Baha'u'llah and Abdu'l-Baha do not provide specific and detailed solutions to all such economic questions which mostly pertain to the domain of technical economics, and as such do not concern directly the Cause. True, there are certain guiding principles in Baha'i Sacred Writings on the subject of economics, but these do by no means cover the whole field of theoretical and applied economics, and are mostly intended to guide further Baha'i economic writers and technicians to evolve an economic system which would function in full conformity with the spirit and the exact provisions of the Cause on this and similar subjects. The International House of Justice will have, in consultation with economic experts, to assist in the formulation and evolution of the Baha'i economic system of the future. One thing, however, is certain, that the Cause neither accepts the theories of the Capitalistic economics in full, nor can it agree with the Marxists and Communists in their repudiation of the principle of private ownership and of the vital sacred rights of the individual." (Lights of Guidance, p 549-550 From a letter written on behalf of Shoghi Effendi to an individual believer, June 10, 1930: Ibid.)

interest given, the capitalistic owners reserving the right to discontinue the partnership by a two-thirds vote, or a three-fourths majority vote, should the new partner not prove desirable. By this plan it is possible for the rise of the poor but able employee, thus neutralizing, to some extent, the acknowledged difficulty of men rising to ownership in our day, because of the enormous amount of capital required for successful operations under present, and probably enduring, conditions. The day of small concerns within the means of many able men seems to be over, never to return. The rise to partnership in vast concerns must come chiefly through such means as these permitted by the laws of limited partnership.

6. To-day we hear little of the joint-stock corporation, which has settled into its proper sphere and escapes notice. It was succeeded by the "syndicate," a combination of corporations which pulled together for a time, and expected to destroy destructive competition. The word has already almost passed out of use, and now the syndicate has given place to the trust.

competition - ...Political love also is much bound up with hatred of one party for another; this love is very limited and uncertain. The love of community of interest in service is likewise fluctuating; frequently competitions arise, which lead to jealousy, and at length hatred replaces love. A few years ago, Turkey and Italy had a friendly political understanding; now they are at war! All these ties of love are imperfect. It is clear that limited material ties are insufficient to adequately express the universal love. The great unselfish love for humanity is bounded by none of these imperfect, semi-selfish bonds; this is the one perfect love, possible to all mankind, and can only be achieved by the power of the Divine Spirit. No worldly power can accomplish the universal love.

Let all be united in this Divine power of love! Let all strive to grow in the light of the Sun of Truth, and reflecting this luminous love on all men, may their hearts become so united that they may dwell evermore in the radiance of the limitless love. (‘Abdu’l-Bahá, PT, p. 36-37)

7. We see in all these efforts of men the desire to furnish opportunities to mass capital, to concentrate the small savings of the many and to direct them to one end. The conditions of human society create for this an imperious demand; the concentration of capital is a necessity for meeting the demands of our day, and as such should not be looked at askance, but be encouraged. There is nothing detrimental

--- Page 81. The Gospel of Wealth - IV Popular Illusions about Trusts

to human society in it, but much that is, or is bound soon to become, beneficial. It is an evolution from the heterogeneous to the homogeneous,

(2) Spencer's Law of Evolution, enunciated in Part 2 of First Principles (1862), reads: "an integration of matter and concomitant dissipation of motion, during which the matter passes from an indefinite incoherent homogeneity to a definite coherent heterogeneity." Carnegie, not notably exact in quotation, has here literally reversed the order of "development" commentary on his subservience to or understanding of the English thinker.

and is clearly another step in the upward path of development.

capital - It is quite otherwise with the human species, which persists in the greatest error, and in absolute iniquity. Consider an individual who has amassed treasures by colonizing a country for his profit: he has obtained an incomparable fortune and has secured profits and incomes which flow like a river, while a hundred thousand unfortunate people, weak and powerless, are in need of a mouthful of bread. There is neither equality nor benevolence. So you see that general peace and joy are destroyed, and the welfare of humanity is negated to such an extent as to make fruitless the lives of many. For fortune, honors, commerce, industry are in the hands of some industrialists, while other people are submitted to quite a series of difficulties and to limitless troubles: they have neither advantages, nor profits, nor comforts, nor peace.

Then rules and laws should be established to regulate the excessive fortunes of certain private individuals and meet the needs of millions of the poor masses; thus a certain moderation would be obtained. However, absolute equality is just as impossible, for absolute equality in fortunes, honors, commerce, agriculture, industry would end in disorderliness, in chaos, in disorganization of the means of existence, and in universal disappointment: the order of the community would be quite destroyed. Thus difficulties will also arise when unjustified equality is imposed. It is, therefore, preferable for moderation to be established by means of laws and regulations to hinder the constitution of the excessive fortunes of certain individuals, and to protect the essential needs of the masses. For instance, the manufacturers and the industrialists heap up a treasure each day, and the poor artisans do not gain their daily sustenance: that is the height of iniquity, and no just man can accept it. Therefore, laws and regulations should be established which would permit the workmen to receive from the factory owner their wages and a share in the fourth or the fifth part of the profits, according to the capacity of the factory; or in some other way the body of workmen and the manufacturers should share equitably the profits and advantages. Indeed, the capital and management come from the owner of the factory, and the work and labor, from the body of the workmen. Either the workmen should receive wages which assure them an adequate support and, when they cease work, becoming feeble or helpless, they should have sufficient benefits from the income of the industry; or the wages should be high enough to satisfy the workmen with the amount they receive so that they may themselves be able to put a little aside for days of want and helplessness.

When matters will be thus fixed, the owner of the factory will no longer put aside daily a treasure which he has absolutely no need of (for, if the fortune is disproportionate, the capitalist succumbs under a formidable burden and gets into the greatest difficulties and

troubles; the administration of an excessive fortune is very difficult and exhausts man's natural strength). And the workmen and artisans will no longer be in the greatest misery and want; they will no longer be submitted to the worst privations at the end of their life. It is, then, clear and evident that the repartition of excessive fortunes among a small number of individuals, while the masses are in need, is an iniquity and an injustice. In the same way, absolute equality would be an obstacle to life, to welfare, to order and to the peace of humanity. In such a question moderation is preferable. It lies in the capitalists' being moderate in the acquisition of their profits, and in their having a consideration for the welfare of the poor and needy-- that is to say, that the workmen and artisans receive a fixed and established daily wage-- and have a share in the general profits of the factory.

It would be well, with regard to the common rights of manufacturers, workmen and artisans, that laws be established, giving moderate profits to manufacturers, and to workmen the necessary means of existence and security for the future. Thus when they become feeble and cease working, get old and helpless, or leave behind children under age, they and their children will not be annihilated by excess of poverty. And it is from the income of the factory itself, to which they have a right, that they will derive a share, however small, toward their livelihood.

In the same way, the workmen should no longer make excessive claims and revolt, nor demand beyond their rights; they should no longer go out on strike; they should be obedient and submissive and not ask for exorbitant wages. But the mutual and reasonable rights of both associated parties will be legally fixed and established according to custom by just and impartial laws. In case one of the two parties should transgress, the court of justice should condemn the transgressor, and the executive branch should enforce the verdict; thus order will be reestablished, and the difficulties, settled. The interference of courts of justice and of the government in difficulties pending between manufacturers and workmen is legal, for the reason that current affairs between workmen and manufacturers cannot be compared with ordinary affairs between private persons, which do not concern the public, and with which the government should not occupy itself. In reality, although they appear to be private matters, these difficulties between the two parties produce a detriment to the public; for commerce, industry, agriculture and the general affairs of the country are all intimately linked together. If one of these suffers an abuse, the detriment affects the mass. Thus the difficulties between workmen and manufacturers become a cause of general detriment. (Abdu'l-Bahá, SAQ, p. 273-276)

homogeneity - What is true of the life of the individual has its

parallels in human society. The human species is an organic whole, the leading edge of the evolutionary process. That human consciousness necessarily operates through an infinite diversity of individual minds and motivations detracts in no way from its essential unity. Indeed, it is precisely an inhering diversity that distinguishes unity from homogeneity or uniformity. What the peoples of the world are today experiencing, Bahá'u'lláh said, is their collective coming-of-age, and it is through this emerging maturity of the race that the principle of unity in diversity will find full expression. From its earliest beginnings in the consolidation of family life, the process of social organization has successively moved from the simple structures of clan and tribe, through multitudinous forms of urban society, to the eventual emergence of the nation-state, each stage opening up a wealth of new opportunities for the exercise of human capacity. (Prosperity of Humankind, p. 4)

8. Abreast of this necessity for massing the wealth of the many in even larger and larger sums for huge enterprises, another law is seen in operation in the invariable tendency from the beginning till now to lower the cost of all articles produced by man. Through the operation of this law the home of the laboring man of our day boasts luxuries which even in the palaces of monarchs as recent as Queen Elizabeth were unknown. It is a trite saying that the comforts of to-day were the luxuries of yesterday, and conveys only a faint impression of the contrast, until one walks through the castles and palaces of older countries, and learns that two or three centuries ago these had for carpets only rushes, small open spaces for windows, glass being little known, and

Luxuries - The Captivity of Man - `Abdu'l-Bahá said:--"Luxuries cut off the freedom of communication. One who is imprisoned by desires is always unhappy; the children of the Kingdom have unchained themselves from their desires. Break all fetters and seek for spiritual joy and enlightenment; then, though you walk on this earth, you will perceive yourselves to be within the divine horizon. To man alone is this possible. When we look about us we see every other creature captive to his environment.

"The bird is a captive in the air and the fish a captive in the sea. Man alone stands apart and says to the elements, I will make you my servants! I can govern you! He takes electricity, and through his ingenuity imprisons it and makes of it a wonderful power for lighting, and a means of communication to a distance of thousands of miles. But man himself may become a captive to the things he has invented. His true second birth occurs when he is freed from all material things: for he only is free who is not a captive to his desires. He has then as Jesus has said, become captive to the Holy Spirit." (`Abdu'l-Bahá in London, p. 87-88)

were without gas or water-supply, or any of what we consider to-day the conveniences of life. As for those chief treasures of life, books, there is scarcely a working-man's family which has not at its command, without money and without price, access to libraries to which the palace was recently a stranger.

9. If there be in human history one truth clearer and more indisputable than another, it is that the cheapening of articles, whether of luxury or of necessity or of those classed as artistic, insures their more general distribution, and is one of the most potent factors in refining and lifting a people, and in adding to its happiness. In no period of human activity has this great agency been so potent or so widespread as in our own. Now, the cheapening of all these

--- Page 82. The Gospel of Wealth - IV Popular Illusions about Trusts

good things, whether it be in the metals, in textiles, or in food, or especially in books and prints, is rendered possible only through the operation of the law, which may be stated thus:

[Baha'i Comment](#)

cheapness is in proportion to the scale of production. To make ten tons of steel a day would cost many times as much per ton as to make one hundred tons; to make one hundred tons would cost double as much per ton as a thousand; and to make one thousand tons per day would cost greatly more than to make ten thousand tons. Thus, the larger the scale of operation the cheaper the product. The huge steamship of twenty thousand tons burden carries its ton of freight at less cost, it is stated, than the first steamships carried a pound. It is, fortunately, impossible for man to impede, much less to change, this great and beneficent law, from which flow most of his comforts and luxuries, and also most of the best and most improving forces in his life.

10. In an age noted for its inventions, we see the same law running through these. Inventions facilitate big Operations, and in most instances require to be worked upon a great scale. Indeed, as a rule, the great invention which is beneficent in its operation would be useless unless operated to supply a thousand people where ten were supplied

[Baha'i Comment](#)

before. Every agency in our day labors to scatter the good things of life, both for mind and body, among the toiling millions. Everywhere we look we see the inexorable law ever producing bigger and bigger things. One of the most notable illustrations of this is seen in the railway freight-car. When the writer entered the service of the Pennsylvania Railroad from seven to eight tons were carried upon eight wheels; to-day they carry fifty tons. The locomotive has quadrupled in power. The steamship to-day is ten times bigger, the blast-furnace has seven times more capacity, and the tendency everywhere is still to increase. The contrast between the hand printing-press of old and the elaborate newspaper printing-machine of to-day is even more marked.

11. We conclude that this overpowering, irresistible tendency

--- Page 83. The Gospel of Wealth - IV Popular Illusions about Trusts

toward aggregation of capital and increase of size in every branch of product cannot be arrested or even greatly impeded, and that, instead of attempting to restrict either,

aggregation - ...All things are involved in all things. For every single phenomenon has enjoyed the postulates of God, and in every form of these infinite electrons it has had its characteristics of perfection.

Thus this flower once upon a time was of the soil. The animal eats the flower or its fruit, and it thereby ascends to the animal kingdom. Man eats the meat of the animal, and there you have its ascent into the human kingdom, because all phenomena are divided into that which eats and that which is eaten. Therefore, every primordial atom of these atoms, singly and indivisible, has had its courings throughout all the sentient creation, going constantly into the aggregation of the various elements. Hence do you have the conservation of energy and the infinity of phenomena, the indestructibility of phenomena, changeless and immutable, because life cannot suffer annihilation but only change.

we should hail every increase as something gained, not for the few rich, but for the millions of poor, seeing that the law is salutary, working for good and not for evil. Every enlargement is an improvement, step by step, upon what has preceded. It makes for higher civilization, for the enrichment of human life, not for one, but for all classes of men. It tends to bring to the laborer's cottage the luxuries hitherto enjoyed only by the rich, to remove from the most squalid homes much of their squalor, and to foster the growth of human happiness relatively more in the workman's home than in the millionaire's palace. It does not tend to make the rich poorer, but it does tend to make the poor richer in the possession of better things, and greatly lessens the wide and deplorable gulf between the rich and the poor. Superficial politicians may, for a time, deceive the uninformed, but more and more will all this be clearly seen by those who are now led to regard aggregations as injurious.

The apparent annihilation is this: that the form, the outward image, goes through all these changes and transformations. Let us again take the example of this flower. The flower is indestructible. The only thing that we can see, this outer form, is indeed destroyed, but the elements, the indivisible elements which have gone into the composition of this flower are eternal and changeless. Therefore the realities of all phenomena are immutable. Extinction or mortality is nothing but the transformation of pictures and images, so to speak--the reality back of these images is eternal. And every reality of the realities is one of the bounties of God. (Foundations of World Unity, p. 52)

salutary - You cannot give up a salutary law just because on rare occasions the innocent may be punished. (Bahá'u'lláh, Kitáb-i-Aqdás, p. 204)

superficial - Those who are uninformed of the world of reality, who do not comprehend existing things, who are without perception of the inner truth of creation, who do not penetrate the real mysteries of material and spiritual phenomena and who possess only a superficial idea of universal life and being are but embodiments of pure ignorance. They believe only that which they have heard from their fathers and ancestors. Of themselves they have no hearing, no sight, no reason, no intellect; they rely solely upon tradition. Such persons imagine that the dominion of God is an accidental dominion or kingdom.

For instance they believe that this world of existence was created six or seven thousand years ago; as if God did not reign before that time and had no creation before that period. They think that divinity is accidental, for to them divinity is dependent upon existing things whereas in reality as long as there has been a God there has been a creation. As long as there has been light, there have been recipients of that light, for light cannot become manifest unless those things which perceive and appreciate it exist. The world of divinity presupposes creation, presupposes recipients of bounty, presupposes the existence of worlds. No divinity can be conceived as separate from creation, for otherwise it would be like imagining an empire without a people. A king must needs have a kingdom, must needs have an army and subjects. Is it possible to be a king and have no country, no army, no subjects? This is an absurdity. If we say that there was a time when there was no country, no army and no subjects, how then could there have been a king and ruler? For these things are essential to a king. (Foundations of World Unity, p. 107)

superficial - "People today indeed do tend to be very superficial in their thinking, and it would seem as if the educational systems in use are sorely lacking in ability to produce a mature mind in a person

who has reached supposedly adult life! All the outside influences that surround the individual seem to have an intensely distracting effect, and it is a hard job to get the average person to do any deep thinking or even a little meditation on the problems facing him and the world at large. Over and over again Baha'u'llah cried out against the heedlessness of humanity, and warns of the fate such an attitude must lead to. Did we not know what God plans to do, and will do, with the world in the future, we should certainly be as hopeless as many of the best thinkers of our generation have become." (From a letter written on behalf of the Guardian to an individual believer, September 22, 1948) Lights of Guidance, page 211-212)

superficial - AMERICA PASSING THROUGH CRISIS -

Moreover, the country of which it forms a part is passing through a crisis which, in its spiritual, moral, social and political aspects, is of extreme seriousness-- a seriousness which to a superficial observer is liable to be dangerously underestimated.

The steady and alarming deterioration in the standard of morality as exemplified by the appalling increase of crime, by political corruption in ever widening and ever higher circles, by the loosening of the sacred ties of marriage, by the inordinate craving for pleasure and diversion, and by the marked and progressive slackening of parental control, is no doubt the most arresting and distressing aspect of the decline that has set in, and can be clearly perceived, in the fortunes of the entire nation.

Parallel with this, and pervading all departments of life--an evil which the nation, and indeed all those within the capitalist system, though to a lesser degree, share with that state and its satellites regarded as the sworn enemies of that system--is the crass materialism, which lays excessive and ever-increasing emphasis on material well-being, forgetful of those things of the spirit on which alone a sure and stable foundation can be laid for human society. ... (Citadel of Faith, p. 124-125)

12. In all great movements, even of the highest value, there is cause for criticism, and new dangers arising from new conditions, which must be guarded against. There is no nugget free from more or less impurity, and no good cause without its fringe of scoria. The sun itself has spots, but, as has been wisely said, these are rendered visible only by the light itself sends forth.

criticism - 155 Motive, manner, mode, become relevant; but there is also the matter of love: love for one's fellows, love for one's community, love for one's institutions. The responsibility resting on the individual to conduct himself in such away as to ensure the stability of society takes on elemental importance in this context. For vital as it is to the progress of society, criticism is a two-edged sword: it is all too often the harbinger of conflict and contention. (Individual Rights and Freedoms)

13. The benefits, therefore, which have come to the world through this law of aggregation and increase take several forms, to some of which objection is made.

[Baha'i Comment](#)

14. One form of aggregation is the growth of establishments constantly extending their field of operations, the special form which has been most criticized being the department store. We look back to the time when one petty establishment sold one class of articles. The subdivision of labor is seen in its fullest development throughout the Eastern world,

[Baha'i Comment](#)

--- Page 84. The Gospel of Wealth - IV Popular Illusions about Trusts

where many servants are

required, each restricted to doing one part of many operations required to produce one whole. Traces of this system still linger among us. In dealing with department stores the first question is, Do they provide articles at less cost for the masses? Upon cheapness, indeed, depends the wider distribution of desirable articles among the people, the enjoyment of which is greatly to be desired as inevitably carrying with it elevation to a higher stage of civilization. Increased comfort means increased refinement, and this means a higher standard of life. No one questions the fact that these great stores do furnish more value for the money than it was possible for small separate selling agencies to do. The increased scale of operations all under one management insures much cheaper distribution. That they are so generally patronized is the best proof that they are beneficial, and, what should not be lost sight of, they are relatively more advantageous for the general public than for the few rich. In like manner it is the masses of the people, not the few, who are most benefited by the growth of huge and all-embracing establishments in every line of production and distribution. It is inevitable

that the introduction of a new system should disturb and finally overthrow the older and less desirable system.

15. The chief complaint made against the department stores is that, while under the old system of small separate establishments there were secured as valuable citizens to the State a hundred independent owners, the department store may have only five. In the writer's opinion, this is a mistake, as experience already demonstrates that the great and successful establishment is dependent upon numerous active members participating directly in the results. It may be accepted as a law that the store which interests the greatest number of assistants, other things being equal, will prove the most successful, and it is a matter of common knowledge even to-day that in these vast establishments it is already the rule for all those in charge of the numerous departments

--- Page 85. The Gospel of Wealth - IV Popular Illusions about Trusts

to be directly interested in the profits. In other words, the small, petty master in his little store has given place to the

character - For every thing, however, God has created a sign and symbol, and established standards and tests by which it may be known. The spiritually learned must be characterized by both inward and outward perfections; they must possess a good character, an enlightened nature, a pure intent, as well as intellectual power, brilliance and discernment, intuition, discretion and foresight, temperance, reverence, and a heartfelt fear of God. For an unlit candle, however great in diameter and tall, is no better than a barren palm tree or a pile of dead wood. (Abdu'l-Bahá, SDC, p. 33-34)

Perhaps someone will say that, since the capacity and worthiness of men differ, therefore, the difference of capacity certainly causes the difference of characters.

But this is not so, for capacity is of two kinds: natural capacity and acquired capacity. The first, which is the creation of God, is purely good--in the creation of God there is no evil; but the acquired capacity has become the cause of the appearance of evil. For example, God has created all men in such a manner and has given them such a constitution and such capacities that they are benefited by sugar and honey and harmed and destroyed by poison. This nature and constitution is innate, and God has given it equally to all mankind. But man begins little by little to accustom himself to poison by taking a small quantity each day, and gradually increasing it, until he reaches such a point that he cannot live without a gram of opium every day. The natural capacities are thus completely perverted. Observe how much the natural capacity and constitution can be changed, until by different habits and training they become entirely perverted. One does not criticize vicious people because of their innate capacities and nature, but rather for their acquired capacities and nature. (Abdu'l-Bahá, SAQ, p. 215)

THE CAUSES OF THE DIFFERENCES IN THE CHARACTERS OF MEN

Question.--How many kinds of character has man, and what is the cause of the differences and varieties in men?

Answer.--He has the innate character, the inherited character, and the acquired character which is gained by education.

With regard to the innate character, although the divine creation is purely good, yet the varieties of natural qualities in man come from

bigger, much more important manager of a department, those revenues generally exceed those of the petty owner he has supplanted. Nor is this all: the field for the display of exceptional ability is much wider than it could possibly be in the smaller establishment, and will as often win partnership in one of these establishments, or at least an equivalent of partnership, as the owner of the small store achieved success. This bigger system grows bigger men, and it is by the big men that the standard of the race is raised. The race of shopkeepers is bound to be improved, and to become not only better business men, and better men in themselves, but more valuable citizens for the State. Dealing with petty affairs tends to make small men; dealing with larger affairs broadens and strengthens character.

the difference of degree; all are excellent, but they are more or less so, according to the degree. So all mankind possess intelligence and capacities, but the intelligence, the capacity and the worthiness of men differ. This is evident.

For example, take a number of children of one family, of one place, of one school, instructed by one teacher, reared on the same food, in the same climate, with the same clothing, and studying the same lessons--it is certain that among these children some will be clever in the sciences, some will be of average ability, and some dull. Hence it is clear that in the original nature there exists a difference of degree and varieties of worthiness and capacity. This difference does not imply good or evil but is simply a difference of degree. One has the highest degree, another the medium degree, and another the lowest degree. So man exists; the animal, the plant and the mineral exist also--but the degrees of these four existences vary. What a difference between the existence of man and of the animal! Yet both are existences. It is evident that in existence there are differences of degrees. (‘Abdu'l-Bahá, SAQ, p. 212-213)

16. We have taken department stores as the form most under criticism, but what we have said here may be taken as said of all other branches of business, that the larger the scale upon which it can be successfully conducted the better it is for the race as a whole, and in greater degree better for the masses of the race than for the few.

Baha'i Comment

17. We come now to another phase of aggregation: the consolidation of various works scattered in different parts of the country into one solid company. These consolidations are now classed as trusts.

[Baha'i Comment](#)

18. As far as the consolidation of various plants engaged in one branch of manufacture is concerned, this is only obeying the great law of aggregation, which, we have seen, is beneficial, although the real object of the consolidators may, in some cases, have been the belief that through these consolidations ruinous competition might be ended. Color is given to this belief because it is obvious that the cheapening of product cannot result to so great an extent by combining works in scattered places as when one establishment enlarges itself. On the other hand, something is to be allowed

[Baha'i Comment](#)

--- Page 86. The Gospel of Wealth - IV Popular Illusions about Trusts

for the claim that each separate work may be utilized to supply the wants of a tributary region, thus saving

cost of transportation. The one solid enlarged establishment will, however, probably be able to manufacture its surplus not needed in the region tributary to it at a cost so much less than is possible at the small scattered establishments as to enable it to pay the freight upon what it desires to sell beyond its natural territory. In so far as consolidation of scattered works is intended to save cost of transportation, and thus to produce more cheaply, the consolidation is to be hailed as beneficial for the country; for the foundation upon which we rest: is that cheapness of articles leads to their wider distribution among the masses, and is a gain when attained. Reduced cost of production, under the free play of competition, insures reduced prices to the consumer.

19. The people are aroused against trusts because they are said to aim at securing monopolies in the manufacture and distribution of their products; but the whole question is, Have they succeeded, or can they succeed, in monopolizing products? Let us consider. That the manufacturer of a patented article can maintain

monopoly - ... If fair-minded and intelligent men of knowledge should ponder and reflect upon the judicious laws of the Lord of mankind, they will no doubt bear witness to the perfection of Divine Providence in the laws thus instituted. For instance, these three firm and irrefutable ordinances, namely, first: the question of inheritance by which monopoly of wealth will be removed and the question of socialism solved; second: the question of universal peace and international agreements regarding disarmament and conserving expenditure now devoted to implements of war; third: the question of all being commanded to acquire a profession, art or trade whereby they May earn a living, thus lightening the burden of expense to those upon whom it falls, such as farmers, laborers, et al. This expense is created by the idlers and unemployed members of the human family.

a monopoly goes without saying. Our laws expressly give him a monopoly. That it has been wise for the State to give an inventor this for a time will not be seriously questioned. So beneficial has it proved that the nations of the world are one after the other following our patent laws. Our chief industrial rival, Great Britain, has done so as far as possible, and the chairman of the British Patent Commission expressed to me the regret that it was found impracticable, at present, to go further in the same direction.

These fair-minded and intelligent men will also testify that the readjustment of the world and the salvation of mankind from great dangers is conditioned upon following the commands of this Most Great Manifestation. Thus will they utter the blessed words: "Blessed is God, the Possessor of the Dominion and the Kingdom!" (The Brilliant Proof, p. 68-69)

20. There are only two conditions other than patents which render it possible to maintain a monopoly. These are when the parties absolutely control the raw material out of which the article is produced, or control territory into which rivals can enter only with extreme difficulty. Such is virtually the case with the Standard Oil Company, and as long as it can

legislation - The Baha'i Cause covers all economic and social questions under the heading and ruling of its laws. The essence of the Baha'i spirit is that, in order to establish a better social order and economic condition, there must be allegiance to the laws and principles of government. Under the laws which are to govern the world, the socialists may justly demand human rights but without resort to force and violence. The governments will enact these laws, establishing just legislation and economics in order that all humanity may enjoy a full measure of welfare and privilege; but this will always be according to legal protection and procedure. Without legislative administration, rights and demands fail, and the welfare of the commonwealth cannot be realized. Today the method of demand is the strike and resort to force, which is manifestly wrong and destructive of human foundations. Rightful privilege and demand must be set forth in laws and regulations.

While thousands are considering these questions, we have more essential purposes. The fundamentals of the whole economic condition are divine in nature and are associated with the world of the heart and spirit. This is fully explained in the Baha'i teaching, and without knowledge of its principles no improvement in the economic state can be realized. The Baha'is will bring about this improvement and betterment but not through sedition and appeal to physical force--not through warfare, but welfare. Hearts must be so cemented together, love must become so dominant that the rich shall most willingly extend assistance to the poor and take steps to

--- Page 87. The Gospel of Wealth - IV Popular Illusions about Trusts

maintain a monopoly of raw materials it goes without saying that it can maintain a

monopoly in the product. This is a fact that the public must recognize, but what legislation can do to prevent it is difficult to say. Citizens of the United States have a right to buy anything they choose. This right could scarcely be restricted, nor, upon the whole, would it seem wise to restrict it, since that of the Standard Oil is the only case in which monopoly of an article has been secured. It has been rendered possible only by exceptional ability and in circumstances not likely ever to occur again. The price of its continued success is a line of such able men as its originators. Its second source of strength lies in the fact that through its extensive operations it has been enabled to reduce the price of its product to the consumer. it is a unique organization, for there is nothing like it in the world, and therefore it is not to be classed with the ordinary trusts, which are numerous and are constantly increasing.

establish these economic adjustments permanently. If it is accomplished in this way, it will be most praiseworthy because then it will be for the sake of God and in the pathway of His service. For example, it will be as if the rich inhabitants of a city should say, "It is neither just nor lawful that we should possess great wealth while there is abject poverty in this community," and then willingly give their wealth to the poor, retaining only as much as will enable them to live comfortably. (‘Abdu’l-Bahá, Promulgation Universal Peace, p. 238- 239)

21. Within the last few months a wholly new and enterprising development of the trust idea has appeared in the railway world - one which reflects much credit upon the brain which conceived it. This is the purchase by the leading trunk-lines of large amounts of the stock of their less prominent competitors. We now see a vice-president of the Pennsylvania Railway Company sitting on the board of the Baltimore and Ohio. The possible outcome of this movement, if pursued, assumes portentous proportions, far surpassing in their effect any previous phase of the trust, and may lead to an extension of the powers of the Interstate Commission, and perhaps to other legislation at present unthought of. The subject is too far-reaching for more than mere mention in this paper. The country must see its future development, which will be waited with deep concern by the thoughtful student of economic problems.

Trusts - The question of socialization is very important. It will not be solved by strikes for wages. All the governments of the world must be united and organize an assembly the members of which should be elected from the parliaments and the nobles of the nations. These must plan with utmost wisdom and power so that neither the capitalist suffer from enormous losses nor the laborers become needy. In the utmost moderation they should make the law; then announce to the public that the rights of the working people are to be strongly preserved. Also the rights of the capitalists are to be protected. When such a general plan is adopted by the will of both sides, should a strike occur, all the governments of the world collectively should resist it. Otherwise, the labor problem will lead to much destruction, especially in Europe. Terrible things will take place.

For instance, the owners of properties, mines and factories should share their incomes with their employees and give a fairly certain percentage of their products to their workmen in order that the employees may receive, beside their wages, some of the general income of the factory so that the employee may strive with his soul in the work. No more trusts will remain in the future. The question of the trusts will be wiped away entirely. Also, every factory that has ten thousand shares will give two thousand shares of these ten thousand to its employees and will write the shares in their names, so that they may have them, and the rest will belong to the capitalists. Then at the end of the month or year whatever they may earn after the expenses and wages are paid, according to the number of shares, should be divided among both. In reality, so far great injustice has befallen the common people. Laws must be made because it is impossible for the laborers to be satisfied with the present system. They will strike every month and every year. Finally, the capitalists will lose. In ancient times a strike occurred among the Turkish soldiers. They said to the government: "Our wages are very small and they should be increased." The government was forced to give them their demands. Shortly afterwards they struck again. Finally all the incomes went to the pockets of the soldiers to the extent that they killed the king, saying: "Why didst thou not increase the income so that we might have received more?"

It is impossible for a country to live properly without laws. To solve this problem rigorous laws must be made, so that all the governments of the world will be the protectors thereof. (Abdu'l-Bahá, Foundations of World Unity, p. 43-44)

22. The genesis of trusts is as follows: Manufacturers of most staple articles (especially of iron and steel) are subject to long periods of serious depression, succeeded by short inter-

[Baha'i Comment](#)

--- Page 88. The Gospel of Wealth - IV Popular Illusions about Trusts

vals of high profits. Because during depression no increase is made in capacity, and the world's population and wants are constantly growing, one morning it is discovered that demand has overtaken and outrun supply. But the production of an increased supply is no easy matter. It usually means, beginning at the beginning, obtaining the raw materials from mine or soil, passing these through various processes for which the necessary machinery and facilities are wanting, and it is a year or eighteen months, or even two years, before the supply of most articles can be materially increased. Demand becomes imperious and unsatisfied, and prices bound upward. Many new men are induced to build new works. The extensions of the old works supply all demands, and even a shade beyond; then comes the collapse. It is during one of these long

periods of depression, when many of the manufacturers are on the verge of bankruptcy, that there arises in the heart a hope, soon crystallized into a belief, that a new way has been found to avoid the natural consequences of the unchanging economic laws. It is soon felt that savage competition should cease between those enduring a common affliction, who should be brother manufacturers, and that the lion and the lamb should lie down together. They forget, in the hour of their misery, that the moralist has expressed the fear lest the one may be found inside the other. First, all kinds of understandings and fair promises are made - alas! only to be broken; and finally the promoter makes his appearance, and our unfortunate manufacturers fall an easy prey. Enormous sums are offered for antiquated plants which may not have been able to do more than pay their way for years. These are tied together, and the new industrial makes its appearance as a trust, under the delusion that if a dozen or twenty invalids be tied together vitality will be infused thereby into the mass. This is not true of all that are classed as trusts; there are exceptions; I speak only

generally.

23. Should these combinations be made upon the eve of a

--- Page 89. The Gospel of Wealth - IV Popular Illusions about Trusts

period of activity, as was the case recently, then there is a triumphant vindication of the new nostrum, the industrial world has found its panacea for all ills, and there is never to be ruinous competition again. The public is alarmed; it hears for a time of the advance of prices in the products of these gigantic concerns which temporarily control the market, and demands legislation against them. Generally speaking, as in the present instance, the advance in prices would have taken place even if no trusts existed, being caused by increased demand. The very name of trust stinks in our nostrils. We believe the public to be needlessly alarmed upon the subject, for the following reasons:

[Baha'i Comment](#)

24. Few trusts have a monopoly through patents or through the supply of raw material or of territory, and what happens is this: For a short time competition is hindered, but rarely, if ever, completely stifled. The profits of the trusts are high, and capital, ever watchful for an opportunity to make unusual gains, seeks its level by a law of its being, and needs only the opportunity to engage in this highly profitable manufacture. A relative of one of the principal officials or one of the chiefs of a department in the trust, knowing its great profits, gets some friend with capital to build new works in cooperation with him, and the result is that we soon see springing up over the country rival works, each of which has the great giant trust more or less at its mercy. A threat to reduce prices, and the trust, to which this may mean millions of dollars of loss, will sooner or later come to an agreement with the little David who threatens to attack the Goliath, and the rival concern is arranged with or purchased. This only whets the appetite of others who see the success of the first innovator, and other works soon spring up. No sooner has the trust purchased one threatened rival than two appear, and the end is

[Baha'i Comment](#)

disaster. The people may rest assured that neither in one article nor in another is it possible for any trust to exact exorbitant profits without thereby speedily undermining its own foundations. It is not

--- Page 90. The Gospel of Wealth - IV Popular Illusions about Trusts

long since trusts first made their appearance, and already many have disappeared. Many still existing are being assailed, the names of which will readily occur to our readers. Only a few survive to-day, and none have secured the coveted monopoly. Most of the metals and many of the staple articles have been formed into trusts, which, although yet living, are rapidly being attacked to their final destruction. The press used to tell every morning of the organization of some trust or other, and even to-day we still hear of proposed additions to the list of these attempted gigantic monopolies, which enjoy an ephemeral existence. Upon most of them can already be written the appropriate epitaph:

It was so soon to be done for,
I wonder what I was begun for."

(3) The first line should read: "It is so soon that I am done for."

*An Epitaph "For a Child Aged Three Weeks,"
Cheltenham
Churchyard.*

25. Every attempt to monopolize the manufacture of any staple article carries within its bosom the seeds of failure. Long before we could legislate with much effect against trusts there would be no necessity for legislation. The past proves this, and the future is to confirm it. There should be nothing but encouragement for these vast aggregations of capital for the manufacture of staple articles. As for the result being an increase of price to the consumer beyond a brief period, there need be no fear. On the contrary, the inevitable result of these aggregations is, finally and permanently, to give to the consumer cheaper articles that would have been otherwise possible to obtain; for capital is stimulated by the high profits of the trust, for a season, to embark against it. The result is very soon a capacity of production beyond the wants of the consumer, and as the new works erected are of the most improved pattern, and capable of producing cheaper than the old works, the vulnerable

[Baha'i Comment](#)

trusts are compelled to buy and capitalize at two or three times their cost. There is thus no danger ahead to the community from trusts, nor any cause for fear.

--- Page 91. The Gospel of Wealth - IV Popular Illusions about Trusts

26. The great natural laws, being the outgrowth of human nature and human needs, keep on their irresistible course. Competition in all departments of human activity is not to be suppressed. The individual manufacturer who is tempted into the unusually profitable business of the trust will take care of the monopoly question and prevent injury to the nation. The trust, so far as aggregation and enlargement go, is one day to be recognized as a grand step toward cheaper products for the people than could have been obtained by any other mode than the aggregation of capital and establishments. Already the ghosts of numerous departed trusts which aimed at monopolies have marched across the stage of human affairs, each pointing to its fatal wound, inflicted by that great corrective, competition. Like the ghosts of Macbeth's victims, the line promises to

[Baha'i Comment](#)

stretch longer and longer, and also like those phantoms of the brain, they "come like shadows, so depart."

The earth hath bubbles
as the water hath,
And these are of them.

*(4) Macbeth, Act I, scene
3, line 79.*

The masses of the people, the toiling millions, are soon to find in this great law of aggregation of capital and of factories another of those beneficent agencies which in their operation tend to bring to the homes of the poor, in greater degree than ever, more and more of the luxuries of the rich, and into their lives more of sweetness and light. The only people who have reason to fear trusts are those who trust them.

V

An Employer's View of the Labor Question

(1) From the Forum, I (April 1886), 114-125.

1. THE struggle in which labor has been engaged during the past three hundred years, first against authority and then against capital, has been a triumphal march. Victory after victory has been achieved. Even so late as in Shakespere's time, remains of villeinage or serfdom still existed in England. Before that, not only the labor but the person of the laborer belonged to the chief. The workers were either slaves or serfs; men and women were sold with the estate upon

[Baha'i Comment](#)

which they worked, and became the property of the new lord, just as did the timber which grew on the land. In those days we hear nothing of strikes or of trades-unions, or differences of opinion between employer and employed. The fact is, labor had then no right which the chief, or employer, was bound to respect. Even as late as the beginning of this century, the position of the laborer in some departments was such as can scarcely be credited. What do our laboring friends think of this, that down to 1779 the miners of Britain were in a state of serfdom. They "were compelled by law to remain in the pits as long as the owner chose to keep them at work there, and were actually sold as part of the capital invested in the works. If they accepted an engagement elsewhere, their master could always have them fetched back and flogged as thieves for having attempted to rob him of their labor. This law was modified in 1779, but was not repealed till after the acts passed in

--- Page 93. The Gospel of Wealth - V An Employer's View of the Labor Question

1797 and 1799" (The Trades-Unions of England, p. 119).

(2) *By Louis Philippe, Albert*

d'Orleans, Comte de Paris (1830-1894). His Les Associations ouvries en Angleterre was translated and published in England in 1869 (Thomas Hughes, ed.).

This was only ninety-seven years ago. Men are still living who were living then. Again, in France, as late as 1806, every workman had to procure a license; and in Russia, down to our own days, agricultural laborers were sold with the soil they tilled.

2. Consider the change, nay, the revolution. Now the poorest laborer in America or in England, or indeed throughout the civilized world, who can handle a pick or a shovel, stands upon equal terms with the purchaser of his labor. He sells or withholds it as may seem best to him. He negotiates, and thus rises to the dignity of an independent contractor. When he has performed the work he bargained to do, he owes his employer nothing, and is under no obligation to him. Not only has the laborer conquered his political and personal freedom: he has achieved industrial freedom as well, as far as the law can give it, and he now fronts his master, proclaiming himself his equal under the law.

[Baha'i Comment](#)

3. But, notwithstanding this complete revolution, it is evident that the permanent relations to each other of labor and capital have not yet evolved. The present adjustment does not work without friction, and changes must be made before we can have industrial pence. To-day we find collisions between these forces, capital and labor, when there should be combination. The mill hands of an industrial village in France have just risen against their employers, attacked the manager's home and killed him. The streets of another French village are barricaded against the expected forces of order. The ship-builders of Sunderland, in England, are at the verge of starvation, owing to a quarrel with their employers; and Leicester has just been the scene of industrial riots. In our country, labor disputes and strikes were never so numerous as now.

(3) For work stoppages -- strikes or boycotts -- there are only fragmentary figures before 1850. Beginning with that date the United States Commissioner of Labor began a more systematic compilation. These statistics bore out Carnegie's contention. Following the depression of 1884-1885 there was a nationwide wave of strikes. In 1885, when Carnegie must have been maturing this essay, an index of strikes and workers involved increased by fifty per cent. The next year, 1886, was

[Baha'i Comment](#)

to be even more fruitful of labor turbulence. Its full impact came in May, after the publication of this essay, but the rapid growth of labor union membership, the multiplication of new unions, and "the great railroad strike" on the southwest lines of Jay Gould occurred in the early months of that year.

East and West, North and South,

--- Page 94. The Gospel of Wealth - V An Employer's View of the Labor Question

everywhere, there is unrest, showing that an equilibrium has not yet been reached between employers and employed.

4. A strike or lockout is, in itself, a ridiculous affair. Whether a failure or a success, it gives no direct proof of its justice or injustice. In this it resembles war between two nations. It is simply a question of strength and endurance between the contestants. The gage of battle, or the duel, is not more senseless, as a means of establishing what is just and fair, than an industrial strike or lockout. It would be folly to conclude that we have reached any permanent adjustment between capital and labor until strikes and lockouts are as much things of the past as the gage of battle

[Baha'i Comment](#)

or the duel have become in the most advanced communities.

5. Taking for granted, then, that some further modifications must be made between capital and labor, I propose to consider the various plans that have been suggested by which labor can advance another stage in its development in relation to capital. And, as a preliminary, let it be noted that it is only labor and capital in their greatest masses which it is necessary to consider. It is only in large establishments that the industrial unrest of which I have spoken ominously manifests itself. The farmer who hires a man to assist him, or the gentleman who engages a groom or a butler, is not affected by strikes. The innumerable cases in which a few men only are directly concerned, which comprise in the aggregate the most of labor, present upon the whole a tolerably satisfactory condition of affairs. This clears the ground of much, and leaves us to deal only with the immense mining

--- Page 95. The Gospel of Wealth - V An Employer's View of the Labor Question

[Baha'i Comment](#)

and manufacturing concerns of recent growth, in which capital and labor often array themselves in alarming antagonism.

6. Among expedients suggested for their better reconciliation, the first place must be assigned to the idea of cooperation, or the plan by which the workers are to become part-owners in enterprises, and share their fortunes.

(4) Producer's co-operation was of immense interest to organized labor in the post-Civil War era. Aside from harmonizing appealingly with American ideals, it was during depression years a form of unemployment relief. The officers of the Knights of Labor gave the device much verbal, though inconstant, support; it also made a wide appeal to liberal preachers, professors, and editors. Even E. L. Godkin (1831-1902), editor of the Nation and generally a conservative spokesman, supported co-operation. In the mid-eighties, the "highest point of the cooperative movement," producers' cooperative ventures numbered 135, chiefly in mining, cooperage, and shoes. Most were very small scale enterprises.

There is no doubt that if this could be effected it would have the same beneficial effect upon the workman which the ownership of land has upon the man who has hitherto tilled the land for another. The sense of ownership would make of him

[Baha'i Comment](#)

more of a man as regards himself, and hence more of a citizen as regards the commonwealth. But we are here met by a difficulty which I confess I have not yet been able to overcome, and which renders me less sanguine than I should like to be in regard to cooperation. The difficulty is this, and it seems to me inherent in all gigantic manufacturing, mining, and commercial operations. Two men or two combinations of men will erect blast-furnaces, iron-mills, cotton-mills, or piano manufactories adjoining each other, or engage in shipping or commercial business. They will start with actual capital and credit; and to those only superficially acquainted with the personnel of these concerns, success will seem as likely to attend the one as the other.

Nevertheless, one will fail after dragging along a lifeless existence, and pass into the hands of its creditors; while the neighboring mill or business will make a fortune for its owners. Now, the successful manufacturer, dividing every month or every year a proportion of his profits among his workmen, either as a bonus or as dividends upon shares

--- Page 96. The Gospel of Wealth - V An Employer's

View of the Labor Question

owned by them, will not only have a happy and contented body of operatives, but he will inevitably attract from his rival the very best workmen in every department. His rival, having no profits to divide among his workmen, and paying them only a small assured minimum to enable them to live, finds himself despoiled of foremen and of workmen necessary to carry on his business successfully. His workmen are discontented and, in their own opinion, defrauded of the proper fruits of their skill, through incapacity or inattention of their employers. Thus, unequal business capacity in the management produces unequal results.

7. It will be precisely the same if one of these manufactories belongs to the workmen themselves; but in this case, in the present stage of development of the workmen, the chances of failure will be enormously increased. It is, indeed, greatly to be doubted whether any body of workingmen in the world could to-day organize and successfully carry on a mining or manufacturing or commercial business in competition with concerns owned by men

[Baha'i Comment](#)

trained to affairs. If any such cooperative organization succeeds, it may be taken for granted that it is principally owing to the exceptional business ability of one of the managers, and only in a very small degree to the efforts of the mass of workmen-owners. This business ability is excessively rare, as is proved by the incredibly large proportion of those who enter upon the stormy sea of business only to fail. I should say that twenty cooperative concerns would fail to every one that would succeed. There are, of course, a few successful establishments, notably two in France and one in England, which are organized upon the cooperative plan, in which the workmen participate in the profits. But these were all created by the present owners, who now generously share the profits with their workmen, and are making the success of their manufactories upon the cooperative plan the proud work of their lives. What these concerns will become when the genius for affairs is no longer with them to guide, is a matter of grave doubt and, to me,

--- Page 97. The Gospel of Wealth - V An Employer's View of the Labor Question

of foreboding. I can, of course, picture in my mind a state of civilization in which the most talented business men shall find their most cherished work in carrying on immense concerns, not primarily for their own personal aggrandizement, but for the good of the masses of workers engaged therein, and their families; but this is only a foreshadowing of a dim and distant future. When a class of such men has evolved, the problem of capital and labor will be permanently solved to the entire satisfaction of both. But as this manifestly belongs to a future generation, I cannot consider cooperation, or common ownership, as the next immediate step in advance which it is possible for labor to make in its upward path.

8. The next suggestion is that peaceful settlement of differences should be reached through arbitration. Here we are upon firmer ground. I would lay it down as a maxim that there is no excuse for a strike or a lockout until arbitration of differences has been offered by one party and refused by the other. No doubt serious trouble attends even arbitration at present, from the difficulty of procuring suitable men to judge

[Baha'i Comment](#)

intelligently between the disputants. There is a natural disinclination among business men to expose their business to men in whom they have not entire confidence. We lack, so far, in America a retired class of men of affairs. Our vile practice is to keep on accumulating more dollars until we die. If it were the custom here, as it is in England, for men to withdraw from active business after acquiring a fortune, this class would furnish the proper arbitrators. On the other hand, the ex-presidents of trades-unions, such as Mr. Jarrett or Mr. Wihle,

(5) John Jarrett, an immigrant from Wales, was a mill worker who became President of the Amalgamated Association of Iron and Steel Workers, a consolidation of the various craft unions in the industry. When the Federation of Organized Trades and Labor Unions, a predecessor of the American Federation, was organized in 1881, Jarrett became the first president. William Weihe (the Carnegie misspelling reflects on his acquaintance with the union in his industry), a native American, succeeded Jarrett in the early eighties as President of the Amalgamated Association of Iron and Steel Workers. Ironically, in view of Carnegie's admiration, Weihe was president of the Association in 1892, when at the Homestead Works, one of the Carnegie plants, occurred the classic test of strength between union and management, the latter represented by Henry Clay Frick (1849-1918). The Homestead Strike of 1892 was, of course, subsequent to this essay.

after they have retired from active control, would

--- Page 98. The Gospel of Wealth - V An Employer's View of the Labor Question

commend themselves to the manufacturers and to the men as possessed of the necessary technical knowledge, and educated to a point where commercial reasons would not be without their proper weight upon them. I consider that of all the agencies immediately available to prevent wasteful and embittering contests between capital and labor, arbitration is the most powerful and most beneficial.

9. The influence of trades-unions upon the relations between the employer and employed has been much discussed. Some establishments in America have refused to recognize the right of the men to form themselves into these unions, although I am not aware that any concern in England would dare to take this position. This policy, however, may be regarded as only a temporary phase of the situation. The right of the working-men to combine and to form trades-unions is no less sacred than the right of the manufacturer to enter into associations and

[Baha'i Comment](#)

conferences with his fellows, and it must sooner or later be conceded. Indeed, it gives one but a poor opinion of the American workman if he permits himself to be deprived of a right which his fellow in England long since conquered for himself. My experience has been that trades-unions, upon the whole, are beneficial both to labor and to capital. They certainly educate the working-men, and give them a truer conception of the relations of capital and labor than they could otherwise form. The ablest and best workmen eventually come to the front in these organizations; and it may be laid down as a rule that the more intelligent the workman the fewer the contests with employers. It is not the intelligent workman, who knows that labor without his brother capital is helpless, but the blatant ignorant man, who regards capital as the natural enemy of labor, who does so much to embitter the relations between employer and

--- Page 99. The Gospel of Wealth - V An Employer's View of the Labor Question

employed; and the power of this ignorant demagogue arises chiefly from the lack of proper organization among the men through which their

real voice can be expressed. This voice will always be found in favor of the judicious and intelligent representative. Of course, as men become intelligent more deference must be paid to them personally and to their rights, and even to their opinions and prejudices; and, upon the whole, a greater share of profits must be paid in the day of prosperity to the intelligent than to the ignorant workman. He cannot be imposed upon so readily. On the other hand, he will be found much readier to accept reduced compensation when business is depressed; and it is better in the long run for capital to be served by the highest intelligence, and to be made well aware of the fact that it is dealing with men who know what is due to them, both as to treatment and compensation.

10. One great source of the trouble between employers and employed arises from the fact that the immense establishments of to-day, in which alone we find serious conflicts between capital and labor, are not managed by their owners, but by salaried officers, who cannot possibly have any permanent interest in the welfare of the workingmen. These officials are

[Baha'i Comment](#)

chiefly anxious to present a satisfactory balance-sheet at the end of the year, that their hundreds of shareholders may receive the usual dividends, and that they may therefore be secure in their positions, and be allowed to manage the business without unpleasant interference either by directors or shareholders. It is notable that bitter strikes seldom occur in small establishments where the owner comes into direct contact with his men, and knows their qualities, their struggles, and their aspirations. It is the chairman, situated hundreds of miles away from his men, who only pays a flying visit to the works and perhaps finds time to walk through the mill or mine once or twice a year, that is chiefly responsible for the disputes which break out at intervals. I have noticed that the manager who confers oftenest with a committee of

--- Page 100. The Gospel of Wealth - V An Employer's View of the Labor Question

his leading men has the least trouble with his workmen. Although it may be impracticable for the presidents of these large corporations to know the working-men personally, the manager at the mills, having a

committee of his best men to present their suggestions and wishes from time to time, can do much to maintain and strengthen amicable relations, if not interfered with from headquarters. I, therefore, recognize in trades-unions, or, better still, in organizations of the men of each establishment, who select representatives to speak for them, a means, not of further embittering the relations between employer and employed, but of improving them.

11. It is astonishing how small a sacrifice upon the part of the employer will sometimes greatly benefit the men. I remember that at one of our meetings with a committee, it was incidentally remarked by one speaker that the necessity for obtaining credit at the stores in the neighborhood was a grave tax upon the men. An ordinary workman, he said, could not afford to maintain himself and family for a month, and as he only received his pay monthly, he was compelled to obtain credit and to pay exorbitantly for everything, whereas, if he had the cash, he could, buy at twenty-five per cent less. "Well," I said, "why cannot we overcome that by paying every two weeks?" The reply

[Baha'i Comment](#)

was: "We did not like to ask it, because we have always understood that it would cause much trouble; but if you do that it will be worth an advance of five per cent. in our wages." We have paid semi-monthly since. Another speaker happened to say that although they were in the midst of coal, the price charged for small lots delivered at their houses was a certain sum per bushel. The price named was double what our best coal was costing us. How easy for us to deliver to our men such coal as they required, and charge them cost! This was done without a cent's loss to us, but with much gain to the men. Several other points similar to these have arisen by which their labors might be lightened or products increased, and others suggesting changes in machinery or facilities which, but for the

--- Page 101. The Gospel of Wealth - V An Employer's View of the Labor Question

conferences referred to, would have been unthought of by the employer and probably never asked for by the men. For these and other reasons I attribute the greatest importance to an organization of the men, through whose

duly elected representatives the managers may be kept informed from time to time of their grievances and suggestions. No matter how able the manager, the clever workman can often show him how beneficial changes can be made in the special branch in which that workman labors. Unless the relations between manager and workmen are not only amicable but friendly, the owners miss much; nor is any man a first-class manager who has not the confidence and respect, and even the admiration, of his workmen. No man is a true gentleman who does not inspire the affection and devotion of his servants. The danger is that such committees may ask conferences too often; three or four meetings per year should be regarded as sufficient.

12. I come now to the greatest cause of the friction which prevails between capital and labor in the largest establishments the real essence of the trouble, and the remedy I have to propose.

[Baha'i Comment](#)

13. The trouble is that the men are not paid at any time the compensation proper to that time. All large concerns necessarily keep filled with orders, say for six months in advance, and these orders are taken, of course, at prices prevailing when they are booked. This year's operations furnish perhaps the best illustration of the difficulty. Steel rails at the end of last year for delivery this year were \$29 per ton at the works. Of course the mills entered orders freely at this price, and kept on entering them until the demand growing unexpectedly great carried prices up to \$35 per ton. Now, the various mills in America are compelled for the next six months or more to run up orders which do not average \$31 per ton at the seaboard and Pittsburg and pay \$34 at Chicago. Transportation, ironstone, and prices of all kinds have advanced upon them in the meantime, and they must therefore run the

--- Page 102. The Gospel of Wealth - V An Employer's View of the Labor Question

bulk of the year upon very small margins of profit. But the men, noticing in the papers the "great boom in

[Baha'i Comment](#)

steel rails," very naturally demand their share of the advance, and, under existing faulty arrangements between capital and labor, they have secured it. The employers, therefore, have grudgingly given what they know under proper arrangements they should not have been required to give, and there has been friction, and still is dissatisfaction upon the part of the employers. Reverse this picture. The steel-rail market falls again. The mills have still six months' work at prices above the prevailing market, and can afford to pay men higher wages than the then existing state of the market would apparently justify. But having just been amerced in extra payments for labor which they should not have paid, they naturally attempt to reduce wages as the market price of rails goes down, and there arises discontent among the men, and we have a repetition of the negotiations and strikes which have characterized the beginning of this year. In other words, when the employer is going down the employee insists on going up, and vice versa. What we must seek is a plan by which the men will receive high wages when their employers are receiving high prices for their product, and hence are making large

profits; and, per contra, when the employers are receiving low prices for product, and therefore small if any profits, the men will receive low wages.

(6) Methods of paying labor, whereby wages had a fluctuating relation with changes in the market price of the product, were not uncommon at this time in American industry. Wages were lowered when prices fell and vice versa. Attempts to introduce maximum or minimum limits to wage changes were variants of the scheme. Workers of course preferred a fixed rate of wages. Sliding scales existed in coal mining, shipping on the Great Lakes, and in the iron and steel industry. A dispute over this feature of payment was one facet of the Homestead outbreak.

If this plan can be found, employers and employed will be "in the same boat," rejoicing together in their prosperity, and calling into play their fortitude together in adversity. There will be no room for quarrels, and instead of a feeling of antagonism

--- Page 103. The Gospel of Wealth - V An Employer's View of the Labor Question

there will be a feeling of partnership between employers and employed.

14. There is a simple means of producing this result, and to its general introduction both employers and employed should steadily bend their energies. Wages should be based upon a sliding scale, in proportion to the net prices received for product month by month. And I here gladly pay Mr. Potter, president of the North Chicago Rolling Mill Company, the great compliment to say that he has already taken a step in this direction, for to-day he is working his principal mill upon this plan. The result is that he has had no stoppage whatever this year, nor any dissatisfaction. All has gone smoothly along, and this in itself is worth at least as much to the manufacturer and to the men as the difference in wages one way or another which can arise from the new system.

[Baha'i Comment](#)

15. The celebrated Crescent Steel Works of Pittsburg, manufacturers of the highest grades of tool steel, pay their skilled workmen by a sliding scale, based upon prices received for product - an important factor in the eminent success of that firm. The scale adopted by the iron manufacturers and workmen is only an approach to the true sliding scale;

[Baha'i Comment](#)

nevertheless it is a decided gain both to capital and labor, as it is adopted from year to year, and hence eliminates strikes on account of wages during the year, and limits these interruptions from that cause to the yearly negotiation as to the justice or injustice of the scale. As this scale, however, is not based upon the prices actually received for product, but upon the published list of prices, which should be received in theory, there is not complete mutuality between the parties. In depressed times, such as the iron industry has been passing through in recent years, enormous concessions upon the published card prices have been necessary to effect sales, and in these the workmen have not shared with their employers. If, however, there was added to the scale, even in its present form, a stipulation that all causes of difference

--- Page 104. The Gospel of Wealth - V An Employer's View of the Labor Question

which could not be postponed till the end of the year, and then considered with the scale, should be referred to arbitration, and that, in case of failure of the owners and workmen to agree at the yearly conference, arbitration

should also be resorted to, strikes and lockouts would be entirely eliminated from the iron business; and if the award of the arbitrators took effect from the date of reference the works could run without a day's interruption.

16. Dismissing, therefore, for the present all consideration of cooperation as not being within measurable distance, I believe that the next steps in the advance toward permanent, peaceful relations between capital and labor are:

[Baha'i Comment](#)

17. *First.* That compensation be paid the men based upon a sliding scale in proportion to the prices received for product.

[Baha'i Comment](#)

18. *Second.* A proper organization of the men of every works to be made, by which the natural leaders, the best men, will eventually come to the front and confer freely with the employers.

[Baha'i Comment](#)

19. *Third.* Peaceful arbitration to be in all cases resorted to for the settlement of differences which the owners and the mill committee cannot themselves adjust in friendly conference.

[Baha'i Comment](#)

20. *Fourth.* No interruption ever to occur to the operations of the establishment, since the decision of the arbitrators shall be made to take effect from the date of reference.

[Baha'i Comment](#)

21. If these measures were adopted by an establishment, several important advantages would be gained:

[Baha'i Comment](#)

22. *First.* The employer and employed would simultaneously share their prosperity or adversity with each other. The scale once settled, the feeling of antagonism would be gone, and a feeling of mutuality would ensue. Capital and labor would be shoulder to shoulder, supporting each other.

[Baha'i Comment](#)

23. *Second.* There could be neither strike nor lockout, since both parties had agreed to abide by a forthcoming decision of disputed points. Knowing that in the last resort strangers were to be called in to decide what should be a family affair,

--- Page 105. The Gospel of Wealth - V An Employer's View of the Labor Question

the cases would, indeed, be few which would not be amicably adjusted by the original parties without calling in others to judge between them.

[Baha'i Comment](#)

24. Whatever the future may have in store for labor, the evolutionist, who sees nothing but certain and steady progress for the race, will never attempt to set bounds to its triumphs, even to its final form of complete and universal industrial cooperation, which I hope is some day to be reached. But I am persuaded that the next step forward is to be in the direction I have here ventured to point out; and as one who is now most anxious to contribute his part toward helping forward the day of amicable relations between the two forces of capital and

[Baha'i Comment](#)

labor, which are not enemies, but are really auxiliaries who stand or fall together, I ask at the hands of both capital and labor a careful consideration of these views.

VI

Results of the Labor Struggle

(1) Published originally in the Forum, I (August 1886), 538-551. Between the date of this and the preceding essay, part of organized labor had launched on May 1, 1886, a movement for the eight-hour day. According to one contemporary estimate, no fewer than 340,000 men took part, and 190,000 actually struck. Regionally this labor pressure was most uneven. Chicago was center of great excitement. There the eight-hour program got tangled with an existing strike in the McCormick Harvester Works and with the agitational efforts of a small group of anarchists who displayed the familiar radical desire to fish in troubled waters. A mass meeting called in Haymarket Square on May 4th to protest a police attack upon McCormick workers proved a dull affair, hut later in the evening when the police moved into the Square to disperse the meeting, some unidentified person threw a bomb which killed a police officer. Eight anarchists were arrested and tried as accessories to murder; of the seven sentenced to hang, four were executed, one committed suicide, and two, whose sentences were commuted to life, along with one sentenced to fifteen years, were pardoned in 1893 by Governor Altgeld (1847-1902) of Illinois. The Haymarket trial became one of the most famous illustrations of a miscarriage of justice in American history. Carnegie does not exaggerate the hysteria or terror of the times; few, including many labor leaders, shared his serenity.

1. WHEN "An Employer's View of the Labor Question" was written, labor and capital were at peace, each performing its proper function; capital providing for the wants of labor, and labor regularly discharging its daily task. But before that paper reached the public the most serious labor revolt that ever occurred in this country was upon us. Capital, frightened almost into panic, began to draw back into its strongholds, and many leaders of public opinion seemed to lose self-command. Among the number were not a few of our foremost political economists. These writers of the closet, a small but important class in this country removed from personal contact with every-day affairs, and uninformed of the solid

--- Page 107. The Gospel of Wealth - VI Results of the Labor Struggle

basis of virtue in the wage-receiving class upon which American society rests, necessarily regarded such phenomena from a purely speculative standpoint. Some of them apparently thought that the fundamental institutions upon which peaceful development depends had been, if not completely overthrown, at

Institutions - The Baha'i Commonwealth of the future, of which this vast Administrative Order is the sole framework, is, both in theory and practice, not only unique in the entire history of political institutions, but can find no parallel in the annals of any of the world's recognized religious systems. No form of democratic government; no system of autocracy or of dictatorship, whether monarchical or republican; no intermediary scheme of a purely aristocratic order; nor even any of the recognized types of theocracy, whether it be the Hebrew Commonwealth, or the various Christian ecclesiastical organizations, or the Imamate or the Caliphate in Islam--none of these can be identified or be said to conform with the Administrative Order which the master-hand of its perfect Architect has fashioned. (World Order of Bahá'u'lláh, page 152)

Economists - Now concerning our social principles, namely the teachings of His Holiness Bahá'u'lláh spread far and wide fifty years ago, they verily comprehend all other teachings. It is clear and evident that without these teachings progress and advancement for mankind are in no wise possible. Every community in the world findeth in these Divine Teachings the realization of its highest aspirations. These teachings are even as the tree that beareth the best fruits of all trees. Philosophers, for instance, find in these heavenly teachings the most perfect solution of their social problems, and similarly a true and noble exposition of matters that pertain to philosophical questions. In like manner men of faith behold the reality of religion manifestly revealed in these heavenly teachings, and clearly and conclusively prove them to be the real and true remedy for the ills and infirmities of all mankind. Should these sublime teachings be diffused, mankind shall be freed from all perils, from all chronic ills and sicknesses. In like manner are the Baha'i economic principles the embodiment of the highest aspirations of all wage-earning classes and of economists of various schools.

In short, all sections and parties have their aspirations realized in the teachings of Bahá'u'lláh. As these teachings are declared in churches, in mosques and in other places of worship, whether those of the followers of Buddha or of Confucius, in political circles or amongst materialists, all shall bear witness that these teachings bestow a fresh life upon mankind and constitute the immediate remedy for all the ills of social life. None can find fault with any of these teachings, nay rather, once declared they will all be acclaimed, and all will confess their vital necessity, exclaiming, 'Verily this is the truth and naught is there beside the truth but manifest error.'

In conclusion, these few words are written, and unto everyone they will be a clear and conclusive evidence of the truth. Ponder them in thine heart. The will of every sovereign prevaieth during his reign, the will of every philosopher findeth expression in a handful of

least gravely endangered, and that civilization itself had received a rude shock from the disturbance. More than one did not hesitate to intimate that the weakness of democratic institutions lay at the foundation of the revolt. Suggestions were made that the suffrage should be confined to the educated; that the masses might be held in stricter bonds. When we hear the cry of these alarmists we are tempted to reverse the rebuke of the sacred Teacher: they are always troubled more by the mote in their own country's eye than by the beam in the eye of other lands. They forget that not sixty days before, monarchical Belgium was convulsed with labor revolts, compared with which ours were insignificant and practically harmless. That country, with its five and a half millions of inhabitants, had more rioters than the United States, with its fifty-six millions; and instead of restoring peace, as this country did, by means of the established forms of order, the Belgian government had to abandon, for a time, all law, and publicly authorize every citizen to wage private war against the insurgents.

(2) In March 1886 there was a riot in Liege, followed by outbreaks in all the industrial districts. They were repressed with much

disciples during his lifetime, but the Power of the Holy Spirit shineth radiantly in the realities of the Messengers of God, and strengtheneth Their will in such wise as to influence a great nation for thousands of years and to regenerate the human soul and revive mankind.

Consider how great is this power! It is an extraordinary Power, an all-sufficient proof of the truth of the mission of the Prophets of God, and a conclusive evidence of the power of Divine Inspiration.

(ABDU'L-BAHA'S TABLET TO DR. FOREL, p. 26-28)

bloodshed.

2. Our magazines, reviews, and newspapers have been filled with plans involving radical changes considered necessary by these socialists for the restoration and maintenance of proper relations between capital and labor. The pulpit has been equally prolific. Thirty days have not elapsed since the excitement was at its height, and yet to-day capital and labor are again cooperating everywhere, as at the date of my first paper, and we are now in position to judge of the extent of the disturbance and to reduce the specter to its real dimensions. It will soon be seen that what occurred was a very

--- Page 108. The Gospel of Wealth - VI Results of the Labor Struggle

inadequate cause for the alarm created. The eruption was not, in itself, a very serious matter, either in its extent or in its consequences. Its lesson lay in the indications it gave of the forces underlying it. There are in the United States today a total of more than twenty millions of workers who earn their bread by the sweat of their brow; in trade and

Press - We return to the phenomenal characteristics of speech. Content, volume, style, tact, wisdom, timeliness are among the critical factors in determining the effects of speech for good or evil.

Consequently, the friends need ever to be conscious of the significance of this activity which so distinguishes human beings from other forms of life, and they must exercise it judiciously.

Their efforts at such discipline will give birth to an etiquette of expression worthy of the approaching maturity of the human race.

Just as this discipline applies to the spoken word, it applies equally to the written word; and it profoundly affects the operation of the press.

The significance and role of the press in a new world system are conspicuous in the emphasis which the Order of Bahá'u'lláh places on accessibility to information at all levels of society.

Shoghi Effendi tells us that Bahá'u'lláh makes "specific reference to 'the swiftly appearing newspapers', describes them as 'the mirror of the world' and as 'an amazing and potent phenomenon', and prescribes to all who are responsible for their production the duty to be sanctified from malice, passion and prejudice, to be just and fair-minded, to be painstaking in their inquiries, and ascertain all the facts in every situation".

In His social treatise, "The Secret of Divine Civilization", `Abdu'l-Baha offers insight as to the indispensability of the press in future society.

He says it is "urgent that beneficial articles and books be written, clearly and definitely establishing what the present-day requirements of the people are, and what will conduce to the happiness and advancement of society".

Further, He writes of the "publication of high thoughts" as the "dynamic power in the arteries of life", "the very soul of the world".

Moreover, He states that, "Public opinion must be directed toward whatever is worthy of this day, and this is impossible except through the use of adequate arguments and the adducing of clear, comprehensive and conclusive proofs."

transportation alone there are more than seven millions. At the very height of the revolt, not more than 250,000 of these had temporarily ceased to labor. This was the estimate given by "Bradstreet's" on the 14th of May. Three days later it was 80,000, and four days after that only 47,000. The remaining millions continued to pursue their usual vocations in peace. It is fair to assume that the number reported on the 14th of May included all those who were dissatisfied and had requested advance of wages or redress of grievances, but were not really strikers at all. A demonstration that shrinks to one fourth its size from the 14th to the 17th of May, and then again to one half its remaining proportions in the next three days, can scarcely be called a contest. The number of those involved in a serious struggle with capital did not, therefore, at any one time exceed 50,000 - not one per cent of the total wage-receiving class, in the brandies where labor troubles occurred. How then, one is tempted to ask, did so small an interruption seem so great? Why was it taken for granted that a general revolt of labor had taken place, when not one worker in a hundred had really entered

As to manner and style, Bahá'u'lláh has exhorted "authors among the friends" to "write in such a way as would be acceptable to fair-minded souls, and not lead to cavilling by the people".

And He issues a reminder: "We have said in the past that one word hath the influence of spring and causeth hearts to become fresh and verdant, while another is like unto blight which causeth the blossoms and flowers to wither."

In the light of all this, the code of conduct of the press must embrace the principles and objectives of consultation as revealed by Bahá'u'lláh.

Only in this way will the press be able to make its full contribution to the preservation of the rights of the people and become a powerful instrument in the consultative processes of society, and hence for the unity of the human race. (Individual Rights & Freedoms, #165-179)

upon a contest? The reason for the delusion is obvious. The omnipresent press, with the electric telegraph at its command, spreads the report of a local disturbance in East St. Louis over the entire three million square miles of the land.

(3) The great railroad strike of 1886 was precipitated on the Gould southwest lines, Texas Pacific, Missouri Pacific, and others, by the Knights of Labor in order to raise the wages of unskilled workers, secure the recognition of the union, and punish Gould for the discharge of union workmen in spite of an understanding concluding a strike in 1885. The outbreak did not involve at first hand engineers, firemen, conductors, or brakemen, who were organized in brotherhoods or craft unions. Shopmen, trackmen, and yardmen contributed the strike's core; telegraphers were sympathetic. About 9,000 strikers were involved. The local leader was Martin Irons, a machinist who had emigrated from Scotland as a boy. A Congressional committee stigmatized him as "a dangerous if not pernicious man." In any case he did not act harmoniously with the centralized command of the Knights, notably Terence V. Powderly (1849-1924), Grand Master Workman. The strikers effectively interfered with freight traffic by "killing engines" and other devices, and the strike did great damage to the commerce and prosperity of St. Louis. The "chaos" which the Congressional committee found endemic in East St. Louis erupted in April into a day of violence with gunfire and incendiarism. Early in May the strike petered out; Gould was victorious.

It is felt almost as

--- Page 109. The Gospel of
Wealth - VI Results of the
Labor Struggle

distinctly in New Orleans, Boston, and San Francisco as in the city of St. Louis itself, upon the opposite side of the river. The thoughts of men throughout the country concentrate upon this one point of outbreak. Excitable natures fancy the trouble to be general, and even imagine that the very ground trembles under their own feet. In this way the petty, local difficulty upon the Wabash system of railways, which involved only 3700 Knights of Labor, and a strike of a few hundred men on the Third Avenue Railway, New York, together with a few trifling and temporary disputes at other points, were magnified into a general warfare between capital and labor. There were but a few local skirmishes; peace already reigns; and our professors and political economists and the whole school of pessimists who tremble for the safety of human society in general, and of the Republic in particular, and the ministers that have bodily essayed to revolutionize existing conditions, are free to find another subject for their anxious fears and forebodings. The relations between capital

and labor which have slowly evolved themselves in the gradual development of the race will not be readily changed. The solid walls with which humanity fortifies itself in each advanced position gained in its toilsome march forward will not fall to the ground at the blast of trumpets. Present conditions have grown up slowly, and can be changed for the better only slowly and by small, successive steps. A short history of the disturbances will, however, furnish many useful and needed lessons.

3. The trouble grew, as many serious troubles do grow, from a trifle. A leader of the Knights of Labor was dismissed.

--- Page 110. The Gospel of Wealth - VI Results of the Labor Struggle

Whether the fact that he was a labor leader influenced his superior to dismiss him will probably never be known; but this much is to be said, that it was very likely to do so. Salaried officials in the service of large corporations are naturally disposed to keep under them only such men as give them no trouble.

leadership - How pathetic indeed are the efforts of those leaders of human institutions who, in utter disregard of the spirit of the age, are striving to adjust national processes, suited to the ancient days of self-contained nations to an age which must either achieve the unity of the world, as adumbrated by Bahá'u'lláh, or perish. At so critical an hour in the history of civilization it behoves the leaders of all the nations of the world, great and small, whether in the East or in the West, whether victors or vanquished, to give heed to the clarion call of Bahá'u'lláh and, thoroughly imbued with a sense of world solidarity, the sine qua non of loyalty to His Cause, arise manfully to carry out in its entirety the one remedial scheme He, the Divine Physician, has prescribed for an ailing humanity. Let them discard, once for all, every preconceived idea, every national prejudice, and give heed to the sublime counsel of `Abdu'l-Bahá, the authorized Expounder of His teachings. You can best serve your country, was `Abdu'l-Bahá's rejoinder to a high official in the service of the federal government of the United States of America, who had questioned Him as to the best manner in which he could promote the interests of his government and people, if you strive, in your capacity as a citizen of the world, to assist in the eventual application of the principle of federalism underlying the government of your own country to the relationships now existing between the peoples and nations of the world. (Peace, page 21)

That materialistic ideals have, in the light of experience, failed to satisfy the needs of mankind calls for an honest acknowledgement that a fresh effort must now be made to find the solutions to the

agonizing problems of the planet. The intolerable conditions pervading society bespeak a common failure of all, a circumstance which tends to incite rather than relieve the entrenchment on every side. Clearly, a common remedial effort is urgently required. It is primarily a matter of attitude. Will humanity continue in its waywardness, holding to outworn concepts and unworkable assumptions? Or will its leaders, regardless of ideology, step forth and, with a resolute will, consult together in a united search for appropriate solutions? (Promise of World Peace, page 6)

4. On the other hand, the safety of its leaders is the key of labor's position. To surrender that is to surrender everything. Even if the leader in question had not been as regularly at work as other men, even if he had to take days now and then to attend to official duties for his brethren, the superior of that man should have dealt very leniently with him. The men cannot know whether their leader is stricken down for proper cause or not; but, at the same time, they cannot help suspecting. And here I call the attention of impartial minds to the elements of manhood and the high sense of honor and loyalty displayed upon the part of working-men who sacrifice so much and throw themselves in the front of the conflict to secure the safety of their standard-bearers. Everything reasonable can be done with men of this spirit. The loyalty which they show to their leaders can be transferred to their employers by treating

courtesy - Say: Let truthfulness and courtesy be your adorning. Suffer not yourselves to be deprived of the robe of forbearance and justice, that the sweet savors of holiness may be wafted from your hearts upon all created things. Say: Beware, O people of Baha, lest ye walk in the ways of them whose words differ from their deeds. Strive that ye may be enabled to manifest to the peoples of the earth the signs of God, and to mirror forth His commandments. Let your acts be a guide unto all mankind, for the professions of most men, be they high or low, differ from their conduct. It is through your deeds that ye can distinguish yourselves from others. Through them the brightness of your light can be shed upon the whole earth. Happy is the man that heedeth My counsel, and keepeth the precepts prescribed by Him Who is the All-Knowing, the All-Wise. (Bahá'u'lláh, Gleanings, page 305)

dignity - All men have been created to carry forward an ever-advancing civilization. The Almighty beareth Me witness: To act like the beasts of the field is unworthy of man. Those virtues that befit his dignity are forbearance, mercy, compassion and loving-kindness towards all the peoples and kindreds of the earth. Say: O friends! Drink your fill from this crystal stream that floweth through the heavenly grace of Him Who is the Lord of Names. Let others partake of its waters in My name, that the leaders of men in every land may fully recognize the purpose for which the Eternal Truth hath been revealed, and the reason for which they themselves have been created. (Bahá'u'lláh, Gleanings, page 215)

them as such men deserve. Society has nothing to fear from men so staunch and loyal to one another. Nor is the loyalty shown in this instance exceptional; it distinguishes working-men as a class. Mr. Irons has said that "one hour's gentlemanly courtesy on the part of the manager would have averted all the disaster." Whether this be true or not, the statement should not be overlooked, for it is true that one hour of courtesy on the part of employers would prevent many strikes. Whether the men ask in proper manner for interviews, or observe all the rules of etiquette, is immaterial. We expect from the presumably better-informed party representing capital much more in this respect than from labor; and it is not asking too much of men intrusted with the management of great properties that they should devote some part of their attention to searching out the

--- Page 111. The Gospel of Wealth - VI Results of the Labor Struggle

causes of disaffection among their employees, and, where any exist, that they should meet the men more than half-way in the endeavor to allay them. There is nothing but

good for both parties to be derived from labor teaching the representative of capital the dignity of man, as man. The workingman, becoming more and more intelligent, will hereafter demand the treatment due to an equal.

5. The strikers at first were excusable, even if mistaken, in imagining that their leader had been stricken down; but, under the excitement of conflict, violence was resorted to; and further, an attempt was made to drag into the quarrel railway lines that had nothing to do with it. The men took up these wrong positions and were deservedly driven from them. And labor here received a salutary lesson--namely, that nothing is to be gained by violence and lawlessness, nor by endeavoring to unjustly punish the innocent for the sins of the guilty. Public sentiment, always disposed to side with labor, was with the men at first, but soon finding itself unable to sanction their doings, it veered to the other side. When the strikers lost that indispensable ally they lost all.

STRIKES - You have questioned me about strikes. This question is and will be for a long time the subject of great difficulties. Strikes are due to two causes. One is the extreme greed and rapacity of the manufacturers and industrialists; the other, the excesses, the avidity and intransigence of the workmen and artisans. It is, therefore, necessary to remedy these two causes.

But the principal cause of these difficulties lies in the laws of the present civilization; for they lead to a small number of individuals accumulating incomparable fortunes, beyond their needs, while the greater number remain destitute, stripped and in the greatest misery. This is contrary to justice, to humanity, to equity; it is the height of iniquity, the opposite to what causes divine satisfaction.

This contrast is peculiar to the world of man: with other creatures--that is to say, with nearly all animals--there is a kind of justice and equality. Thus equality exists in a shepherd's flock and in a herd of deer in the country. Likewise, among the birds of the prairie, of the plain, of the hills or of the orchard, and among every kind of animal some kind of equality prevails. With them such a difference in the means of existence is not to be found; so they live in the most complete peace and joy.

It is quite otherwise with the human species, which persists in the greatest error, and in absolute iniquity. Consider an individual who has amassed treasures by colonizing a country for his profit: he has obtained an incomparable fortune and has secured profits and incomes which flow like a river, while a hundred thousand unfortunate people, weak and powerless, are in need of a mouthful of bread. There is neither equality nor benevolence. So you see that general peace and joy are destroyed, and the welfare of humanity is negated to such an extent as to make fruitless the lives of many. For fortune, honors, commerce, industry are in the hands of some industrialists, while other people are submitted to quite a series of difficulties and to limitless troubles: they have neither advantages, nor profits, nor comforts, nor peace.

Then rules and laws should be established to regulate the excessive fortunes of certain private individuals and meet the needs of millions of the poor masses; thus a certain moderation would be obtained. However, absolute equality is just as impossible, for absolute equality in fortunes, honors, commerce, agriculture, industry would end in disorderliness, in chaos, in disorganization of the means of existence, and in universal disappointment: the order of the community would be quite destroyed. Thus difficulties will also arise when unjustified equality is imposed. It is, therefore, preferable for moderation to be established by means of laws and regulations to hinder the constitution of the excessive fortunes of certain individuals, and to protect the essential needs of the masses. For instance, the manufacturers and the industrialists heap up a treasure each day, and the poor artisans do not gain their daily sustenance: that is the height of iniquity, and no just man can accept it. Therefore, laws and regulations should be established which would permit the workmen to receive from the factory owner their wages and a share in the fourth or the fifth part of the profits, according to the capacity of the factory; or in some other way the body of workmen and the manufacturers should share equitably the profits and advantages. Indeed, the capital and management come from the owner of the factory, and the work and labor, from the body of the workmen.

Either the workmen should receive wages which assure them an adequate support and, when they cease work, becoming feeble or helpless, they should have sufficient benefits from the income of the industry; or the wages should be high enough to satisfy the workmen with the amount they receive so that they may themselves be able to put a little aside for days of want and helplessness. (`Abdu'l-Bahá, SAQ, Pages 274-275)

6. The other branch of the revolt of labor occurred in New York city, where the employees of the Third Avenue Railway struck for fewer hours and better pay. If ever a strike was justifiable this one was. It is simply disgraceful for a corporation to compel its men to work fifteen or sixteen hours a day. Such was the verdict of the public, and the men won a deserved victory. Here again,

Trade Unions and Strikes - Guidelines in Respect to Membership in Trade Unions and Participation in Strikes

"On the question of trade unions the Guardian's secretary made the following comment on his behalf in a letter dated 2 February 1951. 'Regarding your question about trade unions: The Guardian considers that this is a matter for each National Spiritual Assembly to advise the believers on. As long as the trade unions are not members of any particular political party, there does not seem to be any objection to the Baha'is belonging to them.'

"...the British National Spiritual Assembly wrote to the Guardian as follows: 'In this country the law recognises strikes as legal when called by properly constituted authorities such as a Trade Union, and our own understanding is that in such circumstances the Baha'i teaching, in spite of Abdu'l-Baha's express disapproval of strikes,

as at St. Louis, for lack of proper leadership, they went too far; and in their demand for the employment of certain men and the dismissal of others they lost their only sure support - public sentiment. This was compelled to decide against their final demands, and consequently they failed, and deservedly failed. How completely public sentiment, when aroused, compels obedience, as we have seen it did both at St. Louis and in New York city, is further shown by the result of the order, issued June 6, requiring the men of all the city railroads in Brooklyn

--- Page 112. The Gospel of Wealth - VI Results of the Labor Struggle

and New York to stop work until the striking employees of the Third Avenue line were reinstated. The edict was disregarded by the men themselves, who found that compliance would not be approved by the community, and that, therefore, the attempt would fail. It was an attempt that the worst foe of labor might have instigated.

neither requires nor forbids an individual to strike but leaves him free to decide for himself in the particular circumstances of his case what is the proper course of action.'

"The Guardian's secretary replied on his behalf in a letter dated July 11, 1956: 'As regard strikes, the Guardian feels that your own understanding of the matter as expressed in your letter is quite correct, and he does not see the necessity of adding anything to it. We should avoid becoming rigid and laying down any more rules and regulations of conduct.'

"Based on the above guidelines, we are to emphasize the following points. 1. A Baha'i can become a member of a trade union as long as he is not required to also join a political party. 2. Abdu'l-Baha in general disapproved of strikes. The Baha'i attitude is that when the law recognizes strikes as legal, as when called by a properly constituted authority such as a trade union, the Baha'i teaching neither requires nor forbids an individual to participate in the strike but leaves him free to decide for himself what is the proper course of action in the particular circumstances."

7. These were the two chief strikes from which came the epidemic of demands and strikes throughout the country. None of these ebullitions proved of much moment. A rash had broken out upon the body politic, but it was only skin-deep, and disappeared as rapidly as it had come. At a somewhat later date the disturbance took a different form. A demand was made that the hours of labor should be reduced from ten to eight hours a day. To state this demand is to pronounce its fate. Existing conditions are not changed by twenty-per cent leaps and bounds, and especially in times like these, when business is not even moderately profitable. Such a request simply meant that many employers of labor would not be able to keep their men at work at all. History proves, nevertheless, that the hours of labor are being gradually reduced. The percentage of men working from ten to eleven hours in this country in 1830 was 29.7. These ten-hour workers increased in 1880 to 59.6 per cent of the whole; while the classes who in 1830 worked excessive hours - from twelve to thirteen - constituted 32.5 per cent. In 1880 they were only 14.6 per cent; while the number of men compelled to

counsel - The Master advises the members to "take counsel together in such wise that no occasion for ill-feeling or discord may arise". He affirms that: This can be attained when every member expresseth with absolute freedom his own opinion and setteth forth his argument. Should any one oppose, he must on no account feel hurt for not until matters are fully discussed can the right way be revealed. The shining spark of truth cometh forth only after the clash of differing opinions.... (p. 21)

It is important to note that truth emerges after the "clash" of carefully articulated views (which may well be expressed with enthusiasm and vigour), not from the clash of feelings. A clash of feelings is likely to obscure the truth, while a difference of opinion facilitates the discovery of truth.

'Abdu'l-Baha provides the following advice concerning the manner in which views should be expressed in the course of consultation. It is suggested that this guidance could also pertain to the expression of feelings:

They must then proceed with the utmost devotion, courtesy, dignity, care and moderation to express their views. They must in every matter search out the truth and not insist upon their own opinion, for stubbornness and persistence in one's views will lead ultimately to discord and wrangling and the truth will remain hidden... (Community Functioning, page 6)

work between thirteen and fourteen hours, which was in 1830 13.5 per cent, had fallen in 1880 to 2.3 per cent. Those working twelve hours are generally employed in double shifts, night and day. I do not believe that we have reached the limit of this reduction, but I do believe that any permanent reduction will be secured only by the half-hour at a time. If labor be guided by wise counsel, it will ask for reductions of half-hours, and then wait until a reduction to this extent is firmly established, and surrounding circumstances have adjusted themselves to that.

--- Page 113. The Gospel of Wealth - VI Results of the Labor Struggle

8. In considering the reasonableness of the demand for fewer hours of labor, we must not lose sight of the fact that the American works more hours, on an average, than his fellow in Great Britain. Twenty-three trades in Massachusetts are reported as working sixty hours and seventeen minutes a week, on the average, while the same crafts in Great Britain work only fifty-three hours and fifty minutes, showing that the American works an hour a day longer than his English brother. In

Management - Then rules and laws should be established to regulate the excessive fortunes of certain private individuals and meet the needs of millions of the poor masses; thus a certain moderation would be obtained. However, absolute equality is just as impossible, for absolute equality in fortunes, honors, commerce, agriculture, industry would end in disorderliness, in chaos, in disorganization of the means of existence, and in universal disappointment: the order of the community would be quite destroyed. Thus difficulties will also arise when unjustified equality is imposed. It is, therefore, preferable for moderation to be established by means of laws and regulations to hinder the constitution of the excessive fortunes of certain individuals, and to protect the essential needs of the masses. For instance, the manufacturers and the industrialists heap up a treasure each day, and the poor artisans do not gain their daily sustenance: that is the height of iniquity, and no just man can accept it. Therefore, laws and regulations should be established which would permit the workmen to receive from the factory owner their wages and a share in the fourth or the fifth part of the profits, according to the capacity of the factory; or in some other way the body of workmen and the manufacturers should share equitably the profits

British textile factories, the number of working hours in a week ranges from fifty-four to fifty-six. In mines, foundries, and machine-shops, fifty-four hours make a week's work, which is equivalent to nine hours a day, six days a week; but the men, in all cases, work enough overtime each day to insure them a half-holiday on Saturday. In some districts, notably in Glasgow, the men prefer to work two weeks, and make every other Saturday a whole holiday. This gives them an opportunity to leave on early morning trains, on excursions, and to spend Saturday and Sunday with friends. The Allegheny Valley Railroad Company, under the management of my friend Mr. McCargo, introduced the half-Saturday holiday in the shops some time ago, with the happiest results. Mr. McCargo found, by years of experience, that working-men lose about half a day a week. Since the half-holiday was established no more time has been lost than before. The men work five and one half days a week regularly. While they are not paid, of course, for the half-holiday, they could not be induced to give it up. This example should be followed, not only by all the railroads of the country, but by every employer of labor, and should be supported by every man

and advantages. Indeed, the capital and management come from the owner of the factory, and the work and labor, from the body of the workmen. Either the workmen should receive wages which assure them an adequate support and, when they cease work, becoming feeble or helpless, they should have sufficient benefits from the income of the industry; or the wages should be high enough to satisfy the workmen with the amount they receive so that they may themselves be able to put a little aside for days of want and helplessness. (Abdu'l-Bahá, SAQ, Page 274-275)

who seeks to improve the condition of the wage-receiving classes.

9. I venture to suggest to the representatives of labor, however, that before they demand any reduction upon ten hours per day, they should concentrate their efforts upon making ten hours the universal practice, and secure this. At present, every ton of pig-iron made in the world, except at two estab-

--- Page 114. The Gospel of Wealth - VI Results of the Labor Struggle

lishments, is made by men working in double shifts of twelve hours each, having neither Sunday nor holiday the year round. Every two weeks the day men change to the night shift by working twenty-four hours consecutively. Gas-works, paper-mills, flour-mills, and many other industries, are run by twelve-hour shifts, and breweries exact fifteen hours a day, on an average, from their men. I hold that it is not possible for men working ten hours a day to enlist public sentiment on their side in a demand for the shortening of their task, as long as many of their fellows are compelled to work twelve or more hours a

Labor - One of Baha'u'llah's teachings is the adjustment of means of livelihood in human society. Under this adjustment there can be no extremes in human conditions as regards wealth and sustenance. For the community needs financier, farmer, merchant and laborer just as an army must be composed of commander, officers and privates. All cannot be commanders; all cannot be officers or privates. Each in his station in the social fabric must be competent--each in his function according to ability but with justness of opportunity for all. (Abdu'l-Bahá, Promulgation of Universal Peace, page 216)

day.

10. The eight-hour movement is not, however, without substantial foundation. Works that run day and night should be operated with three sets of men, each working eight hours. The steel-rail mills in this country are generally so run. The additional cost of the three sets of men has been divided between the workmen and the employers, the latter apparently having to meet an advance of wages to the extent of 16-2/3 per cent, but against this is to be placed the increased product which can be obtained. This is not inconsiderable, especially during the hot months, for it has been found that men working twelve hours a day continuously cannot produce as much per hour as men working eight hours a day; so that, if there be any profit at all in the business, the employer derives some advantage from the greater productive capacity of his works and capital, while the general expenses of the establishment remain practically as they were before. Since electric lighting has been perfected, many establishments which previously could not be run at night can be run with success. I therefore look for a large

productive - Not surprisingly, therefore, there is increasing recognition that the world is in urgent need of a new "work ethic". Here again, nothing less than insights generated by the creative interaction of the scientific and religious systems of knowledge can produce so fundamental a reorientation of habits and attitudes. Unlike animals, which depend for their sustenance on whatever the environment readily affords, human beings are impelled to express the immense capacities latent within them through productive work designed to meet their own needs and those of others. In acting thus they become participants, at however modest a level, in the processes of the advancement of civilization. They fulfill purposes that unite them with others. To the extent that work is consciously undertaken in a spirit of service to humanity, Baha'u'llah says, it is a form of prayer, a means of worshiping God. Every individual has the capacity to see himself or herself in this light, and it is to this inalienable capacity of the self that development strategy must appeal, whatever the nature of the plans being pursued, whatever the rewards they promise. No narrower a perspective will ever call up from the people of the world the magnitude of effort and commitment that the economic tasks ahead will require.

A challenge of similar nature faces economic thinking as a result of the environmental crisis. The fallacies in theories based on the belief that there is no limit to nature's capacity to fulfill any demand made on it by human beings have now been coldly exposed. A culture which attaches absolute value to expansion, to acquisition, and to the satisfaction of people's wants is being compelled to recognize that such goals are not, by themselves, realistic guides to policy. Inadequate, too, are approaches to economic issues whose decision-making tools cannot deal with the fact that most of the major challenges are global rather than particular in scope. (Prosperity of Humankind, page 12)

increase in the number of establishments working men only eight hours, but employing the machinery that now runs only ten hours the entire twenty-four. Each shift, of course, takes turn of each of the three parts into which the twenty-four hours are divided, and thus the lives of the men are rendered

--- Page 115. The Gospel of Wealth - VI Results of the Labor Struggle

less monotonous and many hours for recreation and self-improvement are obtained.

11. The literature called forth by the recent excitement is preponderatingly favorable to cooperation, or profit-sharing, as the only true remedy for all disputes between labor and capital. My April article has been criticized because it relegated that to the future. But the advocates of this plan should weigh well the fact that the majority of enterprises are not profitable; that most men who embark in business fail--indeed, it is stated that only five in every hundred succeed, and that, with the exception of a few wealthy and partially retired manufacturers, and a very few wealthy corporations, men engaged in business affairs are in the midst of an

profit-sharing - It is by friendly consultation and cooperation, by just copartnership and profit-sharing, that the interests of both capital and labor will be best served. The harsh weapons of the strike and lockout are injurious, not only to the trades immediately affected, but to the community as a whole. It is, therefore, the business of the governments to devise means for preventing recourse to such barbarous methods of settling disputes. 'Abdu'l-Baha said at Dublin, New Hampshire, in 1912:-- Now I want to tell you about the law of God. According to the divine law, employees should not be paid merely by wages. Nay, rather they should be partners in every work. The question of socialization is very difficult. It will not be solved by strikes for wages. All the governments of the world must be united, and organize an assembly, the members of which shall be elected from the parliaments and the noble ones of the nations. These must plan with wisdom and power, so that neither the capitalists suffer enormous losses, nor the laborers become needy. In the utmost moderation they should make the law, then announce to the public that the rights of the working people are to be effectively preserved; also the rights of the capitalists are to be protected. When such a general law is adopted, by the will of both sides, should a strike occur, all the governments of the world should collectively resist it. Otherwise the work will lead to much destruction, especially in Europe. Terrible things will take place. (Bahá'u'lláh & New Era, page 145)

anxious and increasing struggle to keep their heads above water. How to pay maturing obligations, how to obtain cash for the payment of their men, how to procure orders or how to sell product, and, in not a few instances, how to induce their creditors to be forbearing, are the problems which tax the minds of business men during the dark hours of night, when their employees are asleep. I attach less and less value to the teaching of those doctrinaires who sit in their cozy studies and spin theories concerning the relations between capital and labor, and set before us divers high ideals. The banquet to which they invite the working-man when they propose industrial cooperation is not yet quite prepared, and would prove to most of those who accepted the invitation a Barmecide feast. Taken as a whole, the condition of labor to-day would not be benefited, but positively injured, by cooperation.

12. Let me point out, however, to the advocates of profit-sharing that ample opportunity already exists for workingmen to become part-owners in almost any department of industrialism, without changing present relations. The great railway corporations, in all cases, as well as the great manufacturing companies generally, are stock concerns, with

--- Page 116. The Gospel of Wealth - VI Results of the Labor Struggle

shares of fifty or a hundred dollars each, which are bought and sold daily in the market. Not an employee of any of these but can buy any number of shares, and thus participate in the dividends and in the management. That capital is a unit is a popular error. On the contrary, it is made up of hundreds and thousands of small component parts, owned, for the most part, by people of limited means. The Pennsylvania Railway proper, for instance, which embraces only the 350 miles of line between Pittsburg and Philadelphia, is today owned by 19,340 shareholders, in lots of from one fifty-dollar share upward. The New York Central Railway, of 450 miles,

industrialism - The greatest bestowal of God to man is the capacity to attain human virtues. Therefore, the teachings of religion must be reformed and renewed because past teachings are not suitable for the present time. For example, the sciences of bygone centuries are not adequate for the present because sciences have undergone reform. The industrialism of the past will not ensure present efficiency because industrialism has advanced. The laws of the past are being superseded because they are not applicable to this time. All material conditions pertaining to the world of humanity have undergone reform, have achieved development, and the institutes of the past are not to be compared with those of this age. ('Abdu'l-Baha: Promulgation of Universal Peace, page 378)

between New York and Buffalo, belongs not to one, or two, or several capitalists, but to 10,418 shareholders, of whom about one third are women and executors of estates. The entire railway system of America will show a similar wide distribution of ownership among the People. There are but three railway corporations in which the great capitalists hold a considerable interest; and the interest in two of these is held by various members of a family, and in no case does it amount to the control of the whole. In one of these very cases, the New York Central, as we have seen, there are more than ten thousand owners.

13. Steel-rail mills, with only one exception, show a like state of affairs. One of them belongs to 215 shareholders; of whom 7 are employees, 32 are estates, and 57 are women. Another of these concerns is owned by 302 stockholders; of whom 101 are women, 29 are estates, representing an unknown number of individuals, and 20 are employees of the company. A large proportion of the remaining owners are small holders of comparatively limited means, who have, from time to time, invested

trustees - Since the body of humankind is one and indivisible, each member of the race is born into the world as a trust of the whole. This trusteeship constitutes the moral foundation of most of the other rights -- principally economic and social -- which the instruments of the United Nations are attempting similarly to define. The security of the family and the home, the ownership of property, and the right to privacy are all implied in such a trusteeship. The obligations on the part of the community extend to the provision of employment, mental and physical health care, social security, fair wages, rest and recreation, and a host of other reasonable expectations on the part of the individual members of society.

The principle of collective trusteeship creates also the right of every person to expect that those cultural conditions essential to his or her identity enjoy the protection of national and international law. Much like the role played by the gene pool in the biological life of humankind and its environment, the immense wealth of cultural diversity achieved over thousands of years is vital to the social and economic development of a human race experiencing its collective coming-of-age. It represents a heritage that must be permitted to bear its fruit in a global civilization. On the one hand, cultural expressions

their savings where they had confidence both as to certainty of income and safety of principal. The Merrimac Manufacturing Company (cotton), of Lowell, is owned by 2500 shareholders, of whom forty-two per cent are holders of one share, twenty-one per cent of two, and ten per cent of three shares. Twenty-seven per cent are holders

--- Page 117. The Gospel of Wealth - VI Results of the Labor Struggle

of over three shares; and not less than thirty-eight per cent. of the whole stock is held by trustees, guardians, and executors of charitable, religious, educational, and financial institutions.

14. I have obtained from other concerns similar statements, which need not be published. They prove without exception that from one fourth to one third of the number of shareholders in corporations are women and executors of estates. The number of shareholders I have given are those of record, each holding a separate certificate. But it is obvious, in the case of executors, that this one certificate may represent a

need to be protected from suffocation by the materialistic influences currently holding sway. On the other, cultures must be enabled to interact with one another in ever-changing patterns of civilization, free of manipulation for partisan political ends.

"The light of men", Baha'u'llah says, "is Justice. Quench it not with the contrary winds of oppression and tyranny. The purpose of justice is the appearance of unity among men. The ocean of divine wisdom surgeth within this exalted word, while the books of the world cannot contain its inner significance." (Prosperity of Mankind, Page 6&7)

capitalist - The question of socialization is very important. It will not be solved by strikes for wages. All the governments of the world must be united and organize an assembly the members of which should be elected from the parliaments and the nobles of the nations. These must plan with utmost wisdom and power so that neither the capitalist suffer from enormous losses nor the laborers become needy. In the utmost moderation they should make the law; then announce to the public that the rights of the working people are to be strongly preserved. Also the rights of the capitalists are to be protected. When such a general plan is adopted by the will of both sides, should a strike occur, all the governments of the world collectively should resist it. Otherwise, the labor problem will lead to much destruction, especially in Europe. Terrible things will take place.

For instance, the owners of properties, mines and factories should share their incomes with their employees and give a fairly certain percentage of their products to their workingmen in order that the

dozen owners. Many certificates issued in the name of a firm represent several persons, while shares held by a corporation may represent hundreds; but if we assume that every certificate of stock issued by the Pennsylvania Railroad Company represents only two owners, which is absurdly under the truth, it follows that, should every employee of that great company quarrel with it, the contest would be not against a few, but against a much larger body than they themselves constitute. It is within the mark to say that every striking employee would oppose his personal interest against that of three or four other members of the community. The total number of men employed by the Pennsylvania Railroad Company is 18,911 -- not as many as there are shareholders of record. and what is true of the Pennsylvania Railway Company is true of the railway system as a whole, and, in a greater or less degree, of mining and manufacturing corporations generally. When one, therefore, denounces great corporations for unfair treatment of their men, he is not denouncing the act of some monster capitalist, but that of hundreds and thousands of small holders,

employees may receive, beside their wages, some of the general income of the factory so that the employee may strive with his soul in the work. (Foundations of World Unity, Page 43)

It is, then, clear and evident that the repartition of excessive fortunes among a small number of individuals, while the masses are in need, is an iniquity and an injustice. In the same way, absolute equality would be an obstacle to life, to welfare, to order and to the peace of humanity. In such a question moderation is preferable. It lies in the capitalists' being moderate in the acquisition of their profits, and in their having a consideration for the welfare of the poor and needy-- that is to say, that the workmen and artisans receive a fixed and established daily wage-- and have a share in the general profits of the factory. (Abdu'l-Bahá, Some Answered Questions, page 275)

scarcely one of whom would be a party to unfair or illiberal treatment of the working-man; the majority of them, indeed, would be found on his side; and, as we have seen, many of the owners themselves would be working-men. Labor has only to bring its just grievances to the attention of owners to secure fair and liberal treatment.

--- Page 118. The Gospel of Wealth - VI Results of the Labor Struggle

The "great capitalist" is almost a myth, and exists, in any considerable number or degree, only in the heated imagination of the uninformed. Aggregate capital in railway corporations consists of many more individuals than it employs.

15. Following the labor disturbances, there came the mad work of a handful of foreign anarchists in Chicago and Milwaukee,

(4) Though Carnegie may have been unruffled, he was not necessarily able to make fine distinctions. The eight-hour movement of May, 1886, aroused labor enthusiasm in Chicago and Milwaukee and became entangled with an existing labor dispute. In Milwaukee Paul Grottkau, who had once been in Chicago and associated with some of its apostles of violence, edited the

anarchists - Extreme pacifists are thus very close to the anarchists, in the sense that both of these groups lay an undue emphasis on the rights and merits of the individual. The Baha'i conception of social life is essentially based on the subordination of the individual will to that of society. It neither suppresses the individual nor does it exalt him to the point of making him an anti-social creature, a menace to society. As in everything, it follows the "golden mean." The only way that society can function is for the minority to follow the will of the majority. (Unfolding Destiny, Page 435-436)

Arbeiter Zeitung, played a role in the Central Labor Union, and had great influence with foreign-born workers, for he had once been expelled from Germany under its anti-socialist laws. But Grottkau now advocated conventional labor union tactics; he was more socialist than anarchist. The eight-hour drive in Milwaukee, involving "some lawlessness and riotous proceedings" and considerable excitement, had led to brushes with police and the militia. The latter on May 5th, breaking up an attack on the North Chicago Rolling Mills, fired on the crowd. Subsequently, Grottkau and thirty-six others were arrested. Many were convicted and punished with fines or short jail terms. Grottkau went free on a technicality.

who thought they saw in the excitement a fitting opportunity to execute their revolutionary plans. Although labor is not justly chargeable with their doings, nevertheless the cause of labor was temporarily discredited in public opinion by these outbreaks. The promptitude with which one labor organization after another not only disclaimed all sympathy with riot and disorder, but volunteered to enroll itself into armed force for the maintenance of order, should not be overlooked by the student of labor problems desirous of looking justly at the question from the laborer's point of view. It is another convincing proof, if further proof were necessary, that whenever the peace of this country is seriously

threatened, the masses of men, not only in the professions and in the educated classes, but down to and through the very lowest ranks of industrious workers, are determined to maintain it. A survey of the field, now that peace is restored, gives the results as follows:

16. *First.* The "dead line" has been definitely fixed between

--- Page 119. The Gospel of Wealth - VI Results of the Labor Struggle

the forces of disorder and anarchy and those of order. Bomb-throwing means swift death to the thrower. Rioters assembling in numbers and marching to pillage will be remorselessly shot down; not by the order of a government above the people, not by overwhelming standing armies, not by troops brought from a distance, but by the masses of peaceable and orderly citizens of all classes in their own community, from the capitalist down to and including the steady workingman, whose combined influence constitutes that irresistible force, under democratic institutions, known as public sentiment. That sentiment has not only supported the officials who

anarchy - There can be no doubt that the decline of religion as a social force, of which the deterioration of religious institutions is but an external phenomenon, is chiefly responsible for so grave, so conspicuous an evil. "Religion," writes Baha'u'llah, "is the greatest of all means for the establishment of order in the world and for the peaceful contentment of all that dwell therein. The weakening of the pillars of religion hath strengthened the hands of the ignorant and made them bold and arrogant.

Verily I say, whatsoever hath lowered the lofty station of religion hath increased the waywardness of the wicked, and the result cannot be but anarchy." "Religion," He, in another Tablet, has stated, "is a radiant light and an impregnable stronghold for the protection and welfare of the peoples of the world, for the fear of God impelleth man to hold fast to that which is good, and shun all evil. Should the lamp of religion be obscured, chaos and confusion will ensue, and the lights of fairness, of justice, of tranquillity and peace cease to shine." "Know thou," He, in yet another connection, has written, "that they who are truly wise have likened the world unto the human temple. As the body of man needeth a garment to clothe it, so the body of mankind must needs be adorned with the mantle of justice and wisdom. Its robe is the Revelation vouchsafed unto it by God." (World Order of Bahá'u'lláh, pages 186-187)

shot down disturbers of the peace, but has extolled them in proportion to the promptitude of their action.

17. *Second.* Another proof of the indestructibility of human society, and of its determination and power to protect itself from every danger as it arises and to keep marching forward to higher states of development, has been given in Judge Mallory's words: "Every person who counsels, hires, procures, or incites others to the commission of any unlawful or criminal act, is equally guilty with those who actually perpetrate the act, though such person may not have been present at the time of the commission of the offense.

(5) Judge James A. Mallory of Milwaukee had been prominent during the eighties in a fusion movement or Citizens' ticket to unite Democrats and Republicans against a labor party, the program of which advocated enlarged municipal services. In 1888 fusion defeated the labor effort by a narrow majority. Mallory also presided over the grand jury hearing that handed up indictments for "inciting to riot" in the Milwaukee eight-hour day excitement. Carnegie quotes from his charge to the jury. Mallory did not preside over the trials because "affidavits of prejudice" were filed against him.

The difference between liberty

liberty - It is this distinguishing impulse of human consciousness that provides the moral imperative for the enunciation of many of the rights enshrined in the Universal Declaration and the related Covenants. Universal education, freedom of movement, access to information, and the opportunity to participate in political life are all aspects of its operation that require explicit guarantee by the international community. The same is true of freedom of thought and belief, including religious liberty, along with the right to hold opinions and express these opinions appropriately. Since the body of humankind is one and indivisible, each member of the race is born into the world as a trust of the whole. This trusteeship constitutes the moral foundation of most of the other rights -- principally economic and social -- which the instruments of the United Nations are attempting similarly to define. The security of the family and the home, the ownership of property, and the right to privacy are all implied in such a trusteeship. The obligations on the part of the community extend to the provision of employment, mental and physical health care, social security, fair wages, rest and recreation, and a host of other reasonable expectations on the part of the individual members of society. (Prosperity of Humankind, page 6)

and license of speech is now clearly defined - a great gain.

18. *Third.* It has likewise been clearly shown that public sentiment sympathizes with the efforts of labor to obtain from capital a fuller recognition of its position and claims than has hitherto been accorded. And in this expression, "a fuller recognition," I include not only pecuniary compensation, but what I conceive to be even more important to-day - a greater

--- Page 120. The Gospel of Wealth - VI Results of the Labor Struggle

consideration of the working-man as a man and a brother. I trust the time has gone by when corporations can hope to work men fifteen or sixteen hours a day. and the time approaches, I hope, when it will be impossible, in this country, to work men twelve hours a day continuously.

sentiment - High aims and pure motives, however laudable in themselves, will surely not suffice if unsupported by measures that are practicable and methods that are sound. Wealth of sentiment, abundance of good-will and effort, will prove of little avail if we should fail to exercise discrimination and restraint and neglect to direct their flow along the most profitable channels. The unfettered freedom of the individual should be tempered with mutual consultation and sacrifice, and the spirit of initiative and enterprise should be reinforced by a deeper realization of the supreme necessity for concerted action and a fuller devotion to the common weal. (Bahá'i Administration, page 12)

19. *Fourth.* While public sentiment has rightly and unmistakably condemned violence, even in the form for which there is the most excuse, I would have the public give due consideration to the terrible temptation to which the working-man on a strike is sometimes subjected. To expect that one dependent upon his daily wage for the necessities of life will stand by peaceably and see a new man employed in his stead, is to expect much. This poor man may have a wife and children dependent upon his labor. Whether medicine for a sick child, or even nourishing food for a delicate wife, is procurable, depends upon his steady employment. In all but a very few departments of labor it is unnecessary, and, I think, improper, to subject men to such an ordeal. In the case of railways and a few other employments it is, of course, essential for the public wants that no interruption occur, and in such case substitutes must be employed; but the employer of labor will find it much more to his interest, wherever possible, to allow his works to remain idle and await the result of a dispute, than to employ the class of men that can be inclined to take the place of other men who have stopped work. Neither the

workmen - The court of justice and the government have, therefore, the right of interference. When a difficulty occurs between two individuals with reference to private rights, it is necessary for a third to settle the question. This is the part of the government. Then the problem of strikes-- which cause troubles in the country and are often connected with the excessive vexations of the workmen, as well as with the rapacity of manufacturers--how could it remain neglected? Good God! Is it possible that, seeing one of his fellow-creatures starving, destitute of everything, a man can rest and live comfortably in his luxurious mansion? He who meets another in the greatest misery, can he enjoy his fortune? That is why, in the Religion of God, it is prescribed and established that wealthy men each year give over a certain part of their fortune for the maintenance of the poor and unfortunate. That is the foundation of the Religion of God and is binding upon all.

And as man in this way is not forced nor obliged by the government, but is by the natural tendency of his good heart voluntarily and radiantly showing benevolence toward the poor, such a deed is much praised, approved and pleasing.

Such is the meaning of the good works in the Divine Books and Tablets. (‘Abdu'l-Bahá, Some Answered Questions, pages 276-277)

best men as men, nor the best men as workers, are thus to be obtained. There is an unwritten law among the best workmen: "Thou shalt not take thy neighbor's job." No wise employer will lightly lose his old employees. Length of service counts for much in many ways. Calling upon strange men should be the last resort.

20. *Fifth.* The results of the recent disturbances have given indubitable proof that trades-unions must, in their very nature, become more conservative than the mass of the men they represent. If they fail to be conservative, they go to pieces through their own extravagance. I know of three

--- Page 121. The Gospel of Wealth - VI Results of the Labor Struggle

instances in which threatened strikes were recently averted by the decision of the Master Workman of the Knights of Labor, supported by the best workmen, against the wishes of the less intelligent members of that organization. Representative institutions eventually bring to the front the ablest and most prudent men, and will be found as beneficial in the industrial as

industrial - The oneness of mankind... implies an organic change in the structure of present-day society, a change such as the world has not yet experienced.... It calls for no less than the reconstruction and the demilitarization of the whole civilized world--a world organically unified in all the essential aspects of its life, its political machinery, its spiritual aspiration, its trade and finance, its script and language, and yet infinite in the diversity of the national characteristics of its federated units.

It represents the consummation of human evolution... and... carries with it no more and no less than a solemn assertion that attainment to this final stage in this stupendous evolution is not only necessary but inevitable, that its realization is fast approaching, and that nothing short of a power that is born of God can succeed in establishing it.

Baha'i Scriptures maintain that adherence to the principle of the oneness of humanity will have a direct and enduring impact on man's spiritual, social and physical environments. Universal acceptance of this principle will entail a major restructuring of the world's educational, social, agricultural, industrial, economic, legal and political systems. This restructuring will facilitate the emergence of a sustainable, just and prosperous world civilization. Ultimately only a spiritually based civilization--in which science and religion work in harmony--will be able to preserve the ecological balance of the earth, foster stability in human population, and advance both the material and the spiritual well-being of all peoples and nations. (Shoghi Effendi, World Order of Bahá'u'lláh, pages 42-43)

they have proved themselves to be in the political world. Leaders of the stamp of Mr. Powderly, Mr. Arthur, of the Brotherhood of Locomotive Engineers, and Messrs. Wihle and Martin, of the Amalgamated Iron and Steel Association, will gain and retain power; while such as the radical and impulsive Mr. Irons,

(6) Powderly became Grand Master Workman of the Knights of Labor in 1879 and served until 1893. Under his leadership the Knights grew to be the country's largest labor organization in 1886 and then declined into a local, agrarian organization. Powderly induced the Knights to discard their religious and secret features. Like most Knights, he was the foe of strikes. P. M. Arthur (1831-1903), originally an immigrant from Scotland and after 1874 Grand Chief of the Brotherhood of Locomotive Engineers, incurred a discharge of epithets and abuse from organized labor's opponents for his part in the railroad strikes of 1877; later employers and capitalists came to regard both the union and its leader as "conservative," an opinion concurred in by radicals in the labor movement. William Martin, during the eighties Secretary of the Amalgamated Association of Iron and Steel Workers, had been born in Scotland. For Wihle (really Weihe) see Essay V, note 5; on Irons, note 3 above.

if at first clothed with power, will soon lose it.

21. Thus, as the result of the recent revolt, we see advantages gained by both capital and labor. Capital is more secure because of what has been demonstrated, and labor will hereafter be more respectfully treated and its claims more carefully considered, in deference to an awakened public opinion in favor of the laborer. Labor won while it was reasonable in its demands and kept the peace; it lost when it asked what public sentiment pronounced unreasonable, and especially when it broke the peace.

Public opinion must be directed toward whatever is worthy of this day, and this is impossible except through the use of adequate arguments and the adducing of clear, comprehensive and conclusive proofs. For the helpless masses know nothing of the world, and while there is no doubt that they seek and long for their own happiness, yet ignorance like a heavy veil shuts them away from it. (Secret of Divine Civilization, page110)

22. The disturbance is over and peace again reigns; but let no one be unduly alarmed at frequent disputes between capital and labor. Kept within legal limits, they are encouraging symptoms, for they betoken the desire of the working-man

--- Page 122. The Gospel of Wealth - VI Results of the Labor Struggle

to better his condition; and upon this desire hang all hopes of advancement of the masses. It is the stagnant pool of Contentment, not the running stream of Ambition, that breeds disease in the

Sustainable Development - No Industrial Slavery

In the Book of Aqdas Baha'u'llah forbids slavery, and 'Abdu'l-Baha has explained that not only chattel slavery, but also industrial slavery, is contrary to the law of God. When in the United States in 1912, He said to the American people:-- Between 1860 and 1865 you did a wonderful thing; you abolished chattel slavery; but today you must do a much more wonderful thing: you must abolish industrial slavery....

The solution of economic questions will not be brought about by array of capital against labor, and labor against capital, in strife and conflict, but by the voluntary attitude of goodwill on both sides. Then a real and lasting justness of conditions will be secured....

Among the Baha'is there are no extortionate, mercenary and unjust practices, no rebellious demands, no revolutionary uprisings against existing governments....

It will not be possible in the future for men to amass great fortunes by the labors of others. The rich will willingly divide. They will come to this gradually, naturally, by their own volition. It will never be accomplished by war and bloodshed.

body social and political. The workingmen of this country can no more be induced to sanction riot and disorder than can any other class of the community. Isolated cases of violence under strong provocation may break out upon the surface, but the body underneath is sound to the core, and resolute for the maintenance of order.

It is by friendly consultation and cooperation, by just copartnership and profit-sharing, that the interests of both capital and labor will be best served. The harsh weapons of the strike and lockout are injurious, not only to the trades immediately affected, but to the community as a whole. It is, therefore, the business of the governments to devise means for preventing recourse to such barbarous methods of settling disputes. 'Abdu'l-Baha said at Dublin, New Hampshire, in 1912:-- (Bahá'u'lláh and the New Era, pages 144-145)

23. For the first time within my knowledge, the leading organs of public opinion in England have shown a more correct appreciation of the forces at work in the Republic than some of our own despondent writers. The London "Daily News" said truly that "the territorial democracy of America can be trusted to deal with such outbreaks"; and the "Daily Telegraph" spoke as follows:

There is no need for any fear to be entertained lest the lawbreakers of Chicago should get the better of the police, and, if it be necessary to invoke their aid, of the citizens of that astonishing young city. Frankly speaking, such rioters would have a better chance of intimidating Birmingham than of overawing

Universal Peace - Today there is no greater glory for man than that of service in the cause of the "Most Great Peace". Peace is light whereas war is darkness. Peace is life; war is death. Peace is guidance; war is error. Peace is the foundation of God; war is satanic institution. Peace is the illumination of the world of humanity; war is the destroyer of human foundations. When we consider outcomes in the world of existence we find that peace and fellowship are factors of upbuilding and betterment whereas war and strife are the causes of destruction and disintegration. All created things are expressions of the affinity and cohesion of elementary substances, and non-existence is the absence of their attraction and agreement. Various elements unite harmoniously in composition but when these elements become discordant, repelling each other, decomposition and non-existence result. Everything partakes of this nature and is subject to this principle, for the creative foundation in all its degrees and kingdoms is an expression or outcome of love. Consider the restlessness and agitation of the human world today because of war. Peace is health and construction; war is disease and dissolution. When the banner of truth is raised, peace becomes the cause of the welfare and advancement of the human world. In all cycles and ages war has been a factor of derangement and discomfort whereas peace and brother-hood have brought security and consideration of human interests. This distinction is especially pronounced in the present world conditions, for warfare in former centuries had not attained the degree of savagery and destructiveness which now characterizes it. If two nations were at war in olden times, ten or twenty thousand would be sacrificed but in this century the destruction of one hundred thousand lives in a day is quite possible. So perfected has the science of killing become and so efficient the means and instruments of its accomplishment that a whole nation can be obliterated in a short time. Therefore comparison with the methods and results of ancient warfare is out of the question. (Abdu'l-Bahá, Foundations of World Unity, Page 20)

Chicago, St. Louis, or New York. In dealing with the insurgents of this class the record of the great Republic is singularly clear.

Not only the democracy, but the industrious working-men of which the democracy is so largely composed, have amply fulfilled the flattering predictions of our English friends, and may safely be trusted in the future to stand firmly for the maintenance of peace.

VII

Distant Possessions: The Parting of the Ways

(1) From the North American Review, CLXVII (August 1898), 239-248.

1. TWICE only have the American people been called upon to decide a question of such vital import as that now before them.

[Baha'i Comment](#)

2. Is the Republic, the apostle of Triumphant Democracy, of the rule of the people, to abandon her political creed and endeavor to establish in other lands the rule of the foreigner over the people, Triumphant Despotism?

3. Is the Republic to remain one homogeneous whole, one united people, or to become a scattered and disjointed aggregate of widely separated and alien races?

[Baha'i Comment](#)

4. Is she to continue the task of developing her vast continent until it holds a population as great as that of Europe, all Americans, or to abandon that destiny to annex, and to attempt to govern, other far distant parts of the world as outlying possessions, which can never be integral parts of the Republic?

[Baha'i Comment](#)

5. Is she to exchange internal growth and advancement for the development of external possessions which can never be really hers in any fuller sense than India is British or Cochin China French? Such is the portentous question of the day. TWO equally important questions the American people have decided wisely, and their flag now waves over the greater portion of the English-speaking race; their country is the richest of all countries, first in manufactures, in mining, and in commerce (home and foreign), first this year also in ex-

[Baha'i Comment](#)

Wealth - VII Distant Possessions: The Parting of the Ways

ports. But, better than this, the average condition of its people in education and in living is the best. The luxuries of the masses in other lands are the necessities of life in ours. The school-house and the church are nowhere so widely distributed. Progress in the arts and sciences is surprising. In international affairs her influence grows so fast, and foreshadows so much, that one of the foremost statesmen has recently warned Europe that it must combine against her if it is to hold its own in the industrial world. The Republic remains one solid whole, its estate inclosed in a ring fence, united, impregnable, triumphant, clearly destined to become the foremost power of the world, if she continue to follow the true path. Such are the fruits of wise judgment in deciding the two great issues of the past, Independence and Union.

6. In considering the issue now before us, the agitator, the demagogue, has no part. Not feeling, not passion, but deliberate judgment alone, should have place. The question should be calmly weighed; it is not a matter of party, nor of class; for the fundamental interest of every citizen is a common interest, that which is best for the poorest being best for the richest. Let us, therefore, reason together, and be well assured, before we change our position, that we are making no plunge into an abyss. Happily, we have the experience of others to guide us, the most instructive being that of our own race in Great Britain.

[Baha'i Comment](#)

7. There are two kinds of national possessions, one colonies, the other dependencies. In the former we establish and reproduce our own race. Thus Britain has peopled Canada and Australia with English-speaking people, who have naturally adopted our ideas of self-government. That the world has benefited thereby goes without saying; that Britain has done a great work as the mother of nations is becoming more and more appreciated the more the student learns of world-wide affairs. No nation that ever

[Baha'i Comment](#)

existed has done so much for the progress of the world as the little islands in the North Sea known as Britain.

--- Page 125. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

8. With dependencies it is otherwise. The most grievous burden which Britain has upon her shoulders is that of India, for there it is impossible for our race to grow. The child of English-speaking parents must be removed and reared in Britain. The British Indian official must have long respites in his native land. India means death to our race. The characteristic feature of a dependency is that the acquiring power cannot reproduce its own race there.

10. There was something to be said for colonies from the point of view of pecuniary gain in the olden days, when they were treated as the legitimate spoil of the conquerer. It is Spain's fatal mistake that she has never realized that it is impossible to follow this policy in our day. Britain is the only country which has realized this truth. British colonies have complete self-

[Baha'i Comment](#)

[Baha'i Comment](#)

government; they even tax the products of their own motherland. That Britain possesses her colonies is a mere figure of speech; that her colonies possess her is nearer the truth. "Our Colonial Empire" seems a big phrase, but, as far as material benefits are concerned, the balance is the other way. Thus, even loyal Canada trades more with us than with Britain. She buys her Union Jacks in New York. Trade does not follow the flag in our day; it scents the lowest price current. There is no patriotism in exchanges.

11. Some of the organs of manufacturing interests, we observe, favor foreign possessions as necessary or helpful markets for our products. But the exports of the United States this Year are greater than those of any other nation in the world.

--- Page 126. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

Even Britain's exports are less, yet Britain possesses, it is said, a hundred colonies and dependencies scattered all over the world. The fact that the United States has none does not prevent her products and manufactures

[Baha'i Comment](#)

from invading Japan, China, Australia, New Zealand, Canada, and all parts of the world in competition with those of Britain. Possession of colonies or dependencies is not necessary for trade reasons. What her colonies are valued for, and justly so, by Britain, is the happiness and pride which the mother feels in her children. The instinct of motherhood is gratified, and no one living places a higher estimate upon the sentiment than I do. Britain is the kindest of mothers, and well deserves the devotion of her children.

12. If we could establish colonies of Americans, and grow Americans in any part of the world now unpopulated and unclaimed by any of the great powers, and thus follow the example of Britain, heart and mind might tell us that we should have to think twice, yea, thrice, before deciding adversely. Even then our decision should be adverse; but there is at present no such question before us. What we have to face is the question whether we should embark upon the difficult and dangerous policy of undertaking the government of alien races in lands where it is impossible for our own race to be produced.

[Baha'i Comment](#)

13. As long as we remain free from distant possessions we are impregnable against serious attack; yet, it is true, we have to consider what obligations may fall upon us of an international character requiring us to send our forces to points beyond our own territory. Up to this time we have disclaimed all intention to interfere with affairs beyond our own continent, and only claimed the right to watch over American interests according to the Monroe Doctrine, which is now firmly established. This carries with it serious responsibilities, no doubt, which we cannot escape. European nations must consult us upon territorial questions pertaining to our continent, but this makes no tremendous demand upon our

--- Page 127. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

military or naval forces. We are at home, as it were, near our base, and sure of the support of the power in whose behalf and on whose request we may act. If it be found essential to possess a coaling-station at Porto Rico for future possible, though not probable,

[Baha'i Comment](#)

contingencies, there is no insuperable objection. Neither would the control of the West Indies be alarming if pressed upon us by Britain, since the islands are small and the populations must remain insignificant and without national aspirations. Besides, they are upon our own shores, American in every sense. Their defense by us would be easy. No protest need be entered against such legitimate and peaceful expansion in our own hemisphere, should events work in that direction. I am no "Little" American, afraid of growth, either in population or territory, provided always that the new territory be American, and that it will produce Americans, and not foreign races bound in time to be false to the Republic in order to be true to themselves.

14. As I write, the cable announces the annexation of Hawaii,

(2) Hawaii was officially annexed by the United States by Joint Resolution of Congress in 1898 and was administered as a Territory until it achieved statehood.

which is more serious; but the argument for this has been the necessity for holding the only coaling-station in the Pacific so situated as to be

[Baha'i Comment](#)

essential to any power desirous of successfully attacking our Pacific coast. Until the Nicaragua Canal

(3) Prior to the building of the Panama Canal a passage at Nicaragua was projected (as early as 1850), and various concessions were granted, but the United States preferred the present site.

is made, it is impossible to deny the cogency of this contention. We need not consider it a measure of offense or aggression, but as strictly defensive. The population of the islands is so small that national aspirations are not to be encountered, which is a great matter. Nor is it obtained by conquest. It is ours by a vote of its people, which robs its acquisition of many dangers. Let us hope that our far-outlying possessions may end with Hawaii.

15. To reduce it to the concrete, the question is: Shall we

--- Page 128. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

attempt to establish ourselves as a power in the far East and possess the Philippines for glory? The glory we already

[Baha'i Comment](#)

have, in Dewey's victory overcoming the power of Spain in a manner which adds one more to the many laurels of the American navy, which, from its infancy till now, has divided the laurels with Britain upon the sea. The Philippines have about seven and a half millions of people, composed of races bitterly hostile to one another, alien races, ignorant of our language and institutions. Americans cannot be grown there. The islands have been exploited for the benefit of Spain, against whom they have twice rebelled, like the Cubans. But even Spain has received little pecuniary benefit from them. The estimated revenue of the Philippines in 1894-95 was £2,715,980, the expenditure being £2,656,026, leaving a net result of about \$300,000. The United States could obtain even this trifling sum from the inhabitants only by oppressing them as Spain has done. But, if we take the Philippines, we shall be forced to govern them as generously as Britain governs her dependencies, which means that they will yield us nothing, and probably be a source of annual expense. Certainly they will be a grievous drain upon revenue if we consider the enormous army and navy which we shall be forced to maintain upon their account.

16. There are many objections to our undertaking the government of dependencies; one I venture to submit as being peculiar to ourselves. We should be placed in a wrong position. Consider Great Britain in India to-day. She has established schools and taught the people our language. In the Philippines, we may assume that we should do the same, and with similar results. To travel through India as an American is a point of great advantage if one wishes to know the people of India and their aspirations. They unfold to Americans their inmost thoughts, which they very naturally withhold from their masters, the British. When in India, I talked with many who had received an English education in the British schools, and found that they had read and

--- Page 129. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

pondered most upon Cromwell and Hampden, Wallace and Bruce and Tell, upon Washington and Franklin. The Briton is sowing the seed of rebellion with one hand in his schools, - for education makes

[Baha'i Comment](#)

rebels, - while with the other he is oppressing patriots who desire the independence of their country. The national patriotism upon which a Briton plumes himself he must repress in India. It is only a matter of time when India, the so-called gem of the British crown, is to glitter red again. British control of India is rendered possible to-day only by the division of races, or rather of religions, there. The Hindus and Mohammedans still mistrust each other more than they do the British, but caste is rapidly passing away, and religious prejudices are softening. Whenever this distrust disappears, Britain is liable to be expelled, at a loss of life and treasure which cannot be computed. The aspirations of a people for independent existence are seldom repressed, nor, according to American ideas hitherto, should they be. If it be a noble aspiration for the Indian or the Cuban, as it was for the citizen of the United States himself, and for the various South American republics once under Spain, to have a country to live and, if necessary, to die for, why is not the revolt noble which the man of the Philippines has been making against Spain? Is it possible that the Republic is to be placed in the position of

the suppressor of the Philippine struggle for independence? Surely, that is impossible. With what face shall we hang in the school-houses of the Philippines our own Declaration of Independence, and yet deny independence to them? What response will the heart of the Philippine Islander make as he reads of Lincoln's Emancipation Proclamation? Are we to practise independence and preach subordination, to teach rebellion in our books, yet to stamp it out with our swords, to sow the seed of revolt and expect the harvest of loyalty? President McKinley's call for volunteers to fight for Cuban independence against the cruel dominion of Spain meets with prompt response, but who would answer the call of

--- Page 130. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

the President of an "imperial" republic for free citizens to fight the Washington

(4) Anti-imperialists were fond of comparing Aguinaldo, the Philippine rebel, with George Washington.

and slaughter the patriots of some distant dependency which struggles for

independence?

17. It has hitherto been the glorious mission of the Republic to establish upon secure foundations Triumphant Democracy, and the world now understands government of the people, for the people, and by the people. Tires the Republic so soon of its mission, that it must, perforce, discard it to undertake the impossible task of establishing Triumphant Despotism, the rule of the foreigner over the people? and must the millions of the Philippines who have been asserting their God-given right to govern themselves be the first victims of Americans, whose proudest boast is that they conquered independence for themselves?

[Baha'i Comment](#)

18. Let another phase of the question be carefully weighed. Europe is to-day an armed camp, not chiefly because the home territories of its various nations are threatened, but because of fear of aggressive action upon the part of other nations touching outlying "possessions." France resents British control of Egypt, and is fearful of its West African possessions; Russia seeks Chinese territory, with a view to expansion to the Pacific;

[Baha'i Comment](#)

Germany also seeks distant possessions; Britain, who has acquired so many dependencies, is so fearful of an attack upon them that this year she is spending nearly eighty millions of dollars upon additional warships, and Russia, Germany, and France follow suit. Japan is a new element of anxiety; and by the end of the year it is computed she will have sixty-seven formidable ships of war. The naval powers of Europe, and Japan also, are apparently determined to be prepared for a terrific struggle for possessions in the far East, close to the Philippines and why not for these islands themselves? Into this vortex the Republic is cordially invited to enter by those powers who expect her policy to be of benefit to them, but her action

--- Page 131. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

is jealously watched by those who fear that her power might be used against them.

19. It has never been considered the part of wisdom to thrust one's hand into the hornet's nest, and it does seem as if the United States must lose all claim to ordinary prudence and good sense if she enter this arena and become involved in the intrigues and threats of war which make Europe an armed camp.

[Baha'i Comment](#)

20. It is the parting of the ways. We have a continent to populate and develop; there are only twenty-three persons to the square mile in the United States. England has three hundred and seventy, Belgium five hundred and seventy-one, Germany two hundred and fifty. A tithe of the cost of maintaining our sway over the Philippines would improve our internal waterways; build the Nicaragua Canal; construct a waterway to the ocean from the Great Lakes, an inland canal along the Atlantic seaboard, and a canal across Florida, saving eight hundred miles' distance between New York and New Orleans; connect Lake Michigan with the Mississippi; deepen all the harbors upon the lakes; build a canal from Lake Erie to the Allegheny River; slack-water through movable dams the entire length of the Ohio River

[Baha'i Comment](#)

to Cairo; thoroughly improve the Lower and Upper Mississippi, and all our seaboard harbors. All these enterprises would be as nothing in cost in comparison with the sums required for the experiment of possessing the Philippine Islands, seven thousand miles from our shores. If the object be to render our Republic powerful among nations, can there be any doubt as to which policy is the better? To be more powerful at home is the surest way to be more powerful abroad. To-day the Republic stands the friend of all nations, the ally of none; she has no ambitious designs upon the territory of any power upon another continent; she crosses none of their ambitious designs, evokes no jealousy of the bitter sort, inspires no fears; she is not one of them, scrambling for possessions; she stands apart, pursuing her own

--- Page 132. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

great mission, and teaching all nations by example. Let her become a power annexing foreign territory, and all is changed in a moment.

21. If we are able to compete with other nations for foreign possessions, we must have a navy like theirs. It should be superior to any other navy, or we play a second part. It is not enough to have a navy equal to that of Russia or of France, for Russia and France may combine against us just as they may against Britain. We at once enter the field as a rival of Britain, the chief possessor of foreign possessions, and who can guarantee that we shall not even have to measure our power against her?

[Baha'i Comment](#)

22. What it means to enter the list of military and naval powers having foreign possessions may be gathered from the following considerations. First, look at our future navy. If it is only to equal that of France it means fifty-one battleships; if of Russia, forty battle-ships. If we cannot play the game without being at least the equal of any of our rivals, then eighty battle-ships is the number Britain possesses. We now have only four, with five building. Cruisers, armed and unarmed, swell the number threefold, Britain having two hundred and seventy-three ships of the line built or ordered, with three hundred,

[Baha'i Comment](#)

and eight torpedo-boats in addition; France having one hundred and thirty-four ships of the line and two hundred and sixty-nine torpedo-boats. All these nations are adding ships rapidly. Every armor- and gun-making plant in the world is busy night and day. Ships are indispensable, but recent experience shows that soldiers are equally so. While the immense armies of Europe need not be duplicated, yet we shall certainly be too weak unless our army is at least twenty times what it has been - say five hundred thousand men. Even then we shall be powerless as against any one of three of our rivals - Germany, France, and Russia.

23. This drain upon the resources of these countries has become a necessity from their respective positions, largely as graspers for foreign possessions. The United States to-day,

--- Page 133. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

happily, has no such necessity, her neighbors being powerless against her, since her possessions are concentrated and her power is one solid mass.

[Baha'i Comment](#)

24. To-day two great powers in the world are compact, developing: themselves in peace throughout vast conterminous territories. When war threatens they have no outlying possessions which call never be really "possessed," but which they are called upon to defend. They fight upon the exposed edge only of their own soil in case of attack, and are not only invulnerable, but they could not be more than inconvenienced by the world in arms against them. These powers are Russia and the United States. The attempt of Britain to check Russia, if the wild counsels of Mr. Chamberlain

(5) Joseph Chamberlain (1836-1914), the British statesman who, at first a Liberal, became a Conservative in 1895 and a spokesman for "the new imperialism" in Lord Salisbury's government.

were followed, could end in nothing but failure. With the irresistible force of the glacier, Russia moves upon the plains below. Well for Russia, and well for the world, is her advance over pagan China, better even for Britain from the standpoint of business, for every Russian to-day trades as much with Britain as do nine Chinamen. Britain,

[Baha'i Comment](#)

France, Germany, Belgium, Spain, are all vulnerable, having departed from the sagacious policy of keeping possessions and power concentrated. Should the United States depart from this policy, she also must be so weakened in consequence as never to be able to play the commanding part in the world, disjointed, that she can play whenever she desires if she remain compact.

25. Whether the United States maintain its present unique position of safety, or forfeit it through acquiring foreign possessions, is to be decided by its action in regard to the Philippines; for, fortunately, the independence of Cuba is assured; for this the Republic has proclaimed to the world that she has drawn the sword.

(6) The Teller Resolution before the outbreak of the Spanish-American War disclaimed for the United States any intention "to exercise sovereignty, jurisdiction, or control" over Cuba.

But why should the less

--- Page 134. The Gospel of Wealth - VII Distant Possessions: The Parting of the Ways

than two millions of Cuba receive national existence and

[Baha'i Comment](#)

the seven and a half millions of the Philippines be denied it? The United States, thus far in their history, have no page reciting self-sacrifice made for others; all their gains have been for themselves. This void is now to be grandly filled. The page which recites the resolve of the Republic to rid her neighbor, Cuba, from the foreign possessor will grow brighter with the passing centuries, which may dim many pages now deemed illustrious. Should the coming American be able to point to Cuba and the Philippines rescued from foreign domination and enjoying independence won for them by this country and given to them without money and without price, he will find no citizen of any other land able to claim for his country services so disinterested and so noble.

26. We repeat, there is no power in the world that could do more than inconvenience the United States by attacking its fringe, which is all that the world combined could do, so long as our country is not compelled to send its forces beyond its own compact shores to defend worthless possessions. If our country were blockaded by the united powers of the world for years,

[Baha'i Comment](#)

she would emerge from the embargo richer and stronger, and with her own resources more completely developed. We have little to fear from external attack. No thorough blockade of our enormous seaboard is possible; but even if it were, the few indispensable articles not produced by ourselves (if there were any such) would reach us by way of Mexico or Canada at slightly increased cost.

27. From every point of view we are forced to the conclusion that the past policy of the Republic is her true policy for the future; for safety, for peace, for happiness, for progress, for wealth, for power - for all that makes a nation blessed.

VIII

Americanism Versus Imperialism

Part I

(1) From the North American Review, CLXVIII (January and March, 1899), 1-13; 362-372. The Spanish-American War broke out in April 1898 largely because American public opinion had become so excited as to demand Spain grant Cuba independence. A small group of Americans, including Theodore Roosevelt, Henry Cabot Lodge (1850-1924), and A. T. Mahan, also hoped to utilize the conflict to acquire for the United States other Spanish territories, notably the Philippine Islands. Other "Great Powers," for example Germany, Japan and Great Britain, were naturally divided in their sympathies. The first two, while recognizing they could, not turn back the fait accompli of American conquest -- if such occurred -- were themselves expansionist minded; Great Britain regarded American expansion more benignly. After the United States won a military decision, American Commissioners were dispatched to Paris to negotiate a peace with Spain without any definite instructions on Pacific acquisitions from President McKinley or W.R. Day (1849-1923), Secretary of State. The Commissioners debated among themselves what to do. So did the nation's press, politicians and other leaders of opinion. In October 1898 the President decided the United States must take the whole Philippine archipelago. The Senate ratified a treaty to that effect by a narrow two-thirds vote in February 1899. The Filipinos, whose opinion was not solicited, mounted an insurrection against their new masters. Throughout these events Great Britain's foreign policy saw in the United States a counterweight to her own rivals in the imperialist scramble in the Far East. Though English statesmen uttered avuncular approval for American expansion, no concrete understandings or engagements between representatives of the two nations resulted. Of course one of the most effective ways to smear an American policy politically was to arraign it as pro-British.

These events were the background of Carnegie's timely essay. His ideas had some support in the Cabinet, and one member tried to get him to change McKinley's annexationist course, but in an interview Carnegie found the President "obdurate."

1. For several grave reasons I regard possessions in the far East as fraught with nothing but disaster to the Republic. Only one of these, however, can now be considered - the dangers of war and of the almost constant rumors and

--- Page 136. The Gospel of Wealth - VIII Americanism versus Imperialism

threats of war to which all nations interested in the far East are subject. There is seldom a week which does not bring alarming reports of threatened hostilities, or of new alliances, or of changes of alliances, between the powers arming for the coming struggle. It is chiefly this far Eastern question which keeps every ship-yard, gun-yard, and armor-yard in the world busy night and day, Sunday and Saturday, forging engines of destruction. It is in that region the thunderbolt is expected; it is there the storm is to burst.

To introduce this essay by Carnegie, the compiler feels it's important to get a current perspective of that time from the "*Century of Light*." A book written in 2001 under the supervision of the Universal House of Justice.

"From the point of view of wealth and influence, "the world" of 1900 was Europe and, by grudging concession, the United States. Throughout the planet, Western imperialism was pursuing among the populations of other lands what it regarded as its "civilizing mission". In the words of one historian, the century's opening decade appeared to be essentially a continuation of the "long nineteenth century",³ an era whose boundless self-satisfaction was perhaps best epitomized by the celebration in 1897 of Queen Victoria's diamond jubilee, a parade that rolled for hours through the streets of London, with an imperial panoply and display of military power far surpassing anything attempted in past civilizations. As the century began, there were few, whatever their degree of social or moral sensitivity, who perceived the catastrophes lying ahead, and few, if any, who could have conceived their magnitude. The military leadership of most European nations assumed that war of some kind would break out, but viewed the prospect with equanimity because of the twin fixed convictions that it would be short and would be won by their side. To an extent that seemed little short of miraculous, the international peace movement was enlisting the support of statesmen, industrialists, scholars, the media, and influential personalities as unlikely as the tsar of Russia. If the inordinate increase in armaments seemed ominous, the network of painstakingly crafted and often overlapping alliances seemed to give assurance that a general conflagration would be avoided and regional disputes settled, as they had been through most of the previous century. This illusion was reinforced by the fact that Europe's crowned heads - most of them members of one extended family, and many of them exercising seemingly decisive political power - addressed one another familiarly by nicknames, carried on an intimate correspondence, married one another's sisters and daughters, and vacationed together throughout long stretches of each year at one another's castles, regattas and shooting lodges. Even the painful disparities in the distribution of wealth were being energetically - if not very systematically - addressed in Western societies through legislation designed to restrain the worst of the corporate freebooting of preceding decades and to meet the most urgent demands of growing urban populations.

The vast majority of the human family, living in lands outside the Western world, shared in few of the blessings and little of the optimism of their European and American brethren. China, despite its ancient civilization and its sense of itself as the "Middle Kingdom", had become the hapless victim of plundering by Western

nations and by its modernizing neighbour Japan. The multitudes in India - whose economy and political life had fallen so totally under the domination of a single imperial power as to exclude the usual jockeying for advantage - escaped some of the worst of the abuses afflicting other lands, but watched impotently as their desperately needed resources were drained away. The coming agony of Latin America was all too clearly prefigured in the suffering of Mexico, large sections of which had been annexed by its great northern neighbour, and whose natural resources were already attracting the attention of avaricious foreign corporations. Particularly embarrassing from a Western point of view - because of its proximity to such brilliant European capitals as Berlin and Vienna - was the medieval oppression in which the hundred million nominally liberated serfs in Russia led lives of sullen, hopeless misery. Most tragic of all was the plight of the inhabitants of the African continent, divided against one another by artificial boundaries created through cynical bargains among European powers. It has been estimated that during the first decade of the twentieth century over a million people in the Congo perished - starved, beaten, worked literally to death for the profit of their distant masters, a preview of the fate that was to engulf well over one hundred million of their fellow human beings across Europe and Asia before the century reached its end.

These masses of humankind, despoiled and scorned - but representing most of the earth's inhabitants - were seen not as protagonists but essentially as objects of the new century's much vaunted civilizing process. Despite benefits conferred on a minority among them, the colonial peoples existed chiefly to be acted upon - to be used, trained, exploited, Christianized, civilized, mobilized - as the shifting agendas of Western powers dictated. These agendas may have been harsh or mild in execution, enlightened or selfish, evangelical or exploitative, but were shaped by materialistic forces that determined both their means and most of their ends. To a large extent, religious and political pieties of various kinds masked both ends and means from the publics in Western lands, who were thus able to derive moral satisfaction from the blessings their nations were assumed to be conferring on less worthy peoples, while themselves enjoying the material fruits of this benevolence.

To point out the failings of a great civilization is not to deny its accomplishments. As the twentieth century opened, the peoples of the West could take justifiable pride in the technological, scientific and philosophical developments for which their societies had been responsible. Decades of experimentation had placed in their hands material means that were still beyond the appreciation of the rest of humanity. Throughout both Europe and America vast industries had risen, dedicated to metallurgy, to the manufacturing of chemical products of every kind, to textiles, to construction and to the production of instruments that enhanced every aspect of life. A

continuous process of discovery, design and improvement was making accessible power of unimaginable magnitude - with, alas, ecological consequences equally unimagined at the time - especially through the use of cheap fuel and electricity. The “era of the railroad” was far advanced and steamships coursed the sea-ways of the world. With the proliferation of telegraph and telephone communication, Western society anticipated the moment when it would be freed of the limiting effects that geographical distances had imposed on humankind since the dawn of history.”

(Prepared under the supervision of the Universal House of Justice [2001], Century of Light; pp.2-5)

possessions

“By God! In earthly riches fear is hidden and peril is concealed. Consider ye and call to mind that which the All-Merciful hath revealed in the Qur'an: `Woe betide every slanderer and defamer, him that layeth up riches and counteth them.'+F1 Fleeting are the riches of the world; all that perisheth and changeth is not, and hath never been, worthy of attention, except to a recognized measure.” (Bahá'u'lláh [1863-1892], Tablets of Baha'u'llah; Page 219)

constant rumors and threats of war

“Christ said: "Think not that I am come to send peace on earth: I came not to send peace, but a sword" (Matt. x, 34), and He predicted a period of wars and rumors of wars, of tribulations and afflictions that would continue till the coming of the Son of Man "in the glory of the Father."” (J.E. Esslemont [1937]: Baha'u'llah and the New Era, p.46)

2. It is only four years since Japan defeated China and had ceded to it a portion of Chinese territory, the fruits of victory. Then appeared upon the scene a combination of France, Russia, and Germany, which drove Japan out of China. Russia took part of the spoils for herself, and Germany later took territory near by. Japan got nothing. Britain, the most powerful of

Colonization

Although the Universal House of Justice is speaking here of world conditions immediately after world war one, the theme of their exposition relates directly to the overall condition of the world due to colonization.

“Since the driving force of colonialism itself was economic exploitation, it was perhaps inevitable that most movements of liberation assumed a broadly socialistic ideological cast. Within only a few short years, these circumstances had created a fertile ground for exploitation by the world’s superpowers. For the Soviet Union, the situation seemed to offer an opportunity to induce a shift in the existing alignment of nations by gaining a preponderating influence in what was by now beginning to be called the “Third World”. The

all, stood by neutral. Had she decided to defend Japan, the greatest war ever known would have been the probable result; the thunderbolt would have fallen. Were the question to be decided to-day, it is now considered probable that Britain would support Japan.

response of the West - wherever development aid failed to retain the loyalties of recipient populations - was to resort to the encouragement and arming of a wide variety of authoritarian regimes.

As outside forces manipulated new governments, attention was increasingly diverted from an objective consideration of developmental needs to ideological and political struggles that bore little or no relation to social or economic reality. The results were uniformly devastating. Economic bankruptcy, gross violations of human rights, the breakdown of civil administration and the rise of opportunistic elites who saw in the suffering of their countries only openings for self-enrichment - such was the heartbreaking fate that engulfed one after another of the new nations who, only short years before, had begun life with such great promise.”

(Prepared under the supervision of the Universal House of Justice [2001], Century of Light; pp.88-89)

neutral

“Hitherto the usual practice of mankind has been that if one nation attacked another, the rest of the nations of the world remained neutral, and accepted no responsibility in the matter unless their own interests were directly affected or threatened. The whole burden of defense was left to the nation attacked, however weak and helpless it might be. The teaching of Baha'u'llah reverses this position and throws the responsibility of defense not specially on the nation attacked, but on all the others, individually and collectively. As the whole of mankind is one community, an attack on any one nation is an attack on the community, and ought to be dealt with by the community. Were this doctrine generally recognized and acted on, any nation contemplating an aggression on another would know in advance that it would have to reckon with the opposition not of that other nation only, but of the whole of the rest of the world. This knowledge alone would be sufficient to deter even the boldest and most bellicose of nations. When a sufficiently strong league of peace-loving nations is established war will, therefore, become a thing of the past. During the period of transition from the old state of international anarchy to the new state of international solidarity aggressive wars will still be possible, and in these circumstances, military or other coercive action in the cause of international justice, unity and peace may be a positive duty. 'Abdu'l-Baha writes that in such case:--

A conquest can be a praiseworthy thing, and there are times when war becomes the powerful basis of peace, and ruin the very means of reconstruction. If, for example, a high-minded sovereign marshals his troops to block the onset of the insurgent and the aggressor, or

again, if he takes the field and distinguishes himself in a struggle to unify a divided state and people, if, in brief, he is waging war for a righteous purpose, then this seeming wrath is mercy itself, and this apparent tyranny the very substance of justice and this warfare the cornerstone of peace. Today, the task befitting great rulers is to establish universal peace, for in this lies the freedom of all peoples.-- The Secret of Divine Civilization, pp. 70-71.”

(J.E. Esslemont [1937]: Baha’u’llah and the New Era, pp.171-172)

It is interesting that Carnegie mentions that Britain was neutral in the conflict between China and Japan, and that France, Germany and Russia all got involved and distributed the spoils of war amongst them. Queen Elizabeth of Britain was one of the few world leaders directly addressed by Bahá’u’lláh that replied in a dignified manner to his summons. Bahá’u’lláh addressing Queen Victoria somewhere between 1868-1877 says;

"O Queen in London! Incline thine ear unto the voice of thy Lord, the Lord of all mankind, calling from the Divine Lote-Tree: Verily, no God is there but Me, the Almighty, the All-Wise! ... We have been informed that thou hast forbidden the trading in slaves, both men and women. This, verily, is what God hath enjoined in this wondrous Revelation. God hath, truly, destined a reward for thee, because of this. He, verily, will pay the doer of good, whether man or woman, his due recompense... We have also heard that thou hast entrusted the reins of counsel into the hands of the representatives of the people. Thou, indeed, hast done well, for thereby the foundations of the edifice of thine affairs will be strengthened, and the hearts of all that are beneath thy shadow, whether high or low, will be tranquillized.” (Bahá’u’lláh [1868-1977], Proclamation of Baha’u’llah; p.33)

Abdu’l-Baha says the following about Queen Victoria;

“Victoria, Queen of England, was really superior to all the kings of Europe in ability, justness and equitable administration. During her long and brilliant reign the British Empire was immensely extended and enriched, due to her political sagacity, skill and foresight.” (Abdu’l-Bahá [1912], Promulgation Universal Peace; p.282)

The following excerpt from the book entitled “Baha’u’llah” prepared under the supervision of the Universal House of Justice, points out the distinct difference in language in which Baha’u’llah addressed the rulers of America and Great Britain, then to those rulers in mainland Europe and Asia:

“In Akka, Baha'u'llah continued the dictation of a series of letters to

individual rulers, which He had begun in Adrianople. Several contained warnings of the judgment of God on their negligence and misrule, warnings whose dramatic fulfillment aroused intense public discussion throughout the Near East. Less than two months after the exiles arrived in the prison-city, for example, Fu'ad Pasha, the Ottoman foreign minister, whose misrepresentations had helped precipitate the banishment, was abruptly dismissed from his post and died in France of a heart attack. The event was marked by a statement which predicted the early dismissal of his colleague, Prime Minister Ali Pasha, the overthrow and death of the Sultan, and the loss of Turkish territories in Europe, a series of disasters which followed on the heels of one another.

A letter to Emperor Napoleon III warned that, because of his insincerity and the misuse of his power: "...thy kingdom shall be thrown into confusion, and thine empire shall pass from thine hands, as a punishment for that which thou hast wrought.... Hath thy pomp made thee proud? By My life! It shall not endure..."[79] Of the disastrous Franco-Prussian War and the resulting overthrow of Napoleon III, which occurred less than a year after this statement, Alistair Horne, a modern scholar of nineteenth century French political history has written:

History knows of perhaps no more startling instance of what the Greeks called peripateia, the terrible fall from prideful heights. Certainly no nation in modern times, so replete with apparent grandeur and opulent in material achievement, has ever been subjected to a worse humiliation in so short a time.

Only a few months before the unexpected series of events in Europe that led to the invasion of the Papal States and the annexation of Rome by the forces of the new Kingdom of Italy, a statement addressing Pope Pius IX had urged the Pontiff "Abandon thy kingdom unto the kings, and emerge from thy habitation, with thy face set towards the Kingdom... Be as thy Lord hath been.... Verily, the day of ingathering is come, and all things have been separated from each other. He hath stored away that which He chose in the vessels of justice, and cast into the fire that which befitteth it...."

Wilhelm I, King of Prussia, whose armies had won such a sweeping victory in the Franco-Prussian War, had been warned by Baha'u'llah in the Kitab-i-Aqdas to heed the example of the fall of Napoleon III and of other rulers who had been victorious in war, and not to allow pride to keep him back from recognizing this Revelation. That Baha'u'llah foresaw the failure of the German Emperor to respond to this warning is shown by the ominous passage which appears later in that same Book:

O banks of the Rhine! We have seen you covered with gore,

inasmuch as the swords of retribution were drawn against you; and you shall have another turn. And We hear the lamentations of Berlin, though she be today in conspicuous glory.

A strikingly different note characterizes two of the major pronouncements, that addressed to Queen Victoria[83] and another to the "Rulers of America and the Presidents of the Republics therein." The former praises the pioneering achievement represented by the abolition of slavery throughout the British Empire, and commends the principle of representative government. The latter, which opens with the announcement of the Day of God, concludes with a summons, a virtual mandate, that has no parallel in any of the other messages: "Bind ye the broken with the hands of justice, and crush the oppressor who flourisheth with the rod of the commandments of your Lord, the Ordainer, the All-Wise."

(Prepared at the request of the Universal House of Justice by the Baha'i International Community Office of Public Information [1991], Bahá'u'lláh; Pages 21-22)

3. Germany obtained a concession in China, and Britain promptly appeared, demanding that Germany should maintain the "open door" in all her Chinese territory; the same demand was made on Russia. Both perforce consented. The far East is a mine of dynamite, always liable to explode. The relative strength of the powers contending for empire in the far East is as follows: Great Britain has 80 first-class ships of war, 581 war-ships in all; France has 50 first-class war-ships, and a total of 403; Russia has 40 first-class warship", 286: in all; Germany has 28 first-class war-ships, a total of 216. Japan will soon rank with Germany, and be stronger

"...an era whose boundless self-satisfaction was perhaps best epitomized by the celebration in 1897 of Queen Victoria's diamond jubilee, a parade that rolled for hours through the streets of London, with an imperial panoply and display of military power far surpassing anything attempted in past civilizations." (Prepared under the supervision of the Universal House of Justice [2001], Century of Light; p.2)

there because close to the scene of action.

4. The United States proposes to enter into the zone of danger with 18 first-class and a total of 81 ships. These would hardly count as half that number, however, owing to her greater distance from the battle-ground. Russia is 8000 miles,

--- Page 137. The Gospel of Wealth - VIII Americanism versus Imperialism

the other Europeans about 9000 miles from it. The United States is from 15,000 to 17,000 miles distant via the Cape and via the Straits; the route via Europe is about 12,000 miles, but that would be impracticable during war-time, as the American ships going via Europe would pass right into the trap of their European enemies.

armaments

Compose your differences, and reduce your armaments, that the burden of your expenditures may be lightened, and that your minds and hearts may be tranquillized. Heal the dissensions that divide you, and ye will no longer be in need of any armaments except what the protection of your cities and territories demandeth. Fear ye God, and take heed not to outstrip the bounds of moderation, and be numbered among the extravagant.

We have learned that you are increasing your outlay every year, and are laying the burden thereof on your subjects. This, verily, is more than they can bear, and is a grievous injustice. Decide justly between men, and be ye the emblems of justice amongst them. This, if ye judge fairly, is the thing that behoveth you, and beseemeth your station.

Beware not to deal unjustly with any one that appealeth to you, and entereth beneath your shadow. Walk ye in the fear of God, and be ye of them that lead a godly life. Rest not on your power, your armies, and treasures. Put your whole trust and confidence in God, Who hath created you, and seek ye His help in all your affairs. (Baha'u'llah [1863-1892], Gleanings from the Writings of Baha'u'llah, pp.250-251)

5. The armies of the European nations are as follows: Germany's army on a peace footing numbers 562,352 men, on a war footing, 3,000,000 (and a large addition ordered); France's army on a peace footing, 615,413, on a war footing, 2,500,000; Russia's, on a peace footing, 750,944, on a war footing, 2,512,143. All Frenchmen and Germans over twenty, and all Russians over twenty-one years of age are subject to military service. They are, in fact, first soldiers, then citizens.

“How savage and fearful the ferocity of man against his fellowman! Consider what is taking place now in the Balkans, what blood is being shed. Even the wild beasts and ferocious animals do not commit such acts. The most ferocious wolf kills but one sheep a day, and even that for his food. But now in the Balkans one man destroys ten fellow beings. The commanders of armies glory in having killed ten thousand men, not for food, nay, rather, for military control, territorial greed, fame and possession of the dust of the earth. They kill for national aggrandizement, notwithstanding this terrestrial globe is but a dark world of grossest matter. It is a world of sorrow and grief, a world of disappointment and unhappiness, a world of death. For after all, the earth is but the everlasting graveyard, the vast, universal cemetery of all mankind. Yet men fight to possess this graveyard, waging war and battle, killing each other. What ignorance! How spacious the earth is with room in plenty for all! How thoughtful the providence which has so allotted that every man may derive his sustenance from it! The Lord, our Creator, does not ordain that anyone should starve or live in want. All are intended to participate in the blessed and abundant bestowals of our God. Fundamentally, all warfare and bloodshed in the human world are due to the lack of unity between the religions, which through superstitions and adherence to theological dogmas have obscured the one reality which is the source and basis of them all.” (‘Abdu’l-Baha [1912]: Promulgation of Universal Peace; p. 396)

6. It is obvious that the United States cannot contest any question or oppose any demand of any one of its rivals which secures the neutrality of the other powers, as France, Germany, find Russia did that of Britain. She cannot stand alone. What the *Saturday Review*

(2) *"This is the British publication of course.*

says here is true:

Let us be frank and say outright that we expect mutual gain in material interests from this

“These masses of humankind, despoiled and scorned - but representing most of the earth’s inhabitants - were seen not as protagonists but essentially as objects of the new century’s much vaunted civilizing process. Despite benefits conferred on a minority among them, the colonial peoples existed chiefly to be acted upon - to be used, trained, exploited, Christianized, civilized, mobilized - as the shifting agendas of Western powers dictated. These agendas may have been harsh or mild in execution, enlightened or selfish, evangelical or exploitative, but were shaped by materialistic forces that determined both their means and most of their ends. To a large extent, religious and political pieties of various kinds masked both ends and means from the publics in Western lands, who were thus able to derive moral satisfaction from the blessings their nations were assumed to be conferring on less worthy peoples, while themselves enjoying the material fruits of this benevolence.” (Prepared under the supervision of the Universal House of Justice [2001], Century of Light; p.4)

rapprochement. The American commissioners at Paris are making their bargains, whether they realize it or not, under the protecting naval strength of England, and we shall expect a material *quid pro quo* for this assistance. We expect the United States to deal generously with Canada in the matter of tariffs, and we expect to be remembered when the United States comes into possession of the Philippine Islands, and above all we expect her assistance on the day, which is quickly approaching, when the future of China comes up for settlement, for the young Imperialist has entered upon a path where it will require a strong friend, and a lasting friendship between the two nations can be secured not by frothy sentimentality on public platforms, but by reciprocal advantages in solid material interests.

7. Bishop Potter has recently stated that we must become the "cat's-paw of Britain" if we venture into the arena, and

--- Page 138. The Gospel of Wealth - VIII Americanism versus Imperialism

that is true. By Britain's neutrality, and by that alone, were we permitted to take the Philippines at all from Spain. But for that, France, Germany, and Russia never would have stood aloof, and the price demanded President McKinley has had to pay - the "open door," which secures the trade of our possessions for Britain. Nothing more significant has occurred than the statement of Senator Davis,

(3) Henry Gassaway Davis (1823-1918), Senator from West Virginia, served as delegate to the first two International American Congresses.

chairman of the Senate Committee upon Foreign Relations, whose ability, influence, and position are alike commanding. He says:

I favor a treaty of alliance including the United States, Great Britain, and Japan, for the protection of all their interests north of the

[Baha'i Comment](#)

equator. The rest of the world would have a wholesome fear, synonymous with respect, for us.

8. We may assume after this that it is true that, just as we were allowed by Britain to take the Philippines from Spain, so our position in the East depends upon her continued support or alliance - rather a humiliating position, I should say, for the Republic. But let us see about alliances. Can we depend upon an alliance? National combinations change with alarming rapidity in Europe. France and Britain, allied, fought the Crimean War. They took Sebastopol as we took Manila. Their flags waved together there, but they did not consider that that fact gave them the right to demand territory. To-day Russia and France are in firm alliance against Britain and other nations. Germany fought Austria; to-day they are in the Triple Alliance together. Italy allied with France fought the battle of Solferino; to-day Italy is a member of the Triple Alliance against France. Europe is a kaleidoscope, where alliances change, dissolve, recombine, and take other forms with passing events. During the

One must recognize the foresight of Carnegie here to have the vision to see that these alliances between the nations were constantly in flux and certainly not reliable. In fact, the growing power of the Britain, U.S. alliance would cause Germany to escalate its material production.

“...as the Master had also warned - when Germany, feeling constrained by a growing web of hostile alliances, embarked on a massive naval building programme aimed at eliminating the previously accepted British lead.” (Prepared under the supervision of the Universal House of Justice [2001], *Century of Light*; p.29)

Carnegie says, “*There is no alliance, not even the most apparently incongruous, that cannot be made, and that will not be made, to meet the immediate interests or ambitions of nations.*”

“Material brotherhood does not prevent nor remove warfare; it does not dispel differences among mankind. But spiritual alliance destroys the very foundation of war, effaces differences entirely, promulgates the oneness of humanity, revivifies mankind, causes hearts to turn to the Kingdom of God and baptizes souls with the Holy Spirit.” (‘Abdu’l-Baha [1912]: *Promulgation of Universal Peace*; p.130)

past week the bitter enmity which recently existed between Germany and Britain, owing to German interference in the Transvaal, is changed, and it is announced that "they see together upon

--- Page 139. The Gospel of Wealth - VIII Americanism versus Imperialism

many points and expect to cooperate more and more in the future." This morning the question is, Shall France and Germany combine for some common ends? This would have been considered remarkable a short time ago, but statesmen will remember that Germany and France did combine with Russia to drive Japan out of China. There is no alliance, not even the most apparently incongruous, that cannot be made, and that will not be made, to meet the immediate interests or ambitions of nations. Senator Davis seems to rest satisfied with an alliance for his country with Britain and Japan. If he had an alliance to-day, it might not be worth the paper it was written upon to-morrow.

9. I say, therefore, that no American statesman should place his country in any position which it could not defend relying only upon its own strong right arm. Its arm at present is not much to depend upon; its eighty-one ships of war are too trifling to be taken into account; and as for its army what are its fifty-six thousand regulars? Its volunteers are being disbanded. Both its navy and its army are good for one thing only - for easy capture or destruction by either one of the stronger powers. It is the protection of Britain, and that alone, upon which we have to rely in the far East a slender thread indeed. Upon the shifting sands of alliances we are to have our only foundation.

[Baha'i Comment](#)

10. The writer is not of those who believe that the Republic cannot make itself strong enough to walk alone, and to hold her own, and to be an imperial power of herself, and not the weak protege of a real imperial power. But in order to make herself an imperial power she must do as imperial powers do - she must create a navy equal to the navy of any other power. She must have hundreds of thousands of regular troops to cooperate with the navy.

"...she must create a navy equal to the navy of any other power. She must have hundreds of thousands of regular troops to cooperate with the navy."

"...the greatest need of the world of humanity today is to receive the efficacy of the Holy Spirit. Until the Holy Spirit becomes effective, interpenetrating the hearts and spirits, and until perfect, reasonable faith shall obtain in the minds of men, it is impossible for the social body to be inspired with security and confidence. Nay, on the contrary, day by day enmity and strife shall increase among men and the differences and divergences of the nations shall augment; day by day additions to armies and navies of the world shall be made, and great is the fear of the great pandemic war, the war unparalleled in history; for armaments which heretofore have been so limited are now becoming amplified on a grand scale. It is becoming severe, drawing nigh unto the degree that men shall war upon the seas, war upon the plains, nay, rather, shall war in the very atmosphere; and such conditions of warfare never obtained in bygone days. The

dangers of war grow equally with the growth of armaments.”
(Abdu'l-Baha: Baha'i Scriptures, pp.280-281)

11. If she devoted herself exclusively and unceasingly to creating a navy equal to that of Britain, for instance, which is what she will need if she is not to be at the mercy of stronger powers, that will be the work of more than twenty years,

--- Page 140. The Gospel of Wealth - VIII Americanism versus Imperialism

building twenty war-ships per year; hitherto our navy has added only six per year. In order to get the men to man these ships, she must take the means to educate them. That she can do this there is no question; that the American either on sea or land is at least equal to the man of any other nation cannot be gainsaid. More than this, I know the American workman, especially the mechanic, to be the most skilful, most versatile, in the world - and victories at sea depend as much upon the mechanic below as upon the gunner on deck, and American gunners have no equals. It was no surprise to me that the American war-ships sunk those of Spain without loss. I spent last winter abroad in the

Baha'i Comment

society of distinguished men of European nations who congregate at Cannes. The opinion was universally held by them that for a time the Spanish navy would be master over us, although it was admitted the superior resources of the United States must eventually insure victory. I said then that, whenever any war-ships in the world met those of the American navy, the other war-ships would go to the bottom - for two reasons: first, our ships were the latest and their equipment was the best, and, second, I knew the kind of men who were behind the guns. If ever the Republic falls from her industrial ideals and descends to the level of the war ideals of Europe, she will be supreme; I have no doubt of that. The man whom this stimulating climate produces is the wiriest, quickest, most versatile of all men, and the power of organization exists in the American in greater perfection than in any other. But what I submit is that at present the Republic is an industrial hive, without an adequate navy and without soldiers; that she therefore must have a protector; and that if she is to figure in the East, she cannot be in any sense an imperial power at all. Imperialism implies naval and military force behind, Moral

force, education, civilization, are not the backbone of Imperialism; these are the moral forces which make for the higher civilization, for Americanism. The foundation for Imperialism is

--- Page 141. The Gospel of Wealth - VIII Americanism versus Imperialism

brutal physical strength, fighting men with material forces, war-ships and artillery.

12. The author of "A Look Ahead," which first appeared in the *North American Review*

(4) Carnegie's own article, in June 1893 (CLVI, 685-710), reprinted in the 1893 edition of Triumphant Democracy.

is not likely to be suspected of hostility to the coming together of the English-speaking race. It has been my dream, and it is one of the movements that lie closest to my heart. For many years a united flag has floated from my summer home in my native land, the Stars and Stripes and the Union Jack sewn together - the first flag of that kind ever seen. That flag will continue to fly there and the winds to blow the two from side to side in loving embrace. But I do not favor a formal alliance, such as that

patriotism of race

“It is racial, patriotic, religious and class prejudice, that has been the cause of the destruction of Humanity.” (Abdu’l-Baha [1911]: Abdu’l-Baha in London,p.28)

“Both the material and intrinsic development of man are conditional upon amity and love and the greatest honor and pleasure in the human world is love; but the ways and means are different. Sometimes the cause of love is simply relationship and kinship; and sometimes it is a racial bond, patriotism, political affairs, etc. But, through all these various bonds and means it is impossible to obtain a real and pure love; it is rather superficial and temporary. Such love may easily be changed into enmity and rancor, for it is affected by the slightest manifestation of hostility; whereas a true and ideal love is faith and assurance.” (Abdu’l-Baha [1910]: Star of the West, Vol. 1:8, Aug. 1 1910, p.5)

desired by Senator Davis. On the contrary, I rely upon the "alliance of hearts," which happily exists to-day.

Alliances of fighting power form and dissolve with the questions which arise from time to time. The patriotism of race lies deeper and is not disturbed by waves upon the surface. The present era of good feeling between the old and the new lands means that the home of Shakspeare and Burns will never be invaded without other than native-born Britons being found in its defense. It means that the giant child, the Republic, is not to be set upon by a combination of other races and pushed to its destruction without a growl coming from the old lion which will shake the earth. But it should not mean that either the old land or the new binds itself to support the other in all its designs, either at home or abroad, but that the Republic shall remain the friend of all nations and the ally of none; that, being free today of all foreign entanglements, she shall not undertake to support Britain, who has these to deal with. Take Russia, for instance. Only last year leading statesmen were pushing Britain into a crusade against that country. They proposed to prevent its legitimate expansion toward

the Pacific - legitimate because it is over coterminous territory, which Russia can absorb and Russian-

--- Page 142. The Gospel of Wealth - VIII Americanism versus Imperialism

ize, keeping her empire solid. She knows better than to have outlying possessions open to attack. Russia has always been the friend of the United States. When Lord Palmerston, Prime Minister of Great Britain, proposed to recognize the South, Russia sent her fleet to New York. Russia sold us Alaska. We have no opposing interests to those of Russia; the two nations are the only two great nations in the world solid, compact, impregnable, because each has developed only coterminous territory, upon which its own race could grow. Even in the matter of trade with Russia, our exports are increasing with wonderful rapidity. Shiploads of American locomotives, American steel bridges, and American electrical machinery for her leave our shores. Everything in which our country is either supreme or becoming supreme goes to Russia. Suppose Britain and Russia clash in the Far East and we have an alliance with Britain, we are at war against

one of our best friends.

13. The sister Republic of France and our own, from her very beginning, have been close friends. The services France rendered at the Revolution may be, but never should be, forgotten by the American. That some interests in France sympathized with Spain was only natural. The financial world in France held the Spanish debt. The religion of France is the religion of Spain. The enemies of the French Republic sided with the monarchy. But this can be said without fear of contradiction, that those who govern France stood the friends of our Republic, and that our enemies in France were also the enemies of the French government. An alliance with Britain and Japan would make us a possible enemy of France. I would not make an alliance which involved that. I would make no alliance with any power under any circumstances that can be imagined; I would have the Republic remain the friend of all powers. That has been her policy from the beginning, and so it should remain.

[Baha'i Comment](#)

14. When "the world shall have a wholesome fear, synonymous with respect, for us," as Senator Davis desires, it will

--- Page 143. The Gospel of Wealth - VIII Americanism versus Imperialism

not be a good day for the Republic. Adherence to Washington's desire seems better to me-that we should be the "friends of all nations"- a wholesome friendship instead of a "wholesome fear."

[Baha'i Comment](#)

15. Reference has been made to possible difference arising between the protector and its ward, but I do not wish to be understood as entertaining the belief that actual war is probable between them. Far from this, my opinion is that actual war will never exist again between the two branches of the English-speaking race. Should one have a grievance, the other would offer arbitration, and no government of either could exist which refused that offer. The most powerful government ever known in Britain was that of Lord Salisbury, when President Cleveland rightfully demanded arbitration in the Venezuelan case.

[Baha'i Comment](#)

(5) The boundary dispute between British Guiana and Venezuela, of long standing, came to a crisis in April 1895 with the arrest of two British officials. Cleveland, persuaded by the Venezuelan minister to invoke the Monroe Doctrine, sent a message to Congress virtually stating that British efforts to enforce claims on Venezuela without arbitration would be considered a cause of war. The question was eventually arbitrated in 1899. See also Essay XI, note 2.

As is well known, Mr. Gladstone's government had agreed to arbitration. Lord Salisbury, upon coming into power, repudiated that agreement. Lord Salisbury denied President Cleveland's request, and what was the result? Some uninformed persons in the United States believe that he was compelled to withdraw his refusal and accede to President Cleveland's request by the attitude of the United States. That was only partially true. The forces in Britain supporting Lord Salisbury compelled him to reverse his decision. This is an open secret. Those nearest and next to him in power who sided with President Cleveland could be named; but the published cables are sufficient. The heir and the next heir to the throne cabled that they hoped and believed the question would be peacefully settled. That behind this cable was the Queen herself, always

the friend of the Republic,
need not be doubted.

--- Page 144. The Gospel of
Wealth - VIII Americanism
versus Imperialism

16. The idea of actual war between Great Britain and the Republic can be dismissed as something which need not be taken into account; but what is to be feared is this: the neutrality of Britain -- even to-day desired by other powers - in case her ward gave her offense, or was, as she supposed, ungrateful, and did not make full return for the protection accorded to the weakling, as we have said. It did not require the active hostility of Great Britain to thwart Japan and push her out of her possessions, but simply her decision not to interfere on Japan's behalf. Had Japan had satisfactory advantages to offer to Britain, she might have had Britain's support. It is the satisfactory bargain that alliances are founded upon in Europe; every European nation has its price, and every one of them has something which the other covets. France could give Britain a free hand in Egypt. Germany could concur in Britain's acquisition of Delagoa Bay

[Baha'i Comment](#)

(6) In 1875 Marshal MacMahon, President of France, acting as arbitrator in a dispute between Great Britain and Portugal over the ownership of Delagoa Bay, awarded this port to Portugal, which began active colonization, extending westward and conflicting with British claims inland. The dispute lasted from 1880 to 1890, when Lord Salisbury delivered an ultimatum, as a consequence of which in 1891 Portugal conceded to Great Britain the right of preemption to her possessions south of the Zambesi River. The Transvaal Republic wanted a seaport, but in 1895 Great Britain annexed the territory between Zululand and Mozambique, thus cutting the Boer Republic off from any port. German interests in Africa looked with disfavor on further British colonial expansion.

and end her troubles in the Transvaal. This is something Britain dearly covets. Russia could give Britain a desired frontier in India. These nations have all co-related interests and desires, and no man can predict what alliances will be broken and what made - it is all a matter of self-interest. The United States has not this position. She has little desirable to offer in exchange for alliance, and in all probability she would be sacrificed for the aims of her strong rivals -- at least she might be, being herself powerless.

17. When a statesman has in his keeping the position and interests of his country, it is not with things as they are to be in the future, but with things as they are in the present, that

--- Page 145. The Gospel of Wealth - VIII Americanism versus Imperialism

it is his serious duty to deal. The dream, in which no one perhaps indulges more than the writer, of the union of the English-speaking race, even that entrancing dream must be recognized as only a dream. The "Parliament of Man, the Federation of the World,"

*(7) "Till the war drum throbbed no longer and the battle flags were furled
In the Parliament of Man, the Federation of the world."*

Locksley Hall, lines 127-128.

we know is to come. The evolutionist has never any doubt about the realization of the highest ideals from the operation of that tendency within us, not ourselves, which makes for righteousness. But he is no statesman - he is only a dreamer - who allows his hopes to stand against facts, and he who proposes that the United States, as she stands

highest ideals

"...harmony, unity and love are held up as the highest ideals in human relationships." (From a letter written on behalf of Shoghi Effendi to the National Spiritual Assembly of Central America, November 9, 1956: Quoted in Lights of Guidance, p.222)

"that tendency within is"

"Self has really two meanings, or is used in two senses, in the Baha'i writings: one is self, the identity of the individual created by God. This is the self mentioned in such passages as 'he hath known God who hath known himself etc.'. The other self is the ego, the dark, animalistic heritage each one of us has, the lower nature that can develop into a monster of selfishness, brutality, lust and so on. It is this self we must struggle against, or this side of our natures, in order to strengthen and free the spirit within us and help it to attain perfection." (From a letter written on behalf of Shoghi Effendi to an individual believer, December 10, 1947: Quoted in Lights of Guidance, p.113)

"Little reflection, little admonition is necessary for us to realize the purpose of our creation. What a heavenly potentiality God has deposited within us! What a power God has given our spirits! He has endowed us with a power to penetrate the realities of things; but we must be self-abnegating, we must have pure spirits, pure intentions, and strive with heart and soul while in the human world to attain everlasting glory." ('Abdu'l-Baha [1912]: Promulgation of Universal Peace; p.187)

to-day, shall enter into the coming struggle in the far East, depending upon any alliance that can be made with any or all of the powers, seems unsuited to shape the policy or deal with the destinies of the Republic.

18. Just consider her position, solid, compact, impregnable. If all the naval forces were to combine to attack her, what would be her reply. She would fill her ports with mines; she would draw her ships of war behind them, ready to rush out as favorable opportunities might offer to attack. But she would do more than this in extremity: she would close her ports, - a few loaded scows would do the business, - and all the powers in the world would be impotent to injure her seriously. The fringe only would be troubled; the great empire within would scarcely feel the attack.

[Baha'i Comment](#)

19. The injury she would inflict upon the principal powers by closing her ports would be much more serious than could be inflicted upon her, because non-exportation of food-stuffs and cotton would mean famine and distress to Britain and injure her to a greater degree than loss in battle. Even in France and in Germany the results of non-exportation would be more serious than the effects of ordinary war. It would only be a matter of a short time until the powers recognized how futile was their attempt to injure seriously this self-

--- Page 146. The Gospel of Wealth - VIII Americanism versus Imperialism

contained Republic, whose estate here lies secure within a ring fence.

"this self-contained Republic, whose estate here lies secure within a ring fence."

The United States has habitually imagined that it could exist in isolation from the rest of the world. George Washington said that this country should not become entangled in the affairs of other nations. But it's obvious to all that the world is shrinking into a neighborhood and -- willingly or unwillingly -- America must assume her responsibility. The U.S. was yanked into WWII with the attack on Pearl Harbor. Then they ventured into Korea, Cambodia, Vietnam, Bosnia and numerous other areas.

"Paradoxical as it may seem, her only hope of extricating herself from the perils gathering around her is to become entangled in that very web of international association which the Hand of an inscrutable Providence is weaving." (Shoghi Effendi [1938], Advent of Divine Justice, pp.87-88)

"This nation, moreover, may well claim to have, as a result of its effective participation in both the first and second world wars, redressed the balance, saved mankind the horrors of devastation and bloodshed involved in the prolongation of hostilities..." (Shoghi Effendi, Citadel Of Faith, p.36)

It appears in the year 2002 that every feeble attempt at isolationism has been met with a crisis that forces the government to re-evaluate her stance. Most recently the terrorist attacks of profound economic implications on American soil. Of course Carnegie could scarcely imagine a contracted world in which trying to dismiss disturbances of the part would eventually visit it's scourge upon the whole.

"One of the striking developments of this kind that Shoghi Effendi discerned in the Writings he was called on to interpret concerned the future role of the United States as a nation, and, to a lesser extent, its sister nations in the Western hemisphere. His foresight is all the more remarkable when one remembers that he was writing during a period of history when the United States was determinedly isolationist in both its foreign policy and the convictions of the majority of its citizens. Shoghi Effendi, however, envisioned the country assuming an "active and decisive part ... in the organization and the peaceful settlement of the affairs of mankind". He reminded Baha'is of 'Abdu'l-Baha's anticipation that, because of the unique nature of its social composition and political development - as opposed to any "inherent excellence or special merit" of its people - the United States had developed capacities that could empower it to be "the first nation to establish the foundation of international agreement". Indeed, he foresaw the governments and peoples of the entire hemisphere becoming increasingly oriented in this direction."

(Prepared under the supervision of the Universal House of Justice [2001], Century of Light; p.52)

20. The national wealth would not grow as fast during the blockade, but that is all. Our foreign trade would suffer, but that is a trifle, not more than four per cent of our domestic commerce. No expert estimates the annual domestic exchanges of the people at less than fifty thousand millions of dollars; those of exports and imports have never yet reached Quite two thousand millions. The annual increase of domestic exchanges is estimated to be just about equal to the total of all our foreign trade, imports and exports combined. Labor would be displaced, but the new demand upon it caused by the new state of affairs would employ it all. We should emerge from the embargo without serious injury. So much for the impregnability of the Republic. To-day fortune rains upon her. For the first time in her history, she has become the greatest exporting nation in the world, even the exports of Britain being less than hers. Her manufactures are invading all lands; commercial expansion proceeds by leaps and bounds. New York has become the financial center of the world. It is London no more,

Impregnable

The Baha'i writings proclaim "religion" to be;

"a radiant light and an impregnable stronghold for the protection and welfare of the peoples of the world" and "the chief instrument for the establishment of order in the world"; affirms its fundamental purpose to be the promotion of union and concord amongst men; warns lest it be made "a source of dissension, of discord and hatred"; commands that its principles be taught to children in the schools of the world, in a manner that would not be productive of either prejudice or fanaticism; attributes "the waywardness of the ungodly" to the "decline of religion"; and predicts "convulsions" of such severity as to "cause the limbs of mankind to quake." (Shoghi Effendi [1944], *God Passes By*, p.217)

When man vainly imagines that his own imaginings are "impregnable" God quickly takes action to humble our ego. For example, upon hearing of the Titanic calamity, Abdu'l-Baha stated;P> "...these events have deeper reasons. Their object and purpose is to teach man certain lessons. We are living in a day of reliance upon material conditions. Men imagine that the great size and strength of a ship, the perfection of machinery or the skill of a navigator will ensure safety, but these disasters sometimes take place that men may know that God is the real Protector. If it be the will of God to protect man, a little ship may escape destruction, whereas the greatest and most perfectly constructed vessel with the best and most skillful navigator may not survive a danger such as was present on the ocean. The purpose is that the people of the world may turn to God, the One Protector; that human souls may rely upon His preservation and know that He is the real safety. These events happen in order that man's faith may be increased and strengthened." ('Abdu'l-Baha [1912]: *Promulgation of Universal Peace*; p.48)

but New York, which is to-day the financial center. This, however, is not yet to be claimed as permanent, but it promises to become so ere long, unless the Republic becomes involved in European wars through Imperialism. Labor is in demand at the highest wages paid in the world; the industrial supremacy of the world lies at our feet. Two questions are submitted to the decision of the American people: first, Shall we remain as we are, solid, compact, impregnable, republican, American? or, second, Shall we creep under the protection, and become, as Bishop Potter says, the "cat's-paw" of Britain, in order that we may grasp the phantom of Imperialism.

21. If the latter be the choice, then it is submitted that we must first begin quietly to prepare ourselves for the new work which Imperialism imposes.

[Baha'i Comment](#)

--- Page 147. The Gospel of
Wealth - VIII Americanism
versus Imperialism

[Baha'i Comment](#)

22. We need a large regular army of trained soldiers. There is no use trying to encounter regular armies with volunteers we have found that out. Not that volunteers would not be superior to the class of men we shall get to enlist simply for pay in the regular army, if they would enlist there and be trained, but because they are not trained. Thirty-eight thousand more men are to be called for the regular army; but it is easy "to call spirits from the vasty deep"

(8) Henry IV, Act iii, scene 1, line 54.

- they may not come. The present force of the army is sixty-two thousand men by law; we have only fifty-six thousand, as the President tells us in his message. Why do we not first fill up the gap, instead of asking for legislation to enlist more? Because labor is well employed and men are scarce in some States to-day; because men who now enlist know for what they are wanted, and that kind of work is not what American soldiers have been asked to perform hitherto. They have never had

to leave their own country, much less to shoot down men whose only crime against the Republic was that they, too, like ourselves, desired their country's independence and believed in the Declaration of Independence-in Americanism. The President may not get the soldiers he desires, and whom he must have if he is not to make shipwreck of his Imperialism. There is very grave reason to doubt whether the army can be raised even to one hundred thousand men without a great advance in pay, perhaps not without conscription. But surely before we appear in the arena in the far East we must have a large regular army.

23. The second indispensable requirement is a navy corresponding, at least in some degree, to the navies of the other powers interested in the East. We can get this in twenty years, perhaps, if we push matters, but this means building twenty ships a year. The securing of men trained to man them will be as difficult a task as the building of the ships. When we have armed ourselves thus, but not till then,

--- Page 148. The Gospel of Wealth - VIII Americanism versus Imperialism

[Baha'i Comment](#)

shall we be in a position to take and hold territory in the far East "by the sole power of our unlorded will," as we should hold it, or not hold it at all. To rush in now, without army or navy, trusting to the treacherous shifting foundation of anybody's "protection," or "neutrality," or "alliance," is to court defeat, and such humiliation as has rarely fallen to the lot of any nation, even the poorest and most madly or most foolishly governed. It is not good sense.

24. This ends the subject upon which I undertook to write, but there remains the practical question, What shall we do with the Philippines? These are not ours, unless the Senate approves the treaty; but, assuming that it will, that question arises.

Philippines - synopsis of history

The islands were named for King Philip II [Son of Charles V] of Spain and were illegally ceded by Spain [along with Guam, Cuba and Puerto Rico] to the U.S. for 20 Million Dollars following the Spanish-American War in 1898. U.S. troops suppressed a guerrilla uprising in a brutal 6-year war from 1899-1905.

In 1934, the U.S. Congress passed an act which made the Phillipines a U.S. Commonwealth. On December 8, 1941, Japan occupied the islands during WWII. On July 4, 1946, independence was proclaimed in accordance with an act passed by congress by the U.S. Congress in 1934. A republic was established and Manuel Roxas became the President of the Republic of the Phillipines.

http://www.puc.edu/Faculty/Milbert_Mariano/MANO/history.html

25. The question can best be answered by asking another: What have we promised to do with Cuba? The cases are as nearly parallel as similar cases usually are. We drove Spain out of both Cuba and the Philippines. Our ships lie in the harbors of both. Our flag waves over both. To Cuba the President in his message renews the pledge given by Congress - she is to be aided to form a "free and independent government at the earliest possible moment."

[Baha'i Comment](#)

26. The magic words "free and independent" will be accepted by the people of Cuba, and our soldiers hailed as deliverers. So well assured of this is our government that only one half the number of troops intended for Cuba are now to be sent there.

[Baha'i Comment](#)

27. Even if we were tempted to play false to our pledge, as the enemies of the Republic in Europe predict we shall, the aspirations of a people for independence are seldom quenched. There are a great number of Americans, and these of the best, who would soon revolt at our soldiers being used against the Cubans fighting for what they had been promised. The latest advices I have from Cuba are

"...mark my prediction, she (Cuba) will ask for annexation."

Cuba never did ask for annexation. In fact the twentieth century saw this island struggle to become as independent as possible from the United States.

"There is no Imperialism here (Cuba) - no danger of foreign wars."

October 22, 1962 - President Kennedy announces to the world that the Soviet Union has deployed nuclear missiles in Cuba. This incident brings the world to the brink of nuclear war. Five days later the Cuban Missile Crisis is resolved with the Soviet Union agreeing to remove its missiles from Cuba and the US agreeing not to invade Cuba and to remove US missiles from Turkey. However the incident

from a good source. This necessity is not likely to arise. Cuba will soon form a government, and, mark my prediction, she will ask for

--- Page 149. The Gospel of Wealth - VIII Americanism versus Imperialism

annexation. The proprietors of Cuba who will control the new government, and many Americans who are becoming interested with them in estates there, will see to this. "Free sugar" means fortune to all. Will the United States admit Cuba? Doubtful. But Cuba need not trouble us very much. There is no Imperialism here - no danger of foreign wars.

results in cementing a relationship between the Soviet Union and Cuba that lasts nearly 30 years and injects over \$100 billion of Soviet aid and loans into Cuba.

<http://www.uscubacommission.org/history4.html>

28. Now, why is the policy adopted for the island of Cuba not the right policy for the Philippine Islands? General Schofield

(9) John McAllister Schofield (1831-1906), Superintendent of the United States Military Academy (1876-1881), commanding general of the army (1895), and noted, among other things, for his part in the acquisition of Pearl Harbor by the United States.

states that thirty thousand troops will be required there, as we may have to "lick them." What work this for Americans! General Miles

Baha'i Comment

(10) Nelson Appleton Miles (1839-1925), succeeded to Schofield's position in 1895. He was active in the Spanish-American War and afterwards.

thinks twenty-five thousand will do. If we promised them what we have promised Cuba, half the number would suffice, as with Cuba, - probably less, and we should be spared the uncongenial task of shooting down people who are guiltless of offense against us.

29. If we insist "the slaves are ours because we bought them," and fail to tell them we come not as slave-drivers, but as friends to assist them to independence, we may have to "lick them," no doubt. It will say much for the Filipinos if they do rebel against "being bought and sold like cattle." It would be difficult to give a better proof of their fitness for self-government.

slavery

"It is forbidden you to trade in slaves, be they men or women. It is not for him who is himself a servant to buy another of God's servants, and this hath been prohibited in His Holy Tablet. Thus, by His mercy, hath the commandment been recorded by the Pen of justice. Let no man exalt himself above another; all are but bondslaves before the Lord, and all exemplify the truth that there is none other God but Him. He, verily, is the All Wise, Whose wisdom encompasseth all things." (Baha'u'llah, The Kitab-i-Aqdas, p. 45)

Also Baha'u'llah revealed the following to Queen Victoria of England

"We have been informed that thou hast forbidden the trading in slaves, both men and women. This, verily, is what God hath enjoined in this wondrous Revelation." (Baha'u'llah, Epistle to the Son of the Wolf, p. 60)

30. Cuba is under the shield of the Monroe Doctrine; no foreign interference is possible there. Place the Philippines under similar conditions until they have a stable government, when eight millions of people can be trusted to protect themselves. The truth is that none of the powers would risk the hostility of eight millions of people who had tasted the hope of independence. "Free and independent" are magical words, never forgotten, and rarely unrealized.

Monroe Doctrine

This was a principle of American foreign policy enunciated in President James Monroe's message to Congress, Dec. 2, 1823. It initially called for an end to European intervention in the Americas, but it was later extended to justify U.S. imperialism in the Western Hemisphere.

--- Page 150. The Gospel of Wealth - VIII Americanism versus Imperialism

31. Only one objection can be made to this policy: they are not fit to govern themselves. First, this has not been proved. This was said of every one of the sixteen Spanish republics as they broke away from Spain; it was said even of Mexico within this generation; it was the belief of the British about ourselves. There is, in the writer's opinion, little force in the objection. In the far East I have visited the village communities in India, to find even there a system of self-government dating back for two thousand years. In no country, not even the most

Baha'i Comment

backward, are government and "orders and degrees" of men not to be found. The head men of tribes and others of lesser authority are often selected by the members. In the wild lands of the Afridis - a tribe in India which has just baffled seventy thousand soldiers, native and British, the largest army ever assembled there-there is a system of self-government, and a rigid one. Human societies cannot exist without establishing, as a rule, peace and order in greater or less perfection.

32. The Filipinos are by no means in the lowest scale - far from it; nor are they much lower than the Cubans. If left to themselves they will make mistakes, but what nation does not? Riot and bloodshed may break out -- in which nation are these absent? Certainly not in our own. But the inevitable result will be a government better suited to the people than any that our soldiers and their officers could ever give.

bloodshed

“Consider how discord and dissension have prevailed in this great human family for thousands of years. Its members have ever been engaged in war and bloodshed. Up to the present time in history the world of humanity has neither attained nor enjoyed any measure of peace, owing to incessant conditions of hostility and strife. History is a continuous and consecutive record of warfare brought about by religious, sectarian, racial, patriotic and political causes. The world of humanity has found no rest. Mankind has always been in conflict, engaged in destroying the foundations, pillaging the properties and possessing the lands and territory of each other, especially in the earlier periods of savagery and barbarism where whole races and peoples were carried away captive by their conquerors. Who shall measure or estimate the tremendous destruction of human life resulting from this hostility and strife? What human powers and forces have been employed in the prosecution of war and applied to inhuman purposes of battle and bloodshed? In this most radiant century it has become necessary to divert these energies and utilize them in other directions, to seek the new path of fellowship and unity, to unlearn the science of war and devote supreme human forces to the blessed arts of peace. After long trial and experience we are convinced of the harmful and satanic outcomes of dissension; now we must seek after means by which the benefits of agreement and concord may be enjoyed. When such means are found, we must give them a trial.” (Abdu’l-Baha [1912]: The Promulgation Of Universal Peace, p.229)

33. Thus only can the Republic stand true to its pledge that the sword was drawn only in the cause of humanity and not for territorial aggrandizement, and true to the fundamental principles upon which it rests: that "government derives its just powers from the consent of the governed"; that the flag, wherever it floats, shall proclaim "the equality of the citizen," "one man's privilege every man's right"; that "all men are created equal," not that under its sway a part only shall be citizens with rights and a part subjects without rights - freemen and serfs, not all freemen. Such is the issue between Americanism and Imperialism.

"the sword was drawn only in the cause of humanity"

"O Rulers of America and the Presidents of the Republics therein... Bind ye the broken with the hands of justice, and crush the oppressor who flourisheth with the rod of the commandments of your Lord, the Ordainer, the All-Wise.

The time must come when the imperative necessity for the holding of a vast, an all-embracing assemblage of men will be universally realized. The rulers and kings of the earth must needs attend it, and, participating in its deliberations, must consider such ways and means as will lay the foundations of the world's Great Peace amongst men. Such a peace demandeth that the Great Powers should resolve, for the sake of the tranquillity of the peoples of the earth, to be fully reconciled among themselves. Should any king take up arms against another, all should unitedly arise and prevent him. If this be done, the nations of the world will no longer require any armaments, except for the purpose of preserving the security of their realms and of maintaining internal order within their territories. This will ensure the peace and composure of every people, government and nation." (Baha'u'llah [1863-1892]: Gleanings From The Writings Of Baha'u'llah, p.249)

"government derives its just powers from the consent of the governed"

In contrast to this principle, in the Baha'i Faith, the governors are directly responsible to God rather than the governed. The current "Spiritual Assemblies" -- an appellation that must in the course of time be replaced by their permanent and more descriptive title of "Houses of Justice," are "invested with an authority rendering them unanswerable for their acts and decisions to those who elect them; solemnly pledged to follow, under all conditions, the dictates of the "Most Great Justice" that can alone usher in the reign of the "Most Great Peace" which Baha'u'llah has proclaimed and must ultimately establish;" (Shoghi Effendi [1944], "God Passes By", p.33)

"the equality of the citizen"

While this is a praiseworthy aspiration, the United States has had problems with this on its soil. The "equality of the white citizen" would be perhaps a more accurate description of the United States at this time. Although Carnegie praises the high ideals of Americanism, he fails to acknowledge the brutal Imperialism of the United States to destroy the American Indian. He fails to point out the second class citizenship of the American Negro.

"No less serious is the stress and strain imposed on the fabric of American society through the fundamental and persistent neglect, by the governed and governors alike, of the supreme, the inescapable and urgent duty -- so repeatedly and graphically represented and stressed by Abdu'l-Baha in His arraignment of the basic weaknesses in the social fabric of the nation -- of remedying, while there is yet time, through a revolutionary change in the concept and attitude of the average white American toward his Negro fellow citizen, a situation which, if allowed to drift, will, in the words of Abdu'l-Baha, cause the streets of American cities to run with blood, aggravating thereby the havoc which the fearful weapons of destruction, raining from the air, and amassed by a ruthless, a vigilant, a powerful and inveterate enemy, will wreak upon those same cities." (Shoghi Effendi [1947-1957]: Citadel of Faith, p.126)

On the other hand, Abdu'l-Baha praises the efforts made by America is the arena of the emancipation of the Negro.

"But I wish to say one thing in order that the blacks may become grateful to the whites and the whites become loving toward the blacks. If you go to Africa and see the blacks of Africa, you will realize how much progress you have made. Praise be to God! You are like the whites; there are no great distinctions left. But the blacks of Africa are treated as servants. The first proclamation of emancipation for the blacks was made by the whites of America. How they fought and sacrificed until they freed the blacks! Then it spread to other places. The blacks of Africa were in complete bondage, but your emancipation led to their freedom also--that is, the European states emulated the Americans, and the emancipation proclamation became universal. It was for your sake that the whites of America made such an effort. Were it not for this effort, universal emancipation would not have been proclaimed. Therefore, you must be very grateful to the whites of America, and the whites must become very loving toward you so that you may progress in all human grades. Strive jointly to make extraordinary progress and mix together completely. In short, you must be very thankful to the whites who were the cause of your freedom in America. Had you not been freed, other blacks would not have been freed either. Now--praise be to God!--everyone is free and lives in tranquillity. I pray that you attain to such a degree of good character and behavior that the names of black and white shall vanish. All shall be called human, just as the name for a flight of doves is dove. They are not called black and white. Likewise with other birds." (Abdu'l-Bahá [1912], Promulgation Universal Peace, pp.45-46)

"all men are created equal"

"O CHILDREN OF MEN! Know ye not why We created you all

from the same dust? That no one should exalt himself over the other. Ponder at all times in your hearts how ye were created. Since We have created you all from one same substance it is incumbent on you to be even as one soul, to walk with the same feet, eat with the same mouth and dwell in the same land, that from your inmost being, by your deeds and actions, the signs of oneness and the essence of detachment may be made manifest. Such is My counsel to you, O concourse of light! Heed ye this counsel that ye may obtain the fruit of holiness from the tree of wondrous glory.” (Baha’u’llah [1862-1863]: Hidden Words of Baha’u’llah, p.20)

imperialism

“From darkest Africa the first stirrings of a conscious and determined revolt against the aims and methods of political and economic imperialism can be increasingly discerned, adding their share to the growing vicissitudes of a troubled age. Not even America, which until very recently prided itself on its traditional policy of aloofness and the self-contained character of its economy, the invulnerability of its institutions and the evidences of its growing prosperity and prestige, has been able to resist the impelling forces that have swept her into the vortex of an economic hurricane that now threatens to impair the basis of her own industrial and economic life. Even far-away Australia, which, owing to its remoteness from the storm-centers of Europe, would have been expected to be immune from the trials and torments of an ailing continent, has been caught in this whirlpool of passion and strife, impotent to extricate herself from their ensnaring influence.” (Shoghi Effendi, The World Order of Baha'u'llah, p. 31)

VIII

Americanism Versus Imperialism

Part II

34. In the January number of the *Review* I dealt with the danger of foreign wars and entanglements as one of several grave reasons against departing from the past policy of the Republic, which has kept it solid and compact upon its own continent, to undertake the subjection and government of subject races in the tropics. I now propose to consider one of the reasons given for such departure - the only one remaining which retains much vitality, for the

[Baha'i Comment](#)

two other reasons once so prominent have already faded away and now are scarcely ever urged. These were "commercial expansion" in peace and "increased power" in war. The President killed the first when compelled by Great Britain to give the "open door" as the price for her support; for to give the "open door" to the nearer foreigner meant the "closed door" to the products of the soil and mines of his own country. There never was and never can be any trade worth quarreling about in the Philippines; but what little there is or can be he has given away. When the country saw Dewey's fleet provisioned from Australia, instead of from our own agricultural land, the claim of possible expansion of American commerce there fell to the ground.

35. The second claim, that the Republic as a war power would be strengthened, held the field even for a shorter period than that of commercial expansion, for it was obvious that distant possessions would only give to our enemies, during war, vulnerable points of attack which had hitherto been wanting. As one solid mass, without outlying possessions, the Republic is practically

[Baha'i Comment](#)

unassailable. Should she keep the Philippines, any one of the great naval powers has her at its mercy. Hence Admiral Sampson

(11) William Thompson Sampson (1840-1902), squadron commander in the Spanish-American war.

warned us but a few days ago that "our risks of and dangers from war had already increased a hundred per cent and that we needed to double our navy." The

--- Page 152. The Gospel of Wealth - VIII Americanism versus Imperialism

President has just asked that our army also be doubled.

36. Thus the claims of "commercial expansion" in peace and of "increased power" in war have led to death of themselves.

[Baha'i Comment](#)

37. There remains to-day, as the one vital element of Imperialism, the contention that Providence has opened for the American people a new and larger destiny, which imposes heavy burdens indeed upon them, but from which they cannot shrink without evading holy duty; that it has become their sacred task to undertake the civilization of a backward people committed to their charge. A foundling has been left at their door, which it is their duty to adopt, educate, and govern. In a word, it is "Humanity," "Duty," "Destiny," which call upon us again for sacrifice. These potent cries, which brought us to the drawing of the sword for oppressed Cuba, are now calling us to a more difficult task, and hence to a greater "duty."

...a new and larger destiny

Carnegie here is referring to "Manifest Destiny."

"...tenet holding that territorial expansion of the United States is not only inevitable but divinely ordained. The phrase was first used by the American journalist and diplomat John Louis O'Sullivan, in an editorial supporting annexation of Texas, in the July-August 1845 edition of the United States Magazine and Democratic Review, a magazine that featured literature and nationalist opinion. The phrase was later used by expansionists in all political parties to justify the acquisition of California, the Oregon Territory, and Alaska. By the end of the 19th century the doctrine was being applied to the proposed annexation of various islands in the Caribbean Sea and the Pacific Ocean."

<http://encarta.msn.com/find/Concise.asp?ti=04198000>

holy duty ...their (United States) sacred task to undertake the civilization of a backward people committed to their charge.

In a review of the twentieth century, the Baha'i authored document "Century of Light," discusses this serious matter of expansion in the "Name of God."

"These masses of humankind, despoiled and scorned - but representing most of the earth's inhabitants - were seen not as protagonists but essentially as objects of the new century's much vaunted civilizing process. Despite benefits conferred on a minority among them, the colonial peoples existed chiefly to be acted upon - to be used, trained, exploited, Christianized, civilized, mobilized - as the shifting agendas of Western powers dictated. These agendas may have been harsh or mild in execution, enlightened or selfish, evangelical or exploitative, but were shaped by materialistic forces that determined both their means and most of their ends. To a large extent, religious and political pieties of various kinds masked both ends and means from the publics in Western lands, who were thus able to derive moral satisfaction from the blessings their nations were assumed to be conferring on less worthy peoples, while themselves enjoying the material fruits of this benevolence." (Baha'i World Centre [2001], Century of Light, 2001, p.4)

Civilization

Today throughout the five continents of the globe it is Europe and most sections of America that are renowned for law and order, government and commerce, art and industry, science, philosophy

and education. Yet in ancient times these were the most savage of the world's peoples, the most ignorant and brutish. They were even stigmatized as barbarians--that is, utterly rude and uncivilized. Further, from the fifth century after Christ until the fifteenth, that period defined as the Middle Ages, such terrible struggles and fierce upheavals, such ruthless encounters and horrifying acts, were the rule among the peoples of Europe, that the Europeans rightly describe those ten centuries as the Dark Ages. The basis of Europe's progress and civilization was actually laid in the fifteenth century of the Christian era, and from that time on, all her present evident culture has been, under the stimulus of great minds and as a result of the expansion of the frontiers of knowledge and the exertion of energetic and ambitious efforts, in the process of development. (Abdu'l-Baha, *The Secret of Divine Civilization*, p.10)

Until the heavenly civilization is founded, no result will be forthcoming from material civilization, even as you observe. See what catastrophes overwhelm mankind. Consider the wars which disturb the world. Consider the enmity and hatred. The existence of these wars and conditions indicates and proves that the heavenly civilization has not yet been established. If the civilization of the Kingdom be spread to all the nations, this dust of disagreement will be dispelled, these clouds will pass away, and the Sun of Reality in its greatest effulgence and glory will shine upon mankind. (Abdu'l-Baha [1912], *The Promulgation Of Universal Peace*, p.96)

All are human beings. Why have the people of America advanced to a high degree of civilization while the tribes of central Africa remain in extreme ignorance and barbarism? The difference and distinction between them is the degree of education. This is unquestioned. The people of Europe and America have been uplifted by education and training from the world of defects and have ascended toward the realm of perfection, whereas the people of Africa, denied educational development, remain in a natural condition of illiteracy and deprivation, for nature is incomplete and defective. Education is a necessity. If a piece of ground be left in its natural and original state, it will either become a thorny waste or be covered by worthless weeds. When cleared and cultivated, this same unproductive field will yield plentiful harvests of food for human sustenance. (Abdu'l-Baha [1912], *The Promulgation Of Universal Peace*, p.329)

Destiny of America

“Among some of the most momentous and thought-provoking pronouncements ever made by Abdu'l-Baha, in the course of His epoch-making travels in the North American continent, are the following: "May this American Democracy be the first nation to establish the foundation of international agreement. May it be the first nation to proclaim the unity of mankind. May it be the first to

unfurl the Standard of the Most Great Peace." And again: "The American people are indeed worthy of being the first to build the Tabernacle of the Great Peace, and proclaim the oneness of mankind.... For America hath developed powers and capacities greater and more wonderful than other nations.... The American nation is equipped and empowered to accomplish that which will adorn the pages of history, to become the envy of the world, and be blest in both the East and the West for the triumph of its people. ...The American continent gives signs and evidences of very great advancement. Its future is even more promising, for its influence and illumination are far-reaching. It will lead all nations spiritually."

The creative energies, mysteriously generated by the first stirrings of the embryonic World Order of Baha'u'llah, have, as soon as released within a nation destined to become its cradle and champion, endowed that nation with the worthiness, and invested it with the powers and capacities, and equipped it spiritually, to play the part foreshadowed in these prophetic words. The potencies which this God-given mission has infused into its people are, on the one hand, beginning to be manifested through the conscious efforts and the nationwide accomplishments, in both the teaching and administrative spheres of Baha'i activity, of the organized community of the followers of Baha'u'llah in the North American continent. These same potencies, apart from, yet collateral with these efforts and accomplishments, are, on the other hand, insensibly shaping, under the impact of the world political and economic forces, the destiny of that nation, and are influencing the lives and actions of both its government and its people.

To the efforts and accomplishments of those who, aware of the Revelation of Baha'u'llah, are now laboring in that continent, to their present and future course of activity, I have, in the foregoing pages sufficiently referred. A word, if the destiny of the American people, in its entirety, is to be correctly apprehended, should now be said regarding the orientation of that nation as a whole, and the trend of the affairs of its people. For no matter how ignorant of the Source from which those directing energies proceed, and however slow and laborious the process, it is becoming increasingly evident that the nation as a whole, whether through the agency of its government or otherwise, is gravitating, under the influence of forces that it can neither comprehend nor control, towards such associations and policies, wherein, as indicated by Abdu'l-Baha, her true destiny must lie. Both the community of the American believers, who are aware of that Source, and the great mass of their countrymen, who have not as yet recognized the Hand that directs their destiny, are contributing, each in its own way, to the realization of the hopes, and the fulfillment of the promises, voiced in the above-quoted words of Abdu'l-Baha. (Shoghi Effendi [1938], *The Advent Of Divine Justice*, pp.85-87)

38. It is encouraging to those who hold to Americanism that the chief strength of the imperialistic movement calling upon us to depart from our republican ideals, rests upon no ignoble foundation to-day. It is not the desire of gain, as our European critics assert, nor the desire of military glory, which gives vitality to the strange outburst for expansion and the proposed holding of alien races in subjection for their good. The average American, especially in the West, really believes that his country can govern these tropical people, and benefit them by so doing; he considers it a duty not to evade a task which, as he sees it, Providence has clearly imposed upon his country. The writer knows that the cynics, both at home and abroad, but especially the latter, will smile at this statement; but the extent of the ignorance of the American people in general, except in the South, about subject races and tropical conditions, cannot be realized by Europeans. This ignorance is truly as great as their belief implies. Their lack of knowledge is at fault, but the greater this lack the clearer is it that they can be credited with absolute sincerity,

Problem of Race

From the Baha'i perspective, racism is one of the most baneful and persistent evils in society. Racial discrimination is baneful because it violates the dignity of human beings. And yet it persists. Racism is poisonous because it cripples its victims, corrupts its perpetrators, and blights human progress. And yet it persists. Why? We believe that racism persists precisely because it is deeply rooted in outdated attitudes and erroneous beliefs.

Accordingly, any campaign to eradicate racism must change those attitudes and beliefs. Although necessary, political action alone cannot offer a permanent solution. In the Baha'i view, racism will be eliminated only when the peoples of the world are convinced of the oneness of humankind and proceed to reconstruct their lives and their societies on that basis.

The recognition of the oneness of mankind would require the abandonment of all doctrines of superiority, many of which still persist implicitly despite our preoccupation with its more obvious forms such as apartheid. More importantly, by establishing the foundation for true co-operation, the recognition of this principle would raise civilization to a new level. At this higher level, no one need fear oppression, even those who were formerly oppressors. The sharing of power and responsibility among all citizens can then be implemented without fear, through appropriate legal measures and equitable social and economic policies.

(Baha'i International Community [1989], Statement to the forty-fifth session of the United Nations Commission on Human Rights)

--- Page 153. The Gospel of Wealth - VIII Americanism versus Imperialism

and with those very dangerous things when possessed without knowledge, "good intentions." The people of the South, who have knowledge of the problems of race, are with rare unanimity opposed to further accretions, and see it to be a "holy duty" to keep our Republic from further dangers arising from racial differences.

39. Our national history has not been such as to give our people experience in dealing with this new and essentially foreign question, but the American democracy has displayed in all national crises a highly creditable sensitiveness to the moral features of every issue presented. The deciding voice has been that of those who stood for what made toward its abolition until the issue was placed upon high moral grounds. In the issue of secession, patriotism played the first part, but the enthusiasm of the nation was greatly quickened the moment it became a question of the emancipation of the slaves. Even in the recent issue, when the debasement of the standard of value was

Democracy

Question: Is it not a fact that universal peace cannot be accomplished until there is political democracy in all the countries of the world?

Answer: It is very evident that in the future there shall be no centralization in the countries of the world, be they constitutional in government, republican or democratic in form. The United States may be held up as the example of future government--that is to say, each province will be independent in itself, but there will be federal union protecting the interests of the various independent states. It may not be a republican or a democratic form. To cast aside centralization which promotes despotism is the exigency of the time. This will be productive of international peace. Another fact of equal importance in bringing about international peace is woman's suffrage. That is to say, when perfect equality shall be established between men and women, peace may be realized for the simple reason that womankind in general will never favor warfare. Women will not be willing to allow those whom they have so tenderly cared for to go to the battlefield. When they shall have a vote, they will oppose any cause of warfare. Another factor which will bring about universal peace is the linking together of the Orient and the Occident. (Abdu'l-Baha [1912], The Promulgation Of Universal Peace, p.167)

...unlike the paramount principle of democracy by which the elected are constantly responsible to the electors, Baha'i bodies are responsible at all times to the Founder of their Faith and His

proposed, those who stood for the maintenance of the high standard found their strongest weapon when they placed before the people the moral side of the question, and argued that debts contracted in gold should be paid in gold; that the savings of the people deposited in banks in gold should be so repaid; and that the soldiers' pensions should be paid in money equal to any. The justice of the matter, what was right, what was fair, -- in other words, the moral side of the question, - was potent in determining the decision.

teachings. Whereas in democracy the ruling factor at the top can go no higher than their own councils and their decisions are subject to the scrutiny and approval of those they represent, this ruling factor in the Cause of God is at once the servant of all the servants of God - in other words the body of the faithful - but responsible to a higher factor, divinely guided and inspired, the Guardian or sole interpreter, and the Universal House of Justice, the supreme elected body, or sole legislator. It will be seen that in this system the people, divorced from the corrupt influences of nomination, political canvassing and the violence of those whims and dissatisfactions so easily engendered in the masses by the working of the democratic principle alone, are free to choose those they deem best qualified to direct their affairs and safeguard their rights on the one hand, and to protect and serve the interests of the Cause of God on the other.

The elected Baha'i bodies might be likened to a great network of irrigation pipes, selected and put together by the people for their own benefit. but life-giving waters from on high flow through this system, independent of the people, independent of any will of the pipes, and this water is the divinely guided and inspired counsels of the Guardian and the Supreme Body of the Cause, which they receive, in this Baha'i dispensation, from no less a source than the twin Manifestations of God. The system of Baha'u'llah, Shoghi Effendi wrote, "cannot ever degenerate into any form of despotism, of oligarchy, or of demagoguery which must sooner or later corrupt the machinery of all man-made and essentially defective political institutions." (Ruhiiyyih Khanum [1969], *The Priceless Pearl*, p.349)

Moral Laxity

The steady and alarming deterioration in the standard of morality as exemplified by the appalling increase of crime, by political corruption in ever widening and ever higher circles, by the loosening of the sacred ties of marriage, by the inordinate craving for pleasure and diversion, and by the marked and progressive slackening of parental control, is no doubt the most arresting and distressing aspect of the decline that has set in, and can be clearly perceived, in the fortunes of the entire nation. (Shoghi Effendi, *Citadel of Faith*, p. 124)

40. We hear much of the decline of the pulpit in our day, and upon theological questions and dogmas its influence cannot be what it once was. Yet, as far as our country is concerned, I should say that the power of the pulpit upon all moral questions has gained as much as it has lost upon theological issues. It is not less powerful to-day in this domain of the Republic than in Scotland, and far more so than in any other English-speaking country. In such questions its voice has been potent when decisively pronounced upon one side or

--- Page 154. The Gospel of Wealth - VIII Americanism versus Imperialism

the other, as it generally has been; but in regard to Imperialism it has been divided. Bishop Potter, Dr. van Dyke, Dr. Cuyler, Dr. Parkhurst, Dr. Eaton, and others equally prominent stand firmly against it. On the other hand, Bishop Doane, Dr. Lyman Abbott, and others have taken the opposite view, but solely from the standpoint of the good of the subject races, not in the slightest degree for our own advantage.

(12) Carnegie here calls the roll of divines, most of whom were

Decline of the Pulpit

The Pen of the Divine Expounder exhorteth, at this moment, the manifestations of authority and the sources of power, namely the kings and rulers of the earth--may God assist them--and enjoine them to uphold the cause of religion, and to cleave unto it. Religion is, verily, the chief instrument for the establishment of order in the world, and of tranquillity amongst its peoples. The weakening of the pillars of religion hath strengthened the foolish, and emboldened them, and made them more arrogant. Verily I say: The greater the decline of religion, the more grievous the waywardness of the ungodly. This cannot but lead in the end to chaos and confusion. Hear Me, O men of insight, and be warned, ye who are endued with discernment! (Baha'u'llah [1873-1892], Tablets Of Baha'u'llah Revealed After The Kitab-i-Aqdas, pp.63-64)

...the realm of the religionist has gradually narrowed and darkened, and the sphere of the materialist has widened and advanced; for the religionist has held to imitation and counterfeit, neglecting and discarding holiness and the sacred reality of religion. When the sun sets, it is the time for bats to fly. They come forth because they are creatures of the night. When the lights of religion become darkened, the materialists appear. They are the bats of night. The decline of religion is their time of activity; they seek the shadows when the world is darkened and clouds have spread over it.

Baha'u'llah has risen from the eastern horizon. Like the glory of the sun He has come into the world. He has reflected the reality of divine religion, dispelled the darkness of imitations, laid the foundation of new teachings and resuscitated the world. (Abdu'l-Baha [1912], The Promulgation Of Universal Peace, pp.179-180)

Due to theological questions and dogmas its influence (Religion) cannot be what it once was

The beginnings of all great religions were pure; but priests, taking possession of the minds of the people, filled them with dogmas and superstitions, so that religion became gradually corrupt. (Abdu'l-Baha [1911], Abdu'l-Baha in London, p.125)

Many religious leaders have grown to think that the importance of religion lies mainly in the adherence to a collection of certain dogmas and the practice of rites and ceremonies! Those whose souls they profess to cure are taught to believe likewise, and these cling tenaciously to the outward forms, confusing them with the inward truth.

Now, these forms and rituals differ in the various churches and

conspicuous in the Anti-Imperialist League, a spontaneous uprising of intellectuals against "imperialism." At least three were "first citizens of New York City. Henry C. Potter (1835-1908), Episcopalian bishop of New York, a clerical and social liberal and leader in the fight against municipal corruption; Henry Van Dyke (1852-1935), Princeton graduate and pastor of the Brick Presbyterian Church, a fabulous preacher and teacher, a literary man and self-styled "adventurous conservative"; and Charles Henry Parkhurst (1842-1933), pastor of the Madison Square Presbyterian Church, whose blistering sermon (1892) on the alliance between politicians and vice forced him to collect the evidence and brought on the Lexow Investigation (1894) which led to the defeat of Tammany Hall. Theodore Ledyard Cuyler (1822-1909), Princeton graduate, was pastor in the Lafayette Avenue Presbyterian Church, Brooklyn, and a conservative in theology. Homer Eaton (1834-1913) after 1889 was Secretary of the Methodist Book Concern in New York and Treasurer of the denomination's Board of Foreign Missions. The deviant divines were W. C. Doane (1832-1913), first Bishop of the Protestant Episcopal Diocese of Albany, a high churchman with gifts as an administrator; and Lyman Abbott (1835-1922), Congregationalist pastor of the Plymouth Church (Henry W. Beecher's Church) in Brooklyn during the nineties, editor of the Outlook--the new name (1893) of the Christian Union -- and a reconciler of evolution and historic Christianity. Abbott later became a zealous apostle of Theodore Roosevelt.

This view, and this alone, is what gives Imperialism most of its remaining vitality.

amongst the different sects, and even contradict one another; giving rise to discord, hatred, and disunion. The outcome of all this dissension is the belief of many cultured men that religion and science are contradictory terms, that religion needs no powers of reflection, and should in no wise be regulated by science, but must of necessity be opposed, the one to the other. The unfortunate effect of this is that science has drifted apart from religion, and religion has become a mere blind and more or less apathetic following of the precepts of certain religious teachers, who insist on their own favourite dogmas being accepted even when they are contrary to science. This is foolishness, for it is quite evident that science is the light, and, being so, religion truly so-called does not oppose knowledge. (Abdu'l-Baha [1911], Paris Talks, pp.143-144)

41. Here is the essence of the whole matter given by Professor Alden

(13) Raymond M. Alden (1873-1924), later professor at the University of Illinois and at Stanford.

of the University of Pennsylvania:

Apropos of the missionary argument for expansion, the clergyman under whose ministry I sat last Sunday offered the following petition on behalf of the Filipinos:

"We pray thee that those who prefer to remain in darkness, and are even willing to fight in order to do so, may, whether willingly or unwillingly, be brought into the light."

Instantly there came to my mind the naive remark of the pious

--- Page 155. The Gospel of Wealth - VIII Americanism versus Imperialism

author of the "Chanson de Roland," in describing one of the victories of Charlemagne over the Mussulmans:

"...willingly or unwillingly, be brought into the light" and also

"There was not a pagan left in the city who was not either killed or made a Christian."

There is really no justification in all the religious teachings that justify force or compulsion in advancing your religious beliefs. No doubt some who have conquered in the "Name of God" probably earnestly felt they were doing "God's Will." It's interesting to note how many of these colonial powers "justified" their Imperialism by getting the blessings of the Church. Thus they could derive moral satisfaction and at the same time garner land and wealth. They really could "have their cake, and eat it too" - so to speak. The Eagles phrased it in a song -

We satisfy our endless needs and justify our bloody deeds.
In the name of destiny and in the name of God.
(The Eagles, The Last Resort)

Do not quarrel with anybody, and shun every form of dispute. Utter the Word of God. If he accepteth it the desired purpose is attained, and if he turneth away leave him to himself and trust to God. (Abdu'l-Baha, Selections from the Writings of Abdu'l-Baha, p. 210)

Let there be no compulsion in Religion. Now is the right way made distinct from error. (The Qur'an (Rodwell tr), Sura 2 - The Cow)

For it is impossible to keep the Law without Christ, though man may, for the sake of honor or property, or from fear of punishment, feign outward holiness. The heart which does not discern God's grace in Christ cannot turn to God nor trust in him; it cannot love his commandments and delight in them, but rather resists them. For nature rebels at compulsion (Sermons of Martin Luther, Twofold Use of Law & Gospel, Letter and Spirit)

remes paien
Ne seit ocis, o
devient crestiens.

That is to say: "There was not a pagan left in the city who was not either killed or made a Christian." So may it be in Manila, when a similar dilemma is prepared for its inhabitants.

42. Bishop Doane is the most prominent representative of the religious world who upholds the missionary view, and he would probably hesitate to push it to its logical conclusion, as his less known ministerial adherent does. The Bishop gives the argument of "Duty" in the following:

Bishop Doane says that precedent seems to indicate that both by the inherent national right of sovereignty and under the existing Constitution we can provide for the government of the people whom we have rescued, but that if this supposition shall be found untrue, "then we must remember that, in the emergency, national life and duty are more

If priests of religion really adored the God of love and served the Divine Light, they would teach their people to keep the chief Commandment, 'To be in love and charity with all men'. But we find the contrary, for it is often the priests who encourage nations to fight. Religious hatred is ever the most cruel! (Abdu'l-Baha, Paris Talks, p. 147)

important than the letter of a document, and that the Constitution, not being, as some people seem to think it, a close and final revelation of God, can be amended.

... No difficulties and no anxieties can alter the facts or change the situation or put back the advancing movement of God's will, which tends to the final substitution of the civilization, the liberty, and the religion of English-speaking people for the lost domination of the Latin races and the Latin religion. God has called the people in America to be his instruments in a movement perhaps even greater in its consequences than the Reformation in England or the liberation of Italy or the unification of Germany, and in the spirit of dependence on Him, with the quiet courage of patient faith, we must rise to the duty of the hour."

43. It is with the view Bishop Doane presents that we anti-Imperialists have to deal, not with spouting party politicians waving the flag, and descending to clap-trap phrases to "split the ears of the groundlings." In the Bishop's words we see some reason for the charge sometimes made against ecclesiastics, viz., that, their attention being chiefly fixed upon the other world, they seldom shine as advisers upon affairs pertaining to this. The Bishop's remedy for overcoming constitutional obstacles, for instance, is easily sug-

--- Page 156. The Gospel of Wealth - VIII Americanism versus Imperialism

gested; but such an amendment to the Constitution is impossible, since upon this question all the Southern States are attached to its present provisions, and against "rescuing" and governing subject races by force. Having in their own land some experience of race problems of which the North and West are ignorant, they stand for the old Americanism. Then, again, the Bishop reveals to us "God's will," which, he informs us, "tends to the final

Liberty

That which beseemeth man is submission unto such restraints as will protect him from his own ignorance, and guard him against the harm of the mischief-maker. Liberty causeth man to overstep the bounds of propriety, and to infringe on the dignity of his station. It debaseth him to the level of extreme depravity and wickedness.

Regard men as a flock of sheep that need a shepherd for their protection. This, verily, is the truth, the certain truth. We approve of liberty in certain circumstances, and refuse to sanction it in others. We, verily, are the All-Knowing.

Say: True liberty consisteth in man's submission unto My commandments, little as ye know it. Were men to observe that which We have sent down unto them from the Heaven of Revelation, they would, of a certainty, attain unto perfect liberty. Happy is the man that hath apprehended the Purpose of God in whatever He hath revealed from the Heaven of His Will, that pervadeth all created things. Say: The liberty that profiteth you is to be found nowhere except in complete servitude unto God, the Eternal Truth. Whoso hath tasted of its sweetness will refuse to barter it for all the dominion of earth and heaven. (Baha'u'llah, Gleanings from the Writings of Baha'u'llah, p. 336)

"...a layman who cannot pretend to know the designs of the Creator"

He hath endowed every soul with the capacity to recognize the signs of God. How could He, otherwise, have fulfilled His testimony unto men, if ye be of them that ponder His Cause in their hearts. He will never deal unjustly with any one... (Baha'u'llah, Gleanings from the Writings of Baha'u'llah, p. 106)

Know thou that the ear of man hath been created that it may hearken unto the Divine Voice on this Day that hath been mentioned in all the Books, Scriptures, and Tablets. (Baha'u'llah, Epistle to the Son of the Wolf, p. 2)

The Word of God may be likened unto a sapling, whose roots have been implanted in the hearts of men. (Baha'u'llah, Gleanings from the Writings of Baha'u'llah, p. 97)

He hath moreover deposited within the realities of all created things the emblem of His recognition... (The Bab, Selections from the Writings of the Bab, p. 112)

substitution of the civilization, the liberty, and the religion of English-speaking people for the lost domination of the Latin races and the Latin Catholic religion." It may be open even for a layman who cannot pretend to know the designs of the Creator to observe that, in the case of the tropics, the Unknown Power seems to have placed an insurmountable barrier against the English-speaking race. Professor Worcester,

(14) Dean C. Worcester (1866-1924), born in Thetford, Vermont, and educated there and at the University of Michigan, was a naturalist on the Michigan faculty and participator in scientific expeditions to the Philippine Islands in the eighties. In 1898, he published a book, The Philippine Islands and Their People, which came to the attention of President McKinley; not surprisingly, he appointed Worcester in January 1899 a member of the Philippine Commission, one of the three civilians. The duties of this group were to determine how American "authority" should be extended humanely over the islands. Worcester believed the United States must retain the islands and govern them for a considerable period. He remained on the Commission until 1913 and served as Secretary of the Interior in the Philippine Insular Government from 1901 to 1913. Worcester's opinion, here quoted by Carnegie, is in the former's volume, p. 67. It reads, "It is doubtful, in my judgment, if many successive generations of European or American children could be reared there."

who knows most about the Philippines, tells us that our

“...perhaps the Bishop may have misinterpreted God's will.”

Misinterpreting the divine commands, men have acquired prejudices and on these prejudices they have waged religious wars and caused bloodshed. Behold what is happening to-day! Men are killing their brothers, believing this to be the cause of salvation, believing that such work is approved by God, believing that those whom they kill will be sent to hell. (Abdu'l-Baha [1912], Divine Philosophy, p. 101)

Look at the Gospel of the Lord Christ and see how glorious it is! Yet even today men fail to understand its priceless beauty, and misinterpret its words of wisdom.

Christ forbade war! When the disciple Peter, thinking to defend his Lord, cut off the ear of the servant of the High Priest, Christ said to him: 'Put up thy sword into the sheath'. [1] Yet, in spite of the direct command of the Lord they profess to serve -- men still dispute, make war, and kill one another, and His counsels and teaching seem quite forgotten. [1 St John xviii, 11.] (Abdu'l-Baha [1911], Paris Talks, p. 48)

“In my travels, I have found the universal laws everywhere working to higher and higher standards of national life.”

Therefore, no one should glorify himself over another; no one should manifest pride or superiority toward another; no one should look upon another with scorn and contempt; and no one should deprive or oppress a fellow creature. All must be considered as submerged in the ocean of God's mercy. (Abdu'l-Baha [1912], The Promulgation of Universal Peace, p. 63)

Throughout past centuries each system of religious belief has boasted of its own superiority and excellence, abasing and scorning the validity of all others. Each has proclaimed its own belief as the light and all others as darkness. Religionists have considered the world of humanity as two trees: one divine and merciful, the other satanic; they themselves the branches, leaves and fruit of the divine tree and all others who differ from them in belief the product of the tree which is satanic. Therefore, sedition and warfare, bloodshed and strife have been continuous among them. The greatest cause of human alienation has been religion because each party has considered the belief of the other as anathema and deprived of the mercy of God. (Abdu'l-Baha [1912], The Promulgation of Universal Peace, p. 230)

“...genuine faith in the divine government throughout all the world”

... the manifold bounties of the Lord of all beings have, at all times,

race cannot settle there and make permanent homes; neither can it in other parts of the tropics, nor has it ever done so. It has tried to do so in India, but failed. If a British child be born there, it must be sent home. In the Philippines it is even worse. Can Bishop Doane point to any considerable or successful settlement of our race in the tropics? He cannot do so, and this fact would seem to imply that perhaps the Bishop may have misinterpreted God's will. It would seem that, perhaps, in his own way he intends the people he has placed in the tropics to develop a

--- Page 157. The Gospel of Wealth - VIII Americanism versus Imperialism

civilization for themselves, and is keeping his loving, fatherly eye upon his children there just as tenderly as upon the Bishop. In my travels, I have found the universal laws everywhere working to higher and higher standards of national life. All the world steadily improves. Only impatient men, destitute of genuine faith in the divine government throughout all the world, doubt that all goes well. The Bishop's eminent colleague, Bishop Potter, sees "God's will," our "holy duty,"

through the Manifestations of His Divine Essence, encompassed the earth and all that dwell therein. Not for a moment hath His grace been withheld, nor have the showers of His loving-kindness ceased to rain upon mankind. (Baha'u'llah, Gleanings from the Writings of Baha'u'llah, p. 18)

There can be no doubt whatever that if for one moment the tide of His mercy and grace were to be withheld from the world, it would completely perish. For this reason, from the beginning that hath no beginning the portals of Divine mercy have been flung open to the face of all created things, and the clouds of Truth will continue to the end that hath no end to rain on the soil of human capacity, reality and personality their favors and bounties. Such hath been God's method continued from everlasting to everlasting. (Baha'u'llah, Gleanings from the Writings of Baha'u'llah, p. 68)

‘When bishops in the same church disagree, it is difficult to decide.’

If reason is the perfect standard and criterion of knowledge, why are opinions at variance and why do philosophers disagree so completely with each other? This is a clear proof that human reason is not to be relied upon as an infallible criterion. (Abdu'l-Baha, Baha'i World Faith - Abdu'l-Baha Section, p. 252)

No two men can be found who may be said to be outwardly and inwardly united. (Baha'u'llah, Tablets of Baha'u'llah, p. 163)

The subject of “interpretation” has led mankind astray from the true intent of the Prophets throughout history. In this day and age Baha’u’llah has revealed the “Covenant” so that these differences may disappear by submitting to an external and infallible authority.

Inasmuch as there was no appointed explainer of the Book of Christ, everyone made the claim to authority, saying, "This is the true pathway and others are not." To ward off such dissensions as these and prevent any person from creating a division or sect the Blessed Perfection, Baha'u'llah, appointed a central authoritative Personage, declaring Him to be the expounder of the Book. This implies that the people in general do not understand the meanings of the Book, but this appointed One does understand. Therefore, Baha'u'llah said, "He is the explainer of My Book and the Center of My Testament." In the last verses of the Book instructions are revealed, declaring that, "After Me," you must turn toward a special Personage and "whatsoever He says is correct." In the Book of the Covenant Baha'u'llah declares that by these two verses this Personage is meant. (Abdu'l-Baha, The Promulgation of Universal Peace, p. 382)

so differently from Bishop Doane. When bishops in the same church disagree, it is difficult to decide.

44. Perhaps we are not justified in quoting Dr. Abbott as still an Imperialist, since his latest article in the Outlook is entitled "An Official Disclaimer of Imperialism." After quoting the Cuban Resolution passed by Congress, he asks:

Why should not Congress at the present juncture pass a similar resolution respecting the Philippines? ...When pacification is secured, our mission is at an end. ... The above resolution respecting Cuba was simply an affirmation of the principles of this government wrought into its Constitution, vital to its life, affirmed and reaffirmed at many periods of its history. It denies that we wish either to hold people in subjection or to possess their territory as our own. Under circumstances do the American people desire to hold under military government against their will a discontented and resisting people.

[Baha'i Comment](#)

*(15) In the Outlook, LXI,
207 f.*

45. These sentiments justify the title. They are indeed a disclaimer, of Imperialism, but it seems that, like Bishop Potter, Dr. Abbott has not been favored with the revelation of God's will made to Bishop Doane, for, according to him, "whenever the subject races are pacified our mission ends"; while it is only after pacification that the Bishop's "Holy Mission" can begin to enforce "God's will" by the crusade against the Catholic (Latin) form of religion, for the introduction of "the religion of English-speaking people," of which we have in our land more than two hundred and fifty different forms, all used and loved by those who speak the English tongue.

--- Page 158. The Gospel of Wealth - VIII Americanism versus Imperialism

Even our valued Catholic friends are often "English-speaking people."

"...two hundred and fifty different forms (of the english speaking divisions of Christianity)."

Religious wars have been many. Nine hundred thousand martyrs to the Protestant cause was the record of conflict and difference between that sect of Christians and the Catholics. Consult history and confirm this. How many languished in prisons! How merciless the treatment of captives! All in the name of religion! Consider and estimate the outcome of other wars between the people and sects of religious belief.

From the beginning of human history down to this time the world of humanity has not enjoyed a day of absolute rest and relaxation from conflict and strife. Most of the wars have been caused by religious prejudice, fanaticism and sectarian hatred. Religionists have anathematized religionists, each considering the other as deprived of the mercy of God, abiding in gross darkness and the children of Satan. (Abdu'l-Baha, The Promulgation of Universal Peace, p. 265)

46. Nevertheless, we must recognize that, diametrically opposed as Bishop Doane and his school, and Dr. Abbott and his school are in their conclusions, they both have as their aim what they believe to be the good of the poor backward races, and neither pecuniary gain nor military glory for their own country. None of these earnest, good men have anything in common with the ranting political school. They see only serious and unsought "duty" where the others find "gain" or "glory," if not for the nation, at least for themselves as politicians.

[Baha'i Comment](#)

47. Imperialism can become a "holy duty" only if we can by forcible interference confer blessings upon the subject races; otherwise it remains what the President once said it was, "criminal aggression." Let us see, therefore, whether good or evil flows from such interference. This is easily ascertained, for there are many dependencies of European powers throughout the world, and many races held in subjection. Has the influence of the superior race upon the inferior ever proved beneficial to either? I know of no case in which it has been or is, and I have visited many of the dependencies. Where is

Superior Race

Anthropology, physiology, psychology, recognize only one human species, albeit infinitely varied in the secondary aspects of life. Recognition of this truth requires abandonment of prejudice -- prejudice of every kind -- race, class, colour, creed, nation, sex, degree of material civilization, everything which enables people to consider themselves superior to others.

Acceptance of the oneness of mankind is the first fundamental prerequisite for reorganization and administration of the world as one country, the home of humankind. Universal acceptance of this spiritual principle is essential to any successful attempt to establish world peace.... (The Universal House of Justice [1995], The Promise of World Peace)

there anything to show that it has been? On the contrary, the mass of authority declares that the influence of a superior race upon an inferior in the tropics is not elevating, but demoralizing. It is not difficult to understand why. Take the Philippines, for instance. The prevailing religion is our own Christian religion, Catholic, of course, but Christian, as in France and Belgium. In the interior there are Mohammedans, next in importance. Mr. Bray, the resident English consul, gives in the Independent a picture of happy life in Manila, which reminded me of what I had found in the East.

(16) Howard W. Bray, British consul at Singapore and a behind-the-scenes negotiator between the Americans and the Filipinos, published "The Character and Rights of the Filipinos," in the Independent, L (1898), 1312-1316.

--- Page 159. The Gospel of Wealth - VIII Americanism versus Imperialism

48. One of the great satisfactions in traveling around the world is in learning that God has made all peoples happy in their own homes. We find no people in any part of the world desirous of exchanging their lot with any other. My own experience has

“...God has made all peoples happy in their own homes.”

...to interfere with matters of conscience is simply to give them [peoples who have a religion forced upon them without free-will] greater currency and strength; the more you strive to extinguish the more will the flame be kindled, more especially in matters of faith and religion, which spread and acquire influence so soon as blood is shed, and strongly affect men's hearts. (Abdu'l-Baha, A Traveller's Narrative, p. 21)

Convictions and ideas are within the scope of the comprehension of the King of kings [God], not of kings; and soul and conscience are between the fingers of control of the Lord of hearts, not of [His] servants. (Abdu'l-Baha, A Traveller's Narrative, p. 91)

impressed this truth very strongly upon me. Upon our journey to the North Cape, we stopped in the Arctic Circle to visit a camp of Laplanders in the interior. A guide is provided, with instructions to keep in the rear of the hindmost of the party going and returning, to guard against any being left behind. Returning from the camp, I walked with this guide, who spoke English and had traveled the world round in his earlier years as a sailor, and was proud to speak of his knowing New York, Boston, New Orleans, and other ports of ours. Reaching the edge of the fiord, and looking down upon it, we saw a hamlet upon the opposite side, and one two-story house under construction, with a grass-plot surrounding it, a house so much larger than any of the adjacent huts that it betokened great wealth. Our guide explained that a man had made a great fortune. He was their multi-millionaire, and his fortune was reported to reach no less a figure than thirty thousand kroner (seven thousand five hundred dollars), and he had returned to his native place of Tromso to build this "palace" and spend his days there. Strange preference for a night six months long! But it was home. I asked the guide which

The Old Testament says that God created man like unto His own image; in the Qur'an it says: "There is no difference in the Creation of God!" Think well, God has created all, cares for all, and all are under His protection. The policy of God is better than our policy. We are not as wise as God! (Abdu'l-Baha [1911], Abdu'l-Baha in London, p. 55)

The Cause of God has room for all. It would, indeed, not be the Cause of God if it did not take in and welcome everyone -- poor and rich, educated, and ignorant, the unknown and the prominent -- God surely wants them all, as He created them all." (From a letter written on behalf of Shoghi Effendi to two individual believers, December 2, 1942: The Individual and Teaching, p. 25)

...the Essence of Divinity, the Sun of Truth, shines forth upon all horizons and is spreading its rays upon all things. Each creature is the recipient of some portion of that power, and man, who contains the perfection of the mineral, the vegetable and animal, as well as his own distinctive qualities, has become the noblest of created beings. (Abdu'l-Baha [1911], Abdu'l-Baha in London, p. 23)

place in all the world he would select if ever he made such a fortune - with a lingering hope that he would name some place in our own favored land. How could he help it? But his face beamed with pleasure at the idea of ever being rich, and he said finally: "Ah, there is no place like Tromso!"

49. Traveling in southern India, one day I was taken into the country to see tapioca roots gathered and ground for use. The adults working in the grove, men and women, had each a rag around the loins, but the boys and girls, with their black, glossy skins, were free of all encumbrance. Our guide explained to these people that we were from a country so

--- Page 160. The Gospel of Wealth - VIII Americanism versus Imperialism

far away, and so different from theirs, that the waters were sometimes made solid by the extreme cold and we could walk upon them; that sometimes it was so intensely cold that the rain was frozen into particles, and lay on the earth so deep that people could not walk through it, and that three and four layers of heavy clothes had to be worn. This happy people, as our

[Baha'i Comment](#)

guide told us, wondered why we stayed there, why we did not come and enjoy life in their favored clime.

50. It is just so with the Philippines to-day, as one can see from Mr. Pray's account of them. It is astonishing how much all human beings the world round are alike in their essentials. These peoples love their homes and their country, their wives and children, as we do, and they have their pleasures. If, in our humanitarian efforts and longing to benefit them, under the call of duty or destiny, we should bring a hundred to New York, give them fine residences on Fifth Avenue, a fortune conditioned upon their remaining, and try to "civilize" them, as we should say, they would all run away if not watched, and risk their lives in an attempt to get back to their own civilization, which God has thought best to provide for them in the Philippines. They have just the same feelings as we have, not excluding love of country, for which, like ourselves, as we see, they are willing to die. Oh, the pity of it! the pity of it! that Filipino mothers with American mothers equally mourn their lost sons -- one fallen, defender of his country; the other the

"...all human beings the world round are alike in their essentials."

He looketh on all things with the eye of oneness, and seeth the brilliant rays of the divine sun shining from the dawning-point of Essence alike on all created things, and the lights of singleness reflected over all creation. (Baha'u'llah, The Seven Valleys, p. 18)

All (people) were created alike by the (the blow of the) breath of His command, and the loftiness, exaltation and debasement appeared among the people after they had been created. (Compilations, Baha'i Scriptures, p. 200)

Love of Country

Though loyal to their respective governments, though imbued with the love of their own country, and anxious to promote at all times, its best interests, the followers of the Baha'i Faith, nevertheless, viewing mankind as one entity, and profoundly attached to its vital interests, will not hesitate to subordinate every particular interest, be it personal, regional or national, to the over-riding interests of the generality of mankind, knowing full well that in a world of interdependent peoples and nations the advantage of the part is best to be reached by the advantage of the whole, and that no lasting result can be achieved by any of the component parts if the general interests of the entity itself are neglected.... (Shoghi Effendi [1941], The Promised Day is Come, p. vi)

Patriotic love is finite; the love of one's country causing hatred of all others, is not perfect love! Compatriots also are not free from quarrels amongst themselves. (Abdu'l-Baha [1911], Paris Talks, p. 36)

Of old it hath been revealed: "Love of one's country is an element of the Faith of God." The Tongue of Grandeur hath, however, in the day of His manifestation proclaimed: "It is not his to boast who loveth his country, but it is his who loveth the world." Through the power released by these exalted words He hath lent a fresh impulse, and set a new direction, to the birds of men's hearts, and hath obliterated every trace of restriction and limitation from God's holy Book. (Baha'u'llah, Gleanings from the Writings of Baha'u'llah, p. 95)

invader. Yet the invader was ordered by those who see it their "duty" to invade the land of the Filipinos for their civilization. Duty, stern goddess, what strange things men sometimes do in thy name!

The Faith of Islam, the succeeding link in the chain of Divine Revelation, introduced, as Baha'u'llah Himself testifies, the conception of the nation as a unit and a vital stage in the organization of human society, and embodied it in its teaching. This indeed is what is meant by this brief yet highly significant and illuminating pronouncement of Baha'u'llah: "Of old [Islamic Dispensation] it hath been revealed: 'Love of one's country is an element of the Faith of God.'" This principle was established and stressed by the Apostle of God, inasmuch as the evolution of human society required it at that time. Nor could any stage above and beyond it have been envisaged, as world conditions preliminary to the establishment of a superior form of organization were as yet unobtainable. The conception of nationality, the attainment to the state of nationhood, may, therefore, be said to be the distinguishing characteristics of the Muhammadan Dispensation, in the course of which the nations and races of the world, and particularly in Europe and America, were unified and achieved political independence. (Shoghi Effendi [1941], *The Promised Day is Come*, p. 120)

Essential Unity

In a letter addressed to Queen Victoria over a century ago, and employing an analogy that points to the one model holding convincing promise for the organization of a planetary society, Bahá'u'lláh compared the world to the human body. There is, indeed, no other model in phenomenal existence to which we can reasonably look. Human society is composed not of a mass of merely differentiated cells but of associations of individuals, each one of whom is endowed with intelligence and will; nevertheless, the modes of operation that characterize man's biological nature illustrate fundamental principles of existence. Chief among these is that of unity in diversity. Paradoxically, it is precisely the wholeness and complexity of the order constituting the human body -- and the perfect integration into it of the body's cells -- that permit the full realization of the distinctive capacities inherent in each of these component elements. No cell lives apart from the body, whether in contributing to its functioning or in deriving its share from the well-being of the whole. The physical well-being thus achieved finds its purpose in making possible the expression of human consciousness; that is to say, the purpose of biological development transcends the mere existence of the body and its parts.

What is true of the life of the individual has its parallels in human society. The human species is an organic whole, the leading edge of the evolutionary process. That human consciousness necessarily operates through an infinite diversity of individual minds and motivations detracts in no way from its essential unity. Indeed, it is precisely an inhering diversity that distinguishes unity from homogeneity or uniformity. What the peoples of the world are today

experiencing, Bahá'u'lláh said, is their collective coming-of-age, and it is through this emerging maturity of the race that the principle of unity in diversity will find full expression. From its earliest beginnings in the consolidation of family life, the process of social organization has successively moved from the simple structures of clan and tribe, through multitudinous forms of urban society, to the eventual emergence of the nation-state, each stage opening up a wealth of new opportunities for the exercise of human capacity. (Baha'i International Community [1995]: The Prosperity of Humankind ")

51. Another reason which, we submit, renders it beyond our power to benefit these people is that, with the exception of a few men seeking their own gain, the only Americans whom the Filipinos can ever know must be our soldiers, for American women and children cannot make their homes there. No holy influence flowing from American homes, no Christian women, no sweet children; nothing there but men and

--- Page 161. The Gospel of Wealth - VIII Americanism versus Imperialism

soldiers, the former only a few adventurers who, failing to succeed at home, thought they could make money there. Now, every writer upon the subject tells that the presence of soldiers in any town in the tropics is disastrous to both native and foreigner; that the contact of the superior race with the inferior demoralizes both, for reasons well

Baha'i Comment

understood. Forty-six per cent of the British army in India is at all times diseased. What imperialistic clergyman or intelligent man but knows the soldiers in foreign camps, so far from being missionaries for good, require missionaries themselves more than the natives? It would all be so different if Americans could settle and establish their homes in the Philippines, and amalgamate with the people, making a colony. It is in colonies, not in dependencies, that Britain has done good work. Soldiers will not benefit the inferior race in the Philippines. Men there for gain will not. Missionaries there are already in abundance. Beyond a few of a different sect of Christianity, we have nothing more we can send, and these will find welcome there if we cease warfare upon the people, while to-day they would be regarded as enemies. It is not civilization, not improvement, therefore, that Imperialism can give to the Philippines, should we hold permanent possession. It is serious injury both to the Filipinos and to our soldiers, and to the American citizens who go there. It is a bad day for either soldier or business man when, in a foreign land, he is bereft of the elevating influences which center in the home.

52. The religious school of Imperialists intends doing for the Filipinos what is best for them, no doubt; but when we crush in any people its longing for independence, we take away with one hand a more powerful means of civilization than all which it is possible for us to bestow with the other. There is implanted in the breast of every human community the sacred germ of self-government, as the most potent means of Providence for raising them in the scale of being. Any ruler, be he President or Czar, who attempts to suppress the growth

--- Page 162. The Gospel of Wealth - VIII Americanism versus Imperialism

of this sacred spark is guilty of the greatest of public crimes. There is no people or tribe, however low in the scale, that does not have self-government in a greater or less degree. The Haitians and the San Domingans do not require our interference. Why is it not seen to be our duty to force our ideas upon these, our neighbors? The Filipinos are not inferior to these people. On the contrary, we have Admiral Dewey and General Merritt

[Baha'i Comment](#)

*(17) Wesley Merritt (1834-1910),
commander of the first Philippine
Expedition in the Spanish-
American War.*

both stating that the Filipinos are more capable of self-government than the Cubans. It may be taken as a truism that a people which is willing to fight and to die for the independence of their country is at least worthy of a trial of the self-government it seeks. The Filipinos have done this. Even if they had not, it is better for the development of a people that they should attempt to govern themselves, this being the only school in which they can ever learn to do so. No matter through what years of failure they have to struggle, the end is certain, the successful development of the faculty of government. Through this stern but salutary school our own race traveled for centuries in Britain, with varying fortunes, but the end was the evolution of constitutional government. The cost is great, but the result is beyond price. No superior race ever gave it to an inferior without settling among and amalgamating with that race. In the Philippines, and in the tropics generally, this is impossible. The intruding race cannot be grown there, and where we cannot grow our own race we

cannot give civilization to the other. We can only retard, not hasten, their development.

53. India has been subject to British rule for nearly two hundred years, and yet not one piece of artillery can yet be intrusted to native troops. The people have still to be held down as in the beginning. It is so in every dependency in which the superior power assumes the right to govern the inferior, without being able to settle there and amalgamate

--- Page 163. The Gospel of Wealth - VIII Americanism versus Imperialism

with it. We challenge the Imperialist to give one instance to the contrary in all Britain's possessions.

The Press

The press will, under such a system [world commonwealth], while giving full scope to the expression of the diversified views and convictions of mankind, cease to be mischievously manipulated by vested interests, whether private or public, and will be liberated from the influence of contending governments and peoples. (Shoghi Effendi [1936], The World Order of Baha'u'llah, p. 204)

As to manner and style, Baha'u'llah has exhorted "authors among the friends" to "write in such a way as would be acceptable to fair-minded souls, and not lead to cavilling by the people". And He issues a reminder: "We have said in the past that one word hath the influence of spring and causeth hearts to become fresh and verdant, while another is like unto blight which causeth the blossoms and flowers to wither."

In the light of all this, the code of conduct of the press must embrace the principles and objectives of consultation as revealed by Baha'u'llah. Only in this way will the press be able to make its full contribution to the preservation of the rights of the people and become a powerful instrument in the consultative processes of society, and hence for the unity of the human race. (Letters of The Universal House of Justice, 1988 Dec 29, Individual Rights and Freedoms, p. 10)

Conscience of Man

...those time-honored and powerful strongholds of orthodoxy, whose deliberate aim is to maintain their stranglehold over the thoughts and consciences of men (Shoghi Effendi [1936], The World Order of Baha'u'llah, p. 17)

"The Call of God," Abdu'l-Baha has written, "when raised, breathed a new life into the body of mankind, and infused a new spirit into the whole creation. It is for this reason that the world hath been moved to its depths, and the hearts and consciences of men been quickened. Ere long the evidences of this regeneration will be revealed, and the fast asleep will be awakened." (Shoghi Effendi [1936], The World Order of Baha'u'llah, p. 169)

54. The impulse which carried many clergymen and other good people away at first was creditable to their hearts and emotions. But Dr. Abbott's remarkable article just quoted may be taken as evidence that the reason is now demanding audience, and not what we should like to do, but what conditions render it possible for us to do, or wisely undertake, is now to be soberly considered.

[Baha'i Comment](#)

55. The press also, like the pulpit, has done its part to stir the impulse to meet the demands of the "New Destiny"; but one of the most prominent organs of all in this work, and the leading government organ in the West, the "Times-Herald" of Chicago, - to judge from a recent editorial, - is also finding its hot passion chilled at the throne of reason, as it confronts and examines the conditions of the situation. It says:

The conscience of the American people will not tolerate the slaughter of Filipinos in a war of conquest. We do not seek their land; we do not wish to replace the yoke of Spain with one bearing the more merciful and just label of

Conscience

Conscience, however, is not an unchangeable absolute. One dictionary definition, although not covering all the usages of the term, presents the common understanding of the word "conscience" as "the sense of right and wrong as regards things for which one is responsible; the faculty or principle which pronounces upon the moral quality of one's actions or motives, approving the right and condemning the wrong".

The functioning of one's conscience, then, depends upon one's understanding of right and wrong; the conscience of one person may be established upon a disinterested striving after truth and justice, while that of another may rest on an unthinking predisposition to act in accordance with that pattern of standards, principles and prohibitions which is a product of his social environment. Conscience, therefore, can serve either as a bulwark of an upright character or can represent an accumulation of prejudices learned from one's forebears or absorbed from a limited social code. (Letters of The Universal House of Justice, 1992 Dec 10, Issues Related to Study Compilation)

the United States. Let the President announce that we have no intention to annex Asiatic territory, and that the pledge of Congress as to Cuban independence will be the pledge of the American nation to the Philippines.

56. If the President had said this in his message to the Filipinos there could not to-day rise before him the specter of nearly five thousand human beings "mowed down like grass," as the cable describes, and sixty of our own fellow citizens sacrificed and several hundreds wounded.

(18) On September 15, 1898, the Filipinos declared their independence. On February 4, 1899, fighting broke out between them and American troops.

This is the effect of his failure to say to the one people what he said to the other. His responsibility is great.

[Baha'i Comment](#)

57. I write upon the eve of the birthday of the greatest public man of the century, perhaps of all the centuries, if his strange history be considered - Abraham Lincoln. Washington, Franklin, and Jefferson may have become 'back num-

--- Page 164. The Gospel of Wealth - VIII Americanism versus Imperialism

bers," as we have been often told, for, as men of the past century, they could not know our destiny; but here is the man of our own time, whom many of us were privileged to know. Are his teachings to be discarded for those of any now living who were his contemporaries? Listen to him: "No man is good enough to govern another without that man's consent. I say this is the leading principle, the sheet-anchor of American republicanism."

(19) From Lincoln's speech at Peoria, October 18, 1854.

It is not fashionable for the hour to urge that the "consent of the governed" is all-important; but it will be fashionable again one of these days.

[Baha'i Comment](#)

58. It seems as if Lincoln were inspired to say the needful word for this hour of strange subversion of all we have hitherto held dear in our political life. Our "duty" to bear the "White Man's Burden"

(20) Title of the much-quoted Kipling poem.

is to-day's refrain, but Lincoln tells us: "When the white man governs himself, that is self-government; but when he governs himself and also governs another man, that is more than self-government; that is despotism." Lincoln knew nothing of the new "Duty" and new "Destiny," or whether it is "Duty which makes Destiny" or "Destiny which makes Duty"; but he knew the old doctrines of Republicanism well.

Despotism

Will the despotism of former governments answer the call for freedom which has risen from the heart of humanity in this cycle of illumination? It is evident that no vital results are now forthcoming from the customs, institutions and standpoints of the past. In view of this, shall blind imitations of ancestral forms and theological interpretations continue to guide and control the religious life and spiritual development of humanity today? Shall man, gifted with the power of reason, unthinkingly follow and adhere to dogma, creeds and hereditary beliefs which will not bear the analysis of reason in this century of effulgent reality? (Abdu'l-Baha [1912], *Promulgation Universal Peace*; p. 140-141)

Republicanism

Although a republican form of government profiteth all the peoples of the world, yet the majesty of kingship is one of the signs of God. We do not wish that the countries of the world should remain deprived thereof. If the sagacious combine the two forms into one, great will be their reward in the presence of God. (Baha'u'llah, *Tablets of Baha'u'llah*, p. 28)

It is very evident that in the future there shall be no centralization in the countries of the world, be they constitutional in government, republican or democratic in form. The United States may be held up as the example of future government -- that is to say, each province will be independent in itself, but there will be federal union protecting the interests of the various independent states. It may not be a republican or a democratic form. To cast aside centralization which promotes despotism is the exigency of the time. This will be productive of international peace. (Abdu'l-Baha [1912], *The Promulgation of Universal Peace*, p. 167)

No Baha'i can be regarded as either a Republican or Democrat, as such. He is above all else, the supporter of the principles enunciated by Baha'u'llah, with which, I am firmly convinced, the programme of no political party is completely harmonious... (*Principles of Bahai Administration*, p. 29)

59. One other lesson from the great American: "Our reliance is in the love of liberty which God has planted in us. Our defense is in the spirit which prizes liberty as the heritage of all men in all lands everywhere. Those who deny freedom to others deserve it not for themselves, and under a just God cannot long retain it."

(21) This is somewhat inaccurately quoted from Lincoln's speech at Edwardsville, Illinois, September 11, 1858.

60. Are these broad liberty-loving and noble liberty-giving principles of Americanism, as proclaimed by President Lincoln, to be discarded for the narrow liberty-denying, race-subjecting Imperialism of President McKinley when the next appeal is made to the American people? We have never for

--- Page 165. The Gospel of Wealth - VIII Americanism versus Imperialism

one moment doubted the answer; for they have never yet failed to decide great issues wisely nor to uphold American ideals.

Justice

O SON OF SPIRIT! The best beloved of all things in My sight is Justice; turn not away therefrom if thou desirest Me, and neglect it not that I may confide in thee. By its aid thou shalt see with thine own eyes and not through the eyes of others, and shalt know of thine own knowledge and not through the knowledge of thy neighbor. Ponder this in thy heart; how it behooveth thee to be. Verily justice is My gift to thee and the sign of My loving-kindness. Set it then before thine eyes. (Baha'u'llah, The Hidden Words of Baha'u'llah, p.3)

The light of men is Justice. Quench it not with the contrary winds of oppression and tyranny. The purpose of justice is the appearance of unity among men. The ocean of divine wisdom surgeth within this exalted word, while the books of the world cannot contain its inner significance. Were mankind to be adorned with this raiment, they would behold the day-star of the utterance, 'On that day God will satisfy everyone out of His abundance,' [1 cf. Qur'an 4:129.] shining resplendent above the horizon of the world. Appreciate ye the value of this utterance; it is a noble fruit that the Tree of the Pen of Glory hath yielded. (Baha'u'llah, Tablets of Baha'u'llah, p. 67)

American Ideals

When I arrived in this country, I realized that American ideals are indeed most praiseworthy and that the people here are lovers of truth. They investigate reality, and there is no trace of fanaticism among them. Today the nations of the world are on the verge of war, influenced and impelled by prejudices of ignorance and racial fanaticism. Praise be to God! You are free from such prejudice, for you believe in the oneness and solidarity of the world of humanity. There is no doubt that the divine confirmations will uphold you. (Abdu'l-Baha [1912], The Promulgation of Universal Peace, p. 337)

A rectitude of conduct, an abiding sense of undeviating justice, unobscured by the demoralizing influences which a corruption-ridden political life so strikingly manifests; a chaste, pure, and holy life, unsullied and unclouded by the indecencies, the vices, the false standards, which an inherently deficient moral code tolerates, perpetuates, and fosters; a fraternity freed from that cancerous growth of racial prejudice, which is eating into the vitals of an already debilitated society -- these are the ideals which the American believers must, from now on, individually and through concerted action, strive to promote, in both their private and public lives... (Shoghi Effendi [1938], The Advent of Divine Justice, p. 23)

61. Never had this nation greater cause to extol Abraham Lincoln than upon this the ninetieth anniversary of his birth, and never till to-day had it cause to lament that a successor in the Presidential chair should attempt to subvert his teachings.

This Nation

May this American democracy be the first nation to establish the foundation of international agreement. May it be the first nation to proclaim the universality of mankind. May it be the first to upraise the standard of the Most Great Peace, and through this nation of democracy may these philanthropic intentions and institutions be spread broadcast throughout the world. Truly, this is a great and revered nation. Here liberty has reached its highest degree. The intentions of its people are most praiseworthy. They are, indeed, worthy of being the first to build the Tabernacle of the Most Great Peace and proclaim the oneness of mankind. (Abdu'l-Baha, The Promulgation of Universal Peace, p. 36)

Democracy in England

(1) From the North American Review, CXLII (January 1886), 74-80. The advance toward parliamentary electoral reform is conventionally associated with the passage of three loosely-called reform bills; the first in 1832, the second in 1867, and the third in 1884-1885. Their general tendency was to extend the suffrage from a landed class, constituting a minority of the nation, to all males who possessed or occupied some property; and to redistribute seats in Parliament so that representation would have a more direct relation to population. When Gladstone was Prime Minister, the Act of 1884, adding about 2,000,000 voters to the rolls, in effect gave agricultural workers the franchise; that of 1885 pretty generally established single member constituencies approximately equal in population.

1. THE most interesting political problem which the world presents to-day is undoubtedly that now pressing for solution in England. For the first time in their history, the majority of her people have power. Henceforth England is democratic. Cajoled, overruled, thwarted for generations by the aristocratic

[Baha'i Comment](#)

classes, who have doled out to them from time to time only such small measures of reform as were necessary to prevent revolution, the people have never been fully heard. A climax was reached, however, last session, when an act was forced upon the House of Lords which at once transferred power from the privileged few to the masses. It is this fact which renders the situation there so interesting to the political student.

2. To understand the position, it is needful to look for a few moments at the scope of the great act just referred to. The electoral system of England was quite fair when established centuries ago. The centers of population then lay in the south of England, and this district very properly sent to Parliament a majority of representatives. Those were the days when pretty little Bideford in Devonshire was required

--- Page 167. The Gospel of Wealth - IX Democracy in England

to send sixteen sail against the Armada, while Liverpool's quota was but two. But as population shifted to the middle and north of the

[Baha'i Comment](#)

island, the great cities like Birmingham, Leeds, Manchester, and Glasgow, each sending but two representatives, were offset by the two members from some decaying village in the south. Seventy thousand electors, say in Birmingham or Glasgow, had no more weight than a few hundred in Woodstock or Eye. To aggravate this injustice, the aristocratic landholders kept firm hold of the counties by restricting the right of voting to such as paid a rental sufficiently high to exclude all but the farmers, and traders who were wholly dependent upon them.

3. All this has been changed. The bill of last year gave the suffrage to residents throughout the country districts. Even the hitherto despised farm-laborers are now voters. The total electorate is increased about forty per cent. The squires and parsons who have for generations designated the county representatives, now find themselves powerless against the populace. The influence of this revolution is already seen in the character of the representatives whom they have just returned. The old-fashioned country squire has been discarded, and a

[Baha'i Comment](#)

rising barrister, rich merchant, or large employer of labor, has taken his place. Most significant was the remark of one of the Liberal managers to me, that he had on his list thirteen titled gentlemen ready to serve the state in Parliament, for whom no satisfactory constituencies could be found, their titles being regarded as elements of weakness before the new voters.

4. Even more important than the vast addition of voters to the electorate is the redistribution of seats which the measure enacts. One hundred and sixty-seven have been taken from the smaller constituencies and given to the great cities. All constituencies less than ten thousand in number have been abolished. What England is and has been, under the rule of a privileged class chiefly intent upon preserving their privileges, and restricted at every turn by feudal traditions,

--- Page 168. The Gospel of Wealth - IX Democracy in England

is well known. What she is to become under the rule of a democracy, in which no barriers exist between the

[Baha'i Comment](#)

popular will and its prompt execution, is now the question.

5. To this but one reply can be given. The people of England will proceed to assimilate their political institutions to those of all other English-speaking communities. The institutions will be rapidly colonialized and Americanized. This process began some years ago, and has continued without cessation. And just in proportion as the people have been able to influence their rulers has the movement been accelerated. The record of recent legislation shows only a copying of our institutions.

[Baha'i Comment](#)

6. The first and by far the most important step ever taken in this direction was the adoption some years ago of a system of public education. Every child in the land now receives an education equal to that which we bestow. Small fees are still collected from parents, but the local school boards have authority to pay these fees should parents be unable to do so. Attendance is compulsory. The first generation of those who have benefited by this system are now appearing upon the stage of action with the inevitable result: they are radical.

[Baha'i Comment](#)

Education is everywhere a sure destroyer of privilege. The boy who can read the Declaration of Independence may be trusted to feel its force sooner or later. The doctrine of political equality, once known, enters the heart of man a welcome guest. Following us again, as we have seen, the Electoral Act is a great step toward our plan of equal districts and universal suffrage. Legislation upon law, a department in which Britain has long been considered supreme, has recently been in the direction of combining law and equity, after our practice. The patent laws of England have just been modeled after our own, although there is yet much to be done to bring them to our standard. In regard to married women's property, the year before last witnessed the discarding of feudal ideas and the adoption of our American law upon the subject. In a short time we are to see marriage

--- Page 169. The Gospel of Wealth - IX Democracy in England

with a deceased wife's sister allowed in England, as it is in other English-speaking lands. If we except legislation upon Irish land, which Mr. Gladstone and every member of the government

pronounced exceptional and only justifiable upon the plea of necessity, it would be difficult to point out any change made in the laws of Britain during the past twenty years which is not in the direction of the colonial and republican practice. If we regard prospective legislation, we again find the parent land is politically under the influence of her children; her part for some years is to follow them.

7. England's position is indeed unique among nations. Time was when not only all English-speaking communities, but the thinkers of all nations, looked to her for lessons in political development. The mother of nations was the mother of parliaments. Trial by jury, habeas corpus, freedom of the press, constitutional government itself—all these are her work; but they are of the past, and are accepted as the law of gravitation is, there being no further dispute about them. The world requires the solution of new problems, fitting a more advanced condition; and toward this the fondest admirers of the dear old land must blush to own her contribution has been but scanty. A new English-speaking community, about to

[Baha'i Comment](#)

found a state, might indeed still look to England, but it would be to learn, not what to adapt, but what to avoid. Instead of standing forth a model, she has become a warning. No state would think of adopting throne, hereditary chamber, primogeniture and entail, union of church and state, or any other of the remains of feudal institutions with which England is afflicted. Her more enterprising children seem to stand reminding her that

To have done is nothing
But to stand, like rusty
mail,
In monumental
mockery.

*(2) Quoted inaccurately
from Troilus and Cressida,
Act III, scene 3, lines 151
ff.*

--- Page 170. The Gospel of
Wealth - IX Democracy in
England

It is not to be supposed,
unless Britain's star has set,
and Britons are Britons no
more, that the people - now
educated, and becoming more
and more apprised of the
truth that they have been
indulging in a Rip Van Winkle
sleep - win rest content,
deprived of the position they
once held as the foremost
nation of the world, the

pioneer in political progress. I am quite sure that Britons are still Britons, a mighty race, whose part in the world, great as it has been, is not yet played to a finish. England has risen from her slumber.

8. The appeal to the people which has just taken place has unfortunately resulted in an equivocal response. For several reasons the towns which voted first have deserted the Liberals for the Tories. First, the Irish vote, from dictates of policy, was thrown against their natural allies, the Liberals. Second, the premature explosion of the issue of church disestablishment on the eve of the election frightened many Liberal churchmen into opposition. The Englishman regards every new question as a bogey, and has to be led up quietly to the object, and accustomed to it before he can be driven on. A third reason, no doubt more potent than a surface view would indicate, was a deep aversion to the Liberal policy in Egypt and in the Sudan,

(3) The defeat of the Liberals and the decline of Gladstone's influence resulted in part from the disaster to General Charles Gordon at Khartoum, where, failing to evacuate the Sudan as expected by the home government, and unrelieved until too late, he was besieged by the Mahdists and

[Baha'i Comment](#)

killed.

which resulted in a loss of thousands of lives, and added twenty millions sterling to the budget. A fourth cause is found in the theory of "Fair Trade" as opposed to "Free Trade." Great distress prevails in the manufacturing districts, and many operatives were carried away in the hope that there might be some virtue in the fair trade idea. Thus the Liberals fought at enormous disadvantage in the towns, and lost a great many seats which are safe for them under normal conditions.

9. Turning to the country districts, the reverse is found. All that the most advanced Radical hoped for has been accomplished, and more. The enfranchised voters have turned upon

--- Page 171. The Gospel of Wealth - IX Democracy in England

their former oppressors, the parson and the squire, and their class, and have driven them from the field. The new Parliament will differ from other Parliaments in nothing so much as this: that the members from the country are Radical instead of being Tory magnates as hitherto. The

[Baha'i Comment](#)

gains in the counties have equalized the losses in the towns, and all to the advantage of the Radical wing of the Liberal party. Left to struggle with the Tories alone, Mr. Gladstone and his followers would have had a triumphant majority, and been able to carry the Liberal program complete. But here comes in the most important factor of all. As Richelieu says to the king, of Cromwell, "A great man has arisen in England" -Parnell. His triumph is complete. He holds both parties at his mercy. The scales of power are in his hand. In presence of this great fact speculation concerning the Radical program is vain. The question of Ireland overshadows all. Nothing else will be heard of. Not even the reform of the rules of procedure of the House, which is a crying necessity, can be accomplished except by arrangement with the "uncrowned King of Ireland." The natural course would be an alliance between Mr. Gladstone and Mr. Parnell, when probably a few of the Whigs -- Goschen and Hartington - would go sulking to their tents. Rosebery and Harcourt, and even Granville, if he does not finally retire, which is probable, may be depended upon, however, to

remain with the advanced wing, which is headed by Chamberlain, Morley, Dilke, and Trevelyan. Even with this alliance it is probable that an appeal would have to be made to the country next year upon the one vital question of Home Rule for Ireland; and as the Liberals would then have the Irish vote, the result cannot be doubtful.

(4) Since Carnegie is here dealing with events both complicated and critical, it is not surprising that his analysis and forecasts went awry. The parliamentary election of December 1885 had an outcome exceptional in English history. The Liberal Party under Gladstone won a plurality of seats but the combined total of Conservatives and of the followers of Charles Stewart Parnell (1848-1891) equaled it. Parnell was at the crest of his influence. A Protestant, Irish landowner, Parnell hated England. He had consolidated, as far as any man could, the various sects and programs of Irish discontent; his Land League drew sympathy and financial support from America. Though he did not publicly condemn the violent acts of Irish terrorists, Parnell primarily sought to wring concessions from the English Parliament by making himself a nuisance through procedural delays and by dramatizing his cause. Even before the election of 1885 Gladstone has decided upon a measure for Irish home rule; afterwards it seemed a practical necessity. By sponsoring it he split from his party the old Whigs and many of the Radicals. Chamberlain and Sir George Otto Trevelyan (1838 - 1928) resigned from the Cabinet; Rosebery and Morley stayed in; Sir Charles Wentworth Dilke (1843-1911) voted for the bill. The Commons defeated home rule by thirty votes; ninety-three Liberals voted

against it. Gladstone resigned and Salisbury returned to office. The other statesmen mentioned are Viscount George Joachim Goschen (1831-1907), member of the Gladstone Cabinet (1888) and, with Spencer Compton Cavendish, Marquis of Hartington (1838-1908), an active Liberal Unionist on the Irish question; George Leveson-Gower Granville (1815-1891), colonial secretary in the Gladstone ministry of 1868, and foreign secretary (1870-1874, and 1880-1885), a firm supporter of Gladstone on home rule; Sir William Granville Harcourt (1827-1904), Liberal.

--- Page 172. The Gospel of Wealth - IX Democracy in England

10. But neither Mr. Gladstone nor the Marquis of Salisbury, not even Parnell, nor any other man, can tell what combination the kaleidoscope of British politics is to form during the next sixty days. It is useless, therefore, for me to speculate further upon it. This much, however, is certain: The democracy are in power, and their measures will be carried, if not this session, then in some early Parliament. And included in these will be Home Rule for Ireland, with rights similar to those enjoyed by the States of the American Union - a further imitation of her giant child by the motherland. When this great question is settled, but not till then, the Radical program of further democratic reforms

[Baha'i Comment](#)

will be in order.

11. The most important consideration of all is the future attitude of Great Britain toward other nations. Is the British democracy to be pacific or belligerent? Is Britain to continue to embroil herself in wars in all parts of the world? Is she to maintain her costly and useless interferences in the quarrels of Europe? I think not. I believe that the British democracy is to be pacific, and that the American doctrine of non-intervention will commend itself to it. Britain will be more and

--- Page 173. The Gospel of Wealth - IX Democracy in England

more inclined to follow the example of America in regard to foreign affairs, as she has done in home affairs. "Friendship with all, entangling alliances with none," is to become the common platform of the democracy on both sides of the Atlantic. I believe, further, that it will not be long ere both parties in Britain will pledge themselves, as both parties here have done, to offer arbitration for the settlement of international disputes before drawing the sword. In short, Herbert

[Baha'i Comment](#)

Spencer's great law will be further vindicated: "As power is held arbitrarily by king or chief the military type is developed, and wars of dynasties and aggression ensue. As power passes to the people the industrial type is developed, and peace ensues."

12. In all this we see the unceasing movement of the various divisions of the English-speaking race throughout the world to assimilate their political institutions, each division taking that which the others have proved to be best. English law is already universal; the decisions of the Supreme Court of Washington are quoted wherever our language is spoken. Religion, too, may be said, in a broad sense, to be universal. Our speech is also the tongue of a hundred million Anglo-Saxons; our literature is also the same, and political institutions are rapidly becoming assimilated. The world is soon to see this community of language, religion, and political forms merge into the great Anglo-Saxon democracy. The child now lives who will see every English-speaking community living under institutions founded upon the extremest

[Baha'i Comment](#)

view of the rights of man, as formulated in our Declaration of Independence, without a vestige of privilege from birth, without king or aristocracy, without united church and state, without great standing armies, unhampered by primogeniture and entail, with equal electoral privileges and equal districts. In short, with only such slight variations of laws as are necessary to adjust them to differing conditions and climates, the various divisions of the English race will live in peaceful brotherhood, each governing itself as a free and

--- Page 174. The Gospel of Wealth - IX Democracy in England

independent nation, but held to the others with bonds stronger than those of conquest, feudal dependency, or colonial relationship, and ready to help one another in need. This is the ideal federation of the English-speaking people of the world. It is also the only one possible or desirable.

13. The great parent land, it is true, lags behind at present. It is characteristic of her to be slow; but it is no less characteristic of her that what she once sets her hand to do, that she accomplishes. Twenty years' reign of the people will place her abreast of the most advanced of her children, and twenty years more may restore to her the political leadership of the world.

Home Rule in America

*(1) Address before the Glasgow Junior Liberal Association, St. Andrew's Hall, Glasgow, September 13, 1887.
Published in the Scottish Leader, September 1887.*

1. MR. President, Ladies, and Gentlemen: I have first to thank the officers of the Junior Liberal Association for giving me the great privilege of standing before a vast audience of my fellow-countrymen here in the second city of the Empire, in that city which has done more than any other city to draw closer the two branches of the great English-speaking race, my native and my adopted land. The great ships which you are sending forth every year to ply to and fro across

international arbitration - Baha'u'llah declared the coming of the Most Great Peace. All the nations and peoples will come under the shadow of the Tent of the Great Peace and Harmony--that is to say, by general election a Great Board of Arbitration shall be established, to settle all differences and quarrels between the Powers; so that disputes shall not end in war. ('Abdu'l-Bahá in London, page 30)

the Atlantic are shuttles weaving a glorious web between the two nations. Already we have spelled out in the glorious pattern international arbitration, and there is yet to come, as we draw closer and closer together, eternal friendship and good will.

2. The recent appointment of a commission to settle the fisheries dispute proves once more that never henceforth is a drop of blood of one branch of the race to be shed by the other branch. And, in speaking of that Fisheries Commission, permit me to say that I, for one, and I believe all Liberals and all British people, were rejoiced that a man like Mr. Chamberlain should have found a position in which he can do more good to his country than in any which he could find at home. It is a great work, this upon which he has embarked. I know that the Pall Mall represents him as a Jonah thrown : overboard to the fishes, but I trust that he too, like Jonah,

--- Page 176. The Gospel of Wealth - X Home Rule in America

will return from the excursion wholly uninjured, with increased reputation, and able to boast that he has done

conciliation - Today the world of humanity is in need of international unity and conciliation. To establish these great fundamental principles a propelling power is needed. It is self-evident that the unity of the human world and the Most Great Peace cannot be accomplished through material means. They cannot be established through political power, for the political interests of nations are various and the policies of peoples are divergent and conflicting. They cannot be founded through racial or patriotic power, for these are human powers, selfish and weak. The very nature of racial differences and patriotic prejudices prevents the realization of this unity and agreement. Therefore, it is evidenced that the promotion of the oneness of the kingdom of humanity, which is the essence of the teachings of all the Manifestations of God, is impossible except through the divine power and breaths of the Holy Spirit. Other powers are too weak and are incapable of accomplishing this. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 12)

something which no other traveler has ever done.

(2) Over the details of the fisheries question in the waters to the northeast of the United States there had been quarrels since the treaty closing the Revolution. Aside from the justice or injustice of the issues in dispute, it was difficult to secure an adjustment between Great Britain and the United States because the former "stood as broker between the United States and Canada, and had great difficulty in managing their Canadian clients." As for the United States, Maine and Massachusetts were usually furthering circumstances that would make the importation of fish from Canada impossible, either by embargoes or tariffs. At this particular time "Blaine & Company" -- Republicans-- were trying to stir up anti-British feeling to win the Irish heart (the Irish vote). In spite of these handicaps, President Cleveland and his Secretary of State, T. F. Bayard (1828-1898), and the Salisbury ministry resolved upon an effort at conciliation. In the fall of 1887 a Fisheries Commission met in Washington; Joseph Chamberlain was the leader of the British delegation. In February 1888 Cleveland submitted the Bayard-Chamberlain Treaty to the Senate. Partisanship on the eve of the presidential election of 1888 contributed to its rejection by the Senate. In any case Chamberlain made the acquaintance of the American lady who became his wife.

3. When I accepted the invitation to deliver a political address before this audience, I stated that it would be unbecoming in me to enter into the quarrels - the temporary and passing quarrels - which, unfortunately, have existed in the Liberal party, but which, I am happy to say, between the date of my acceptance and the date of my appearance, have largely vanished into thin air. The recent elections did not show much of a schism in the Liberal party, and therefore I approach the subject of Home Rule in America to-night, feeling that I in nowise become a party to the dissatisfactions and to the jealousies which have existed among you. For I tell you this: be he Liberal Gladstonian, be he Liberal Unionist, be he Conservative, or be he Tory, -- I believe I have described all the variations, -in the soul of every honest and fair and patriotic citizen of this great land there lies like a weight the conviction that, whatever may come, the present condition of affairs in Ireland must cease. You must no longer disgrace the English name, and make us blush in America for the land of our fathers - the land that

--- Page 177. The Gospel of Wealth - X Home Rule in

liberty - We will pray that the ensign of international peace may be uplifted and that the oneness of the world of humanity may be realized and accomplished. All this is made possible and practicable through your efforts. May this American democracy be the first nation to establish the foundation of international agreement. May it be the first nation to proclaim the universality of mankind. May it be the first to upraise the standard of the Most Great Peace, and through this nation of democracy may these philanthropic intentions and institutions be spread broadcast throughout the world. Truly, this is a great and revered nation. Here liberty has reached its highest degree. The intentions of its people are most praiseworthy. They are, indeed, worthy of being the first to build the Tabernacle of the Most Great Peace and proclaim the oneness of mankind. I will supplicate God for assistance and confirmation in your behalf. ("The Promulgation of Universal Peace, pp. 36-37)

The spirit of liberty which in recent decades has swept over the planet with such tempestuous force is a manifestation of the vibrancy of the Revelation brought by Baha'u'llah. His own words confirm it. "The Ancient Beauty", He wrote in a soul-stirring commentary on His sufferings, "hath consented to be bound with chains that mankind may be released from its bondage, and hath accepted to be made a prisoner within this most mighty Stronghold that the whole world may attain unto true liberty." Might it not be reasonably concluded, then, that "true liberty" is His gift of love to the human race? Consider what Baha'u'llah has done: He revealed laws and principles to guide the free, He established an Order to channel the actions of the free, He proclaimed a Covenant to guarantee the unity of the free. Thus, we hold to this ultimate perspective: Baha'u'llah came to set humanity free. (Individual Rights and Freedoms, 219-224)

schism - The time has come for the Baha'i community to become more involved in the life of the society around it, without in the least supporting any of the world's moribund and divisive concepts, or slackening its direct teaching efforts, but rather, by association, exerting its influence towards unity, demonstrating its ability to settle differences by consultation rather than by confrontation, violence or schism, and declaring its faith in the divine purpose of human existence. (Universal House of Justice, Ridvan1985)

America

has been the pioneer of liberty. The mother of nations must no longer stand before the world confessing that at her own doors, in a part of her own empire, she is unable to found just laws which commend themselves to the public sentiment of the governed. Home Rule is certain, and therefore I enter upon no disputed question when I venture to lay before you the phase of Home Rule which we have in America, hoping that when your bill is prepared, you may find some hints there which may be of use to you in solving this great and pressing question.

4. Now, gentlemen, it will be necessary for me to say a few words upon the American Constitution. What is it? I will tell you upon what it is founded. It is founded upon your own Constitution, and it is largely the work of a Scotsman. I appeal to any scholar here, to any man who has read the proceedings antecedent to the adoption of the Constitution. I ask you to read the "Federalist," and you will find that the draft of the American Constitution submitted by Alexander Hamilton was adopted, with very few amendments, and is

[constitution](#) - Once the Parliament of Man is established and its constituent parts organized, the governments of the world having entered into a covenant of eternal friendship will have no need of keeping large standing armies and navies. A few battalions to preserve internal order, and an International Police to keep the highways of the seas clear, are all that will be necessary. Then these huge sums will be diverted to other more useful channels, pauperism will disappear, knowledge will increase, the victories of Peace will be sung by poets and bards, knowledge will improve the conditions and mankind will be rocked in the cradle of felicity and bliss. Then, whether a government is constitutional or republican, hereditary monarchy or democratic, the rulers will devote their time to the prosperity of their nations, the legislation of just and sane laws and the fostering of closer and more amicable relations with their neighbours--thus will the world of humanity become a mirror reflecting the virtues and attributes of the Kingdom of God. (Peace, pages 17 & 18)

to-day that Constitution. I do not think that will cause it to be less favorably considered before a Glasgow audience. Well, the eulogies of that Constitution have been so great and so many, recently, that I will not trouble you with quotations; but in the works of Matthew Arnold, Froude, Freeman, Dicey, and last, but not least, Mackenzie, a Scotsman who has written a wonderful history of America, - a Dundee man, I believe, - and Sir Henry Mayne,

(3) Examples of eulogies to the Constitution are provided by Matthew Arnold, "A Word More about America," Nineteenth Century, XCVI (February, 1885), 219-236; E. A. Freeman, Some Impressions of the United States (1883), pp. 111-119, 134-137; A. V. Dicey, "Parliamentary Sovereignty and Federation," Lectures Introductory to the Study of the Law of the Constitution (1885), pp. 126-165; Sir Henry S. Maine, Popular Government, Four Essays (1886) pp. 196-254. This burst of interest in American institutions followed the British Reform Acts of 1881-2, in effect establishing universal manhood suffrage. British observers were interested in seeing how democracy worked. These were also days when a belief in the superiority of Anglo-Saxon culture touched academic circles on both sides of the Atlantic; English scholars consequently detected commendable similarities or even superiorities in American institutions. Finally, as American higher education attained status, the interchange of academic personnel across the Atlantic quickened; observations on the spot dispelled old misconceptions about the United States and revealed unsuspected merits in

American institutions.

you can read

--- Page 178. The Gospel of Wealth - X Home Rule in America

pages of eulogy which, as an American, my modesty will not permit me to repeat. I will, however, venture to quote from the leaders of your two parties, that you may see how they corroborate the views expressed by these writers.

5. My lord Salisbury has said: "The Americans have a Supreme Court which gives a stability to their institutions, for which we look here in vain; the Americans have a Senate wonderful in its power and efficiency; would that we could have such a second chamber here!" I will tell Lord Salisbury how he can have it. There is no patent for its exclusive use - and there is only one way of getting anything good in a nation. The United States Senate springs from the people. There is not the poison of hereditary privilege in its veins, and that is what makes it so powerful and wonderful in its strength and efficiency; and if my friend Lord Rosebery, when he brings in his bill to reform the

hereditary - The virtues of humanity are many, but science is the most noble of them all. The distinction which man enjoys above and beyond the station of the animal is due to this paramount virtue. It is a bestowal of God; it is not material; it is divine. Science is an effulgence of the Sun of Reality, the power of investigating and discovering the verities of the universe, the means by which man finds a pathway to God. All the powers and attributes of man are human and hereditary in origin--outcomes of nature's processes--except the intellect, which is supernatural. Through intellectual and intelligent inquiry science is the discoverer of all things. It unites present and past, reveals the history of bygone nations and events, and confers upon man today the essence of all human knowledge and attainment throughout the ages. By intellectual processes and logical deductions of reason this superpower in man can penetrate the mysteries of the future and anticipate its happenings. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 7)

House of Lords, which he has promised, can only persuade Lord Salisbury to agree to exclude the hereditary poison, why, then you can get a Senate chamber equal to the American in strength and efficiency. You cannot get it any other way, and unless this is conceded, Lord Rosebery will find that his only safety lies in taking the advice Hamlet gave to the players: "Reform it altogether." Well, now, a greater man than Lord Salisbury - do not cheer; I am not going to give the name, but when I mentioned the name in Edinburgh, all the audience jumped to their feet and cheered, and I enjoyed it very much. As I said, a greater authority than Lord Salisbury, and one who has done a great deal more in improving constitutions, has pronounced the American Constitution the most wonderful work ever struck off at one time by the brain and purpose of man. I do not know whether Mr. Gladstone, being a Scotsman, may not be a little partial to the work of a Scotsman like Alexander Hamilton, but these are his

--- Page 179. The Gospel of
Wealth - X Home Rule in
America

words. The day after to-
morrow there will assemble in

the city of Philadelphia representatives from all parts of the United States, with the judges of the Supreme Court and the President at their head, to celebrate the centenary of the adoption of the Constitution.

(4) In mid-September 1887 a three-day civic celebration was held in Philadelphia to commemorate the centenary of the completion of the work of the Constitutional Convention.

The Constitution, a hundred years ago, was adopted by a population of three millions which fringed the Atlantic coast. To-day it holds peaceful sway over the majority of the English-speaking race -- more English-speaking people than all Great Britain and all her colonies, even were the latter doubled in population; and although this branch of the British people has extended from the Atlantic to the Pacific, and southward from the coast of Maine to the Gulf of Mexico, they have not outrun the benefits or the protection of that Constitution.

6. Let me now describe that Constitution to you. The government of the United States, under the Constitution, is divided into three departments - the legislative, the executive, and the judicial. The Legislature consists of two houses - a House of Representatives, elected for two years by a direct vote of the people; and a Senate, composed of two senators from each of the thirty-eight States, elected for six years by the State Legislature, but so elected that every -two years one third of the entire body retires to the people to seek reelection and have the chance of being displaced by worthier servants. These representatives receive as a compensation for their services one thousand pounds each, per annum. They sit from ten o'clock in the morning till four o'clock in the afternoon, and having paid for the services of these gentlemen, the nation exacts regular attendance. it 'exact's their abilities and attention when these are fresh, and it would not tolerate for a moment one hundred and sixty-eight barristers, as in your present Parliament, who do all their work in the daytime and come to you to muddle your

vanity - ... This is the day whereon all peoples should shed the light of unity and concord. In brief, the pride and vanity of certain of the peoples of the world have made havoc of true understanding, and laid waste the home of justice and of equit (Bahá'u'lláh, Expistle to Son of the Wolf, page 76)

--- Page 180. The Gospel of
Wealth - X Home Rule in
America

business at night. I have sat a great deal in your House of Commons. It is largely a debating club for the display of vanity, and it is no longer a sober, thoughtful legislative chamber. It never will be, as long as its members consider that they give you a gentlemanly class that condescends to serve you in Parliament. Your legislators are always your masters here, but in America they are our paid servants.

7. You know that celebrated story of a gentleman who lost a great deal of money by a false play at whist on the part of his partner. He scolded him, and the matter was referred to the leading expert of the whist club. The question was this: Could a man make such a stupid play as that which was described? And the decision of the referee was that he thought he might-after dinner. That is one point not embraced in Home Rule-but I mention it incidentally.

[Baha'i Comment](#)

8. Well, then, the power of the two houses of Parliament is very much akin to your own in one respect. As far as the House of Representatives is concerned, they have the power of the purse, but the Senate of the United States is of equal power with the House. No act becomes an act without its approval. No treaty can be signed by the President, no appointment made of a petty postmaster, no appointment of an ambassador or minister or agent, without the consent and vote and approval of the most august legislative assembly in this world - the American Senate. There is where we hold our chief ruler. The President must carry with him that body of senators. We have our executive in the President. We make our king every four years, and we pay him a tremendous salary. I suppose all you people would grudge it for a crowned head. We pay him ten thousand pounds per annum, and we have nothing to do with his brothers and his sisters and his cousins and his aunts. And at the end of four years, if we do not like him, we put him down and elect another one. My fellow-countrymen, I would like you to cast your eye over the list of American Presidents and compare them for the last hundred years

treaty - Concerning the proceedings for this world gathering, Abdu'l-Baha, the son of Baha'u'llah and authorized interpreter of his teachings, offered these insights: "They must make the Cause of Peace the object of general consultation, and seek by every means in their power to establish a Union of the nations of the world. They must conclude a binding treaty and establish a covenant, the provisions of which shall be sound, inviolable and definite. They must proclaim it to all the world and obtain for it the sanction of all the human race. This supreme and noble undertaking--the real source of the peace and well-being of all the world--should be regarded as sacred by all that dwell on earth. All the forces of humanity must be mobilized to ensure the stability and permanence of this Most Great Covenant. In this all-embracing Pact the limits and frontiers of each and every nation should be clearly fixed, the principles underlying the relations of governments towards one another definitely laid down, and all international agreements and obligations ascertained. In like manner, the size of the armaments of every government should be strictly limited, for if the preparations for war and the military forces of any nation should be allowed to increase, they will arouse the suspicion of others. The fundamental principle underlying this solemn Pact should be so fixed that if any government later violate any one of its provisions, all the governments on earth should arise to reduce it to utter submission, nay the human race as a whole should resolve, with every power at its disposal, to destroy that government. Should this greatest of all remedies be applied to the sick body of the world, it will assuredly recover from its ills and will remain eternally safe and secure."

The holding of this mighty convocation is long overdue. (Promise of World Peace, page 12)

legislative - The Baha'i Cause covers all economic and social questions under the heading and ruling of its laws. The essence of the Baha'i spirit is that, in order to establish a better social order and economic condition, there must be allegiance to the laws and principles of government. Under the laws which are to govern the world, the socialists may justly demand human rights but without resort to force and violence. The governments will enact these laws, establishing just legislation and economics in order that all humanity may enjoy a full measure of welfare and privilege; but this will always be according to legal protection and procedure. Without legislative administration, rights and demands fail, and the welfare of the common-wealth cannot be realized. Today the method of demand is the strike and resort to force, which is manifestly wrong and destructive of human foundations. Rightful privilege and demand must be set forth in laws and regulations. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 238)

with certain indi-

--- Page 181. The Gospel of
Wealth - X Home Rule in
America

viduals that you have been
cursed with on your throne.
Compare them, man for man,
and see where you will land.
This President nominates his
Cabinet; but, mark you, not a
man is a member of his
Cabinet until the Senate says,
"Approved." He may dismiss
them, but when he nominates
others, every new man must
go through that ordeal before
he becomes a member of the
Cabinet.

9. The President is not only
the first civil magistrate: he is
the first military magistrate.
We bring the civil power right
where we want the civil power
to be - at the head; and we
put the military power where
the military power ought
always to be-at the foot. The
President of the United States
is the commander-in-chief of
the army and of the navy, and
of the military forces of the
States when he chooses to call
them into service. This is no
shadowy power. When
General Grant was at the top
of his fame, it was rumored
that he was about to conclude
a convention with General Lee
which touched upon the policy

[Baha'i Comment](#)

to be pursued; and I saw the telegram which President Lincoln wrote with his own hand: "TO MAJOR-GENERAL GRANT, near Richmond, Virginia: You will hold no conventions with General Lee except for the capitulation of his army. You will not confer, nor discuss, nor conclude any question of any political import whatever. The President holds these questions in his own hands, and he will not submit them to any military conference whatever." That is the kind of power we give our President, and we hold him responsible for the exercise of that power, and at the end of four years he gives us an account of his stewardship. At his call to-day seven millions of men capable of bearing arms, accustomed to bear arms, and only too ready to bear arms in defense of the Union, would stand forth. But two years from now that President would be one of the seven millions shouldering his musket in his ranks.

10. Now, then, our Cabinet does not appear in our House of Congress. They make written communications. They answer

--- Page 182. The Gospel of Wealth - X Home Rule in America

all questions which either House requires, but they do not deliberate with the House, because the American people are most jealous of any interference between the legislative and the executive. Now, to regulate all the rights of these people, the Supreme Court, the object of Lord Salisbury's admiration, has been created. It consists of nine judges. They receive two thousand pounds a year each for their services, and the Chief Justice of the United States receives one hundred pounds more than his fellows. He passed through your country the year before last, the head of the American government in one sense, because the court is above the President, as it interprets the acts of Congress, and is the arbiter of the community. He passed along unnoticed. The aristocracy and the court paid no attention to the Chief Judge of the United States. That is very much to be wondered at, because Buffalo

aristocracy - Similarly, the quality of aristocracy (rule by the best) as it appears in the Faith is in sharp contrast to what is generally understood by this term. Free from electioneering or such external pressures as those coming from economic power or manipulation of the press, the believers seek to elect for membership on their governing institutions those persons whom they regard as best qualified for such office. The elected members are then responsible to God and to their consciences, rather than to those who elect them. You are undoubtedly familiar with Shoghi Effendi's words in Baha'i Administration on the attitude and responsibility of members of Assemblies:

The duties of those whom the friends have freely and conscientiously elected as their representatives are no less vital and binding than the obligations of those who have chosen them. Their function is not to dictate, but to consult, and consult not only among themselves, but as much as possible with the friends whom they represent. They must regard themselves in no other light but that of chosen instruments for a more efficient and dignified presentation of the Cause of God. They should never be led to suppose that they are the central ornaments of the body of the Cause, intrinsically superior to others in capacity or merit, and sole promoters of its teachings and principles. They should approach their task with extreme humility, and endeavour, by their open-mindedness, their high sense of justice and duty, their candour, their modesty, their entire devotion to the welfare and interests of the friends, the Cause, and humanity, to win, not only the confidence and the genuine support and respect of those whom they serve, but also their esteem and real affection. They must, at all times, avoid the spirit of exclusiveness, the atmosphere of secrecy, free themselves from a domineering attitude, and banish all forms of prejudice and passion from their deliberations. They should, within the limits of wise discretion, take the friends into their confidence, acquaint them with their plans, share with them their problems and anxieties, and seek their advice and counsel. And, when they are called upon to arrive at a certain decision, they should, after dispassionate, anxious and cordial consultation, turn to God in prayer, and with earnestness and conviction and courage record their vote and abide by the voice of the majority, which we are told by our Master to be the voice of truth, never to be challenged, and always to be whole-heartedly enforced. To this voice the friends must heartily respond, and regard it as the only means that can ensure the protection and advancement of the Cause. (Universal House of Justice, Administrative Order, page 2)

Bill had not then arrived. But when your Chief Justice visited America, he was received as became a man in his position. The President of the United States received him, the cities received him, and he was everywhere entertained in a manner which, I trust, some future day, the Chief Justice of the United States may experience when he visits this country when the democrats are in power.

11. This Supreme Court has a veto on all laws passed by the House, the Senate, and the President. It does not make a particle of difference if the House of Representatives pass a law, and if the Senate pass it, and if the President approve it, any man can make an issue and appeal to the Supreme Court, "Is that law constitutional?" If it is decided to be unconstitutional it is waste paper. But great as are the powers which our Supreme Court possesses, remember the Supreme Court can start no issue. It can only decide issues which are brought before it, so that it is only when the law would work injustice or create popular discontent that the Supreme Court is appealed to at all. Now, then, having briefly described to you the three

[Baha'i Comment](#)

departments of the American govern-

--- Page 183. The Gospel of Wealth - X Home Rule in America

ment, allow me to say that the Supreme Judges remain for life, subject to removal by the President and the Cabinet for misbehavior or inability to serve.

12. Now, then, we come to the great question, How is it possible that not only one nation but thirty-eight nations -- thirty-eight States covering a continent almost as big as Europe - how are their legislative and political matters managed? In no way is that possible but by Home Rule. Let me show you how deep down the principle of Home Rule goes and how far it extends, how wide-spread it is under this American system. The land of America is divided by government surveyors - and you will understand that I speak now not of the small Atlantic States which were divided before the Constitution was adopted, but of the great West and Northwest in which the majority of the American people dwell. It was divided into six mile-squares. These are called townships, and a

councils - To the efforts and accomplishments of those who, aware of the Revelation of Baha'u'llah, are now laboring in that continent, to their present and future course of activity, I have, in the foregoing pages sufficiently referred. A word, if the destiny of the American people, in its entirety, is to be correctly apprehended, should now be said regarding the orientation of that nation as a whole, and the trend of the affairs of its people. For no matter how ignorant of the Source from which those directing energies proceed, and however slow and laborious the process, it is becoming increasingly evident that the nation as a whole, whether through the agency of its government or otherwise, is gravitating, under the influence of forces that it can neither comprehend nor control, towards such associations and policies, wherein, as indicated by Abdu'l-Baha, her true destiny must lie. Both the community of the American believers, who are aware of that Source, and the great mass of their countrymen, who have not as yet recognized the Hand that directs their destiny, are contributing, each in its own way, to the realization of the hopes, and the fulfillment of the promises, voiced in the above-quoted words of Abdu'l-Baha. (Shoghi Effendi: The Advent of Divine Justice, pages 86-87)

Then, and only then, will the American nation, molded and purified in the crucible of a common war, inured to its rigors, and disciplined by its lessons, be in a position to raise its voice in the councils of the nations, itself lay the cornerstone of a universal and enduring peace, proclaim the solidarity, the unity, and maturity of mankind, and assist in the establishment of the promised reign of righteousness on earth. Then, and only then, will the American nation, while the community of the American believers within its heart is consummating its divinely appointed mission, be able to fulfill the unspeakably glorious destiny ordained for it by the Almighty, and immortally enshrined in the writings of Abdu'l-Baha. Then, and only

few settlers make up a township. By and by they feel the want of roads, they feel the want of everything, and they decide to have a meeting. Now, here is a record of a meeting of a similar character to that which has created thousands and thousands and thousands of councils. You will see it is most interesting. Just listen to where Home Rule begins; see its beginnings - its roots. It always reminds me of that beautiful poem of Ballantine's about the brook when

It dropped from a gray
rock
Upon a messy stone.

(5) James Ballantine (1808-1877), Scottish poet.

Yes, away up there - that is where the Home Rule stream starts. Here is what you find. Here is the township of Burlington, in Calhoun County, Michigan. "Organized in 1837, and held its first township meeting April 3 of that year, electing Justus Goodwin, supervisor; O. C. Freeman, town clerk; Justus Goodwin, Gibesia Sanders, and Moses S. Gleason, justices of the peace; Leon Haughtailing, constable and collector." That is the German element, you see, coming into

then, will the American nation accomplish "that which will adorn the pages of history," "become the envy of the world and be blest in both the East and the West." (Shoghi Effendi: *The Advent of Divine Justice*, pages 90-91)

--- Page 184. The Gospel of
Wealth - X Home Rule in
America

America. "Established six road districts; voted one hundred dollars to build a bridge across the St. Joseph River and fifty dollars for bridging Nottawa Creek; voted fifty dollars for common schools." Ah, gentlemen, that is a vote! Fifty dollars! The first meeting of a few stragglers in the Western wilderness, and the first thing they do is to vote fifty dollars for common schools to educate all their children free of price. Now you are getting at the roots of democracy, gentlemen. But that meeting did another thing. It voted five dollars for wolf-scalps. That throws a great light upon the situation when the wolves were so numerous that they gave a pound premium for every scalp that was brought in. Well, now, that is a beautiful picture of Home Rule. There was no superior officer there. They made themselves and created themselves into a political community. It was universal suffrage - there was no privilege. I do not find anything about who Leon Haughtailing was, or where or when he was born, or who was his grandfather; he was elected, not because he was the richest man, but because

democracy - The institutions of society will succeed in eliciting and directing the potentialities latent in the consciousness of the world's peoples to the extent that the exercise of authority is governed by principles that are in harmony with the evolving interests of a rapidly maturing human race. Such principles include the obligation of those in authority to win the confidence, respect, and genuine support of those whose actions they seek to govern; to consult openly and to the fullest extent possible with all whose interests are affected by decisions being arrived at; to assess in an objective manner both the real needs and the aspirations of the communities they serve; to benefit from scientific and moral advancement in order to make appropriate use of the community's resources, including the energies of its members. No single principle of effective authority is so important as giving priority to building and maintaining unity among the members of a society and the members of its administrative institutions. Reference has already been made to the intimately associated issue of commitment to the search for justice in all matters.

Clearly, such principles can operate only within a culture that is essentially democratic in spirit and method. To say this, however, is not to endorse the ideology of partisanship that has everywhere boldly assumed democracy's name and which, despite impressive contributions to human progress in the past, today finds itself mired in the cynicism, apathy, and corruption to which it has given rise. In selecting those who are to take collective decisions on its behalf, society does not need and is not well served by the political theater of nominations, candidature, electioneering, and solicitation. It lies within the capacity of all people, as they become progressively educated and convinced that their real development interests are being served by programs proposed to them, to adopt electoral procedures that will gradually refine the selection of their decision-making bodies.

As the integration of humanity gains momentum, those who are thus selected will increasingly have to see all their efforts in a global perspective. Not only at the national, but also at the local level, the elected governors of human affairs should, in Baha'u'llah's view, consider themselves responsible for the welfare of all of humankind. (Prosperity of Humankind, pages 14 & 15)

his fellow-citizens thought him the best man at their command. That is the first meeting of the little township of six miles. By and by other settlers come into the neighborhood and form other squares; and they hold similar meetings, and they vote for common schools. In the course of time fifteen or twenty communities have been created, and they combine. They find that they have not good enough school accommodation for each township, and that they cannot have a court-house and all the provisions for government upon so small an area; and they say, Let fifteen or twenty of us townships combine and send representatives elected by universal suffrage in proportion to our population. A convention is created for the county, and they go forward and elect county officers in the manner in which they elected their township officers, and they elect their judges. And I have sufficient faith in the democracy to say, Give me the judge elected by the people. No community in America that has ever tried the experi-

--- Page 185. The Gospel of
Wealth - X Home Rule in
America

ment has regretted it. I tell you the democracy is most interested in the purity of its judges. It is the poor man, the working-man, who is interested in his judges. And as all humanity has its bias, I tell you frankly that your gentlemen have the prejudices of the gentleman class, and your newly made baronets have the prejudices of the aristocracy worse than any old baronets, and your newly made lords are a disgrace to Mr. Gladstone. Well, the county goes forward - the second and larger circle of Home Rule. Observe, now, there is not what we might call a foreign element. There is no outside element, but all an outgrowth from the democracy itself. There is no divine right about it. It is a healthy, grand, glorious growth of the body politic itself. Very well, then; the county gets a little too small for their growing life. They want railroads, churches, halls. They want everything that a civilized people wants. They want everything that is good, and they get everything that is good, so far as human nature can get perfection. Twenty or thirty of these counties conclude that they

Prejudices - The Universal Races Congress was good, for it was intended for the furtherance and progress of unity among all nations and a better international understanding. The purpose was good. The causes of dispute among different nations are always due to one of the following classes of prejudice: racial, lingual, theological, personal, and prejudices of custom and tradition. It requires a universal active force to overcome these differences. A small disease needs a small remedy, but a disease which pervades the whole body needs a very strong remedy. A small lamp may light a room, a larger would light a house, a larger still might shine through the city, but the sun is needed to light the whole world.

The differences in language cause disunion between nations. There must be one universal language. The diversity in Faiths is also a cause of separation. The true foundation of all faiths must be established, the outer differences abolished. There must be a Oneness of Faith. To end all these differences is a very hard task. The whole world is sick, and needs the power of the Great Healer.

These meetings teach us that Unity is good, and that suppression (slavery under the yoke of tradition and prejudice) is the cause of disunion. To know this is not enough. All knowledge is good, but it can bear no fruit except by action. It is well to know that riches are good, but that knowledge will not make a man rich; he must work, he must put his knowledge into practice. We hope the people realize and know that unity is good, and we also hope that they will not be content to stand still in that knowledge. Do not only say that Unity, Love and Brotherhood are good; you must work for their realization. ('Abdu'l-Bahá in London, pages 59 & 60)

will make a State, and they elect officers by a convention as in the case of townships and counties, and they meet and establish a capital, about the center of the proposed State generally. They elect a governor and a House of Representatives, and the State Legislature is composed of two houses, one called the House of Representatives, and the other called the State Senate. The word "Congress" is never used except when the national meeting at Washington is meant. The word "Congress" is sacred to the great central power, as I trust that in the great Home Rule Bill the word "Parliament" will be sacred to that great body which will meet at Westminster and attend to international affairs. Well, now, gentlemen, the State is born in that way. Every State has its own governor; it has its own militia, its own courts, and its own judges, and it manages its own taxation. It does everything that a State can do, everything that pertains to the State itself. That is a very, very broad platform of Home Rule; but the broader

--- Page 186. The Gospel of
Wealth - X Home Rule in
America

you make the Home Rule

principle, always provided that it is subordinate to the national or federal principle, the better for the rulers, and the better for the people themselves.

13. Well, then, the several States, as you are aware, banded together and formed the nation. There were thirteen of them originally. The States being, as you know, before the general government, the people of America gave the general government certain delegated powers, and a comprehensive clause of the Constitution says that all powers not expressly delegated are retained by the States themselves. That is the principle of Home Rule in America. The national government is the sun of our system, and round the government the States revolve, each one on its own axis, some at one angle, some at another, ah State communities governing their own affairs in the way that seems best to them. And therefore it is impossible you can ever have a State revolution in America, any more than it is possible for a man to turn and rend himself. The State Constitution is part and parcel of its people. It is their own work; they made it, and if they do not like it they

constitution - Among the responsibilities assigned to Baha'i institutions which have a direct bearing on these aspects of individual freedom and development is one which is thus described in the Constitution of the "to safeguard the personal rights, freedom and initiative of individuals".

A corollary is: "to give attention to the preservation of human honour".

How noteworthy that in the Order of Baha'u'llah, while the individual willis subordinated to that of society, the individual is not lost in the mass but becomes the focus of primary development, so that he may find his own place in the flow of progress, and society as a whole may benefit from the accumulated talents and abilities of the individuals composing it.

Such an individual finds fulfillment of his potential not merely in satisfying his own wants but in realizing his completeness in being at one with humanity and with the divinely ordained purpose of creation.

The quality of freedom and of its expression -- indeed, the very capacity to maintain freedom in a society -- undoubtedly depends on the knowledge and training of individuals and on their ability to cope with the challenges of life with equanimity.

As the beloved Master has written: "And the honour and distinction of the individual consist in this, that he among all the world's multitudes should become a source of social good.

Is any larger bounty conceivable than this, that an individual, looking within himself, should find that by the confirming grace of God he has become the cause of peace and well-being, of happiness and advantage to his fellow men?

No, by the one true God, there is no greater bliss, no more complete delight." (Individual Rights and Freedoms, Articles 211-218)

can mend it.

14. Now, then, will you permit me, having sketched the American Constitution to you, to apply its provisions to the case of Home Rule at home? And in doing so you will all clearly understand that I do not represent anybody but myself. I bind nobody. The Liberal party -Gladstonian- is not responsible for what I describe as the operations of the American Constitution; and the Unionist is not responsible; and no Tory or Conservative may be alarmed upon the head of his responsibility for anything which I say. Now, then, if we were to deal with the Home Rule question, - taking this great Constitution for our guide, -I will mention in rotation four points, and just tell you how we would settle them - and we would settle them. When the democracy of America puts its foot down it stays there. The first condition is the supremacy of the national Parliament. I do not like the word "imperial." You may have an empire soon

[Baha'i Comment](#)

--- Page 187. The Gospel of
Wealth - X Home Rule in
America

enough. You have very nearly an Empress now, and when you get an Emperor you can use "imperial," but I prefer "national." Well, it goes without saying that when two men ride a horse one must ride behind. There must be no mistake about the powers in the general government. I will not say whether the recent bill introduced was faulty or not in its expression of that power. Unionists may contend that it was, and they have the highest possible authority for thinking the words were unfortunately vague. But of this I have not the slightest doubt, that it never entered into the brain of any man that any assembly given to Ireland or Scotland would not have to bow before the national assembly -- the Parliament. The American Constitution provides this: "This Constitution, and the acts under it passed by the national government, as interpreted by the Supreme Court, are the supreme laws of the land, anything in the State laws or State constitutions to the contrary notwithstanding." And if I were called on to settle the Home Rule question, that is

antagonistic - Firstly: He lays stress on the search for Truth. This is most important, because the people are too easily led by tradition. It is because of this that they are often antagonistic to each other, and dispute with one another.

But the manifesting of Truth discovers the darkness and becomes the cause of Oneness of faith and belief: because Truth cannot be two! That is not possible.

Secondly: Baha'u'llah taught the Oneness of humanity; that is to say, all the children of men are under the mercy of the Great God. They are the sons of one God; they are trained by God. He has placed the crown of humanity on the head of every one of the servants of God. Therefore all nations and peoples must consider themselves brethren. They are all descendants from Adam. They are the branches, leaves, flowers and fruits of One Tree. They are pearls from one shell. But the children of men are in need of education and civilization, and they require to be polished, till they become bright and shining.

Man and woman both should be educated equally and equally regarded.

It is racial, patriotic, religious and class prejudice, that has been the cause of the destruction of Humanity. ('Abdu'l-Bahá in London, pages 27 & 28)

the language I would put into the new bill. Mind you, that power being there, it has never to be exercised. It has only been exercised once in a hundred years upon an important issue, and that issue was one which no human constitution, nor all the human powers on earth, could have averted. The man or nation that tries to bind together in harmonious development freedom and human slavery has attempted the impossible, and when the great democratic forces came face to face, in the development of that country, with the slave power, which disputed its rights, one or the other had to fall; and you know which one fell. You might as well try to bind democracy and privilege. The two are antagonistic forces; and I believe the "Scotsman" newspaper of the 16th of August, in an editorial on the Northwich election, used the most significant words I have heard since I took up my residence among you.

"Democracy means" -- I quote the "Scotsman" - "Democracy means, and rightly means, that privilege shall cease."

--- Page 188. The Gospel of Wealth - X Home Rule in America

15. Well, now, after what had been said about the supremacy of the national government, I ask any Unionist here to consider in his mind to-night whether he has the shadow of a fear that that will not be provided for in the new bill. Has not Mr. Gladstone said, "All parliaments, all assemblies, with statutory powers, are necessarily subordinate to their creator, and I have no objection to name the delegated powers." Now, then, when he names the delegated powers, he will follow the American Constitution.

16. The other point on which great stress is laid, and laid rightly, in my opinion and in the opinion of the American Constitution, is the question of the continued representation of Ireland in the national assembly. Well, gentlemen, a great deal has been said in this controversy about American opinion. I have asked hundreds of Americans- and you have got some intelligent Americans, no doubt, in Glasgow; ask their opinion yourselves. There is not an American living that

subordinate - The virtues and attributes pertaining unto God are all evident and manifest, and have been mentioned and described in all the heavenly Books. Among them are trustworthiness, truthfulness, purity of heart while communing with God, forbearance, resignation to whatever the Almighty hath decreed, contentment with the things His Will hath provided, patience, nay, thankfulness in the midst of tribulation, and complete reliance, in all circumstances, upon Him. These rank, according to the estimate of God, among the highest and most laudable of all acts. All other acts are, and will ever remain, secondary and subordinate unto them.... (Bahá'u'lláh, Gleanings, page 290)

opinion - What Baha'u'llah is calling for is a consultative process in which the individual participants strive to transcend their respective points of view, in order to function as members of a body with its own interests and goals. In such an atmosphere, characterized by both candor and courtesy, ideas belong not to the individual to whom they occur during the discussion but to the group as a whole, to take up, discard, or revise as seems to best serve the goal pursued. Consultation succeeds to the extent that all participants support the decisions arrived at, regardless of the individual opinions with which they entered the discussion. Under such circumstances an earlier decision can be readily reconsidered if experience exposes any shortcomings.

Viewed in such a light, consultation is the operating expression of justice in human affairs. So vital is it to the success of collective endeavor that it must constitute a basic feature of a viable strategy of social and economic development. Indeed, the participation of the people on whose commitment and efforts the success of such a strategy depends becomes effective only as consultation is made the

will not answer this question as every one has answered to me: "Would you agree that the State of Virginia should have a Legislature of its own, and be absolved from the duty of sending representatives to the national Congress at Washington to deliberate equally with all other representatives, and hence be bound equally with the others for all its acts?" And the reply is, "Never." And with the new bill I would say to any Unionists, - because I am most anxious to restore the harmony of the Liberal party, - "Gentlemen, you have a hard enough fight before you; you have many measures, the adoption of which lies deep at your heart; you need every vote and every influence at your command for this campaign." Very well, I ask any Unionist to-night to consider whether he has the slightest doubt but that the representatives of Ireland and Scotland will continue to be sent to the imperial Parliament at Westminster. I do not see how he can have a doubt. I had my doubts when the bill was cabled across the Atlantic. I could see that point clearly myself, and I took prompt measures to point out to

--- Page 189. The Gospel of Wealth - X Home Rule in

organizing principle of every project. "No man can attain his true station", is Baha'u'llah's counsel, "except through his justice. No power can exist except through unity. No welfare and no well-being can be attained except through consultation." (Prosperity of Humankind, page 8)

America

friends here what I thought was the weak point in that bill. But, gentlemen, I thought I could do most good within the party. I have known what Mr. Gladstone has already done. There is no man living can carry reforms as he can, and if his life be spared, he *will*, I am satisfied, - I will not say I am satisfied; I know, because he has said it, that he will, -- deal with this question without touching the question of Irish representation.

17. We come to the third point - Ulster. Now I am going to apply the American Constitution to Ulster, and I tell you it is not without force in Ulster or in any part of Ireland. They will not seek anything beyond what the Americans give their States. If they do, every son of an Irishman in America -- and there are a million of such -- and every American will denounce the demand as something which upon no consideration they themselves would ask, and which every well-wisher of Great Britain prays she never will give. As to Ulster, speaking as an American Home Ruler, that is too trifling a subject to talk about among statesmen. The province of Ulster is very

Statesmen - EXTRACTS FROM THE WRITINGS OF SHOGHI EFFENDI:

Dearly-beloved friends! Humanity, whether viewed in the light of man's individual conduct or in the existing relationships between organized communities and nations, has, alas, strayed too far and suffered too great a decline to be redeemed through the unaided efforts of the best among its recognized rulers and statesmen-- however disinterested their motives, however concerted their action, however unsparing in their zeal and devotion to its cause. No scheme which the calculations of the highest statesmanship may yet devise, no doctrine which the most distinguished exponents of economic theory may hope to advance, no principle which the most ardent of moralists may strive to inculcate, can provide, in the last resort, adequate foundations upon which the future of a distracted world can be built. No appeal for mutual tolerance which the worldly-wise might raise, however compelling and insistent, can calm its passions or help restore its vigour. Nor would any general scheme of mere organized international co-operation, in whatever sphere of human activity, however ingenious in conception or extensive in scope, succeed in removing the root cause of the evil that has so rudely upset the equilibrium of present day society. Not even, I venture to assert, would the very act of devising the machinery required for the political and economic unification of the world--a principle that has been increasingly advocated in recent times--provide in itself the antidote against the poison that is steadily undermining the vigour of organized peoples and nations. What else, might we not confidently affirm, but the unreserved acceptance of the Divine Programme enunciated, with such simplicity and force as

nearly Nationalist, and divided by the aggregate of the poll, it is Nationalist to-day. I reject with contempt and indignation the attempt, in this nineteenth century, to stir up sectarian jealousy. You know, and I know, what Scotland has done for civil and religious liberty. If there be any body of Protestant Irishmen who wish to keep themselves apart and nurse those bitter hatreds, those feuds that give rise to disturbance of the peace - if they want to do that, I am against them; and if there be any body of Catholics that wish to nurture such feuds, and keep themselves apart from their Protestant fellow-citizens, I am against them also. There is no difficulty about Ulster. Whenever you give Ireland Home Rule you will stir up a patriotic flame. And they will all be Irishmen first, and Ulster men and Tipperary men afterward, and the presence of Catholics and Protestants meeting in an assembly laboring for the national good will soften all asperities and make them under-

--- Page 190. The Gospel of Wealth - X Home Rule in America

stand each other better than they have hitherto done. The question of Ulster will settle

far back as sixty years ago, by Baha'u'llah, embodying in its essentials God's divinely-appointed scheme for the unification of mankind in this age, coupled with an indomitable conviction in the unflinching efficacy of each and all of its provisions, is eventually capable of withstanding the forces of internal disintegration which, if unchecked, must needs continue to eat into the vitals of a despairing society. It is towards this goal--the goal of a new World Order, Divine in origin, all-embracing in scope, equitable in principle, challenging in its features--that a harrassed humanity must strive.

To claim to have grasped all the implications of Bahá'u'lláh's prodigious scheme for world-wide human solidarity, or to have fathomed its import, would be presumptuous on the part of even the declared supporters of His Faith. To attempt to visualize it in all its possibilities, to estimate its future benefits, to picture its glory, would be premature at even so advanced a stage in the evolution of mankind.

All we can reasonably venture to attempt is to strive to obtain a glimpse of the first streaks of the promised Dawn that must, in the fullness of time, chase away the gloom that has encircled humanity. All we can do is to point out, in their broadest outline, to what appear to us to be the guiding principles underlying the World Order of Baha'u'llah, as amplified and enunciated by 'Abdu'l-Baha, the Centre of His Covenant with all mankind and the appointed Interpreter and Expounder of His Word. (PEACE, page 20)

itself. Left to a plebiscite of the Ulster people, you will hardly find a man that will not say, "Let us go with our country"; and I would not respect the man that did not say so, were he a hundred times a Protestant of the Protestants. That is not the Protestant religion. It is founded on private judgment and free thought, and the Irish Protestants have much to learn yet as to the fundamental principles of the faith of which they would boldly stand forth as the main adherents.

18. I now come to the fourth point. You will notice I am following the four contentions of the Unionists. Do not laugh at the Unionists. Let me tell you there were reasons for their contentions, much as I differ with them as to the mode which they took to enforce them. I think the Unionists within the councils of the Liberal party would have been much more powerful-I know the representatives of the Unionists in Parliament would have been more powerful if they had labored within the lines of the party under the banner of the only possible chief; but the Unionists whom I have met and wrestled with have always told me, "Mr.

contention - Consider the animosity and hatred existing today between the various nations of the world. What disagreements and hostilities arise, what warfare and contention, how much bloodshed, what injustice and tyranny! Just now there is war in eastern Turkey, also war between Turkey and Italy. Nations are devoted to conquest and bloodshed, filled with the animus of religious hatred, seeking the good-pleasure of God by killing and destroying those whom they consider enemies in their blindness. How ignorant they are! That which is forbidden by God they consider acceptable to Him. God is love; God seeketh fellowship, purity, sanctity and long-suffering; these are the attributes of divinity. Therefore these warring, raging nations have arisen against divinity, imagining they are serving God. What gross ignorance this is! What injustice, blindness and lack of realization! Briefly; we must strive with heart and soul in order that this darkness of the contingent world may be dispelled, that the lights of the Kingdom shall shine upon all the horizons, the world of humanity become illumined, the image of God become apparent in human mirrors, the law of God be well established and that all regions of the world shall enjoy peace, comfort and composure beneath the equitable protection of God. My admonition and exhortation to you is this: Be kind to all people, love humanity, consider all mankind as your relations and servants of the most high God. Strive day and night that animosity and contention may pass away from the hearts of men, that all religions shall become reconciled and the nations love each other, so that no racial, religious or political prejudice may remain and the world of humanity behold God as the beginning and end of all existence. God has created all

Gladstone is all wrong." I will tell you a story in point. Henry Clay was the most popular man America had. Well, he voted against his constituents upon the slavery question, which was the only burning question of the time, and he offered himself for reelection. There was not a ghost of a chance of his being returned to Washington, any more than there is of any Unionist being returned to the next Parliament. Well, Henry Clay saw that there was no use in conducting his canvass if he stood up to defend what he had done, so he went before the farmers of Kentucky and made one speech all over the State, "Now, boys," he said, "you have all got good, trusty rifles. Think of the game your rifle has brought down. Did your rifle ever miss fire? I have shot a good deal, and my rifle missed now and then. Did you on that account throw it away, or did you pick it up and try it again?" There

and all return to God. Therefore love humanity with all your heart and soul. If you meet a poor man, assist him; if you see the sick, heal him; reassure the affrighted one, render the cowardly noble and courageous, educate the ignorant, associate with the stranger. Emulate God. Consider how kindly, how lovingly He deals with all and follow His example. You must treat people in accordance with the divine precepts; in other words, treat them as kindly as God treats them, for this is the greatest attainment possible for the world of humanity. ('Abdu'l-Bahá, Foundations of World Unity, page 73)

--- Page 191. The Gospel of
Wealth - X Home Rule in
America

was no resisting such an appeal, and Clay was reelected by the greatest majority he ever received. Now, admitting all that the most conscientious or contentious Unionist has to say, I think if he has much of human nature in him, much of gratitude for past services, much of admiration for the noblest political career, he will pick up that old rifle -- Gladstone. Just let the old man have another shot.

(6) Gladstone, at the age of eighty-three, won "another shot" in the election of 1892. He got Home Rule by the Commons, but the Lords defeated it. In 1895 the Conservatives under Salisbury returned to power.

I will wager ten to one he will bring down the game. I will tell you another thing: I know your public men pretty well, but I do not believe you have got a rifle in the whole army, in the whole state, in the whole House of Parliament, that can bring down the game like Mr. Gladstone. Now, then, I come to the judicial question. We want to be thorough, the Tories say. We are not thorough when we oppress the people and thrust laws upon them which they do

appeal - America has arisen to spread the teachings of peace, to increase the illumination of humankind and bestow happiness and prosperity upon the children of men. These are the principles and evidences of divine civilization. America is a noble nation, the standard-bearer of peace throughout the world, shedding light to all regions. Foreign nations are not untrammelled and free from intrigues and complications like the United States; therefore, they are not able to bring about universal harmony. But America-- praise be to God!-- is at peace with all the world and is worthy of raising the flag of brotherhood and international agreement. When this is done, the rest of the world will accept. All nations will join in adopting the teachings of Baha'u'llah revealed more than fifty years ago. In His Epistles He asked the parliaments of the world to send their wisest and best men to an international world conference which should decide all questions between the peoples and establish universal peace. This would be the highest court of appeal, and the parliament of man so long dreamed of by poets and idealists would be realized. Its accomplishment would be more far-reaching than the Hague tribunal.

I am most grateful to President Taft for having extended his influence toward the establishment of universal peace. What he has accomplished in making treaties with various nations is very good, but when we have the interparliamentary body composed of delegates from all the nations of the world and devoted to the maintenance of agreement and goodwill, the utopian dream of sages and poets, the parliament of man, will be realized. ('Abdu'l-Bahá, Promulgation of Universal Peace, pages 388 & 389)

not want; we are only thorough when we go to the root of popular dissatisfaction and make our laws just. Now, the American States elect their own judges, who determine all issues between the citizens of the same State. A Pennsylvanian has the right to be tried by the courts of Pennsylvania, and to have his case decided by his fellow-citizen - the judge whose character he knows and trusts. There is no appeal beyond the Supreme Court of Pennsylvania in an issue pertaining to Pennsylvania; but, under the national Constitution, any issue between men of different States may be proceeded with in the courts of the United States. The Supreme Court of the United States sits at Washington, but it has judges in each district of the country. Sometimes one State will have one federal judge, sometimes two. Pennsylvania has two, one at Pittsburg and the other at Philadelphia, three hundred and fifty miles apart. That is matter of arrangement, and you can there have an appeal to the United States Court. Apply that to Ireland. In the first place, Irish judges already exist, and they will be

--- Page 192. The Gospel of Wealth - X Home Rule in

America

retained. It is not likely a good judge would be dismissed.

Therefore I think the Irish executive would take over the Irish judges. It is a prima facie case that a judge is a good judge unless he can be proved bad. It will be for the Irish executive to reappoint or choose their own judges.

What I want to point out to you is that if you pay regard to the lesson of Home Rule in America, you will allow the Irish Assembly to appoint Irish judges and to determine Irish affairs; and you will hold, of course, through the delegated powers, the right, in any issues of an international character, to appeal from these courts to the imperial power, such an appeal as every Scotchman has now to the judicial lords of the House of Lords. Now, that would settle the judicial question; but if you are going to give Ireland Home Rule, and withhold from her or from Scotland, when she gets Home Rule, as I trust she soon will, the control of the highest function, and the very essential of all government, - namely, the right to execute justice and administer the laws among her own citizens, - you are going to give them a mockery; you are going to play "Hamlet" with Hamlet left

out, and you will have the Irish question upon you again and again in worse forms than it is now.

19. You must make the judicial power in Ireland respected in Ireland, and you cannot do that unless it derives its powers from the Irish government. I do not profess that the Liberal party has quite clearly sounded this note, but I trust the democracy will watch with clear eye the clause giving judiciary powers to Ireland. You cannot give Home Rule to Ireland if you take from the government the power to enforce its decrees; you may as well bind the government, Mazeppa-like,

(7) A reference to the famous story of the young Pole, tied naked to the back of a wild horse by the jealous husband of the lady with whom he had an intrigue. Among various literary treatments, that of Byron's Mazeppa is perhaps the best known.

on a wild horse, without whip, spur, or bridle, and expect peace and good government and loyalty in Ireland if you deny to the Irish executive the highest of all

--- Page 193. The Gospel of Wealth - X Home Rule in America

judicial - The purpose is to emphasize the statement that consultation must have for its object the investigation of truth. He who expresses an opinion should not voice it as correct and right but set it forth as a contribution to the consensus of opinion, for the light of reality becomes apparent when two opinions coincide. A spark is produced when flint and steel come together. Man should weigh his opinions with the utmost serenity, calmness and composure. Before expressing his own views he should carefully consider the views already advanced by others. If he finds that a previously expressed opinion is more true and worthy, he should accept it immediately and not willfully hold to an opinion of his own. By this excellent method he endeavors to arrive at unity and truth. Opposition and division are deplorable. It is better then to have the opinion of a wise, sagacious man; otherwise, contradiction and altercation, in which varied and divergent views are presented, will make it necessary for a judicial body to render decision upon the question. Even a majority opinion or consensus may be incorrect. A thousand people may hold to one view and be mistaken, whereas one sagacious person may be right. Therefore, true consultation is spiritual conference in the attitude and atmosphere of love. Members must love each other in the spirit of fellowship in order that good results may be forthcoming. Love and fellowship are the foundation. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 72 & 73)

political functions - the administration of law and the maintenance of peace and order. So says the American Constitution.

20. Now, I will touch upon one point - the land question. Every State of the American Union has a right to make a kirk or a mill of its land if it pleases. It is its own. If the soil of a nation is not the property of that nation, and if you are not going to allow Ireland to manage its own land, what are you going to allow it to manage? The land question is at the foundation of everything in the State, and you find that the Land Bill

[Baha'i Comment](#)

(8) One means of pacifying Irish discontent had been the Gladstonian effort to make more just the arrangements under which Irish tenants held land. These tenants often held their land "at will," subject to six months notice; their rent, a "rack rent," was fixed by competitive bidding, and if evicted from their holdings they received no compensation for improvements or compelled landlords to pay for improvements if tenants were evicted through no fault of their own. Parnell and the Irish Land League agitated for fixity of tenure, fair rent set by the courts, and free sale by tenants of their interests to other tenants. Gladstone's Land Act of 1881 granted these three F's. In 1885 Parliament passed an act for state assistance to land purchases by tenants; the aim was a peasant proprietary.

is discarded - rightly so, and

Mr. Gladstone has said that the sands have run for the landlords. That is too good to believe. I doubt even Mr. Gladstone's power to make a bill as it ought to be in regard to land, because in the Liberal councils you have lots of Irish landlords. Lord Hartington is a large Irish landlord with a rental of thirty thousand pounds a year. I know he is a sincere and honest man, but I know Burns says that

When self the wavering
balance shakes,
It's rarely richt adjusted.

*(9) Robert Burns, "Epistle
to a Young Friend, May,
1788," stanza 3.*

No man should sit as a judge in its own cause, and in America no man who is directly interested in an act of Legislature can constitutionally vote upon it. I am afraid you will have to buy out the landlords before you can get done with them. The poor democracy, the toiling millions of Great Britain, will be mulcted in an enormous sum. Many members of

--- Page 194. The Gospel of Wealth - X Home Rule in America

Parliament are interested in land, and there is that tone in society which seems to say that property in land is different from property in everything else, because for hundreds of years the land has been held up by infamous laws to maintain a class of people who, if left to the free competition of economic forces, would go down in the struggle for existence.

21. Well, what is the solution to the land question? It is a very easy one. Let it alone; let the Irish executive settle with the Irish landlords. The democracy has never been anything but generous in its acts, and it will be generous to the Irish landlords when upon their executive is placed the responsibility of settling with them - if it decides to buy the land at all. I am not in favor of the executive of Ireland touching the land of Ireland, or of the executive of Great Britain touching the land of Great Britain. Let me give a hint to the democracy. You are past the days of unearned increment, and upon the days of earned decrement, and any man foolish enough to counsel the people of Great Britain to

property - Since the body of humankind is one and indivisible, each member of the race is born into the world as a trust of the whole. This trusteeship constitutes the moral foundation of most of the other rights -- principally economic and social -- which the instruments of the United Nations are attempting similarly to define. The security of the family and the home, the ownership of property, and the right to privacy are all implied in such a trusteeship. The obligations on the part of the community extend to the provision of employment, mental and physical health care, social security, fair wages, rest and recreation, and a host of other reasonable expectations on the part of the individual members of society. (Prosperity of Humankind, page 6)

land - The earth is one native land, one home; and all mankind are the children of one Father. God has created them, and they are the recipients of His compassion. Therefore, if anyone offends another, he offends God. It is the wish of our heavenly Father that every heart should rejoice and be filled with happiness, that we should live together in felicity and joy. The obstacle to human happiness is racial or religious prejudice, the competitive struggle for existence and inhumanity toward each other. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 468)

take over the land to-day in a falling market may have his own interest at heart, but he cannot have yours. It is said that the people of Ireland will not do justice to the landlords. No, I hope not. In my wildest and most vindictive moments I have never yet gone so far as to wish that the Irish landlords had justice. No; let us remember that mercy should in that case season justice. But they will get generous treatment, and the democracy of Great Britain can be absolved from all trouble with the land of Ireland if they strengthen Mr. Gladstone's hands, and tell him in unmistakable tones that there are a great many things the democracy of this country will do, and a great many things they will suffer, but, as the Lord helps them, they will never be found on the side of Irish landlords as against Irish, tenants, or pay one penny toward buying their land.

22. There may be some exceedingly patriotic men here who have been saying in their hearts, "We do not want to Americanize our institutions." Why not? The Americans have taken from you everything they could lay their hands upon. They have taken your Constitution and bettered it; they have

Patriotic - We must find a way of spreading love among the sons of humanity.

Love is unlimited, boundless, infinite! Material things are limited, circumscribed, finite. You cannot adequately express infinite love by limited means.

The perfect love needs an unselfish instrument, absolutely freed from fetters of every kind. The love of family is limited; the tie of blood relationship is not the strongest bond. Frequently members of the same family disagree, and even hate each other.

Patriotic love is finite; the love of one's country causing hatred of all others, is not perfect love! Compatriots also are not free from quarrels amongst themselves.

The love of race is limited; there is some union here, but that is insufficient. Love must be free from boundaries!

To love our own race may mean hatred of all others, and even people of the same race often dislike each other.

Political love also is much bound up with hatred of one party for another; this love is very limited and uncertain.

The love of community of interest in service is likewise fluctuating; frequently competitions arise, which lead to jealousy, and at length hatred replaces love. ('Abdu'l-Bahá, Paris Talks, page 36)

The attainment of any object is conditioned upon knowledge, volition and action. Unless these three conditions are forthcoming there is no execution or accomplishment. In the erection of a house it is first necessary to know the ground and design the house suitable for it; second, to obtain the means or funds necessary for the construction; third, to actually build it. Therefore a power is needed to carry out and execute what is known and admitted to be the remedy for human conditions; namely, the unification of mankind. Furthermore, it is evident that this cannot be realized through material process and means. The accomplishment of this unification cannot be through racial power, for races are different and diverse in tendencies. It cannot be through patriotic power, for nationalities are unlike. Nor can it be effected through political power since the policies of governments and nations are various. That is to say, any effort toward unification through these material means would benefit one and injure another because of unequal and individual interests. Some may believe this great remedy can be found in dogmatic insistence upon imitations and interpretations. This would likewise

be without foundation and result. Therefore it is evident that no means but an ideal means, a spiritual power, divine bestowals and the breaths of the Holy Spirit will heal this world sickness of war, dissension and discord. Nothing else is possible; nothing can be conceived of. But through spiritual means and the divine power it is possible and practicable. (Foundations of World Unity, Page 101)

--- Page 195. The Gospel of Wealth - X Home Rule in America

taken your literature, your laws; they have taken your language, and if you would take from America everything that America has to give you, or everything that America ever will have to give you, there would remain a huge, incalculable balance yet left in favor of the parent land. Why should you not take things from your child if you know they are for your good? But your own colony of Canada has practically the same Constitution, as far as Home Rule is concerned. If there be any man who forgets that America is your own child, let him look to Canada - she is practically the same. Do you think that the English-speaking race throughout the world, with the same language, the same traditions, - because all Americans claim your traditions, with the same literature, with the same religion - do you think that it is in the power of man to prevent all English speaking people ultimately from having

political institutions - The Baha'i Commonwealth of the future, of which this vast Administrative Order is the sole framework, is, both in theory and practice, not only unique in the entire history of political institutions, but can find no parallel in the annals of any of the world's recognized religious systems. No form of democratic government; no system of autocracy or of dictatorship, whether monarchical or republican; no intermediary scheme of a purely aristocratic order; nor even any of the recognized types of theocracy, whether it be the Hebrew Commonwealth, or the various Christian ecclesiastical organizations, or the Imamate or the Caliphate in Islam - none of these can be identified or be said to conform with the Administrative Order which the master-hand of its perfect Architect has fashioned....

Let no one, while this System is still in its infancy, misconceive its character, belittle its significance or misrepresent its purpose. The bedrock on which this Administrative Order is founded is God's immutable Purpose for mankind in this day. The Source from which it derives its inspiration is no one less than Baha'u'llah Himself. ... The central, the underlying aim which animates it is the establishment of the New World Order as adumbrated by Baha'u'llah. The methods it employs, the standard it inculcates, incline it to neither East nor West, neither Jew nor Gentile, neither rich nor poor, neither white nor colored. Its watchword is the unification of the human race; its standard the "Most Great Peace." ... February 8, 1934.

The contrast between the accumulating evidences of steady consolidation that accompany the rise of the Administrative Order of the Faith of God, and the forces of disintegration which batter at the fabric of a travailing society, is as clear as it is arresting. Both within and outside the Baha'i world the signs and tokens which, in a mysterious manner, are heralding the birth of that World Order, the establishment of which must signalize the Golden Age of the Cause of God, are growing and multiplying day by day....

"Soon," Baha'u'llah's own words proclaim it, "will the present day Order be rolled up, and a new one spread out in its stead."... (Bahá'u'lláh and the New Era, pages 278-279)

the same political institutions? I will not venture to say what the political institutions of the English race may be in the future. It may be that the "Scotsman" is right, and that democracy means that privilege shall die, and it may be that all English-speaking people will range themselves together upon a platform which develops the extremest rights of man, and the political equality of the citizen. That is possible. It may be possible, on the other hand, you may say, that the majority of the English-speaking race will turn its back upon this advanced political development, and, seeking out some prince, will go back and make him a perpetual king, and make his children kings hereafter, whether they be fools or idiots or not, and spend hundreds of thousands of their hard-won earnings every year to support the entire brood in vulgar riot and ostentation; and it may be that we will create another aristocracy, and that I shall so far forget myself and my lineage, as the direct descendant of weavers and shoemakers - glorious Radicals some of them have been, who have gone to jail just for attending such a meeting as was interrupted in Ireland the other day! - it may be that I will forget that and parade before you as a

baronet. Then you will say,
"We

--- Page 196. The Gospel of
Wealth - X Home Rule in
America

don't know how we will treat Mr. Carnegie coming to visit us; he is not a nobleman, and he has ceased to be a gentleman." But whatever be the system of political institutions adopted in the future, - you may have it either way, - one point I venture to stand by, and that is that the English-speaking race throughout the world is to have the same institutions. If you can adopt some of the provisions of the American Constitution for this emergency, you will have hastened by so much the day when your institutions shall be the same as the institutions of the English-speaking race. How long will it take after that assimilation is perfected before we have a federal council that will forever render it impossible that the blood of the English-speaking man can be shed by English-speaking man? Where lies your greatest hope that your own race, the dominant power of the world, shall coalesce and form a union against which nothing on earth shall stand? In the assimilation of your

Institutions - For Baha'u'llah, we should readily recognize, has not only imbued mankind with a new and regenerating Spirit. He has not merely enunciated certain universal principles, or propounded a particular philosophy, however potent, sound and universal these may be. In addition to these He, as well as Abdu'l-Baha after Him, has, unlike the Dispensations of the past, clearly and specifically laid down a set of Laws, established definite institutions, and provided for the essentials of a Divine Economy. These are destined to be a pattern for future society, a supreme instrument for the establishment of the Most Great Peace, and the one agency for the unification of the world, and the proclamation of the reign of righteousness and justice upon the earth. Not only have they revealed all the directions required for the practical realization of those ideals which the Prophets of God have visualized, and which from time immemorial have inflamed the imagination of seers and poets in every age. They have also, in unequivocal and emphatic language, appointed those twin institutions of the House of Justice and of the Guardianship as their chosen Successors, destined to apply the principles, promulgate the laws, protect the institutions, adapt loyally and intelligently the Faith to the requirements of progressive society, and consummate the incorruptible inheritance which the Founders of the Faith have bequeathed to the world. (World Order of Bahá'u'lláh, pages 19 & 20)

institutions. There lies the point. And where is the hope of that great day which the poet sings of

When the drum shall
beat no longer, when
the battle-flags are
furled,
In the Parliament of
Man, the Federation of
the World?

*(10) See Essay VIII, note
7.*

It lies in the great beneficent principle of Home Rule. Home Rule for each of the divisions, with a central authority over all to keep them in order; and in that congregation of English-speaking people, in that future Parliament - I know not how many divisions, I know not what their size or number, I know not their positions, but I know the position of one power is fixed, immovable, perpetual, and secure - that of this glorious little island. There may be many children clustering around her in that Parliament of Man; there can only be one mother. I say cursed be the arm and withered the tongue of any man, wherever found, who would strive to keep apart, by word or by deed, those children from that mother.

XI

Does America Hate England?

(1) *From the Contemporary Review, LXXII (November 1897), 660-668.*

1. THIS question has been much discussed of late in Britain: and the answer has generally been given in the affirmative; even the Spectator, a powerful and true friend of the Republic, has been reluctantly driven to that side.

hatred - "O friends, help the Oppressed One with well-pleasing virtues and good deeds! Today let every soul desire to attain the highest station. He must not regard what is in him, but what is in God. It is not for him to regard what shall advantage himself, but that whereby the Word of God which must be obeyed shall be upraised. The heart must be sanctified from every form of selfishness and lust, for the weapons of the unitarians and saints were and are the fear of God. That is the buckler which guardeth man from the arrows of hatred and abomination. ('Abdu'l-Bahá, A Traveler's Narrative, page 45 & 46)

2. But the correct answer to this inquiry depends upon what is meant by hatred; for this may be of two kinds - one deep, permanent, generally racial, which creates hereditary antipathy and renders the parties natural enemies; the other only temporary and skin-deep - indignation and resentment aroused by specific questions, which pass with their settlement, leaving no serious estrangement behind.

hatred - My hope is that through the zeal and ardour of the pure of heart, the darkness of hatred and difference will be entirely abolished, and the light of love and unity shall shine; this world shall become a new world; things material shall become the mirror of the divine; human hearts shall meet and embrace each other; the whole world become as a man's native country and the different races be counted as one race.

Then disputes and differences will vanish, and the Divine Beloved be revealed on this earth. ('Abdu'l-Bahá in London, page 38)

3. That several causes exist which must always create more or less irritation in the United States against Great Britain is obvious. The Canadian question must always do so. Imagine Scotland republican, owing allegiance to the United States, and constantly proclaiming its readiness to attack Britain at their bidding. The industrial question also has its effect. A score of articles "made in Germany" are causing irritation in England. What can a thousand articles "made in England" be expected to do in the United States? Industrial competitors, and the workmen employed by them, are very sensitive and easily irritated; and in our day, when every nation of the front rank aspires to manufacture and produce for

irritation - In these days when the peoples of the world are thirsting for the teachings of the Abha Beauty--teachings that provide the incomparable, life-giving waters of immortality--when we Baha'is have pledged ourselves to proffer these living waters to all mankind and are known to be prepared to endure every suffering and tribulation, how pitiful it would be if, despite all this, we were to neglect our binding obligations and responsibilities and to occupy ourselves with disagreeable discussions that provoke irritation and distress and to turn our attention to matters that lead to ill-feeling, to despondency and unhappiness and reduce the penetrating influence of the Word of God. (Bahiyiyh Khanum, page 197)

its own wants, "Foreign Commerce" and "Free Trade" do not always make for peace and good will among

--- Page 198. The Gospel of Wealth - XI Does America Hate England?

nations, but the contrary. Nations are disposed to resent industrial invasion, Free-Trade Britain not less than Protective Germany.

4. But deeper than these causes of irritation there does lie at the core of the national heart of the Republic a strong and ineradicable stratum of genuine respect, admiration, and affection for the old home. The pride of race is always there at the bottom - latent, indeed, in quiet times, but decisively shown in supreme moments when stirred by great issues which affect the safety of the old home and involve the race. The strongest sentiment in man, the real motive which at the crisis determines his action in international affairs, is racial. Upon this tree grow the one language, one religion, one literature, and one law which bind men together and make them brothers in time of need as against men of other races. This racial sentiment goes

racial - "A world community in which all economic barriers will have been permanently demolished and the interdependence of capital and labour definitely recognized; in which the clamour of religious fanaticism and strife will have been forever stilled; in which the flame of racial animosity will have been finally extinguished; in which a single code of international law--the product of the considered judgement of the world's federated representatives--shall have as its sanction the instant and coercive intervention of the combined forces of the federated units; and finally a world community in which the fury of a capricious and militant nationalism will have been transmuted into an abiding consciousness of world citizenship--such indeed, appears, in its broadest outline, the Order anticipated by Baha'u'llah, an Order that shall come to be regarded as the fairest fruit of a slowly maturing age." (Promise of World Peace, page 11)

Other wars are caused by purely imaginary racial differences; for humanity is one kind, one race and progeny inhabiting the same globe. In the creative plan there is no racial distinction and separation such as Frenchman, Englishman, American, German, Italian or Spaniard; all belong to one household. These boundaries and distinctions are human and artificial, not natural and original. All mankind are the fruits of one tree, flowers of the same garden, waves of one sea. In the animal kingdom no such distinction and separation are observed. The sheep of the East and the sheep of the West would associate peacefully. The oriental flock would not look surprised as if saying, "These are sheep of the Occident; they do not belong to our country." All would gather in harmony and enjoy the same pasture without evidence of local or racial distinction. The birds of different countries mingle in friendliness. We find these virtues in the animal kingdom. Shall man deprive himself of these

deeper and reaches higher than questions of mere pecuniary import, or of material interests. The most recent proof that this pride of race exists in America in an intense degree was given, even at the very height of the Venezuelan dispute,

(2)The Venezuelan dispute, one of the major diplomatic fireworks of the nineties, went off because Venezuela and Great Britain could not agree upon the boundary between the former and British Guiana. Venezuela had for years proposed arbitration; in 1895 Cleveland and his Secretary of State, Richard Olney, insisted Britain arbitrate, since the application of her claims violated the Monroe Doctrine. Salisbury rejected the proposal and denied the American interpretation of the Monroe Doctrine. Cleveland proposed to Congress the appointment of a commission to investigate the merits of the disputants and added that after the investigation the United States would resist as aggression any "appropriation" of Venezuela's lands by Great Britain. Britain's freedom of action was limited by the outbreak of violence between British "outlanders" and the Boers in the Transvaal in South Africa. The German Emperor openly congratulated President Paul Kruger of the Boers for maintaining the independence of his country Britain under Salisbury and Chamberlain, Secretary for Colonial Affairs, decided to liquidate the American quarrel and concentrate on South Africa. Consequently, England and Venezuela in February 1897 agreed to arbitration; on the tribunal of reference were two Justices of the American Supreme Court as well as British and neutral representatives. The award came in 1899.

virtues? Man is endowed with superior reasoning power and the faculty of perception; he is the manifestation of divine bestowals. Shall racial ideas prevail and obscure the creative purpose of unity in his kingdom? Shall he say, "I am a German," "I am a Frenchman," or an "Englishman" and declare war because of this imaginary and human distinction? God forbid! (Foundations of World Unity, page 23)

Carnegie's picture of the American reaction to the Boer War is inaccurate. There was a "wild cheer," but it was not out of character. American opinion is predisposed to support under-dog nations, especially when an issue of independence is involved. Irish-Americans and German-Americans there anti-British; and so were the New York world and the New York Times, though not the Hearst papers. Bryan and the Democrats were pro-Boer. Official opinion, on the other hand, accorded with the Carnegie formula. John Hay (183&1905), Secretary of State, wrote: "I hope, if it comes to blows, that England will make quick work of Uncle Paul"; and President McKinley stood off all demands for American intervention. "Uncle Paul" is of course Paul Kruger (1825-1904), president of the Transvaal.

Carnegie's real opinions on the issues were as tangled as the issues themselves. He deplored Cleveland's attitude on the Venezuelan affair. In a private letter, later than this essay, he wrote he was with the Boers heart and soul.

when it was suspected that a combina-

--- Page 199. The Gospel of Wealth - XI Does America Hate England?

tion of European Powers was behind Germany's action in regard to the Transvaal, which had for its aim the humiliation and ruin of Britain, and was taking advantage of the family quarrel to begin the partition of the possessions of the only other member of our race. When the plucky little island

took up the challenge and prepared without a moment's hesitation to meet the world in arms, the American continent, from Maine to California, might be said to have burst forth in one wild cheer - a cheer which meant more than prosaic people will believe, and more, perhaps, than uncontrollable outburst; nor can one tell how far this impulse, which he could not check, would lead him when once in full swing. Senator Wolcott

(3) Edward Oliver Wolcott (1848-1905), Senator from Colorado.

only expressed in the Senate what the outside millions felt; the average American just said to himself: "This is our own race; this is what we do; this is how we do it. Of course we have some difference of our own with her, and we do not intend to let even our motherland light the torch of war upon our continent; she must arbitrate all questions concerning territory here - but this is a little family matter between ourselves. It does not mean that German, Russian, and Frenchman, or any foreigners, may combine to attack our race to its destruction, without counting us in. No, sir-ee."

5. No combination of other races is likely to estimate at a tithe of its true value the strength of this sentiment throughout our race, or correctly to gauge how very much thicker

--- Page 200. The Gospel of Wealth - XI Does America Hate England?

than water our race-blood will be found if it is ever brought to the test.

Races - Praise be to God! The medieval ages of darkness have passed away and this century of radiance has dawned, this century wherein the reality of things is becoming evident, wherein science is penetrating the mysteries of the universe, the oneness of the world of humanity is being established, and service to mankind is the paramount motive of all existence. Shall we remain steeped in our fanaticisms and cling to our prejudices? Is it fitting that we should still be bound and restricted by ancient fables and superstitions of the past, be handicapped by superannuated beliefs and the ignorances of dark ages, waging religious wars, fighting and shedding blood, shunning and anathematizing each other? Is this becoming? Is it not better for us to be loving and considerate toward each other? Is it not preferable to enjoy fellowship and unity, join in anthems of praise to the most high God and extol all His Prophets in the spirit of acceptance and true vision? Then, indeed, this world will become a paradise, and the promised Day of God will dawn. Then, according to the prophecy of Isaiah, the wolf and the lamb will drink from the same stream, the owl and the vulture will nest together in the same branches, and the lion and the calf pasture in the same meadow. What does this mean? It means that fierce and contending religions, hostile creeds and divergent beliefs will reconcile and associate, notwithstanding their former hatreds and antagonism. Through the liberalism of human attitude demanded in this radiant century they will blend together in perfect fellowship and love. This is the spirit and meaning of Isaiah's words. There will never be a day when this prophecy will come to pass literally, for these animals by their natures cannot mingle and associate in kindness and love. Therefore, this prophecy symbolizes the unity and agreement of races, nations and peoples who will come together in attitudes of intelligence, illumination and spirituality. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 369-370)

6. The message which President McKinley sent to Queen Victoria at her Jubilee was another evidence of race pride, and was no mere formal effusion. More men in the United Kingdom than in the United States would hesitate to compliment and praise her Majesty and sing "God Save the Queen" with enthusiasm. She is universally recognized there as the truest of the true friends of the Republic, for she

pride - O BRETHREN! Be forbearing one with another and set not your affections on things below. Pride not yourselves in your glory, and be not ashamed of abasement. By My beauty! I have created all things from dust, and to dust will I return them again. (Bahá'u'lláh, Hidden Words #48 from the Persian)

stood a friend when a friend was needed."

(4) Victoria and her subjects celebrated the Queen's "diamond jubilee" in 1897. She had reigned sixty years. The allusion to the friendship of Queen is probably to her supposed preference for the North during Civil War, Actually it was the Prince Consort, with his immense influence over the Queen, who slowed down ministerial belligerence against Federal Union.

7. It is strange that such evidences of race unity at bottom, and of genuine, cordial friendship, should not outweigh some alleged lack of courtesy of expression in a message written by a President to his own Congress or by a Secretary of State to his own minister. Yet the Spectator concludes Americans hate England, and this opinion it bases upon trifles as these.

(5) In the Venezuela crisis Cleveland's special message to Congress on October 17, 1895, proposing to investigate the merits of claims to disputed territory and to support Venezuela's rightful claims, contained both cautious conditional clauses and cryptic utterances foreboding war. The latter made a great impression at the time. Richard Olney (1835-1917), Secretary State, had previously dispatched a communication to the American Minister in London, directing him to find out if Britain would arbitrate the dispute and asserting, "Today the United States is practically sovereign on continent." While the Spectator

race unity - "The work of the Race Unity Committee should include, as far as is feasible, contacts with all minority groups, and wherever there is a particularly stout prejudice against a special group--such as the feeling against the Japanese in the Western states and the Negroes in the Southern, etc.,--efforts should be made to counteract it by showing publicly the Baha'i example of loving tolerance and brotherly association." (From a letter written on behalf of Shoghi Effendi to an individual believer, December 30, 1945)

regarded with pleasurable anticipation possibility that the Monroe Doctrine would make the Anglo-Saxon supreme in Latin America, it objected to the schoolmasterish and pompous tone of these American utterances.

8. Much stress has been laid in the discussion upon American school-books reciting the facts of American history; this is held to make every American boy and girl a hater of England. This is undoubtedly true; and the pity of it is there is no possible escape, for American history begins with the revolt of the colonies and their struggle for the rights of

--- Page 201. The Gospel of Wealth - XI Does America Hate England?

Britons. The Republic has never had a dangerous foe except Britain, for the short campaign against Mexico made no lasting impression upon the nation. It is impossible to do otherwise than state the facts as they occurred; and even if there were added the further facts that some of the greatest and best of British statesmen opposed the attempt to tax the colonies even at that early day, and that now the kindness and consideration with which Britain reigns over her colonies gives an example

hater - The only division that is real is this: There are heavenly men and earthly men; self-sacrificing servants of humanity in the love of the Most High, bringing harmony and unity, teaching peace and goodwill to men. On the other hand there are those selfish men, haters of their brethren, in whose hearts prejudice has replaced loving kindness, and whose influence breeds discord and strife. ('Abdu'l-Bahá, Paris Talks, page 149)

to the whole world, these things would make no impression upon children. The young American must begin in our day as an intense hater of England; and this we must accept: generations will elapse before it can be greatly modified.

9. On the other hand, it is impossible for any American to acquire further and more detailed knowledge of the struggle for independence, of the later treatment of her colonies by Britain, and of British history and the part his race has played in the Old World, without becoming her admirer, and, should he have British blood in his veins, -- which most Americans can boast, - without being very proud of his race. It is upon this foundation that we have to build our hopes of closer union between the old and the new lands. Englishmen and Hessians fighting Washington must give place in the minds of the young, as they grow older, to other pictures in which Britain and America are seen standing side by side, the two great pillars of civil and religious liberty throughout the world, and the sole members of our race. Later must come the knowledge of Shakspeare, Milton, Burns, and Scott; then

Liberty

59 Expounding the theme of liberty, Baha'u'llah asserted that "the embodiment of liberty and its symbol is the animal"; that "liberty causeth man to overstep the bounds of propriety, and to infringe on the dignity of his station"; that "true liberty consisteth in man's submission unto My commandments".

60 "We approve of liberty in certain circumstances," He declared, "and refuse to sanction it in others."

61 But He gave the assurance that, "Were men to observe that which We have sent down unto them from the Heaven of Revelation, they would, of a certainty, attain unto perfect liberty."

62 And "Mankind in its entirety must firmly adhere to whatsoever hath been revealed and vouchsafed unto it.

63 Then and only then will it attain unto true liberty." (The Universal House of Justice, Individual Rights and Freedoms

the political history of England, Cromwell, Sidney, Russell, Hampden, Chatham, Burke, and the many others, until the young American learns that from Britain he has derived, not only his language, but his laws, religion, and even his free institutions; and that the political institutions of the two countries are similar -- one crowned, the other uncrowned, yet both republican, since in both there is government of the people, for the people, and by the people, which is the es-

--- Page 202. The Gospel of Wealth - XI Does America Hate England?

sence of republicanism. This is the chief point which influences the ardent young politician, and gives the old land at last a warm place in the heart of young America. From this time on, the race sentiment grows stronger and stronger in his heart as knowledge increases.

10. How different with the young Canadian and Australian, who learn with their first lessons that the rights of Britons have never been denied them, and find in Britain the most generous, most illustrious, and kindest of mothers, whom they reverence and love from the beginning. Such are the opposite results of tender and proper regard for colonies and dependencies, and of denial to them of the rights and liberties enjoyed at home.

rights and liberties - The unification of the world of humanity, the welding together of the world's different religions, the reconciliation of Religion and Science, the establishment of Universal Peace, of International Arbitration, of an International House of Justice, of an International Language, the Emancipation of Women, Universal Education, the abolition not only of Chattel Slavery, but of Industrial Slavery, the Organization of Humanity as a single whole, with due regard to the rights and liberties of each individual--these are problems of gigantic magnitude and stupendous difficulty in relation to which Christians, Muhammadans and adherents of other religions have held and still hold the most diverse and often violently opposed views, but Baha'u'llah has revealed clearly defined principles, the general adoption of which would obviously make the world a paradise. (Bahá'u'lláh & New Era, page 256)

11. Whether at this day seeds of future hatred or affection are being sown in the hearts of the millions to come in various parts of the world, should be the vital Question for statesmen engaged in empire-building. What an expanding nation would here do "highly, that should she holily," for assuredly empire founded upon violent conquest, conspiracy, or oppression, or upon any foundation other than the sincere affection of the people embraced, can neither endure nor add to the power or glory of the conquerer, but prove a source of continual and increasing weakness and of shame.

affection - "O friends, consort with all the people of the world with joy and fragrance. If there be to you a word or essence whereof others than you are devoid, communicate it and show it forth in the language of affection and kindness: if it be received and be effective the object is attained, and if not leave it to him, and with regard to him deal not harshly but pray. The language of kindness is the lodestone of hearts and the food of the soul; it stands in the relation of ideas to words, and is as an horizon for the shining of the Sun of Wisdom and Knowledge." ('Abdu'l-Bahá, A Traveler's Narrative, Page 43)

12. While, in the opinion of the writer, there is no deep-seated, bitter national hatred in the United States against Britain, there is no question but there has been recently a wave of resentment and indignation at her conduct. This has sprung from two questions:

opinion - The diversity in the human family should be the cause of love and harmony, as it is in music where many different notes blend together in the making of a perfect chord. If you meet those of different race and colour from yourself, do not mistrust them and withdraw yourself into your shell of conventionality, but rather be glad and show them kindness. Think of them as different coloured roses growing in the beautiful garden of humanity, and rejoice to be among them.

Likewise, when you meet those whose opinions differ from your own, do not turn away your face from them. All are seeking truth, and there are many roads leading thereto. Truth has many aspects, but it remains always and forever one.

Do not allow difference of opinion, or diversity of thought to separate you from your fellow-men, or to be the cause of dispute, hatred and strife in your hearts.

Rather, search diligently for the truth and make all men your friends. Every edifice is made of many different stones, yet each depends on the other to such an extent that if one were displaced the whole building would suffer; if one is faulty the structure is imperfect. ('Abdu'l-Bahá, Paris Talks, page 53 & 54)

13. First, Ambassador Pauncefote and Secretary of State Blaine, years ago, agreed upon a settlement of the Bering Sea question,

(6) The migratory fur seals generally resorted for breeding purposes to islands over which the American government, after the purchase of Alaska exercised jurisdiction. The American government sought to save the fur seals from extinction by domestic protective legislation. Since seals could still be taken on the high seas, these steps were inadequate. Pursuant to a treaty of 1892, negotiated by Pauncefote (1828-1902), British ambassador in Washington, and Blaine, the Bering Sea claims were referred to an international tribunal. It rejected the American claims to the exercise of a wide oceanic jurisdiction and enforced a

treaties - "...Every system, short of the unification of the human race, has been tried, repeatedly tried, and been found wanting. Wars again and again have been fought, and conferences without number have met and deliberated. Treaties, pacts and covenants have been painstakingly negotiated, concluded and revised. Systems of government have been patiently tested, have been continually recast and superseded. Economic plans of reconstruction have been carefully devised, and meticulously executed. And yet crisis has succeeded crisis, and the rapidity with which a perilously unstable world is declining has been correspondingly accelerated. A yawning gulf threatens to involve in one common disaster both the satisfied and dissatisfied nations, democracies and dictatorships, capitalists and wage-earners, Europeans and Asiatics, Jew and Gentile, white and coloured. An angry Providence, the cynic might well observe, has abandoned a hapless planet to its fate, and fixed irrevocably its doom. Sore-tried and disillusioned, humanity has no doubt lost its orientation, and would seem to have lost as well its faith and hope. It is hovering, unshepherded and visionless, on the brink of disaster. A sense of fatality seems to pervade it. An ever-deepening gloom is settling on its fortunes as she recedes further and further from the outer fringes of the darkest zone of its agitated life and penetrates its very heart." (Shoghi Effendi: The World Order of Baha'u'llah, p. 190)

payment to Canadian sealers for vessels illegally taken. In 1811 Russia, Japan, Britain, and the United States joined in a treaty protecting the seals in the North Pacific.

and Lord Salisbury telegraphed his congratula-

--- Page 203. The Gospel of Wealth - XI Does America Hate England?

tions, through Sir Julian Pauncefote, to Mr. Blaine. The two nations were jointly to police the seas and stop the barbarous destruction of the female seals. Canada appeared at Washington and demanded to see the President of the United States upon the subject. Audience was denied to the presumptuous colony; nevertheless, her action forced Lord Salisbury to disavow the treaty. No confidence here is violated, as President Harrison referred to the subject in a message to Congress. Britain was informed that if she presumed to make treaties in which Canada was interested without her consent, she would not have Canada very long. It will be remembered that Canada took precisely the same position in regard to international copyright. It is this long-desired treaty-making power which Canada

has recently acquired for herself, at least as far as concerns fiscal policy, so that she need no longer even consult her suzerain. She can now appear at Washington and insist upon being received when new tariff measures are desired, having suddenly become a "free nation," according to her Prime Minister. There are surprises in store here for the indulgent mother.

14. The repudiation of the Bering Sea settlement aroused a deep feeling of resentment, not only among the uninformed, but among the educated class of Americans, who were and are Britain's best friends; and this has been greatly embittered by charges, commonly made in British publications, that the United States has failed to adhere to the findings of the Bering Sea tribunal. Nothing could be more baseless than such a charge. The tribunal decided that the United States were liable for certain vessels seized which carried the British flag, and payment was directed to be made, either of a stated sum by mutual agreement, or, failing this, of damages to be assessed by a commission. The United States Secretary

Tribunal - A Supreme Tribunal shall be established by the peoples and Governments of every nation, composed of members elected from each country and Government. The members of this Great Council shall assemble in unity. All disputes of an international character shall be submitted to this Court, its work being to arrange by arbitration everything which otherwise would be a cause of war. The mission of this Tribunal would be to prevent war. ('Abdu'l-Bahá, Paris Talks, page 155)

--- Page 204. The Gospel of
Wealth - XI Does America
Hate England?

of State agreed to a fixed sum with Ambassador Pauncefote, "subject to an appropriation by Congress" - those are the very words of the agreement. When the bill was presented in Congress for an appropriation, the ex-chairman of the Committee on Foreign Relations, Mr. Hitt,

(7) Robert R. Hitt (1834-1908).

rose and stated that it had been discovered that the fishing-boats in question were really owned, to a great extent, by naturalized Americans. Evidence had been found that a blacksmith in San Francisco, a British subject, had been paid one hundred dollars to take title to these boats, so that the British flag could be prostituted to cover the killing of the female seals, which was unlawful under American law. Only about one fifth of the amount claimed was due to Canadians; the remainder of the claim belonged to naturalized Americans, who had broken American laws by engaging in this nefarious and unlawful traffic. Mr. Hitt asked that the right of the Government, under the award, to have these claims examined by a

commission, be exercised. Congress agreed to this, and the Commission was promptly appointed and ratified by the Senate unanimously. It is now sitting, and the result, we venture to prophesy, will vindicate the contention of the United States Government - viz., that a fraud has been attempted. Yet many British papers at intervals have repeated the charge that the United States Government has been false to its obligations under the Bering Sea award. Charges of national dishonor - and such a charge involves this - always cause intense bitterness. Writers who make them falsely, as in this case, have much to answer for.

15. Much offense had been taken in Britain at Secretary Sherman's

(8) John Sherman was Secretary of State, 1897-1898.

recent message about the destruction of the seals. It is said that he has not observed the usual diplomatic reserve and courtesy. Granted; but had he not some excuse for plain speaking? It is stated that before Mr. Sherman's letter was written -- to his own minister, be it remembered,

conference - In this Cause consultation is of vital importance, but spiritual conference and not the mere voicing of personal views is intended. In France I was present at a session of the senate, but the experience was not impressive. Parliamentary procedure should have for its object the attainment of the light of truth upon questions presented and not furnish a battleground for opposition and self-opinion. Antagonism and contradiction are unfortunate and always destructive to truth. In the parliamentary meeting mentioned, altercation and useless quibbling were frequent; the result, mostly confusion and turmoil; even in one instance a physical encounter took place between two members. It was not consultation but comedy. ('Abdu'l-Bahá, Promulgation of Universal Peace, page 5)

--- Page 205. The Gospel of
Wealth - XI Does America
Hate England?

not to the British Government - Lord Salisbury had already refused a conference on the subject. After that letter Lord Salisbury thought better of it, and agreed to the conference, which is to meet immediately in Washington. How this matter is viewed in America is shown by the following cable from Washington in to-day's (September 20) newspapers:

The officials of the State Department are not disposed to comment upon the correspondence which has been published relating to the fur-seal question between Great Britain and the United States. They say, however, that it shows that the object sought by the Government of the United States for the past three years has been attained by the agreement of Great Britain to participate in a conference to be held in October. They point out that the refusal of the British Government heretofore to consent to such a conference led to the transmission to Mr. Hay, United States

ambassador in London, of Mr. Sherman's note of May 10, which was followed by Lord Salisbury's reply agreeing to hold a conference.

16. The whole Bering Sea business has been mismanaged by Britain - as is believed, contrary to her real wishes - simply because she could not govern her colony; the colony has governed her, as she will under Sir Wilfrid Laurier

(9) Laurier (1841-1919) was the first French Canadian to become Premier.

and his successors hereafter, as time will show.

17. The second cause of the bitter hostility which has been aroused recently against Britain is her conduct upon the Venezuela question. Let us look at the facts in this case. For many years the United States Government urges upon Great Britain in the most courteous manner that the territorial dispute with Venezuela, her small republican neighbor, should be settled amicably by arbitration. The sixteen American republics having agreed to settle their disputes

[Baha'i Comment](#)

[hostility](#) - "Consider the harmful effect of discord and dissension in a family; then reflect upon the favours and blessings which descend upon that family when unity exists among its various members. What incalculable benefits and blessings would descend upon the great human family if unity and brotherhood were established! In this century when the beneficent results of unity and the ill effects of discord are so clearly apparent, the means for the attainment and accomplishment of human fellowship have appeared in the world. His Holiness Baha'u'llah has proclaimed and provided the way by which hostility and dissension may be removed from the human world. He has left no ground or possibility for strife and disagreement. First he has proclaimed the oneness of mankind and specialized religious teachings for existing human conditions." (Lights of Guidance, page 220, # 732)

[arbitrate](#) - In short, every means that produces war must be checked and the causes that prevent the occurrence of war be advanced;--so that physical conflict may become an impossibility. On the other hand, every country must be properly delimited, its exact frontiers

by arbitration,

(10) Blaine, long an advocate of inter-America co-operation, when he became Secretary of State in Harrison's administration pushed hard to establish an Inter-American Union. The first Inter-American conference assembled in Washington in 1889. The conference failed to establish a customs union, as Blaine had hoped it would, and fell short of tangible short-run accomplishments on other matters. Carnegie had been appointed as one of ten United States delegates to the conference and was partially instrumental in finding a way through the arbitration thicket which confused the conference debates. The conference failed to adopt arbitration as a principle of "American international law" or to compel recourse to it. It did make conquest in defiance of arbitration inadmissible. Nor did the governments later ratify this feature of the conference's work. However, the conference did succeed in establishing a permanent secretariat at Washington which developed into the Pan-American Union. Andrew Carnegie later gave a building to house the Union's activities.

it is hoped that Britain will not attempt to light

--- Page 206. The Gospel of Wealth - XI Does America Hate England?

the torch of war upon the American continent. Mr. Gladstone's administration, through Earl Granville, foreign minister, agree to arbitrate. Lord Salisbury enters upon office, and immediately withdraws from the

marked, its national integrity secured, its permanent independence protected, and its vital interests honoured by the family of nations. These services ought to be rendered by an impartial, international Commission. In this manner all causes of friction and differences will be removed. And in case there should arise some disputes between them, they could arbitrate before the Parliament of Man, the representatives of which should be chosen from among the wisest and most judicious men of all the nations of the world. (Universal House of Justice, Peace, page 18 & 19)

agreement and refuses to arbitrate. Repeated requests from the United States are made without result. Finally, President Cleveland appears upon the scene. Now, President Cleveland has one great wish namely, to bring about a treaty of arbitration between Great Britain and the United States. It was my privilege to introduce the first Parliamentary committee that approached him upon the subject. The interest he took in it was surprising, and his intimate friends well know that the consummation of the treaty of peace lies nearest his heart of all public questions. He is, beyond all things, a believer in the peaceful arbitration of international disputes.

18. He asks Britain for a final reply. Will she, or will she not, arbitrate this territorial dispute with Venezuela? Upon his return to Washington, one evening, from a journey, he reads the refusal of Lord Salisbury, and writes his message before he retires for the night. It gives great offense in Britain, but this is because the British people do not know that for fifteen years the United States Government has been begging Great Britain to arbitrate this question, and that Britain has

[Baha'i Comment](#)

agreed to do so. The message is not addressed to the British Government, but to the American Congress, and the President concludes by stating in effect that it will be the duty of the United States Government to protect Venezuela should Britain presume to enforce her own views of her territorial rights.

19. There is no question but that the United States would have

--- Page 207. The Gospel of Wealth - XI Does America Hate England?

fought, or will to-day fight, any nation - even Britain -- in defense of the principle of peaceful arbitration upon questions relating to the territorial rights of foreign Powers upon the American continent. Sixteen of the seventeen American republics have agreed to arbitrate their differences, and why should a European Power be permitted to make war on that continent thus dedicated to arbitration? Nations have their red rags. Every one knows that Great Britain would fight in defense of her right of asylum. Every one knows that she would defend her colonies to the extent of her power. There should be no mistake made by

arbitration - In past ages humanity has been defective and inefficient because it has been incomplete. War and its ravages have blighted the world; the education of woman will be a mighty step toward its abolition and ending, for she will use her whole influence against war. Woman rears the child and educates the youth to maturity. She will refuse to give her sons for sacrifice upon the field of battle. In truth, she will be the greatest factor in establishing universal peace and international arbitration. Assuredly, woman will abolish warfare among mankind.... ('Abdu'l-Bahá, The Promulgation of Universal Peace, page 108)

the British people upon this point, that the United States will not permit any European nation to attack an American State in consequence of a territorial dispute. These claims are to be settled by peaceful arbitration.

20. It is not alone the uninformed masses of the American people whose passions would be inflamed in support of war in defense of this principle, but the educated classes who will be found most determined in its defense; and it is upon these educated classes, for reasons stated, that Britain must depend for friends, because it is with education alone that there can come a just estimate of the past, and a knowledge of the position which the British people hold to-day in regard to colonial liberties and to international arbitration. It is deeply to be regretted that, although public sentiment in Britain forced Lord Salisbury to accept peaceful arbitration, as requested by the United States Government, nevertheless the majority of the American people cannot be successfully reached and impressed with that fact. The educated people, who follow foreign affairs, do know and appreciate that the best

[Baha'i Comment](#)

people in America had with them the best people in Great Britain in favor of settlement by arbitration, but to the masses it must unfortunately appear that Britain refused arbitration until forced to accept it by the United States. The truth, however, fortunately for our race, is that Lord Salisbury was forced by his own people to recede from his posi-

--- Page 208. The Gospel of Wealth - XI Does America Hate England?

tion. The questions which Britons might ask themselves, when seeking for some explanation of the hatred aroused in the United States recently against their country, seem to be these: Does not a nation deserve to be hated which refuses to fulfill its agreement to arbitrate a territorial dispute with a weak power? Is not irritation justified against a nation which, having agreed to a treaty settling seal fisheries, repudiates it at the dictation of a colony with which the other contracting party has nothing whatever to do?

21. These are the only two questions which have recently aroused the United States against Britain. In that of Venezuela, we have seen that the unfortunate hatred engendered was wholly unnecessary and caused solely by Lord Salisbury refusing to carry out the agreement of his predecessor. Arbitration asked for by the United States has now been agreed to, and the question will soon be out of the way, and, let us hope, soon forgotten, although the triumph of the principle of peaceful arbitration in this case should ever be remembered.

[Baha'i Comment](#)

22. The other question, that of pelagic sealing, is now to be in conference again, as before asked for by the United States, but also refused by Lord Salisbury, - at first, -- and in a fair way toward settlement; and let us hope it is soon also to be forgotten, always excepting that in this case also the principle of peaceful arbitration was invoked and peace preserved through the Bering Sea tribunal, even after the treaty agreed to was canceled upon Canada's demand.

[arbitration](#) - A Supreme Tribunal shall be established by the peoples and Governments of every nation, composed of members elected from each country and Government. The members of this Great Council shall assemble in unity. All disputes of an international character shall be submitted to this Court, its work being to arrange by arbitration everything which otherwise would be a cause of war. The mission of this Tribunal would be to prevent war. ('Abdu'l-Bahá, Paris Talks, page 155)

23. With the removal of these two causes of hatred there remains not a serious cloud upon the horizon between the two branches of our race at present. The proposed general treaty of arbitration is again to be taken up under happier conditions. It is greatly to Lord Salisbury's credit that he proposed it; and in recognition of this service to the cause of peace and good will between the two nations, Americans are disposed to forgive and forget his unfortunate refusal to abide by the agreement of his country to arbitrate the

--- Page 209. The Gospel of Wealth - XI Does America Hate England?

Venezuelan question. As for the denunciation of the Bering Sea treaty which had been agreed upon with Secretary Blaine, no one conversant with the circumstances holds him responsible. He could not have successfully withstood Canada, and there was nothing for him to do but to repudiate.

[Baha'i Comment](#)

24. The treaty, which failed of ratification, obtained, let it always be remembered, within six votes of the necessary two-thirds majority of the Senate. A greater number than these six votes was thrown against it for reasons with which the treaty itself had nothing whatever to do. Into the personal and political history of the opposition to the treaty, which President McKinley declared it was our duty to pass, it would, however, be unprofitable to enter. It is impossible to obtain a two-thirds majority for any measure which becomes involved in the vortex of party politics and personal quarrels. A treaty of peace between the two branches of our race is certain to come. The pulpit, the press, the universities of the United States are its ardent supporters, President McKinley and his Cabinet being among the foremost. No other question before the nation enlists such general enlightened support from the best men of both parties. There is, therefore, no reason in the world why the two nations should not now again draw closer and closer together. On both sides of the Atlantic each should be careful hereafter to give to the other no just cause of offense, and it may be taken as true that, Briton and American being of

[Baha'i Comment](#)

the same race, what would be offensive to the one would be equally so to the other.

25. Both Briton and American can dwell with the greatest satisfaction upon this fact, which recent events have conclusively proven, that there is in each country so powerful an element favoring peace within the race that no Government, however strong, either in the old land or in the new, can decline peaceful arbitration, when offered by the other, as the Christian substitute for the brutal test of war. No small compensation this, even for the estrangement which has arisen over two questions, but which is now rapidly passing

--- Page 210. The Gospel of Wealth - XI Does America Hate England?

away, leaving fortunately unimpaired in the Republic that element which may be trusted to determine international action in a crisis -
- pride of race, a force lying too deep in the national heart to be revealed upon calm seas, but which, under the recent swing of the tempest, bared its great head high enough above the surge to be seen and noted of all men - a dangerous rock upon a fatal

peace - We have enjoined upon all mankind to establish the Most Great Peace--the surest of all means for the protection of humanity. The sovereigns of the world should, with one accord, hold fast thereunto, for this is the supreme instrument that can ensure the security and welfare of all peoples and nations. They, verily, are the manifestations of the power of God and the daysprings of His authority. We beseech the Almighty that He may graciously assist them in that which is conducive to the well-being of their subjects. A full explanation regarding this matter hath been previously set forth by the Pen of Glory; well is it with them that act accordingly. ("Tablets of Bahá'u'lláh revealed after the Kitab-i-Aqdas", p. 126)

shore for other races in

XII

Imperial Federation

(1) From the Nineteenth Century, XXX (September 1891), 490-508. A renewed interest in colonies and the nature of their relationship with the mother country arose in the eighties. The movement has often been called the "new imperialism"; in England it took the form of a difference of opinion and sentiment between "Little Englanders" and the advocates of a "Forward" movement. In 1884 the Imperial Federation League brought together politicians, journalists, and intellectuals, like Sir John Robert Seeley (1834-1895), James Bryce (1838-1922), and Froude, on a vague platform advocating closer imperial ties. While the League had a concrete accomplishment in the calling of the First Colonial Conference in 1887 at the time of Victoria's golden jubilee, it was always riven by schisms over matters of free trade and preferential tariffs within the Empire. Either of these suggested programs involved a modification of the English traditional policy of free trade. The passage of the McKinley Tariff Act of 1890 by the United States, with its high rates and proffer of reciprocity between the United States and certain raw-material-producing nations, so alarmed more extreme English imperialists that they formed in 1891 the United Empire Trade League. Its founder and secretary announced: "The whole object of empire is commerce and the extension of commercial relations." Neither manifestoes nor zeal could budge politicians in places of responsibility, including Salisbury, or still quarrels within the Imperial Federation League. It dissolved in 1894; the United Empire Trade League continued.

1. THE time seems opportune for acting upon the suggestion of the editor of this review, that I should elaborate an idea expressed in a previous article touching the unity of the English-speaking race, and the relations which the parts thereof are to bear to each other; for the "Imperial Federation" and the "United Empire Trade League" are prominently upon the stage, and the monthly magazines and daily press freely discuss the subject. Each of the two societies named has recently been granted an interview with the Prime Minister, and each has been advised by him in turn to take the first forward step and furnish at least rough outlines of its

--- Page 212. The Gospel of Wealth - XII Imperial Federation

plans. It is a fact of much significance that so antagonistic are the views held by these two organizations that the second to be heard by Lord Salisbury thought necessary, previous to its interview, to request that he should not commit himself to the ideas of the first -- evidence of an anxiety which seems to have been wholly unnecessary, as it is evident from Lord Salisbury's

reply that neither of the societies, so far, has been able to lay before him anything requiring consideration. He has wisely called for a bill of particulars, having had enough of glittering generalities. This is a challenge which admits of no denial if these societies are to justify their continued existence. If they cannot formulate a plan, surely they will retire.

2. Before the permanent relations of the parts of the race to each other can be properly considered, however, we must pay some attention to the two phases of the "federation idea" represented by them.

3. The United Empire Trade League attends strictly to business; there is no sentiment about it - trade all over, and nothing but trade. We have, therefore, only to consider, as far as it is concerned, whether Britain and her colonies would make good bargains by banding together against the outside world, and giving to each other more favorable terms than to outsiders. Reduced to this, it becomes simply a matter of figures. The Zollverein idea is here, but the

[Baha'i Comment](#)

[Baha'i Comment](#)

Kriegsverein absent.

(2) In the first part of the nineteenth century various German states under the leadership of Prussia formed the customs union known as the Zollverein. Kriegsverein, to employ the Carnegie vernacular, went beyond trade to joint action in time of war.

Let us, therefore, first consider how Britain would fare under the proposed new departure. She exports about £250,000,000 of her products yearly. Of these, the English-speaking self-governing colonies take £31,000,000, or one eighth; India takes about the same amount; all the other British possessions £20,000,000; in all, about £82,000,000, leaving fully double that amount taken by other countries. It is proposed to discriminate against the customers

--- Page 213. The Gospel of Wealth - XII Imperial Federation

who consume £166,000,000 in favor of those who consume half that amount. With British imports it is just the same, for in 1889 imports and exports to colonies, etc., were only £187,000,000 out of a total of £554,000,000 - one third to the dependencies against two thirds to the foreigners. If there were a prospect of the

former trade growing more rapidly than the other, it might be held that the future would justify the sacrifice, but there is nothing to encourage this view; on the contrary, colonial and Indian trade both tend to decline, while that with foreign nations increases. The reason is clear; the older nations have developed their resources, and trade with them is now practically upon its final basis; the colonies have only recently begun to supply their own wants, and are yet to extend their capacity greatly in this direction. It is scarcely to be expected that with double their present population their demands upon Britain will be much increased. Indeed, the present tendency to decline may continue for a time.

4. The important question is, What response would the nations of the world make to a declaration of industrial war against them? Had Britain and her colonies remained a compact free-trade Empire, like the forty-four States of the Republic, which furnish the world with the best proof of the blessings of free trade, other nations would have no right to object. It is quite a different matter, however, if, when their trade has been established and business built

[Baha'i Comment](#)

upon the other basis, change and disaster should now be visited upon them. A change in the policy of Britain toward other nations, I submit, must now be followed by a change of their policy toward Britain. Discrimination must produce discrimination. The Republic of the United States, for instance, is Britain's greatest customer, taking more of British products than all the English-speaking colonies combined, and more and more every year, while the trade with the colonies is, at best, stationary, notwithstanding their increase of population. It has slightly declined during the past five years. What the

--- Page 214. The Gospel of Wealth - XII Imperial Federation

Republic would do if she were discriminated against needs no guess, for she has recently lodged in the President power to go so far as to prohibit entirely the products of any country that does so.

(3) Carnegie is manipulating a "paper dragon." The McKinley Tariff of 1890 threatened a prohibition of trade as a means of securing reciprocity; the device was directed against certain products and certain nations, for example Latin America, rather than against Great Britain. The trade in fresh beef to Great Britain took the form of exports of live animals and, after the application

of refrigeration to transportation, of chilled or frozen meat. Both of these trades threatened beef producers in Great Britain, but their powerful interest was never able to induce the government to embargo or discriminate by tariff against the American product. Occasionally the British government, alarmed by Texas fever or the "lung plague," pleuropneumonia, clapped on quarantines or enforced them more strictly. A minor dust-up on this score occurred in 1891. In spite of such episodes the fresh beef trade to Great Britain expanded enormously from the seventies on.

Britain is called upon to justify her discrimination against American cattle, for instance, and nothing is surer than that the American people will have to be entirely satisfied that there is good cause for it, or the President will be forced by public sentiment to exercise this power, conservative, patient, and most peace-loving though he be. There would not be two parties upon this issue.

5. How about Germany? She takes from Britain every year products to the amount of about £18,000,000, twice that taken by the whole of British North America, and not far from that taken by the whole of Australasia (£22,000,000). She sends Britain about £3,000,000 per year of flour and cereals, of butter and eggs £1,500,000, of timber

[Baha'i Comment](#)

£1,500,000. What is to be the answer of the irrepressible Emperor if the products of his country are discriminated against in favor of the food products and timber of Canada and Australia? Italy, again, takes about as much of British products as the whole of British North America, £7,000,000, and she finds here each year a market to the extent of £3,000,000 for her hemp, fruits, etc. The Argentine Republic takes from £10,000,000 to £11,000,000 per annum from Britain; the whole of British North America only £8,000,000. What is to be the return shot fired by her if her mutton, wool, and grain which

--- Page 215. The Gospel of Wealth - XII Imperial Federation

she sends here are to be discriminated against? But why continue the list? It is the same story everywhere.

6. Britain has the foreign trade of all her colonies almost exclusively already, except that of Canada, of which she has nearly one half, the United States possessing rather more. All the other colonies deal with foreign nations only to the extent of from five to ten per cent for articles which Britain does not produce. The parent-land, therefore, has nothing to gain by any change in fiscal relations between herself and the colonies; her colonial trade, except perhaps to a small extent with Canada, could not be increased thereby. Why, then, should she jeopardize the control of the markets of the world to the extent of two thirds of her total exports, for nothing'? The fabled dog which dropped the bird from his mouth had for excuse that its shadow in the stream seemed infinitely larger. The Imperial Trade League is not so excusable. It would sacrifice a real turkey in hand for nothing in the bush. This wondrous little island is dependent upon the world for two thirds of its food-supply; equally dependent upon the markets of the world for the sale of its products. There never was so great a people so artificially maintained. What the race has accomplished here under these conditions dwarfs the

[Baha'i Comment](#)

triumphs of all other races; it is marvelous, and if it were not before our eyes, it would be held impossible that a nation so placed could have yet led the world. One asks instinctively what such a breed of men will do when they control continents possessed of unbounded supplies of agricultural and mineral resources combined; but that she, being so placed, should be counseled by a body of able men to inaugurate an industrial war against the world seems something not to be accounted for by any process of reason. Russia, the Argentine or the Brazilian Republic, with its ports blockaded for ten years, would suffer only more or less inconvenience. The United States would emerge from such an embargo stronger and more independent of the world than before. Close the ports of this island for a year,

--- Page 216. The Gospel of Wealth - XII Imperial Federation

and her people would suffer for food. Britain's house is a whole Crystal Palace - she of all nations should be the last to begin stone-throwing.

7. From something in the national character, but much more in the part she has had to play in the world, Britain has excited the envy, jealousy, and ill will of some of the most powerful nations; but I do not believe that my native land has an enemy so bitter as to wish her to plunge into an industrial war which would be so cruelly fatal to her, for even the worst foe must feel that the human race owes an incalculable debt to Britain. It would be a different matter if the imposition of protective duties were proposed bearing equally upon the products of all other countries, for this is a matter for each nation to settle for itself, and other nations could take no offense if Britain decided to reimpose such duties. This would be no declaration of industrial war against other nations, but only a matter of home policy. There is no vital objection to this being tried; although I am certain that free trade is Britain's only policy as I am a thorough disciple of John Stuart Mill - and, I am pleased to add, of his worthy successor, Professor Marshall

*(4) Alfred Marshall (1842-1924),
British economist.*

-in believing that the countries
which have the necessary

[Baha'i Comment](#)

resources within themselves do well to encourage the starting of industries by protecting them for a time against the competition of those firmly rooted in other lands, always, however, with the view of ultimately obtaining a surer and cheaper source of supply within themselves. But the question for Britain is this: Given a nation with a thoroughly equipped manufacturing system producing more than its own people can consume, and which, on the other hand, is dependent for its food-supply upon other nations, what is its policy? The answer seems clear: Peace and free trade with all the world.
Cobden and Bright

*(5) Richard Cobden (1804-1885);
John Bright (1811-1889).*

were right for Britain, and only wrong in assuming, in their enthusiasm, that what was wise

--- Page 217. The Gospel of Wealth - XII Imperial Federation

for an old country producing more articles than it could consume was necessarily wise for every country, including those which had diversified home industries yet to establish. Mill and Marshall are

right for new countries, always provided such have within themselves the necessary resources and adequate market to eventually furnish the articles at less cost to the consumer than would have to be paid if dependent upon a foreign supply. Thus the United States has succeeded by protection in getting the millions of square feet of plate-glass she uses per annum at less cost than a similar article costs in Europe. She often has her steel rails at less than these could be imported for free of duty. She has failed, however, to produce cheaply her supply of sugar by protection. Hence she wisely abandons the attempt, and makes foreign sugar free. Now, because Britain has not the requisite territory to increase greatly her food-supply, any tax imposed upon food must be permanent. The doctrine of Mill does not, therefore, apply, for protection, to be wise, must always be in the nature of only a temporary shielding of new plants until they take root. It will surprise many if Britain ever imposes a permanent tax upon the food of her thirty-eight millions of people, with no possible hope of ever increasing the supply, and thereby reducing the cost, and thus ultimately rendering the tax unnecessary. A tax for

a short period that fosters and increases production, and a tax for all time which cannot increase production, are different things.

8. But if, in the near future, Britain decides to try the old system of protection again, no irremediable injury need ensue, for results will soon prove that free trade is for her the very breath of her nostrils, and she may be able successfully to return to it because she will not have outraged the feelings and incurred the hostility of her former best customers. All will have been treated alike, and therefore none will have reason to complain; although it is always to be remembered that trade once diverted is most difficult to regain.

--- Page 218. The Gospel of Wealth - XII Imperial Federation

The loss owing to this will not be small. While, therefore, it is open to Britain to try "protection," and pay the cost of the experiment, and retrace her steps, he is a bold man who ventures to place an estimate upon the permanent loss to his country which is surely involved in entering upon the "Empire trade" crusade.

[Baha'i Comment](#)

9. Turning from the British and the foreigners' points of view in regard to the proposed industrial crusade against the world, the reply of the colonies to an invitation to join it has yet to be considered.

[Baha'i Comment](#)

10. Let us begin with Canada, the greatest of these. As already stated, she finds a market for more of her products in the neighboring Republic than in the parent-land. She also finds it to her advantage to purchase more from the former than from the latter. During the winter months she is indebted to the courtesy of the Republic for regular communication with the outside world; her steamships land at Portland in Maine, and her traffic, in bond, and her people travel through American territory to reach Quebec or Montreal. Her boasted east-and-west railway system would scarcely pay expenses - it certainly would yield no returns - except that the Republic generously permits it to connect with American railways and compete with them upon equal terms for the traffic to and from Chicago and the great West to Boston, New York, and the East, and to

[Baha'i Comment](#)

transport foreign goods in bond to Chicago and the West. The Canadian Pacific transverses the entire width of the State of Maine. All the ships of Canada receive rights in American ports which are denied to American fishing-vessels in Canadian ports. Any day the Republic thinks proper to resent the acts of her saucy little neighbor, which have recently been annoying, she can practically "bottle up" Canada without giving any cause of complaint from an international point of view. She has simply to withhold privileges now generously granted. It need not be feared that so strong and forbearing a nation will act tyrannously to one so completely in her power. The Republic

--- Page 219. The Gospel of Wealth - XII Imperial Federation

has always been the kindest and most neighborly of neighbors to all her less powerful sisters; *but the power is there*, and this being so, I should like to ask our United Empire Trade League friends what answer Canada would be likely to make to their proposition to discriminate in favor of Britain as against the Republic. Canada may yet, in justice to herself, be compelled to do

just the reverse. There is a large party in Canada in favor of such a step. An invitation from Britain to enter upon the policy of discrimination would require Canada to consider for her own interests in whose favor the discrimination should be. The idea suggested by the League may thus return to plague the inventor. Truly our friends of the Trade League have found and are brandishing a dangerous weapon.

11. With the Australasian colonies the case is different. These have no overshadowing giant alongside; but there is another element there which I submit is equally potent. New South Wales, the largest of the group, imports £23,000,000; exports just about the same. Her total trade with Great Britain, exports and imports, is only one third of this -- something over £15,000,000. Victoria, the other great colony, imports and exports £37,500,000; Britain has of these between £12,000,000 and £13,000,000 - just about one third, as in the case of New South Wales.

[Baha'i Comment](#)

12. But Britain need not be jealous in regard to the remainder; for, as before stated, with the exception of from five to ten per cent of the total, which she cannot supply, she has it all. So far has Australasia advanced under the policy of encouraging home manufactures that the various colonies are able to supply the wants of one another to the extent of about two thirds of their total requirements - a most encouraging state of affairs, as promising the creation of a mighty nation of English-speaking people in the near future. Does any member of our "Fair Trade League" believe that a proposition would be entertained for a moment to lower duties upon articles from Britain, and hence to injure or

--- Page 220. The Gospel of Wealth - XII Imperial Federation

destroy the manufactures of their sister colonies? Has any indication been seen of a desire upon the part of any of these colonies to abandon the high aim each has set before itself of becoming a great power with diversified industries, capable of supplying its own necessary

[Baha'i Comment](#)

wants? The members of the League should endeavor to place themselves in the position of Canada and of Australia, and judge in the case of Canada what its reply to their idea must be, and in the case of Australia what it would be. The officials of that society are, no doubt, preparing their answer to the challenge given by the Prime Minister, and it is to be hoped that it will deal with the points here suggested.

13. Turning now to the Imperial Federation League, we find no business whatever in its program; no considerations of trade; bargains are not thought of; sentiment reigns supreme. Still, it is not so grandly sentimental as it was. A painful falling away is noted. In its early days it pleased many to note that, in their praiseworthy desire for federation, the majority of the English-speaking race in the Republic was never forgotten; but we find no trace of this in the recent proceedings; even my friend Mr. Bolton seems to have abandoned the great idea which first roused his enthusiasm, and which still stirs mine. In his article in the July number of this review he regretfully says:

[Baha'i Comment](#)

If it may not be given to us to realize that grand idea, the confederation of all the nations which have sprung from the race nurtured in these isles, should we not at least use all our energies to promote the union and political consolidation of the Greater Britain which still owns one flag and acknowledges one sovereign?

(6) S. B. Bolton, "Sir John Macdonald on Imperial Federation," Nineteenth Century, XXX (July 1891), 159-160.

14. We have not yet heard from Lord Rosebery, the president, for reasons which call forth for him the deepest sympathy of all.

(7) Rosebery was one of the charter members of the Imperial Federation League and a member of its executive body. Compelled to assume political responsibilities, he stood against extremists in the League. He thought it should be "educational" and encourage colonial and imperial conferences, but he could not fit imperial preference into his program.

It is still possible we shall find, in the first address he

--- Page 221. The Gospel of Wealth - XII Imperial Federation

[Baha'i Comment](#)

delivers upon the subject, that his hopes of the union of the entire race may still be brighter than those expressed by officials who have spoken for the Federation in his absence. For the present, I take it, we must assume that, like the Trade League, it seeks no longer harmony and cooperation among the various parts of the race. It stands now as a body whose effort is to combine only the minority of the English-speaking race in a solid phalanx, leaving out the majority. While, in the case of the first society, it was necessary to go into particulars, in that of the latter it seems only necessary to examine its aim as recently presented.

15. It is deemed possible to create a solid empire, under one head, of parts of the English-speaking race, one the mother country, another in Canada, the third in Australia, each with different environments and totally different problems to solve; and one of the three parts under wholly different institutions from the other two, the latter being democracies without a trace of hereditary privilege, aristocracy, church and state, or entails of the soil, and the

[Baha'i Comment](#)

very air breathed there instilling ideas of political equality in the citizen. It is notable that this hope is chiefly confined to the parent-land, and to those born here who have played great parts till now in the colonies. Such men as Sir John A. Macdonald, Sir Henry Parkes, Sir Samuel Griffith, and others,

(8) Sir John A. Macdonald (181E~1891) was frequently after 1857 a Conservative prime minister of Canada; Sir Henry Parkes (1815-1896) after 1872 served often as prime minister of New South Wales; and Sir Samuel W. Criffith (1845-1920) was prime minister of Queensland.

are not colonists but natives of Britain, and must ever reverence and love her. But the population of Australasia is already nearly three native to one British-born. In Canada, in 1881, more than four fifths were native-born, and every year the percentage of British-born grows less and less. Not one of five thousand native-born Canadians, nor of ten thousand born Australians, has ever seen or ever can see Britain, which to

--- Page 222. The Gospel of Wealth - XII Imperial Federation

the masses is only a name - no doubt a name which they can never mention without

pride and gratitude, but still only a name, not a country; and a country every man worthy of the name of man will have and worship.

16. The native-born Australian is Australian first and last; the native-born Canadian the same. The public ear of my native land is sadly led astray about the feeling of her colonies, because she hears only the voices of her own people, native-born Britons, or a few rich visitors speaking in the name of the colonies. It is these who principally visit the old home, crossing the seas, drawn hither by longings, as pilgrims to their Mecca. The masses of the people in the colonies permit and even encourage upon the part of these native-born Britons the expression of the tenderest sentiments toward their native land; for they know that men are not worthy of the confidence and respect of the communities in which they dwell if they fail in affection for the land which gave them birth, and that the colonist who does not love his native land is not likely to prove much of an acquisition to his adopted one. But it will save much disappointment if the people at home can be made to understand and believe that the following truly represents

[Baha'i Comment](#)

the sentiments of ninety-nine out of every hundred native-born Canadians and Australians. I quote the words of the Premier of the important province of Quebec, Mr. Mercier,

*(9) Honore Mercier (1840-1894),
premier and attorney-general
(1887).*

who, being asked, whether he was opposed to federation, replied:

Yes, I am. I regard that policy as treason to Canada. Imperial federation means that Canada must join Britain in her wars throughout the world, and must weigh the interest of the whole Empire before looking to her own. A tie that would thus subject Canada completely to European dominion would be a most unnatural one, and there are not fifty men in the province of Quebec who are favorable to so unpatriotic a policy. The time has, in fact, come to consider in a very peaceful yet very serious way the right of European Powers to govern people living on the continent of America, whose interests and general tendencies,

commercial or other, are in certain respects opposed to those of the people of Europe. Accordingly, instead of being disposed

--- Page 223. The Gospel of Wealth - XII Imperial Federation

to strengthen the ties at present existing between Britain and Canada, we are, in fact, looking forward with some anxiety to the time when we shall ask for our independence. We shall request it with all due respect to Great Britain, and without any ill feeling toward her people, just as a young man of full age, on leaving his father's home, may sometimes do it with reluctance, but with the proud feeling that he, too, is called upon to take a free and independent share in life. What I say about the province of Quebec may, I believe, be said of the inhabitants of all the other provinces.

17. It surely cannot have failed to attract the attention of the members of the Imperial Federation League that even Sir John Macdonald, a native-born Briton, was forced, certainly much against his will, to announce that Canada was no longer to be dependent, but the ally, of Briton, and even going so far only enabled him to escape defeat by a greatly reduced majority.

In future, England would be the center, surrounded and sustained by an alliance, not only with Canada, but with Australia and all her other possessions; and there would thus be formed an immense confederation of freemen-the greatest confederacy of civilized and intelligent men that ever had an existence on the face of the globe.

[Baha'i Comment](#)

18. Alliances are made between independent nations. Sir John must also have had in mind the Republic, for this is necessary to make the greatest confederacy of intelligent and civilized men. A confederacy of all others of our race would be much smaller than the United States alone.

[Baha'i Comment](#)

19. Sir John asserted the independence of Canada to the fullest extent when he recently commanded Lord Salisbury to tear up a treaty which had been agreed upon by Sir Julian Pauncefote and Secretary Blaine, with Lord Salisbury's cordial approval, which the British Government had presumed to make without consulting Canada. The recent protest of Newfoundland is another case in point.

[Baha'i Comment](#)

(10) On the Pauncefote-Blaine treaty Essay XI, note 8. In 1890 and again in April 1891 Newfoundland sent deputations to London to protest against the principle and arrangement by which France and England arrived at a modus vivendi involving the fishing industry in the colony.

The public is informed that the difficulty has been compromised, but the

--- Page 224. The Gospel of Wealth - XII Imperial

Federation

compromise has necessarily been all on one side. The form of arbitration with France is to be adhered to; but after this has been duly performed, Newfoundland's demands will be complied with. Any treaty rights France is found to possess are to be purchased. There was no other course open to Britain. She cannot govern her colonies; for they are full grown and almost of age and now dictate to her. They must be provided with homes of their own speedily if the filial tie is to be preserved.

20. The Imperial Federation has only to grapple with the initial difficulty to be overthrown, which is this: the native-born Australian wants at maturity a country of his own to live for, fight for, and, if necessary, to die for; the native-born Canadian wants the same. The native-born Briton has this, the American, German, Frenchman. Why not the people of Canada and Australia? The native-born colonist has not the slightest idea of permitting the parent-land, distant thousands of miles, or any land, to have anything to say in or to his own country. That any of their statesmen should favor the proposition that the

[Baha'i Comment](#)

representatives of his country should be sent across seas to be swamped in a Parliament in London, and the destinies of his country subjected to the votes of strangers, would probably be considered by the medical faculty of the colony as a prima facie proof of mental aberration; his incarceration in a lunatic asylum would be imminent. To endeavor to satisfy this commendable and patriotic devotion to the idea of country by offering them part of a land thousands of miles away, which they can never see, is futile. They might as well be asked to consider themselves citizens of the moon, and so to rest and be thankful. These ambitious, enterprising peoples with British blood in their veins are not crying for the moon. There is no rest for such movements; once started, national aspirations are not to be quenched. The sooner these are gratified, the better for all.

21. What lesson has the past to teach us upon this point?

--- Page 225. The Gospel of Wealth - XII Imperial Federation

Spain had great colonies upon the American continent:

where are these now?

Seventeen republics occupy Central and South America.

Five of these have prepared plans for federating. Portugal had a magnificent empire, which is now with the Brazilian Republic. Britain had a colony.

It has passed from its mother's apron-strings and set up for itself, and now the majority of all our races are gathered under its republican flag. What is there in the position of Britain's relation to Australia and Canada that justifies the belief that any different result is possible with them? I know of none; on the contrary, all that I know of the sentiment of the people in the colonies satisfies me that there exists this healthy growth toward national life. They would be unworthy of their sires if they did not possess it. It was not a question of taxes that produced the independence of the United States; this was the incident only which precipitated what was bound to come a few years sooner or

[Baha'i Comment](#)

later, independent of any possible home policy. Franklin and Adams had no idea of separating from the motherland when they led in the refusal to be taxed from Westminster; but they soon found themselves compelled by a public sentiment, until then latent, to advance to independence. Australasia has begun the natural movement toward change in her relations to the old home. Her leaders—still native-born Britons chiefly—kindly propose that Britain may still be allowed to send an ornamental Governor-General. The tie will be slight, but it is now seen, especially in the most important of the colonies, New South Wales, that, as in the case of America, the British-born leaders may be pushed by the native-born Australians into a movement for complete independence. If it does not evolve now it must do so later, for the "Speaker" (July 18) truly says: "It is the fading class of the home-born which keeps alive the traditions and sentiment of the English connection. Every five minutes throughout Australasia an Imperialist dies; every four minutes a Republican is born."

--- Page 226. The Gospel of
Wealth - XII Imperial
Federation

22. The constant reader of the Spectator knows that journal to be equally well informed, and the Times has more than once recently shown that it is not ignorant of the true state of colonial affairs. But these able organs of public opinion seem to be almost alone.

[Baha'i Comment](#)

23. It is of the utmost importance that the people of Britain should promptly realize her true relation to the colonies, which is just this: she is the motherland, and no nation has ever been blessed with a family so numerous, enterprising, and creditable. The only part open to her is to play the mother, and, as her children grow beyond the need of her fostering care, to endeavor to inculcate in them the ambition to go forth and manage for themselves. She should doubt the blood in any weakling content to remain under her protection when the age of manhood comes. True, few departures from the old home are unaccompanied by tears, but, after all, tears of affection, of joy, in the happiness of the child who starts in life for himself. There are only two modes that can

[Baha'i Comment](#)

be pursued: either the colonies will leave the parent nest with the parent's blessing, carrying in their hearts undying love and reverence for her to whom they owe all, or the parting will be made under conditions which must necessarily bring both parent and child lifelong bitterness and lifelong sorrow. The American boy is forever to be in youth the hater of the old home, for in his early years he is fed with stories of the Revolution -- of the struggles and sufferings of Washington and his patriot army, of the desire of his native land for independence, and of the mistaken efforts of Britain to hold it in subjection.

24. This early impression of Britain as the oppressor of his country is not easily removed. It is a thousand pities that the majority of our race is to learn first that the parent-land was their country's only foe. Britain can choose whether Australia and Canada and her other colonies, as they grow to maturity, can set up for themselves with every feeling of filial devotion toward her, or whether every child born

--- Page 227. The Gospel of Wealth - XII Imperial Federation

[Baha'i Comment](#)

in these lands is to be born to regard Britain as the American child must. There is no other alternative, and I beseech our friends of the Imperial Federation to pause ere they involve their country and her children in the disappointment, humiliation, and antagonism which must come if a serious effort be made to check the development and independent existence of the colonies, for independence they must and will seek by virtue of the blood that is in them, and obtain, even by force if necessary. They were not true Britons else.

25. Lord Salisbury has recently said that if Home Rule were granted to Ireland, other portions of the Empire might be "wrenched from the power of the Queen." As he could not mean that there was a danger of foreign nations attempting to "wrench" any of the colonies, he must have meant that the colonies would "wrench" themselves away. Nothing should be left undone to prevent such "wrenches" from coming. To encourage the colonies to follow the example of their mother-land and become nations themselves is the only way to prevent such a "wrench" as took place between the parent

[Baha'i Comment](#)

and the Republic. I should prevent all feeling of "wrenching" upon one side or the other by having the parent-land start her children in life in due course, as her Majesty starts her children. With rare wisdom, she favors early marriages. Britain, as a nation, should imitate the example of her wise Queen, and start her colonies for themselves in homes of their own as soon as they become restless under the old roof-tree, with a God-speed, and a fond, proud mother's blessing.

26. It may be said that the destiny indicated for the parent-land is one unworthy of her past. I cannot share such a thought. The world is still young. As each child of Britain reaches proper growth and departs, another child will be born to her. No limit can be set to this stage of the world's development, no time fixed when the mother will not have quite enough of a family to care for. Generations must pass before the two hundred and eighty millions of India are

--- Page 228. The Gospel of Wealth - XII Imperial Federation

ready to federate into a great nation and govern

[Baha'i Comment](#)

themselves, while Africa was born to her only yesterday. Besides this, the United Kingdom, even of itself, and without colonies, would remain one of the principal nations. Her colonies weaken her powers in war, and confer no advantages upon her in peace. Her population about equals that of France, and will, I believe, eventually equal that of Germany, probably exceed it, leaving only Russia more populous in Europe. Her store of minerals surpasses all others except the United States; she has at her foot the markets of the world for the chief manufactured articles, for, whatever may be said of foreign competition, it cannot possibly amount to much in the future: her navy can control the seas. One of the purest fallacies is that trade follows the flag. Trade follows the lowest price current. If a dealer in any colony wished to buy Union Jacks, he would order them from Britain's worst foe if he could save a sixpence. Trade knows no flag. Britain's greatest customer is the American Republic; and, as we have seen, Germany and France, with a tithe of the population, consume as much as India of British products, and more than all the Australian and Canadian colonies combined.

Canada trades more with the Republic than with Britain. The independence of the colonies will not lessen British trade with them, but increase it, because independence will stir their energies and make them much more enterprising. Hence wealth will be produced faster, and the market for fine articles from Britain be correspondingly increased. This is proved by the result of American independence.

27. With full appreciation of the patriotic sentiment which pervades the two leagues, I cannot refrain from asking their members to consider whether they are not working in the wrong direction, and aiding to thwart and not to promote the true mission of their country in the future. The position which Britain should aim to occupy is no less than the "headship of the race," as the parent of all. Now, even if the various parts of the race in the Empire could be federated

--- Page 229. The Gospel of Wealth - XII Imperial Federation

under one sovereign - of which there is as little likelihood as that the Republic could be induced to enter -- and thus the whole aim of the

[Baha'i Comment](#)

Federation League be accomplished, what then? Eleven millions of people will have been confederated with her-only this and nothing more-and Britain then would only be first in the smaller division of the race. It would not be such a prodigious gain for her, after all. We should have "Hamlet" with Hamlet left out. Few persons have a correct knowledge of the numbers and increase of the various parts of our race. During the past ten years the United States added to its numbers more than the total present number of English-speaking people in all other parts of the world, outside of the United Kingdom. Her increase was 12,500,000. The increase of the United Kingdom and all her English-speaking colonies was not one half as great - about 5,000,000. Britain added slightly more than 3,000,000; Canada only 500,000, a rate of increase not greater than that of Britain; New South Wales (last eight years) only 471,000; Victoria (last nine years) 710,984; all other colonies only trifling numbers. Thus, if we place the Republic in one scale, and all the other parts of the race in the other, the yearly increase in the first scale would more than double that in the second. Even if the United States increase is to be

much less rapid than it has been hitherto, yet the child is born who will see more than 400,000,000 under her sway. No possible increase of the race can be looked for in all the world combined comparable to this. Green

(11) John Richard Green (1837-1883). British historian.

truly says that its "future home is to be found along the banks of the Hudson and the Mississippi." Why should the parent-land, then, be counseled by the Imperial League to endeavor to form closer ties with her other children than with her eldest born, who must dwarf all the rest of the family together? What kind of federation is that which leaves the Republic out? There is no obstacle to forming any tie with the Republic that can possibly be formed with

--- Page 230. The Gospel of Wealth - XII Imperial Federation

the commonwealth of Australia or the Dominion of Canada, for, just as soon as these are asked to forego their inborn desire for independence similar to that of the United States, their answer will settle the question, if, indeed, the

League ever requires to go so far as to ask for Imperial Federation and be refused. It should not be necessary for it to place the parent-land in a position so humiliating, for that its idea is impracticable can be learned in every quarter without exposing itself to the inevitable and wholly unnecessary rebuff.

28. If the United Empire Trade League ever succeeds in getting the government to call a conference of the colonies, to meet in London, as it proposes, to consider its aim, the end of that idea also will have arrived, for few colonial governments could survive the support of a bill appointing delegates even to consider the question of discriminating against other nations in favor of Britain. But, as in the case of the Imperial Federation League, so the United Empire Trade League should be able to satisfy itself, before asking a conference only to be refused, that there is no possibility of obtaining the cooperation of any English-speaking community.

[Baha'i Comment](#)

29. Mistaken, impracticable, and pernicious, however, though the aims of these two societies be, yet it is to their membership that we can best look for efforts in the right direction for such cooperation of the entire race as it is possible to effect; for their hearts are in the right place, and their heads can easily be brought to the favorable consideration of an idea which postulates for their country a much higher position, a much grander mission, than that which they have set themselves to secure -- a position which will keep her in the rightful attitude of parent toward the entire race which has sprung from her.

[Baha'i Comment](#)

30. I respectfully ask the patriotic, sympathetic, and enterprising men of these leagues to permit me to submit for their consideration a summary of the ideas which have forced

[Baha'i Comment](#)

--- Page 231. The Gospel of Wealth - XII Imperial Federation

themselves upon me from a study of the question, made with an earnest desire to secure, first, the unity of our race, and through that, for it, the mastery of the world, for

the good of the world.

31. *First.* The great aim of the federationists should be to draw together the masses of all English-speaking countries, and to make them feel that they are really members of the same undivided race, and share its triumphs; that all English-speaking men are brothers who should rejoice in one another's prosperity and be proud of one another's achievements. The little faults or shortcomings of the other members should be overlooked, and all should dwell upon what is best in each, for, as members of the same race, what disgraces one necessarily reflects upon the entire family. Impossible Imperial Federation and Empire Trade League should give place to Race Alliance, and so embrace all in one common bond, the only test being

If Shakspeare's tongue be
spoken there,
And songs of Burns are
in the air.

[Baha'i Comment](#)

32. Pursuance of this policy during our generation will do much to lay the foundation for a true federation of the whole race, as far as it is possible to combine sovereign powers; and how far that is possible is for future generations, not for this, to learn. That it is possible to a degree, we of to-day already see. Once earnestly kept in view and labored for, and lower aims excluded, it is probable that things now deemed impossible dreams may prove easy of getting. Indeed, the "Parliament of Man" itself is only a question of time in the mind of the evolutionist who sees no bounds to the advance of man in the line of brotherhood. If we may not look into the future and tell what germ is to grow, we can at least do our duty in the present, and cultivate the soil and plant the germ which ought to grow among the members of the same race, leaving to posterity the duty of

--- Page 232. The Gospel of
Wealth - XII Imperial
Federation

nurturing the precious seed,
and, we trust, the fruition of
our hopes.

[Baha'i Comment](#)

33. *Second.* The parent-land should be urged to encourage her colonies, as an able mother encourages her sons, to go forth at maturity and play the part of men-loving and reverencing her, but independent. The idea of federation among colonies should also be encouraged; for no greater calamity could happen than that the various English-speaking communities should be divided into small nations, jealous of one another. The sad condition of Europe to-day, an armed camp, contrasted with that of the United States, which is ere long to contain an English-speaking population as great as the whole of Europe, without any necessity for a standing army, should be continually in mind and proclaimed. The Australian colonies do not require the lesson. These are wise and will federate, and, as one irresistible power, keep the peace and rule that quarter of the globe without armies, for they, like the Republic, can have no neighboring foe; but the union of England and Scotland should be held up to Canada and the United States. I should not like to think that I ever had said or ever should say a word that would tend to perpetuate upon the American continent two divisions of the race, or to feel that I had not

[Baha'i Comment](#)

exerted myself to produce union. The mother-land can do much by reminding Canada of her own union with Scotland, and the happy results which flow from it. The present unfortunate division of the race in America, so fraught with danger, is Britain's work; the duty upon her to correct the evil is imperative. Nor is she unequal to the task, for she has done things that other nations cannot parallel. The cession of the Ionian Islands to classic Greece, the recent cession of Helgoland to Germany, show her capable of generous, even sublime, action.

(12) In 1884 the Ionian Islands, the principal of which is Gorfu, a British protectorate, were formally ceded to the Kingdom of Greece. The British seized Heligoland (Helgoland) in 1807 from the Danes but in 1890 ceded the island to Germany.

She can rise at times to great heights and

--- Page 233. The Gospel of Wealth - XII Imperial Federation

teach nations magnanimity. All she has done of this nature combined were but little in comparison with the uniting of the two children whom her policy separated a century ago. She should tell Canada that whenever it becomes, as

it is becoming, a question of separate independent existence, or of union with the other division of the race, a mother's blessing would attend her union with the Republic. With the appalling condition of Europe before us, it would be criminal for a few millions of people to create a separate government instead of becoming part of a great mass of their own race which joins them, especially since the federal system gives each part the control of all its internal affairs, and has proved that the freest government of the parts produces the strongest government of the whole. The most eminent man in Canada to-day is certainly Goldwin Smith.

(13) British historian and publicist (1823-1910), author of Canada and the Canadian Question (1891). From 1868-1871 he was a professor at Cornell. He was an ardent spokesman for Anglo-Saxon union and supremacy.

He remains an Englishman with allegiance unimpaired, yet he tells Britain that her position upon the American continent is the barrier to sympathetic union with her great child, the Republic. He is right.

34. *Third.* Much is done to prevent harmony in the race by the position that has until recently been held tenaciously by the parent-land in regard to the fiscal policy which every colony has found it best to pursue. Seeing that strictly agricultural communities can never amount to much under present conditions, it should be regarded as a natural and patriotic desire upon the part of Canadians and Australians to give their countries diversified industries, that the various aptitudes of the people may find scope. Britain need have no fear about her trade. Indeed, it is very doubtful if, with all her resources developed to the utmost, she can long continue to meet the demands for her products which must be made upon her, no matter what tariffs may be adopted. Where the iron and steel can be had to supply the coming wants of the

--- Page 234. The Gospel of Wealth - XII Imperial Federation

world is already troubling Bell, Atkinson, Hewitt, and other high authorities.

(14) Of these authorities Sir Isaac Lowthian Bell (181~1904) was an English metallurgist and businessman, organizer of the British Iron and Steel Institute,

Baha'i Comment

author of books on the industry. Abram S. Hewitt (1822 1903), son-in-law of Peter Cooper, an ironmaster, was a pioneer in the introduction into the United States of metal rolling and steelmaking and a successful Democratic politician. On Edward Atkinson see Editor's Introduction, above, p. x.

A writer in the *Times* (July 12), Mr. Harvey, one of the most prominent citizens of Newfoundland and a loyal subject, states this point admirably, and asks that it "be granted by the majority of the people of England and Scotland that a man may doubt the infallibility of the doctrine of free trade under all circumstances, and not be considered a fool or worse." Britain is quite right in adopting free trade for herself, but every colonist visiting the old home should not be attacked and denounced, I might even say abused, because he ventures to think his new country requires a different system for a time.

35. *Fourth.* The process of assimilating the political institutions of all English-speaking countries should be continued, for it should never be forgotten by true federationists that different political conditions form a great barrier to close sympathetic union. No Parliament since that which passed the Reform Bill deserves greater thanks than the present one in this respect. It has done much to bring Britain's institutions in accord with the democratic standard of all the other English-speaking nations. County councils, and especially free education, are important steps toward the unification of our race. In like manner, the recent Copyright Act of the Republic removes a difference. Australasia has also done her part by placing the Republic under obligation, her greatly improved system having already been adopted with beneficial results in many of the States. She has also the simplest and best system of land laws in the world, for which we hope the Republic is soon -- and the United Kingdom later - to discard its own. Thus each of the three parts,

--- Page 235. The Gospel of Wealth - XII Imperial Federation

[Baha'i Comment](#)

improving for herself, improves also for the benefit of the others. The race enjoying the same language, religion, literature, and law should also have the harmonizing blessings of common political institutions.

36. The ground once cleared of Empire Trade League efforts to array one part of the race against the other part, and equally of Imperial Federation aims which would shut out the vast majority of the race and limit the motherland's connection to the smaller portion, and especially if the division of the race upon the North American continent were healed by union, upon the advice of the parent, the efforts of all could then be concentrated upon realizing what Mr. Bolton calls "that grand idea, the confederation of all the nations which have sprung from the race nurtured in these isles." The first-fruits of this movement would probably be seen in the appointment, by the various nations of our race, of international commissions, charged with creating a system of weights, measures, and coins, of port dues, patents, trade-marks, and other matters of similar character which are of

[Baha'i Comment](#)

common interest. If there be a question upon which all authorities are agreed, for instance, it is the desirability of introducing the decimal system of weights, measures, and coins; but an international commission seems the only agency capable of bringing it about.

37. The habit of producing uniform arrangements for the whole of the race having been created by such commissions, the step would be easy to a further development of the international idea. For under harmonious conditions Britain would soon be regarded by the English-speaking people throughout the world as the mother they all revere, and there must inevitably begin a gradual drawing together of the whole race. Even to-day, every federationist has the satisfaction of knowing that the idea of war between the two great branches is scouted on both sides of the Atlantic. Henceforth war between members of our race may be said to be already banished, for English-speaking men will never again be called

--- Page 236. The Gospel of
Wealth - XII Imperial
Federation

upon to destroy one another.

[Baha'i Comment](#)

During the recent differences -- not with Britain, for Britain and the Republic agreed, but with disapproving Canada, which was naturally more irritating to the Republic - not a whisper was ever heard upon either side of any possible appeal to force as a mode of settlement. Both parties in America and each successive government are pledged to offer peaceful arbitration for the adjustment of all international difficulties - a position which it is to be hoped will soon be reached by Britain, at least in regard to all the differences with members of the same race.

38. Is it too much to hope that after this stage has been reached and occupied successfully for a period, another step forward will be taken, and that, having jointly banished war between themselves, a general council should be created by the English-speaking nations, to which may at first be referred only questions of dispute between them? This would only be making a permanent body to settle differences, instead of selecting arbiters as required - not at all a serious advance, and yet it should be the germ from which great fruits would grow.

[Baha'i Comment](#)

39. The Supreme Court of the United States is extolled by the statesmen of all parties in Britain, and has received the compliment of being copied in the plan for the Australian commonwealth. Building upon it, may we not expect that a still higher Supreme Court is one day to come, which shall judge between the nations of the entire English-speaking race, as the Supreme Court at Washington already judges between States which contain the majority of the race?

[Baha'i Comment](#)

40. At first the decisions of the council would probably be made subject to ratification by all the principals, but the powers and duties of such a council, once established, may be safely trusted to increase; to its final influence over the race, and through the race over the world, no limit can be set; in the dim future it might even come that the pride of the citizen in the race as a whole would exceed that which

[Baha'i Comment](#)

--- Page 237. The Gospel of Wealth - XII Imperial Federation

he had in any part thereof - as the citizen of the Republic to-day is prouder of being an American than he is of being a

native of any State of the Union. This is a far look ahead, no doubt, but patriotism is an expansive quality, and men to-day are as patriotic in regard to an entire continent as the ancients were about their respective cities and provinces. The time is coming when even race patriotism will give place to the citizenship of the world.

41. While the decisions of the council would necessarily be restricted to such questions as arose between the members of the race, its influence, and in extreme cases its recommendations, if unanimously made, could not fail to be of weighty import. We can imagine such a tribunal, for instance, unanimously saying a word upon occasion which would settle the most important subject within our horizon of to-day. Is it a very improbable idea that it might hold and obtain the unanimous approval of the powers represented in so holding that the peace of the world, in which the industrial English-speaking race is most deeply concerned, is a question which other nations cannot be allowed wholly to determine for themselves? The commanding position of our

[Baha'i Comment](#)

race will place upon it correspondingly great offices. United as described, it would wield such overwhelming power that resistance would be useless. Its verdict could never be questioned; its word would be law. I believe that it is by our race, and through such means, that war is most probably to be driven from the world which it disgraces, and the reign of peace established among men for ever.

42. In the pursuit of an end so noble, the English-speaking race, wherever situated, can confidently be appealed to; its realization would be a service to mankind which justified labor, expenditure, and even risk. The feeble beginnings of the federation of Europe are already seen in the Triple Alliance. It may fail because not so overwhelmingly strong as to render impotent all efforts to cope with it, and all depends

--- Page 238. The Gospel of Wealth - XII Imperial Federation

upon this; but the idea is there, for three nations have declared themselves banded together, not for the purpose of aggression, defensively, not offensively, and only to keep the peace and to punish the

[Baha'i Comment](#)

peace-breaker. We have nothing to do here with the merits of the controversy which called it forth, but what this Alliance aims to do for the three countries concerned for a few years, the true federation of the English-speaking race would be able to do permanently for the world. The duty is to be ours, if we cooperate, because ours is the only race of which the slightest hope can be entertained that it is soon to become so much stronger than any other race, or probable combination of races, as united to be omnipotent.

43. A race alliance will hasten the day in the coming of which I have implicit faith, when our race will be quite able to say - and will therefore as a duty say - to any powers that threaten to begin the murder of human beings, in the name of war, under any pretence:

*Hold! I command you
both; the one that stirs
makes me his foe.
Unfold to me the cause
of the quarrel, and I will
judge betwixt you.*

*(16) This seems to be a
confused memory of a
celebrated passage from
the play by Home, Douglas*

[Baha'i Comment](#)

(1757), once thought to rival Shakespearean tragedy. The lines should read:

*"Hold, I command you both. The man that stirs Makes me his foe."
(Act IV, scene 2, lines 385-386.)*

44. If ever the parent-land and all her children unite in speaking these words, it need not be feared that a shot will be fired or a sword drawn. The writ of that race union will run the circle round and insure peace. We should thus have the Kriegsverein with power so overwhelming that its exercise would never be necessary. The Zollverein is something so much lower, being only a question of trade, that it scarcely deserves mention in comparison; but even the Zollverein will come of itself in its own good time, when the various members have had time to test and learn their respective capacities - what they can produce best at home, and what they must continue to purchase abroad. Protective tariffs are in their

--- Page 239. The Gospel of Wealth - XII Imperial Federation

very nature experimental and temporary devices. These

[Baha'i Comment](#)

require little attention from the true federationist; indeed, the less they receive the sooner they will pass away. All the forces at work tend to equilibrium of cost throughout the world, and hence the reduction and final abolition of protective duties as no longer necessary.

45. It is obvious that such an alliance of the race is dependent upon a union of hearts, and that force or pressure would only defeat it. No more seeds of lifelong bitterness should be sown. The younger members of the race should remember what is due to the parent; the parent should seek to retain their love and reverence by being "to their faults a little blind and to their virtues very kind,"

(16) Quoted inaccurately from Matthew Prior, "An English Padlock," line 79.

freely according to each, when maturity arrives, the same independent existence and the same exclusive management of its own affairs as she claims for herself, and rather than relinquish which she would sink under the sea. Each member must be free to manage his own home as he thinks proper without incurring hostile criticism or parental interference. All must

[Baha'i Comment](#)

be equal - allies, not dependents.

46. Fate has given to Britain a great progeny and a great past. Her future promises to be no less great and prolific. Many may be the members of the family council of all the English-speaking nations, each complete in itself, which I have predicted as sure to come sooner or later; but, however numerous the children, there can never be but one mother, and that mother, great, honored, and beloved by all her offspring, - as I pray she is to be, - "this Sceptered Isle,"

*(17) Richard II, Act II, scene 1,
line 35.*

my native land. God bless her!

[Baha'i Comment](#)

THE JOHN HARVARD LIBRARY

The intent of
Waldron Phoenix Belknap, Jr.,
as expressed in an early will, was for
Harvard College to use the income from a
permanent trust fund he set up, for "editing and
publishing rare, inaccessible, or hitherto unpublished
source material of interest in connection with the
history, literature, art (including minor and useful
art), commerce, customs, and manners or way of
life of the Colonial and Federal Periods of the United
States... In all cases the emphasis shall be on
the presentation of the basic material." A later testament
broadened this statement, but Mr. Belknap's inter-
ests remained constant until his death.

In linking the name of the first benefactor of Harvard College with the purpose of this later, generous-minded believer in American culture the John Harvard Library seeks to emphasize the importance of Mr. Belknap's purpose. The John Harvard Library of the Belknap Press of Harvard University Press exists to make books and documents about the American past more readily available to scholars and the general reader.

New World Order

Introduction

bruce@webpal.org
[Bruce M. Beach](#)

Table of Contents:

[NWO: A Philosopher's View](#)

Here I explain what the NWO is and what it will be like in the future. Those disciplined enough to actually read and think about this subject are invited to respond with their comments.

[Maturity: Responsibilities](#)

We hear much about *RIGHTS* but here I discuss about the *RESPONSIBILITIES* of the mature adult. Those individuals actually capable of considering the issues concerning the NWO must have matured and this is an attempt to define what that maturity is.

[Quotes: About the NWO by US Presidents and other famous people](#)

Presented here in a categorized form are quotes from many past US presidents about the NWO. There are numerous quotes from many famous people, separated into groups of those who were for and those who were against. Because there are so many

quotes a few, that give the flavor, have been marked with blue stars ********.

Hopefully they will pique your interest to the extent that you will read the rest.

[More: quotes from famous people](#)

While these are not specifically on the subject of the NWO they do give one insight into the thinking of our leaders.

[Proposal: A NWO Constitution](#)

Presented here is a proposal that has been put forth for a NWO constitution. This has

had the backing of lots of groups and a major effort was made to push it forward at a United Nations meeting - but so far it has not really gone anywhere.

[Critic: A NWO Constitution](#)

And here is a critique of the above NWO Constitution proposal, by someone opposed to it.

[History: of the NWO](#)

There have been many conspiracy theory histories written about the NWO and while this "history" still has such a concern it is not as rabid as many but still covers the main items to be found in most of them.

[Hoax: regarding the NWO](#)

There are many, many hoax documents regarding the NWO and there are numbers of people who believe in any them. This is a run of the mill example.

[Bruce M. Beach](#)

Dialog

This is meant to be a dialog, rather than a lecture. Those who are willing to participate are invited to do so by writing to the author at the above email address. Critiques, comments and contributions will be [appended](#).

There is a Table of Contents immediately following but while it is useful to see an outline one can better go to the first topic and just read through the entire presentation.

The author of this page of course works within a particular paradigm, and as an individual subscribes to a specific philosophy, but the description and discussion here is meant to be secular in nature, to describe the social milieu in secular terms, and to provide a secular perspective of what will be a world embracing social activity, no matter how directly one may perceive that activity to be under Divine aegis.

Table of Contents:

[NWO: What it is.](#)

[The Alternatives to the NWO: None](#)

[Concerns about the NWO: Summarized.](#)

[How the NWO will be established: NOT by conspiracy.](#)

America's Role in the NWO: Against and For.

The effect of the NWO: Great GOOD and Great EVIL

The Government of the Anti-Christ: Not what many think

When the NWO will be established: A work in progress.

Peace in the NWO: Not perfect

Freedom in the NWO: The Golden Mean

Prosperity in the NWO: Life is a struggle

Morality in the NWO: A New Victorian Age

Spirituality in the NWO: The continuing path

Critiques: Your comments are welcomed.

The NWO: What it is

The NWO is going to happen.
There is no avoiding it.
Its development is on-going now.

The NWO will be the source of GREAT Good, and GREAT evil.
The nature of that good and evil will be explained. ,
It is true that the NWO Government will be viewed by many
as the government of the anti-Christ,
and a generic explanation of that expression is used herein.

What the NWO will be like is still undefined.
If mankind had become spiritual enough
it would have been the establishment of
the Kingdom of Heaven on Earth.
Unfortunately, that will not be the case.

But neither is it likely to be
a centralized oppressive totalitarian bureaucracy
although some libertarians and anarchists
will see that element in any government.

What the NWO will be
and must be
is a World Government
whose primary objective is to prevent war between the nations
and whose secondary objective is to increase
economic well being and social justice
for all the inhabitants of the earth.

The degree to which it will accomplish those goals
will depend upon the degree of the enlightenment
of its founders.
Security, economic well being, and social justice,
will be evolving values and attainments
dependent upon the social and spiritual evolution (development)
of the all the inhabitants of the planet as a whole.

The momentum to establish the NWO
will greatly accelerate after the Nuclear War
which this author views as now being inevitable.
Those who work to prepare for the restoration
and re-organization of society in the NWO,
such that it will assure World Peace and Prosperity,
are part of the solution.
Those who oppose it
are part of the problem.

Those who assist in the establishment of the NWO,
and work for the restoration and re-organization of society
will be working for the Good
and those who oppose it will be doing evil.

Click here to return to the
[Table of Contents](#)

The Alternatives to the NWO: **None**

Nevertheless, let us consider the proposed alternatives.

1. International anarchy.

Unfettered national sovereignty can only lead to wars. Each country being its own and final judge as to whether it should execute war against another. With the existence of nuclear weapons these will lead to nuclear wars and with the existence of missiles these can become intercontinental wars. The existence of weapons of any kind has always resulted in their use. The only solution is the elimination of weapons of mass destruction.

2. The continued status quo.

The United Nations, as it presently exists, is a failure, as was the League of Nations before it. The reason being, that they both were emasculated from the outset by not having an international police force to enforce their decisions. The how and why this occurred, I discuss below. However, both of those institutions were necessary precursors to the NWO.

3. World Conquest.

a. By communism.

Communism, a centuries old ideal, proved a failure in the industrial age. It still remains the dream of many in Russia, China, and Cuba and of a few elsewhere. Hard right capitalists see the U.N. as being a tool of communism and hard left communists see it as being a tool of capitalism. In truth it will either become the foundation of the NWO, or it will be replaced.

b. By one world power.

The Colonial dreams of any in England, U.S., Russia, China, or wherever, to conquer and rule the world should surely be as dead as the dinosaurs. It would just not possible in this world of Nuclear weapons.

c. By some philosophy.

An equal fantasy is that of conquering the world through some philosophy of force. Jihad of the Moslems, Dominion Theology of the Christians, or Intervention of the Space Brothers.

4. Divine Intervention

Some religions look for a Divine Intervention, some Holy battle, as described in their concepts from the Hindu Bhagavad-Gita, the Jewish Messianic Expectations, the Moslem Jihad of the Last Days, the Christian millennialist and rapture expectations. But, here we are talking about the establishment of a secular government as the NWO. It might have been possible in the 19th century for enlightened Kings and Rulers of the earth to have led humanity into some "Most Great Peace" but that opportunity, if it ever existed, is now past and out of catastrophe mankind will have to restore society and forge a "Lesser Peace" maintained by the threat of combined armed intervention and annihilation of any country who would attempt to violate it.

[Table of Contents](#)

Concerns about the NWO: Summarized.

Many people have serious concerns about the NWO. These have been well summarized by Arthur Lyon Dahl in his book, "The Eco Principle: Ecology and Economics in Symbiosis", published by Zed Books, UK, 1996. (p. 143) as follows:

"It is therefore worth exploring some of the possible causes of this antipathy to world government, and to consider ways to respond to the legitimate concerns and objections.

One problem is the low esteem in which national governments are held today. Widespread corruption and inefficiency have discredited the idea of government in general. In such a situation, most people reason, a bigger government could only be worse. More bureaucracy would be harder to control. A world government would be too distant from the grass roots and too remote from public interests. The checks and balances, such as those between states today, or those of democratic systems that have ultimately reined in the more extreme abuses of national power, might not work. There is a risk that a world government would be just as vulnerable to special economic interests, inefficiency and corruption as national governments, but much more difficult to control.

Then there is the fear that a world government would be vulnerable to takeover by a global dictator. The memories of the attempts by Hitler, Stalin and others to dominate the world have not faded. If this occurred, there would be no possibility for a 'free world' outside to resist and eventually overthrow such a tyrant.

There is also a general lack of confidence in our ability to build a diverse community in which the interests of all members, nationalities and cultures would be safeguarded. The many observed failures to achieve this, even at the national level, do not inspire hope that a world community will be any more successful. Many fear that their cultural differences will be swallowed up by those who are more numerous or more powerful than themselves. The powerful and wealthy who dominate today's nation states similarly fear that their privileges will be taken away from them in a united and democratic world. There is no obvious mechanism to achieve a just balance between states and peoples of widely different sizes and levels of political power and economic development.

Just as various forms of national government were designed to control or compensate for less desirable human tendencies, so are we capable of planning a world federal system with safeguards against our greatest fears. Such a system will be highly decentralized (now popularly called 'subsidiarity' in Europe). Emphasis will be placed on participation, consultation and consensus, with appropriate checks and balances between the *different* centres of decision-making.

Institutional and structural safeguards can be designed to prevent a military or other takeover, and to avoid an uncontrollable bureaucracy. These can be built into the balance between different levels of governments, avoiding an excess concentration of power at any level. Beyond this, the best guarantee against abuse of the powers of a world government will be the high moral standards and pure intentions of those in international positions. The mechanisms to select such individuals, whether by election or appointment, will need to privilege these characteristics.

In any case, the plight of a major part of the world population is already so bad that even a worst-case scenario could hardly cause more suffering. Only a stronger global system has some chance of reducing the extreme inequalities that so divide and threaten the stability of the world today."

Click here to return to the
[Table of Contents](#)

How the NWO will be established: **NOT** by conspiracy.

You can find information about the Bilderbergers, Illuminati, Tri-Lateral Commission, and a half dozen other groups. They do play a role. But it is not a conspiracy as many that write about those groups would have you believe.

The NWO is more like the Industrial Revolution. There was no single organization behind it, nor one group of people who conspired to bring it about. There were groups (governments, bankers, industrialists, scientists, engineers and such) who had their own agendas, (just as there are now in regards to the NWO) and who played a role in bringing it about, but none of them had a Grand Design, and it was not a conspiracy.

Some theorists, such as Marx, felt that it was a natural evolution of society, proceeding from thesis and antithesis to synthesis. Others saw within it (and do today) the technological progression from hunting/gathering through herding and agrarian, to the industrial society and now onto the information age.

In some points of view, the Industrial Revolution, was simply a change in the primary technological means of production. It did not demand or require one specific form of social organization. In that view we could have had monarchy, democracy, capitalism, or communism, or almost any combination thereof. Others feel that the primary technological means of production determines the social organization. Therefore hunting/gathering will require small tribal organization, and agrarian will support larger city-state types of organization, while division of labor and the industrial society requires broad trade and large state like organizations.

The information society is based upon communication and the thesis may be that communication creates community and that global communication is creating a global community.

All of these (except conspiracy) are useful paradigms but none grasp the Greater Reality of the Divine Destiny in the affairs of man.

To know its source, to fathom its purpose, to recognize its destiny, goes beyond the pale of ordinary human knowledge. Still, in all its workings, the events that transpire, the manner in which they will come about, the things which they will accomplish, will look quite natural and ordinary to the uninformed.

[Table of Contents](#)

America's Role in the NWO: Against and For.

"Right or wrong - my country"

and

"My country is always right"

are two patriotic views, whenever found, wherever found, in the world will lead to conflict.

America has paradoxically played both the greatest roles against and for the formation of the NWO. Because it has been both economically and politically the leading power in the world, any of its activities have had the greatest effects. This applies both to those organizations in the U.S. that have advocated programs and policies compatible with establishing the NWO, and those organizations, which have been opposed.

The presentation, in this section, is addressed mainly to those Americans who are opposed to the NWO. Those who are most adamant against the NWO go about with bumper stickers on their cars saying, "Get us out of the UN now!" and will often indicate in conversation that they feel that the President of the United States is a traitor to the country. While those are extreme attitudes, they have had sufficient influence in the past to make the U.S., through the "conservative" members of its Congress, the world's greatest opponent of the NWO.

What is presented here is a series of questions to try to get American opponents of the NWO to view things from a global perspective and the viewpoint of citizens of other countries.

How would American's feel if some other country was to dictate to the U.S. that they were not to do experiments with weapons of mass destruction?

Many of the citizens of North Korea, Iraq and other countries feel that the U.S. is being a bully when the U.S. tells their country to not to experiment with missiles and nuclear weapons. A "fair" system would equally forbid such experiments by large, wealthy, and powerful countries. To do otherwise is like saying that the wealthy in a community can use guns to enforce their will on the poorer citizens, and that the wealthy are the only one's permitted to have guns.

What would Americans think if Russia had invaded Mexico or some South American country to assure that the indigenous Indians were being treated fairly?

Russians would see a parallel between this and the U.S. supported war over Kosovo. While the action was nominally a NATO action, the majority of the troops and equipment were American. Moreover, American indignation about such things is looked upon by much of the rest of the world as a matter of hypocrisy. Citizens of other countries can point out how the U.S. had black slavery, how it treated the indigenous Amerindians, and during the Second World war its citizens of Japanese descent. To other nations, such as China, that have not resolved the conflict between their diverse cultures, and who have masses of people who have not yet adapted to the principles of democracy, it appears that the U.S. is

impatient with an evolutionary process of development. Other nations also feel that they have been singled out for human rights interventions because the U.S. has some other "self interest" or "political agenda" since major instances of ethnic cleansing and human rights violations happen elsewhere without U.S. intervention, despite the loud pleas of the victims.

How would Americans feel if Puerto Rico wanted to become an independent country and the U.S. did not want it to and the U.S. was having war games in Florida and Russia sent in its fleet between Puerto Rico and the U.S. or between the U.S. and Cuba to demonstrate its willingness to protect them?

This may be similar to how China feels about the U.S. sending its fleet in between it and Taiwan during China's war games. China feels that Taiwan's "rebellion" is similar to the rebellion of the Confederate States in the U.S. Civil War and that it has a similar "right" to enforce its rule over Taiwan as the U.S. Federal Government did over the Confederates. Moreover, they are disturbed that the U.S. is supplying arms to Taiwan.

What do you imagine American feelings would be, if the U.S. had supplied a client nation with tanks and other arms, and the Russians came in and destroyed them before they were ever even paid for?

The Russians were really hoping to get oil from Iraq for the arms that they had supplied to them. The U.S. had previously been supplying Iraq also because it wanted a strong buffer against Iran.

What would Americans think if the Russians made a no nuclear missile testing treaty and then said that they were going to unilaterally tear it up?

But the U.S. is doing just that. This does not very likely make the Russians feel very secure. There have equally well been violations of treaties in force, by the Russian side. But the U.S. has been opposed to independent inspection and verification (except of course for other countries like Iraq), so there is no way to actually know what has occurred.

What if in violation of its constitution, the Commander in Chief of the Russian Military (without permission of its Duma) were to start war with a nation (next door to the U.S. - say Canada) win that war and send in occupying troops so that the Russian troops were sitting in Canada?

The Russians would see this as a very parallel situation with there being Americans in Kosovo.

Can you imagine a world with weapons so terrible that nations can destroy the world and that leaders decide that they need rule of law in the whole world so that no one nation cannot bring it to catastrophe. So after the most terrible war the world has ever seen they sit down to form such a system, but the most powerful nation, although it hosts the meeting, refuses to join because the conservatives in the country won't let it. What if this had been Russia hosting the meeting but refusing to join because the dyed in the wool communists wanted to form the Comintern to take over the world.

But actually it was the U.S. that hosted the formation of the League of Nations in San Francisco after the First World War and then refused to join.

What if immediately after the end of that war the Russians had thought the U.S. weak and had invaded it? Would Americans then be a bit suspicious about the Russians?

But it was the U.S., with hundreds of thousands of ally troops, that invaded the Russians after World War I, although the Russians managed to repulse the invasion. A war never told about in American high school history books, but always told about in the Russian ones.

Those astounded by the previous fact should do a key word search on the Internet on the words: "Allied Intervention".

What if this failure to set up world law, brought on an even worse war, and now the Russians had said yes they would join this time, (to form a new system - called the United Nations) but if there was any law about to be passed that they did not like then the conservatives in their country insisted that they would not have to abide by it (this is called the veto) or they would not join? What would Americans think of the Russians about that?

But it was the U.S. not the Russians that insisted on the veto.

What if the Russians had joined the U.N. and while we kept the agreement not to invade another country, without U.N. permission, they went ahead and invaded somewhere in our hemisphere as close as southern Mexico, or in Panama, in complete violation of the U.N. Charter to which they had agreed. Would Americans in that case feel that the Russians were a threat and were pushing.

This is exactly the Kosovo situation from the Russian point of view?

What if the U.S. was in a major depression? Its soldiers were behind in their pay. Housing conditions were terrible. Training was falling apart, and Russia was greatly increasing its military spending invading countries nearby to the U.S., "accidentally" bombing U.S. embassies, refusing to abide by treaties and the U.N. Charter, and there were in Russia conservative leaders crying that everything is falling apart in the Russian Military, and that they need to be spending much, much more for arms development.

However, it is just the reverse, in that it is Russia falling apart economically, Russia which cannot really afford more arms, or to keep up the arms that it has - although yes, they have launched Peter the Great, new nuclear submarines, are struggling to keep Mir in space, when it should be coming down, have a new fighter plane, and so forth, (but the U.S. is FAR, FAR better equipped), and yet the U.S. conservatives are yelling for more and more arms, and demanding that the U.S. not be obedient to the World Court, or follow U.N. decrees.

If the shoe were on the other foot, and it was Russia doing the things above that the U.S. has done, would

Americans think the Russians were being bad international citizens and a threat to their safety?

Do the Americans really need all this screaming for more and more arms? What will it accomplish? Both sides already have more than enough to destroy the world. Both sides are already sufficiently angry with each other to start such a conflict. What will be the end result? Does it not appear inevitable? Should we not be thinking beyond this?

It will not help insight to respond to the above examples with counter examples of wrong doing on the other side, because the above questions were not about fact, but rather about feeling and perception. It is feeling and perception, the creating of emotion that will lead to the great catastrophe

Before we are too hard on the U.S. we must remember that the "Flag of World Unity" was first raised in San Francisco as the League of Nations, and that New York City was the "City of the Covenant" where the United Nations, the beginning of the NWO was established. That covenant will eventually, after World War Three, be extended and made firm, so as to assure that all aggressors are immediately dealt with and no further wide conflicts can occur.

The effect of the NWO: **Great GOOD and Great EVIL**

Some people look upon the NWO as being unmatched evil, others look to it for unparalleled good. In reality it will be neither, but a mixture of the two. The great evil of the NWO is that it is incapable of bringing deep, lasting spiritual peace and unity to mankind. This deficiency is so great that eventually there will again be universal disturbance, although not so great and terrible as the one that will prompt its establishment. That future disturbance will, however, be so disturbing to a much more enlightened humanity that it will finally establish a universal system that will lead to a much more perfect peace and spiritual unity. These matters, however, are seen as being far into the future, at the end of a period of time called the millenium, or a thousand years, and are represented variously in a variety of Jewish, Christian, Moslem, Hindu and other philosophies, (for example such as the Nazi thousand year Reich).

It may strike some strange, to take such a long view of history, but there have been long periods of social structure before, such as the medieval period or the Chinese Dynasties. However, for those who do not see the Divine Destiny and Purpose of society these concepts will be but idle speculation. Indeed, for many, the very purpose behind the NWO, or for that matter life itself, is veiled in a total mystery.

The purpose of the NWO, in the Divine Destiny, is to allow a further period for the maturing of the human race. It is sort of a summer school for a humanity that has failed to pass the grade. Since humanity

has not yet attained unto the maturity of which it is capable it needs to continue to develop its social and spiritual skills. It is this lack of social and spiritual skills that will create many of the evils.

At the present humanity continues to wallow in the problems of racism, nationalism, religionism, and materialism. The problems of selfishness and immorality are universal and rampant. The catastrophe that will usher in the NWO may cause many to re-examine their personal priorities and philosophies but most of the attitudes and problems will remain to be matured out of over a long period (probably centuries) of time.

The two major problems or threats to modern society that will be ameliorated by the NWO are international political and economic warfare. This will of course be at the expense of national independence and it will have a degree of impact on some individuals as to cultural practices, private property ownership, and various social freedoms. These are always the costs of organized society over anarchy but usually the reduction in the freedoms and benefits of the few increases the freedoms and benefits of the many. The privileged wealthy may have their assets confiscated in order to reduce the poverty of the masses. At least that would be the ideal of communism. However, the NWO will not be communistic. Private incentive and greed have now been shown through numerous large social experiments in Russia, China and elsewhere to be greater producers of wealth than communism. But still there remained masses of economically disenfranchised masses in India, Southeast Asia, Africa, South America and elsewhere. Whether or not, and how soon the NWO will find a universal solution to these serious problems is in itself problematical.

The Government of the Anti-Christ: **Not what many think**

Many people are upset about the expected Government of the Anti-Christ. What is offered here is a generic explanation. There are many religions and religious groups that look forward to the establishment of a Theocratic Government over the entire earth. In Christian terms this would be called the Government of Christ. Any alternate world government would be the government of the Anti-Christ.

Numerous graphic descriptions of the Government of the Anti-Christ, are to be found in both the Bible and numerous books by Christian writers. It is an understatement to say that the general interpretation is that it is not a good thing. Nevertheless, most of the interpretations are that it is an inevitable thing, and if this is indeed true then one should consider what is the proper role to play in regards to the secular NWO (the Government of the Anti-Christ).

The relationship to secular governments, of those who wish to follow Theocratic or Divine governments,

has been an age-old question. Jesus advice to "Render unto Caesar that which belongs to Caesar" is probably as good today as ever.

The NWO may well permit theocratic "shadow" governments such as now exist in some cultural communities in many parts of the world. However, resistance or antagonism against the secular government will be anti-social behavior that will require remediation. Those who are separatist or non-conforming will have to undoubtedly be willing to accept whatever penalties or deprivations that may entail.

We must remember that the very reason that the world will be under the rule of a secular government is that it has not progressed spiritually to the point where it can live under a theocratic government. Those who wish to see progress made in that direction need to take a positive and active role in the affairs of the secular government rather than withdrawing or being antagonistic and thus leaving the field open to those with philosophies that they find distasteful.

When the NWO will be established: **A work in progress.**

The NWO has been a work in progress for many decades. To human sense it will appear to be a system that grows like Topsy, however there will be others who feel that there is a Divine Destiny in the affairs of man. A middle view might be that while there is an overall scheme or destiny, that there are also contingent incidences that provide for a degree of variety and the action of human free will. Such it appears to be in most of the affairs of men. From the day that we are born, we have no choice but to grow into human adults, but we do have a range of choice in being educated or ignorant, moral or immoral, athletic or non-athletic, and so forth.

As it is individually with humanity, so is it also collectively. Unfortunately, as observed by Admiral Rickover, humanity has chosen to become an intellectual and technological giant but a moral and spiritual pygmy. Nevertheless, world society, as immature as it may be has grown to adulthood and that adulthood requires and involves it having a world government. Since it cannot, because of mankind's spiritual immaturity, be a spiritual or Theocratic government, establishing a system of universal spiritual peace (seen by Christians as being the Kingdom of Christ on earth) it must then be a secular government, referred to in prophetic literature as being the government of the anti-Christ, or the NWO.

This development of the NWO was not a sudden event, nor will it be a sudden event. The spiritual decay of humanity, at the very time when it should have been a time of its spiritual maturing, has been a century long process. If we were to compare the human collective to that of a single individual we would

say that it is emerging from a decadent teenage, ill-prepared and ill-equipped to assume the responsibilities of adulthood, as it now must.

The human immaturity, as evidenced by two world-wide conflicts, of increasing devastation, and that it is about to engage in a third more catastrophic than all those before. As evidenced by the fact that in a world gifted by God of immense resources, that it continues to spend atrocious amounts on armaments while much of humanity remains ill-fed, ill-housed and ill-educated. This list of the misdirection of its God given resources, spiritual, natural and intellectual could be much extended, but once again it must be emphasized that it did not happen suddenly and that its destiny has been decades in the making.

As a human individual matures their physical requirements change whether their intellectual and spiritual growth keeps pace with their physical growth or not. They require larger sizes of clothing, more calories of food, social mechanisms to control their activities and regulate emerging forces such as sexual drives. The same is true of the human collective. In small numbers it can live in isolated tribes, and in slightly larger numbers as city-states, but eventually nations emerge and as world-enveloping technology develops a world unifying social order becomes a necessity. Whether or not that social order will be secular or spiritual depends upon the maturity of the inhabitants of the planet. Unfortunately, the inhabitants of this planet have chosen spiritual immaturity, hence the NWO as we shall come to know it.

The future mechanisms of the NWO will grow out of those of the present. Namely the United Nations, the IMF, the World Court, national entities, various forms of human government consisting of democracies, kings and despots, collectives of cultures and all the present diversity of races, religions and philosophies. The previous and present spiritual inadequacies and social ill adaptations of these institutions will be but slowly modified. Nevertheless, it is a task upon which the leaders of thought among mankind, must embark. The present inadequacies result from the previous deficiencies and the future inadequacies will result from the present deficiencies. We must make every effort that we can, to remedy the present deficiencies. The responsibility, morally and spiritually, is ours.

Peace in the NWO: **Not perfect**

In Jewish and Christian scriptures there is a time of peace described such that "the lion will lie down with the lamb". Whether or not one looks upon this as a literal expectation, it is representative of expectations of a time of Great Peace. Literalist theologians also have expectations of sudden establishment of peace, an expectation shared by various "new age" groups whereby it will be attained through external intervention from other space dwellers or through some mystical passing of humanity into a new awareness, awakening, or enlightenment.

What we are describing here will be a more conventional series of events. A primary premise of this writer is that there will be a World Nuclear War that will have a motivational effect upon the world's inhabitants to further form the NWO. The first step will be as universal a conclave of the nations and principalities as can be called. Just as the United Nations was formed in San Francisco which was where its predecessor the League of Nations had been established, so also shall the successor to the United Nations (even if it retains the same name) meet in the vicinity of New York, if the devastation so permits. It may however eventually establish a world center and enclave in Jerusalem, a recognized World Center, by four of the World's Religions, and a recognized Holy Place by many cultures and groups. The reason for this is that there will be no other easy and practical way to eliminate the conflict that continually arises over that area and that it avoids catering to national interests and arguments that would arise from locating it elsewhere, aside from choosing some island in the sea.

Conflicts will still continue to arise, however, between cultural majorities and minorities within countries. The resolution of those conflicts will not be simple, even before a world court, and many of them may be traumatic. The standards of governments within countries will quite differ. Some will have less than benevolent despots, but in order to retain a degree of autonomy for all countries and to avoid the problems of over-centralization, there will be a method of recognizing and certifying the "legitimate" governments of each country, and other contenders will be considered revolutionaries which the "legitimate" governments will have the right to suppress, if they can. This in itself will lead to decades of limited, but often severe and tragic conflicts.

[Click here to return to the Table of Contents](#)

Freedom in the NWO: **The Golden Mean**

The great bug-a-boo with many people about the NWO is that they fear that there will be a loss of freedom. In actuality, for most people, their freedom will be increased by the NWO. The greatest and most important freedom, that of the practice of religion and one's relationship to God, will, over time, be greatly increased. Initially, because of the anarchy, resulting from the Great Catastrophe, there will be a removal of the current restraints on persecution and some minority communities in some cultures and nations will be subjected to genocide by the dominant communities, but the more gross incidences will be eliminated in a matter of decades as an International Standard of Freedoms and Rights is established and gradually adhered to. Some cultures, based on a predominant religion that has a lesser traditional degree of tolerance will continue to be more oppressive than others.

Many freedoms are tied to economic independence. In the past money has talked. In the future money will talk. Freedom from poverty gives access to health, education, travel and communication. A man without means is really not very free, except to sit and starve.

Freedom, on the other hand, is very much limited by many institutions other than government. Ask any married man (or woman). Also any employed person. Society may permit you to sleep in on Monday morning, but your employer may take a dim view of your doing so. It is your employer who is limiting this and many other freedoms. Indeed, the more institutions of which one is a member the more their freedoms are limited. Some religious organizations limit their members from smoking and drinking. Neighborhood institutions place many requirements on how one maintains their home. This list goes on and on.

The larger, more complicated and interrelated society becomes the more freedoms are restricted in one sense. To take just one example. No one cares what side of the road one drives down a backwoods path but it becomes very critical on a four-lane highway. In a sense that is a loss of freedom, this inability to drive on whichever side of the road that you wish. On the other hand, an intracontinental network of four lane highways can give one much more freedom to travel than one of backwoods paths. This example too can be many times multiplied. Law, order, and rule restrict freedom on the one hand and greatly increase it on the other.

Too much freedom (anarchy) or too many rules (restrictive bureaucracy) can be equally deleterious. The search must always be for the Golden Mean.

Aside from yelling fire in a crowded theatre, most libertarians would tell you that there should be no restrictions on freedom of speech. Experience has begun to bring even this into question in the minds of many as they hear unlimited profanity pounding their ears from every quarter of the entertainment industry, expect copycat murders following one sensationalized by the media, observe hate crimes proliferated and motivated by hate literature, and hear of nefarious tools of destruction such as pipe bombs explained about on the Internet. Still, the freedom for the exchange of ideas is so important that many fear to draw any line between purity and pornography.

For the last century, technology has been the answer to extending (and perhaps over-extending) freedom, and not just in transportation and communication. Note for example the sexual revolution and also freedoms from disease and injuries as the consequences of accident and war that have been obtained through the advances in medicine and surgery.

There have always been greater freedoms for the wealthy. This will undoubtedly continue to be the case. But as a greater degree of wealth can be extended to a greater number of people on the planet, so can a greater degree of freedom, in every form that we have discussed.

Table of Contents](#)

Prosperity in the NWO: Life is a struggle

Some persons will pin their hopes on the NWO as a panacea for all of mankind's ills. But it is not. The human condition will remain. Life will continue to be a struggle. The Divine Purpose for human life is the development of the soul and for this purpose struggle and tests are necessary.

The NWO will eventually achieve a level of prosperity, for the descendants of the survivors of most of the world's masses, considerably beyond what they have attained now. Certainly far beyond what presently exists for the impoverished masses in the sub-Sahara of North Africa, population centers of Bangladesh, or the rice paddies of China and South East Asia. However, the general level of the world's consumption will probably never match the level of the generally affluent middle classes in the present United States in which many barbaric teenage males drive around in large machines consuming annually great quantities of non-renewable energy, and can spend most of their time in idle preoccupations of games, sports, and various forms of audio visual entertainment and diversion.

The present wasteful consumption of resources, as symptomized above, is rampant throughout North American society, as also evidenced by the number of ounces of clothing possessed by the average member of the population, the annual expenditure on cosmetics, the national per capita expenditure on armaments and weaponry for war. Those who take pleasure in such a standard of living, will find that they have lived in the best of times, never to return again, while those who have lived in the deprivation described earlier will be able to point back to these as the worst of times. All will find the circumstances immediately following the Great Catastrophe as being the absolute worst of times.

But what does the future hold? There will continue to be limited although abundant resources of energy, minerals, water, land and so forth. The ratio of capital assets, even with the massive destruction that will have taken place, will be the greatest to have ever existed in history, simply because of the sudden depletion of population. Initially, in the restoration of civilization, the first priority will have to be given to agriculture, and after that distribution. But soon the importance of communication and technology will return to the fore in the fortunes of any nation.

The question will then remain as to who has the power, influence and control over the means of large-scale production, distribution, and communication. No single answer presents itself. The NWO Government will supervise the control of the world currency but this begs the question, as to who will actually be in control. Strangely, even in Western Democracies, at the present, while the government prints the currencies it is privately involved interests who control them through institutions such the Federal Reserve Bank, the World Bank, the International Monetary Fund and so forth.

While there will be a Supreme World Tribunal, the NWO will not be a single monolithic organization. Other institutions, similar to those we have just named, will have their influence. In addition to the World Government, national, provincial and local governments will all have their spheres of influence. There will continue (or be re-established) all sorts of other licensing, regulating, authorizing authorities such as we have now. There will be boundaries (some not very clear cut) of interaction between these various

entities. Not that much different than from what it is today.

The scourge, and heavy world burden of cost, for both armed and economic warfare will be reduced. The former immediately and the latter more and more over time, but the quality of life in any one area will be dependent upon the resources, industriousness, education, and initiative of the inhabitants of that area. One of the key words there is initiative, because it has been shown time and again that while there are certainly many efficiencies in economics of scale, still centralized control is inefficient and that which is most productive is motivated individual initiative. Some balance must always be struck between the polarity of those two factors. The carrot and the stick will remain the greatest providers of initiative.

It is in regards to questions like this that the question of economic social justice is most clouded. Those with the least economic or social power to control policy will remain on the whiplash end of policy decisions that decide the availability of capital, the application of interest rates and taxes, the degree of economic activity as determined by the level of employment. The motivating factor behind those who presently set such policies is one of greed. Whether or not, and particularly how soon, this can be tempered in the future by some other sense of social justice is presently completely undecided. At this point in time, to describe possible paths and potential programs is but utopian dreaming.

The individual then, under the NWO, will, as the individual now, have to make choices regarding honesty, integrity, morality, compassion, generosity, and a whole range of other spiritual values. The focus of their life, whether it be spiritual or material or any range of balances between the two, will be of their own choosing and they will continue to bear the eternal consequences for the responsibilities of their actions.

Table of Contents](#)

Morality in the NWO: A New Victorian Age

In the eyes of many, the very cause of the Great Catastrophe will have been God's just retribution upon the immorality of mankind. In a sense this is also the cause of the establishment of the NWO. In truth the retribution will not be only for mass failure in individual morality but also for failure in collective social morality as evidenced by rampant racism, wide areas of world poverty, lack of literacy, and a litany of other ills foremost among which must be named the insane building of weapons of mass destruction, narcissistic nationalism, and rabidly dogmatic religions of almost every stripe and fever.

The collective social morality will be harder to correct, but there will be a return to Puritanism beside which the Victorian variety will pale. One would have no need to be surprised by the burning of libraries, the destruction of theatres, the searching out of film storage facilities, and a general purging and

exhibition of repugnance at the emblems of what has become an evil immoral world.

The anger about what has been wrought upon the earth, by what is seen as God's retribution, may not extend only to the physical by-products but to various classes of people who have advocated immoral practices. Whether or not these might also include the military, bankers, lawyers, politicians, or any other group will depend upon the temper of the times.

[Click here to return to the
Table of Contents](#)

Spirituality in the NWO: **The continuing path**

The complete establishment of the NWO, being preceded as it will be by the Great Catastrophe, will be accompanied by a thorough re-evaluation by many of the purpose of life. The problem being so immense, many will flee from it in different ways. Some into cloistered monasteries that separate them from the struggles of the world, others into chemical evasions. The only proper response is the development of the spiritual capacities in relationship to the life in this world, as was the intention of the Creator. For the masses of humanity to travel that path, physically, mentally, intellectually, morally, and spiritually will require centuries to attain unto that Most Great Peace which is the intention of its Creator.

RESPONSIBILITIES

Much is heard today about the violations of human rights. The idea behind forming a statement, *of responsibilities* is that 'rights' for adults are accompanied by responsibilities.

Some Principles of the Responsibilities of Adults

To One's God
To One's Community
To One's Family
To One's Self

To One's God

To know God and to worship Him
To recognize His latest Manifestation and be obedient to His laws
To pray and read the Word of God each day
To teach others about God's Word
To contribute to one's religion
To consort with people of all religions
in a spirit of friendliness and fellowship
To respect all of God's creatures and creation.

To One's Community or Society

To be obedient to one's government
To contribute to the welfare of the poor,

handicapped, elderly, and orphaned

To have a sense of world citizenship

To have a sense of community citizenship

To serve one's fellowman

To work for world unity and peace

To work for universal understanding and language

To support the elimination of prejudices

To support the equal rights of men and women, races,
varied cultures and religions

To support the development of science, the arts, and culture

To One's Family

To teach one's children about religion

To be happy and love one another

To develop strong unified families
and respect the rights of each individual

To support one's family and children

To educate one's children

To One's Self

To sincerely and honestly investigate the Truth
and overcome superstitions and vain imaginations

To be moral and improve one's character

To earn a living by a trade, craft or profession

To become educated and informed

To be moderate and balanced in one's consumption

Summary

There are undoubtedly more rights and responsibilities than one could exhaustively list. There are rights and responsibilities between employers and employees, governments and their citizens, marriage partners and their spouses, children and their parents, and many other combinations that could be named.

The smallest infant, of course has only rights and no responsibilities. It is as one begins to mature that they gain responsibilities. It is for this reason, that they may mature, that young children should start to be given responsibilities starting from a very young age.

In any relationship the responsibilities of the partners to the relationship may, and indeed usually will, differ. Thus it is that governments will have one set of responsibilities and its citizens another. Employers one and employees another. Even within marriages there are defined areas of responsibilities. This is not to say that all citizens, employees, marriage partners, or children within a family are not equal.

Equality, however, is often a chimera. Both the needs and capabilities of individuals differ. Consequently, the rights and responsibilities of an older sibling will often be radically different from those of a younger. Such distinctions apply to the whole of the family of man. Those individuals with particular needs, or talents, must be given special consideration to satisfy those needs, or develop those talents.

The pressing need of individual humanity today is for Justice. The pressing need of collective humanity today is for Unity. When unity is achieved by mankind peace will naturally ensue. Many persons today mistakenly believe that peace is the most pressing need of mankind today, but true and lasting peace will not be just the absence of war, it will be the result of the unification of mankind. If this unification is accompanied by Justice it will also naturally result in prosperity.

The unity of mankind does not presuppose the homogenization of mankind. There can be, indeed must be, diversity in unity. For mankind to fulfill its potential it must display all the diversity and variety in the human garden that is seen, by analogy, in a beautifully cultured flower bed.

These, then, are the ideals that the mature thinker, or if you will, that the mature soul must strive towards in this day. To the degree, and only to the degree, that more and more of humanity becomes composed of mature and responsible adults will the heavenly kingdom appear on earth. It is the responsibility of each one of us to strive towards that goal.

This is a preliminary attempt to develop a statement of the responsibilities of a mature adult.

YOUR assessment, comments, or suggested additions or modifications would be greatly appreciated.

[The following list of quotes is a combination of four, mostly anonymous sources, who are opposed to the NWO, so I apologise that I cannot give better references, such as page numbers, and so forth.

The present editor (Bruce Beach) has further organized, edited and supplemented the quotes. If any reader can provide further quotes, sources, or suggestions, they will be much appreciated. bruce@webpal.org

In order to distinguish my editorial comments I have emphasized them and have placed them in brackets.]

"Quotes from famous people about THE NEW WORLD ORDER"

[The following quotations] "...clearly demonstrate that the words "new world order" are deadly serious and furthermore, have been in use for decades. They did not originate with President George Bush in 1990. The "old world order" is one based on independent nation-states. The "new world order" involves the elimination of the sovereignty and independence of nation-states and [creation of] some form of world government. This means the end of the United States of America, the U.S. Constitution, and the Bill of Rights as we now know them. Most of the new world order proposals involve the conversion of the United Nations and its agencies to a world government, complete with a world army, a world parliament, a world court, global taxation, and numerous other agencies to control every aspect of human life (education, nutrition, health care, population, immigration, communications, transportation, commerce, agriculture, finance, the environment, etc.). The various notions of the "new world order" differ as to details and scale, but agree on the basic principle and substance."

**Statement by one of the original compilers
of some of these quotes.**

[The degree of control is certainly a matter of speculation. There will certainly be some control, (just as there is now, but maybe more or less) or guidelines or restrictions in most of these areas, but the degree would vary from area to area and as a matter of practicality it will often be important to avoid over centralization. A second point raised in the above involves the elimination of national sovereignty, and if we mean by that the right to make war, by either physical or economic means, then that is undoubtedly true, however the NWO by no means requires the elimination of national or cultural identities.]

Statements by (or about) World Leaders (such as US Presidents) in favor of the NWO

"There are a lot of very brilliant people who believe that the nation-state is fast becoming a relic of the past,"

**President Clinton,
New York Times, November 25, 1997**

Click here to return to the
[Index](#)

"What I'm trying to do is to promote a process of reorganization of the world ..."

**President Clinton,
interview with Argentine reporters, October 17, 1997.**

Click here to return to the
[Index](#)

"The developing coherence of Asian regional thinking is reflected in a disposition to consider problems and loyalties in regional terms, and to evolve regional approaches to development needs and to the evolution of a new world order."

Richard Nixon, in Foreign Affairs (October 1967)

[There are those who have proposed Regional Governments. Regional spheres of influence. The aspirations of Japan in Asia, of Russia over what was the USSR, of the US in the Americas (an extension of the Monroe Doctrine), and so forth. But American's see their interests as more global, such as their oil interests in the Near East. Communication, air transportation, use of the seas and satellite space, world wide pollution and environmental concerns, along with many other issues, are global in nature. Large sovereign regional governments could, and would, lead to inter-regional conflicts. Consequently, regional alliances must be seen simply as a step towards greater global unification.]

"He [President Nixon] spoke of the talks as a beginning, saying nothing more about the prospects for future contacts and merely reiterating the belief he brought to China that both nations share an interest in peace and building 'a new world order.'"

Excerpt from an article in The New York Times (February 1972)

[Many of the leaders of China, Russia, the U.S. and many other countries, all recognize the need for an effective world government. The bone of contention remains as to who (and what philosophy) is going to control it. Capitalism has been more economically successful but there are still those who oppose it. They particularly oppose the imposition of "western" capitalism and even "western" culture.]

Click here to return to the

"The United Nations cannot survive as a static organization. Its obligations are increasing as well as its size. Its charter must be changed, as well as its customs. The authors of that charter did not intend that it be frozen in perpetuity. The science of weapons and war has made us all one world and one human race with one common destiny. The United Nations, building on its successes and learning from its failures, must be developed into a genuine world security system."

President John F. Kennedy
September 20, 1963

[All statesmen, no matter their country or political affiliation, have identified the problem just as President Kennedy did here. Those who are opposed to One World Government need to point out an alternative solution, and any suggested to this writer will be gladly published in these pages.]

Click here to return to the

"The world can therefore seize the opportunity [Persian Gulf crisis] to fulfill the long-held promise of a New World Order where diverse nations are drawn together in common cause to achieve the universal aspirations of mankind."

George Herbert Walker Bush

[The quotes from Nixon and Bush should leave no one accusing the NWO concept of being a "leftish" idea. In point of fact, it is a universalist concept that cuts across the lines of the political left and right, besides all geographical and cultural sectors of the world.]

Click here to return to the
[Index](#)

"If we do not follow the dictates of our inner moral compass and stand up for human life, then his lawlessness will threaten the peace and democracy of the emerging new world order we now see, this long dreamed-of vision we've all worked toward for so long."

President George Bush (January 1991)

Click here to return to the
[Index](#)

"What is at stake is more than one small country, it is a big idea - a new world order...to achieve the universal aspirations of mankind...based upon shared principles and the rule of law.... The illumination of a thousand points of light.... The winds of change are with us now."

President George Bush
In his State of the Union message during the Gulf War.

Click here to return to the
[Index](#)

"It is the sacred principles enshrined in the United Nations charter to which the American people will henceforth pledge their allegiance."

President George Bush
addressing the General Assembly of the U.N.,
February 1,1992

Click here to return to the
[Index](#)

The Persian Gulf crisis is a rare opportunity to forge new bonds with old enemies (the Soviet Union). Out of these troubled times a New World Order can merge under a United Nations that performs as envisioned by its founders."

George Bush,
September 11, 1990

Click here to return to the
[Index](#)

"The world can therefore seize the opportunity (the Persian Gulf crisis) to fulfill the long-held promise of a New World Order where diverse nations are drawn together in common cause to achieve the universal aspirations of mankind."

George Bush,
in his State of the Union Address,
January 29, 1991

Click here to return to the
[Index](#)

"Two centuries ago our forefathers brought forth a new nation; now we must join with others to bring forth a new world order."

**32 U.S. Senators and 92 U.S. Representatives
in Washington, D.C. on January 30, 1976,
signed a "Declaration of Interdependence."**

Click here to return to the

"A New World Order"

**Title of article on commencement address
at the University of Pennsylvania by
Hubert H. Humphrey,
printed in the Pennsylvania Gazette (June 1977)**

Click here to return to the
[Index](#)

"I would support a Presidential candidate who pledged to take the following steps: ... At the end of the war in the Persian Gulf, press for a comprehensive Middle East settlement and for a 'new world order' based not on Pax Americana but on peace through law with a stronger U.N. and World Court."

**George McGovern,
in The New York Times (February 1991)**

[From their inceptions, the League of Nations and the United Nations were doomed to failure because of the weakness of their charters that permitted continued national anarchies.]

Click here to return to the
[Index](#)

"We can see beyond the present shadows of war in the Middle East to a new world order where the strong work together to deter and stop aggression. This was precisely Franklin Roosevelt's and Winston Churchill's vision for peace for the post-war period."

**Richard Gephardt,
in The Wall Street Journal (September 1990)**

[And we could add to that President Woodrow Wilson, the effective father of the League of Nations, who

in reality sacrificed his health and life for its formation, but who was frustrated by the shortsightedness of the U.S. Congress.]

Click here to return to the
[Index](#)

"Today, America would be outraged if U.N. troops entered Los Angeles to restore order [referring to the 1991 LA Riot]. Tomorrow they will be grateful! This is especially true if they were told that there were an outside threat from beyond [i.e., an "extraterrestrial" invasion], whether real or *promulgated* [emphasis by original compiler], that threatened our very existence. It is then that all peoples of the world will plead to deliver them from this evil. The one thing every man fears is the unknown. When presented with this *scenario*, individual rights will be willingly relinquished for the guarantee of their well-being granted to them by the World Government."

**Henry Kissinger speaking at Evian, France, May 21, 1992
Bilderburgers meeting.
Unbeknownst to Kissinger,
his speech was taped by a Swiss delegate to the meeting.**

[President Ronald Regan also commented that what this planet needed was an invasion from an outside enemy, in order to unify it. The accuracy of the above quote is however highly suspect, because the Bilderberger meetings are kept very secret and no minutes or reports are released to the public.]

Click here to return to the

"Undersecretary of State Sumner Welles tonight called for the early creation of an international organization of anti-Axis nations to control the world during the period between the armistice at the end of the present war and the setting up of a new world order on a permanent basis."

Text of article in The Philadelphia Inquirer (June 1942)

[Many have thought and struggled for the idea for a long time.]

Click here to return to the
[Index](#)

"In the next century, nations as we know it will be obsolete; all states will recognize a single, global authority. National sovereignty wasn't such a great idea after all."

**Strobe Talbot,
President Clinton's Deputy Secretary of State,
as quoted in Time, July 20th, 1992.**

Click here to return to the
[Index](#)

"But it became clear as time went on that in Mr. Bush's mind the New World Order was founded on a convergence of goals and interests between the U.S. and the Soviet Union, so strong and permanent that they would work as a team through the U.N. Security Council."

**Excerpt from A. M. Rosenthal,
in The New York Times (January 1991)**

Click here to return to the
[Index](#)

"... it's Bush's baby, even if he shares its popularization with Gorbachev. Forget the Hitler 'new order' root; F.D.R. used the phrase earlier."

**William Safire,
in The New York Times (February 1991)**

[An idea whose time has come.]

Click here to return to the
[Index](#)

"Further global progress is now possible only through a quest for universal consensus in the movement towards a new world order."

**Mikhail Gorbachev,
in an address at the United Nations (December 1988)**

[Much of the world sees the need but only catastrophe will motivate it to action.]

Click here to return to the
[Index](#)

"We are beginning to see practical support. And this is a very significant sign of the movement towards a new era, a new age.... We see both in our country and elsewhere... ghosts of the old thinking.... When we rid ourselves of their presence, we will be better able to move toward a new world order...relying on the relevant mechanisms of the United Nations."

**Soviet President Mikhail Gorbachev,
at the Middle East Peace Talks in Madrid (1991)**

Click here to return to the
[Index](#)

"The new world order that is in the making must focus on the creation of a world of democracy, peace and prosperity for all."

**Nelson Mandela,
in The Philadelphia Inquirer (October 1994)**

[And especially universal justice.]

Click here to return to the
[Index](#)

The renewal of the nonproliferation treaty was described as important "for the welfare of the whole world and the new world order."

**President Hosni Mubarak of Egypt,
in The New York Times (April 1995)**

[Another limited idea. What will actually be required after the Third World War (nuclear) is the total elimination of weapons of mass destruction.]

Click here to return to the
[Index](#)

"No one will enter the New World Order unless he or she will make a pledge to worship Lucifer. No one will enter the New Age unless he will take a Luciferian Initiation."

David Spangler, Director of Planetary Initiative, United Nations

[Highly emotional statements like this one are VERY suspect. It is unlikely any person who was pro-NWO would use that kind of terminology or make that kind of statement even if that were their Luciferian philosophy. Further, we must note that the statement is undated and no source is given. It is these types emotional statements that prevent rational discussion of the issues.]

Click here to return to the
[Index](#)

"Fundamental, Bible-believing people do not have the right to indoctrinate their children in their religious beliefs because we, the state, are preparing them for the year 2000 when America will be part of a one-world global society, and their children will not fit in."

Nebraska State Senator Peter Hoagland (1982)

Click here to return to the
[Index](#)

"We have a much bigger objective. We've got to look at the long run here. This is an example - the situation between the United Nations and Iraq - where the United Nations is deliberately intruding into the sovereignty of a sovereign nation.... Now this is a marvelous precedent (to be used in) all countries of the world...."

**Stansfield Turner,
CFR member and former CIA director,
when asked about Iraq on CNN**

Click here to return to the
[Index](#)

"The New World Order is a world that has a super-national authority to regulate world commerce and industry; an international organization that would control the production and consumption of oil; an international currency that would replace the dollar; a World Development Fund that would make funds available to free and communist nations alike; and an international police force to enforce the edicts of the New World Order."

**Willy Brandt, Former West German Chancellor
and former chairman of the Fifth Socialist International,
Chairman of the Brandt Commission in the late 1980's**

Click here to return to the
[Index](#)

Statements by (or about) the Rich and/or Famous in favor of NWO

"We are grateful to The Washington Post, The New York Times, Time Magazine and other great publications whose directors have attended our meetings and respected their promises of discretion for almost forty years. It would have been impossible for us to develop our plan for the world if we had been subject to the bright lights of publicity during those years. But, the work is now much more sophisticated and prepared to march towards a world government. The supranational sovereignty of an intellectual elite and world bankers is surely preferable to the national autodetermination practiced in past centuries."

**David Rockefeller,
(founder of the Trilateral Commission),
in an address to a meeting of The Trilateral Commission,
in June, 1991.**

[Very scary. This should perhaps have been almost better under the conspiracy section. But it is the reality. The reality concerning the monetary system. Who controls the Federal Reserve? The reality concerning Congress. Who controls the main committees? The reality concerning the political parties. Who controls the smoke filled back rooms? But it is most irritating regarding the press. There was a Bilderberger's meeting near where I live. The press made zip effort to report it. Scary. But no different in other countries or systems. The patriotic media only tells us what the military wants us to know during a

war. The loyal media is careful to toe the government's and banker's line during a crisis like Y2K, so that other than the "official" line all we got were "nut" stories. Can we make it different under the New World Order? Sadly, probably not. But we should try.]

Click here to return to the

"At the old Inter-American Office in the Commerce Building here in Roosevelt's time, as Assistant Secretary of State for Latin American Affairs under President Truman, as chief whip with Adlai Stevenson and Tom Finletter at the founding of the United Nations in San Francisco, Nelson Rockefeller was in the forefront of the struggle to establish not only an American system of political and economic security but a new world order."

Part of article in The New York Times (November 1975)

Click here to return to the
[Index](#)

"We are on the verge of a global transformation. All we need is the right major crisis and the nations will accept the New World Order."

David Rockefeller

Click here to return to the
[Index](#)

"But this present window of opportunity, during which a truly peaceful and interdependent world order might be built, will not be open for long. Already there are powerful forces at work that threaten to destroy all of our hopes and efforts to erect an enduring structure of global interdependence."

**David Rockefeller,
speaking at the Business Council for the United Nations,
September 14, 1994**

Click here to return to the
[Index](#)

"The case for government by elites is irrefutable"

**Senator William Fulbright,
Former chairman of the US Senate Foreign Relations Committee,
stated at a 1963 symposium entitled:
The Elite and the Electorate - Is Government by the People Possible?**

[This is not a core concept to the idea of the NWO. There can still be the "one person / one vote". On the other hand, voter eligibility standards, as regards literacy and so forth, does not sound unreasonable. Monitoring of voting to assure fairness, is also another reasonable concept.]

Click here to return to the
[Index](#)

"If instant world government, Charter review, and a greatly strengthened International Court do not provide the answers, what hope for progress is there? The answer will not satisfy those who seek simple solutions to complex problems, but it comes down essentially to this: The hope for the foreseeable lies, not in building up a few ambitious central institutions of universal membership and general jurisdiction as was envisaged at the end of the last war, but rather in the much more decentralized, disorderly and pragmatic process of inventing or adapting institutions of limited jurisdiction and selected membership to deal with specific problems on a case-by-case basis ... In short, the 'house of world order' will have to be built from the bottom up rather than from the top down. It will look like a great 'booming, buzzing confusion,' to use William James' famous description of reality, but an end run around national sovereignty, eroding it piece by piece, will accomplish much more than the old-fashioned frontal assault."

Richard N. Gardner, in Foreign Affairs (April 1974)

[This is a pragmatic view regarding what has occurred to date. But time and opportunity change. A nuclear war may be necessary to bring humanity to that point of change.]

Click here to return to the
[Index](#)

"In short, the 'house of world order' will have to be built from the bottom up rather than from the top down. It will look like a great 'booming, buzzing confusion.' "New World Order Needed for Peace:
State Sovereignty Must Go,
Declares Notre Dame Professor"

Title of article in The Tablet (Brooklyn) (March 1942)

Click here to return to the
[Index](#)

"The old world order changed when this war-storm broke. The old international order passed away as suddenly, as unexpectedly, and as completely as if it had been wiped out by a gigantic flood, by a great tempest, or by a volcanic eruption. The old world order died with the setting of that day's sun and a new world order is being born while I speak, with birth-pangs so terrible that it seems almost incredible that life could come out of such fearful suffering and such overwhelming sorrow."

Nicholas Murray Butler,
in an address delivered before the Union League of Philadelphia,
Nov. 27, 1915

[This may very well be accurate. It is however, a long and painful birth, which has not yet reached its climax at this writing in 1999.]

Click here to return to the
[Index](#)

"The peace conference has assembled. It will make the most momentous decisions in history, and upon these decisions will rest the stability of the new world order and the future peace of the world."

M. C. Alexander,
Executive Secretary of the American Association for International Conciliation,
in a subscription letter for the periodical International Conciliation (1919)

[And many more have met since. But we still await another. Perhaps in September of 2000. If not then, then surely soon.]

Click here to return to the
[Index](#)

"If there are those who think we are to jump immediately into a new world order, actuated by complete understanding and brotherly love, they are doomed to disappointment. If we are ever to approach that time, it will be after patient and persistent effort of long duration. The present international situation of mistrust and fear can only be corrected by a formula of equal status, continuously applied, to every phase of international contacts, until the cobwebs of the old order are brushed out of the minds of the people of all lands."

Dr. Augustus O. Thomas,
president of the World Federation of Education Associations (August 1927),
quoted in the book
International Understanding: Agencies Educating for a New World (1931)

[Or alternatively, through the impetus of great catastrophe. The shared catastrophe of a nuclear WWII would be the first world wide shared event. Even during the first and second world wars, America, while losing soldiers overseas did not taste of the direct effects of war. Today, through such things as the photographs of the earth from space, there has been a growing global consciousness, but the global catastrophe may be the final crucible necessary to get it to meld together.]

Statements by world leaders such as US Presidents of concern about conspiracy

"Since I entered politics, I have chiefly had men's views confided to me privately. Some of the biggest men in the United States, in the Field of commerce and manufacture, are afraid of something. They know that there is a power somewhere so organized, so subtle, so watchful, so interlocked, so complete, so pervasive, that they better not speak above their breath when they speak in condemnation of it."

Woodrow Wilson, The New Freedom (1913)

[There are undoubtedly conspiracies. That there is "A" conspiracy, is questionable. Many leaders have had false ideas similar to those found among the masses of people on such subjects as religion, astrology, and you name it. Among the conspirators that do exist, from the Bilderbergers to the Tri-lateral Commission, from the Oil Cartels to other business associations of great number, from the board of directors of great corporations to their interlocking memberships with the banks and others, their is undoubtedly much overlap in membership, agreement about goals and collusion in policy, but all of their

members would generally resent being considered as being conspirators. Insiders, yes. Power brokers, yes. Elite, probably. But evil conspirators no. Nevertheless, there must be wrested from their clasp the rights of the rest of the citizens of the world. No matter how enlightened or altruistic they may feel, they must not be allowed to govern without the consent of the governed - all the rest of the citizens of the world.]

"The real truth of the matter is, as you and I know, that a financial element in the larger centers has owned the Government ever since the days of Andrew Jackson."

A letter written by FDR to Colonel House, November 21st, 1933

[Unfortunately, undoubtedly true. Regardless of which party happens to be in power at the moment. This however, is not a conspiracy in the intended sense. It is the operation of the "old boys" club. The wealthy looking out for the wealthy. And they do indeed control everything. From large contributions to the political parties, to the corporations, to the media. Oftentimes (usually) even the churches. The control is subtle however. If one does not hold the "right" ideas, they simply do not get promoted or funded. There is no obvious pledge of allegiance that one has to make. In the media for example, a publisher that thinks wrongly just will not get funding. An editor that thinks wrongly will just not get hired. By the time we get down to the cub reporter every attitude is so ingrained that nothing that truly questions the institutions will be seriously considered. This is as true under every system. Capitalism, Communism, Naziism, Catholicism, Judaism, you name it. It is a human problem. The first thing in human history to perhaps offer a break of the iron box has been the Internet, and there are those who are seeking to control it. At the invention of the printing press, there were many concerned about the spread of literacy to the masses. They need not have worried. Ways were found to control the media, as we have just seen. Will the same happen to the web?]

"For a long time I felt that FDR had developed many thoughts and ideas that were his own to benefit this country, the United States. But, he didn't. Most of his thoughts, his political ammunition, as it were, were carefully manufactured for him in advanced by the Council on Foreign Relations-One World Money group. Brilliantly, with great gusto, like a fine piece of artillery, he exploded that prepared "ammunition" in the middle of an unsuspecting target, the American people, and thus paid off and returned his internationalist political support. "The UN is but a long-range, international banking apparatus clearly set up for financial and economic profit by a small group of powerful One-World revolutionaries, hungry for profit and power. "The depression was the calculated 'shearing' of the public by the World Money powers, triggered by the planned sudden shortage of supply of call money in the New York money market....The One World Government leaders and their ever close bankers have now acquired full control

of the money and credit machinery of the U.S. via the creation of the privately owned Federal Reserve Bank."

**Curtis Dall,
FDR's son-in-law as quoted in his book,
My Exploited Father-in-Law**

[Conspiracy theory holds that nothing happens by accident, and in the Divine sense this is true, but not everything is under the control of man. At the outset, no one knew what the outcome and effects of the industrial revolution would be, nor were they in control of those effects. Conspiracy theory holds that every evil happening, plague, war, famine, depression is planned and controlled by the masterminds. But it simply is not true. In the 1800's no one knew that atomic bombs would come into existence, or the effects of air power, electronic communication and so forth. See also the following entry, for a further comment on the Federal Reserve Bank.]

Click here to return to the

"It is well enough that people of the nation do not understand our banking and monetary system, for if they did, I believe that there would be a revolution before morning. And that revolution would be based around the Federal Reserve."

Henry Ford

[The subject of the Federal Reserve Bank is another whole conspiracy subject within itself, but I have put Ford's comment here in connection with that of Dall in the entry above. I did my master's in economics foreign language reading requirement on the subject of the benefit of reserve banking systems - and they are many. The issue of these systems being privately controlled is, however, another matter as is that of autonomous national systems with the ability to print currency, borrowing from outside. It must be conceded that the economic / monetary system will control the political system and that is why it should be the first matter of political concern. In my idealism I propose a heirarchical system of LETS systems, but I fear that this is but utopian thinking and in my New World Order essays I explain my practical expectations.]

"From the days of Sparticus, Wieskhopf, Karl Marx, Trotsky, Rosa Luxemburg, and Emma Goldman, this world conspiracy has been steadily growing. This conspiracy played a definite recognizable role in the tragedy of the French revolution. It has been the mainspring of every subversive movement during the 19th century. And now at last this band of extraordinary personalities from the underworld of the great cities of Europe and America have gripped the Russian people by the hair of their head and have become

the undisputed masters of that enormous empire."

**Winston Churchill,
stated to the London Press, in 1922.**

[Even Churchill was a conspiracy believer. And anti-Semitic at that. What he is talking about, and what this quote relates to, is a book called the Protocols of the Elders of Judaism. It is a completely fallacious Machiavellian book, although insightful in the same sense as was Machiavelli and maybe in some sense as de Touqueville.]

"The governments of the present day have to deal not merely with other governments, with emperors, kings and ministers, but also with the secret societies which have everywhere their unscrupulous agents, and can at the last moment upset all the governments' plans. "

British Prime Minister Benjamin Disraeli, 1876

[This also remains undoubtedly true. But we must remember that the term "societies" is in the plural. They are legion, and often at considerable variance with each other. The ones in Moslem countries are not in harmony with the ones in Christian countries, Japanese Society or the powers that control communist Russia and China (yes they remain largely communist influenced.) Even within those spheres there are often several powers at odds with each other.]

"The powers of financial capitalism had another far reaching aim, nothing less than to create a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole. This system was to be controlled in a feudalist fashion by the central banks of the world acting in concert, by secret agreements, arrived at in frequent private meetings and conferences. The apex of the system was the Bank for International Settlements in Basle, Switzerland, a private bank owned and controlled by the worlds' central banks which were themselves private corporations. The growth of financial capitalism made possible a centralization of world economic control and use of this power for the direct benefit of financiers and the indirect injury of all other economic groups."

Tragedy and Hope: A History of The World in Our Time
(Macmillan Company, 1966)
Professor Carroll Quigley of Georgetown University,
(highly esteemed by his former student,
William Jefferson Blythe Clinton.)

[To recognize this, on either Quigley's part, or Clinton's part, does not mean to advocate it. It can be taken simply as a paradigm in which one must work. The real question that one must ask themselves is what alternative system it is that they would propose. Idealism aside, it will have to be a pragmatic system or it shall never be accomplished.]

Statements of concern about conspiracy by the Rich and/or Famous

"There are some plain common-sense considerations applicable to all these attempts at world planning. They can be briefly stated: 1. To talk of blueprints for the future or building a world order is, if properly understood, suggestive, but it is also dangerous. Societies grow far more truly than they are built. A constitution for a new world order is never like a blueprint for a skyscraper."

Norman Thomas,
in his book What Is Our Destiny? (1944)

[This perhaps does not properly belong under conspirational concerns, but still it is a legitimate concern about the future.]

Click here to return to the

"The real menace of our republic is this invisible government which like a giant octopus sprawls its slimy length over city, state and nation. Like the octopus of real life, it operates under cover of a self created screen....At the head of this octopus are the Rockefeller Standard Oil interests and a small group of powerful banking houses generally referred to as international bankers. The little coterie of powerful international bankers virtually run the United States government for their own selfish purposes. They practically control both political parties."

New York City Mayor John F. Hylan, 1922

[Was it true then? Is it true now? If it is true, is it a problem? If it is a problem, is there a solution? How much serious thought do most people give to these questions?]

Click here to return to the [Index](#)

"The drive of the Rockefellers and their allies is to create a one-world government combining supercapitalism and Communism under the same tent, all under their control.... Do I mean conspiracy? Yes I do. I am convinced there is such a plot, international in scope, generations old in planning, and incredibly evil in intent."

**Congressman Larry P. McDonald, 1976,
(killed in the Korean Airlines 747 that was shot down by the Soviets)**

[Well, okay. But there are many such plots and the plotters are often quite in opposition to each other. It is a battle of the Titans and the earth does shake. It can (and will) bring us to nuclear holocaust.]

Click here to return to the [Index](#)

"The idea was that those who direct the overall conspiracy could use the differences in those two so-called ideologies [marxism/fascism/socialism v. democracy/capitalism] to enable them [the Illuminati] to divide larger and larger portions of the human race into opposing camps so that they could be armed and then brainwashed into fighting and destroying each other."

Myron Fagan

[This is the idea that is false. That there is a single underlying conspiracy. Fagan has no real idea as to whom the Illuminati are, nor what are their real goals. "Those who say don't know and those who know don't say." But in the final analysis, they and all secret societies, cliques, groups, associations and so forth need to have their goals, philosophies, operations and so forth exposed to the general light of day so that the generality of mankind can monitor that all that goes on is in its best interest.]

"What is important is to dwell upon the increasing evidence of the existence of a secret conspiracy, throughout the world, for the destruction of organized government and the letting loose of evil."

Christian Science Monitor editorial, June 19th, 1920

[Ouch. The power of Satan (or Mortal Mind as the Christian Scientists would say)? Is this in some abstract metaphysical sense or are we talking specifics?]

Click here to return to the [Index](#)

"The directors of the CFR (Council on Foreign Relations) make up a sort of Presidium for that part of the Establishment that guides our destiny as a nation."

The Christian Science Monitor, September 1, 1961

[Now THAT is getting specific. Are we now saying that they are "part of a secret society for letting loose evil"? Huhmm. Never know how people are going to see these things.]

Click here to return to the [Index](#)

"The planning of UN can be traced to the 'secret steering committee' established by Secretary [of State Cordell] Hull in January 1943. All of the members of this secret committee, with the exception of Hull, a Tennessee politician, were members of the Council on Foreign Relations. They saw Hull regularly to plan, select, and guide the labors of the [State] Department's Advisory Committee. It was, in effect, the coordinating agency for all the State Department's postwar planning."

**Professors Laurence H. Shoup and William Minter,
writing in their study of the CFR,
"Imperial Brain Trust: The CFR and United States Foreign Policy."
(Monthly Review Press, 1977).**

[And there does seem to be a lot of cross breeding between the CFR and the Tri-lateral Commission. But the question remains, "Is what they propose - evil?" And what would you have as an alternative?]

Click here to return to the [Index](#)

"The most powerful clique in these (CFR) groups have one objective in common: they want to bring about the surrender of the sovereignty and the national independence of the U.S. They want to end

national boundaries and racial and ethnic loyalties supposedly to increase business and ensure world peace. What they strive for would inevitably lead to dictatorship and loss of freedoms by the people. The CFR was founded for "the purpose of promoting disarmament and submergence of U.S. sovereignty and national independence into an all-powerful one-world government."

Harpers, July 1958

["Dictatorship and loss of freedoms" are certainly emotional words but I am sure not ones that would be used by advocates of the policies of the CFR. We must ask ourselves if that is true, especially for most of the inhabitants of this planet, and whether the other goals listed here are for good or evil.]

Click here to return to the [Index](#)

On March 2, 2000 the state-run People's Daily ran a series of articles... The articles also called for a multi-polar world, instead of one in which the United States is the dominant power - calling for the "establishment of a just and reasonable new world order."

**STRATFOR.COM Global Intelligence Update
3 March 2000**

Click here to return to the [Index](#)

Statements outright opposed to the NWO

"The term Internationalism has been popularized in recent years to cover an interlocking financial, political, and economic world force for the purpose of establishing a World Government. Today Internationalism is heralded from pulpit and platform as a 'League of Nations' or a 'Federated Union' to which the United States must surrender a definite part of its National Sovereignty. The World Government plan is being advocated under such alluring names as the 'New International Order,' 'The New World Order,' 'World Union Now,' 'World Commonwealth of Nations,' 'World Community,' etc. All the terms have the same objective; however, the line of approach may be religious or political according to the taste or training of the individual."

**Excerpt from A Memorial to be Addressed to
the House of Bishops and the House of Clerical and Lay Deputies
of the Protestant Episcopal Church in General Convention (October 1940)**

[Yes, but what do you see as that purpose? Is it for good or for evil? If you say for evil, then what would

you have as an alternative? What else will eliminate the threat of nuclear war? If you reply - "The Kingdom of God", then you are not a part of this discussion because we are talking about secular government.]

Click here to return to the

EXCERPTS FROM SENATOR JESSE HELMS' SPEECH BEFORE THE SENATE, ON 15 DECEMBER, 1987, WARNING AGAINST THE NEW WORLD ORDER:

"This campaign against the American people -against traditional American culture and values - is systematic psychological warfare. It is orchestrated by a vast array of interests comprising not only the Eastern establishment but also the radical left. Among this group we find the Department of State, the Department of Commerce, the money center banks and multinational coporations, the media, the educational establishment, the entertainment industry, and the large tax-exempt foundations.

Mr. President, a careful examination of what is happening behind the scenes reveals that all of these interests are working in concert with the masters of the Kremlin in order to create what some refer to as a New World Order. Private organizations such as the Council on Foreign Relations, the Royal Institute of International Affairs, the Trilateral Commission, the Dartmouth Conference, the Aspen Institute for Humanistic Studies, the Atlantic Institute, and the Bilderberger Group serve to disseminate and to coordinate the plans for this so-called New World Order in powerful business, financial, academic, and official circles. . . .

The psychological campaign that I am describing, as I have said, is the work of groups within the Eastern establishment, that amorphous amalgam of wealth and social connections whose power resides in its control over our financial system and over a large portion of our industrial sector. The principal instrument of this control over the American economy and money is the Federal Reserve System. The policies of the Industrial sectors, primarily the multinational corporations, are influenced by the money center banks through debt financing and through the large blocks of stock controlled by the trust departments of the money center banks.

Anyone familiar with American history, and particularly American economic history, cannot fail to notice the control over the Department of State and the Central Intelligence Agency which Wall Street seems to exercise.... The influence of establishment insiders over our foreign policy has become a fact of life in our time. This pervasive influence runs contrary to the real long-term national security of our Nation. It is an influence which, if unchecked, could ultimately subvert our constitutional order.

The viewpoint of the establishment today is called globalism. Not so long ago, this viewpoint was called the "one-world" view by its critics. The phrase is no longer fashionable among sophisticates; yet, the phrase "one-world" is still apt because nothing has changed in the minds and actions of those promoting policies consistent with its fundamental tenets.

Mr. President, in the globalist point of view, nation-states and national boundaries do not count for anything. Political philosophies and political principles seem to become simply relative. Indeed, even constitutions are irrelevant to the exercise of power. Liberty and tyranny are viewed as neither necessarily good nor evil, and certainly not a component of policy.

In this point of view, the activities of international financial and industrial forces should be oriented to bringing this one-world design - with a convergence of the Soviet and American systems as its centerpiece - into being. . . . All that matters to this club is the maximization of profits resulting from the practice of what can be described as finance capitalism, a system which rests upon the twin pillars of debt and monopoly. This isn't real capitalism. It is the road to economic concentration and to political slavery."

[Most world leaders and statesmen, yes like Senator Jesse Helms, one of the most vocal opponents of the New World Order, Chairman of the US Senate Committee on Foreign Relations, dedicated anti-Communitic, devoted defender of the military, and seeming advocate of evermore military spending, coming from the industrial / military complex, well understand the threat to democracy wrought by the "financial powers and interests". The problem is that the above statement offers no alternative solution to the nuclear threat.]

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [NWO Introduction](#)

Thoughts and Attitudes of some World Leaders

bruce@webpal.org

There are many world leaders not represented in the following. From their actions, we can guess at the philosophies and thoughts of:

Palestinian Leaders
The Religious Right in Israel
Hindu Fundamentalists in India
Shiite Fundamentalists in Iran
Sunni Fundamentalists in Iraq
The Members of Al Qaeda
The Central Bureaucracy of China
The Central Bureaucracy of India
and many, many others throughout the world

The world is not a very tolerant place - but the following is made up largely of quotes from influential people in our own North American society.

The Politics of Power

"Power is the great aphrodisiac."

**Henry Kissinger, New York Times,
January 19, 1971.**

"We must find new lands from which we can easily obtain raw materials and at the same time exploit the cheap slave labor that is available from the natives of the colonies. The colonies would also provide a dumping ground for the surplus goods produced in our factories."

**Cecil Rhodes,
"founder" of Rhodesia**

"... somehow, we find it hard to sell our values, namely that the rich should plunder the poor."

former Secretary of State John Foster Dulles

"It is money, money, money! Not ideas, not principles, but money that reigns supreme in American politics."

Senator Robert Byrd, West Virginia

"I want to scare the hell out of the rest of the world."

**U.S. General Colin Powell
talking about U.S. military power
prior to the Gulf War in 1991**

"Short, successful military adventures are as effective as the Super Bowl in diverting people's attention from unpleasant truths."

**John Stockwell,
former CIA official**

"We need a common enemy to unite us."

**Condoleeza Rice,
National Security Advisor, March 2000**

"The people of the world genuinely want peace. Some day the leaders of the world are going to have to give in and give, it to them."

**Dwight Eisenhower,
U.S. president 1953-1961**

"When we got organized as a country and we wrote a fairly radical constitution with a radical bill of rights, giving a radical amount of individual freedom to Americans, it was assumed that the Americans who had that freedom would use it responsibly.... What's happened in America today is too many people live in areas where there's no family structure, no community structure and no work structure. And so there's a lot of irresponsibility. And so a lot of people say there's too much personal freedom. When personal freedom's being abused, you have to move to limit it...."

President Bill Clinton

"Freedom is about authority. Freedom is about the willingness of every single human being to cede to lawful authority a great deal of discretion about what you do."

NYC Mayor Rudolph Giuliani

"We are potentially the most dangerous agency in the country."

**FBI Director Louis Freeh,
to the House Judiciary Subcommittee on Crime, 1997**

"The major function of secrecy in Washington is to keep the U.S. people ... from knowing what the nation's leaders are doing."

**John Stockwell,
former CIA official and author**

"How fortunate for governments that the people they administer don't think."

Adolph Hitler

"You know the one thing that is wrong in this country? Everyone gets a chance to have their fair say."

President Bill Clinton

"Others are engaging even in an ecotype of terrorism whereby they can alter the climate, set off earthquakes, volcanoes remotely through the use of electromagnetic waves... So there are plenty of ingenious minds out there that are at work finding ways in which they can wreak terror upon other nations...It's real, and that's the reason why we have to intensify our [counterterrorism] efforts."

**Secretary of Defense William Cohen
at an April, 1997, counterterrorism conference
sponsored by former Senator Sam Nunn**

"If they do it, it's terrorism, if we do it, it's fighting for freedom."

**a U.S. Ambassador in Central America
in the 1980s,
asked to explain how such U.S. actions
as the mining of Nicaragua's harbors
and bombing of airports
differed from the acts of terrorism
that the U.S. condemned around the world**

"I am strongly in favor of using poisoned gas against uncivilized tribes. The moral effect should be

good...and it would spread a lively terror...."

Winston Churchill
commenting on the British use of poison gas
against the Iraqis after World War I

"[The Third World War] is a war that has been fought by the United States against the Third World. It might also be called the Forty-Year War, like the Thirty-Year and Hundred-Year Wars in Europe, for this one began when the CIA was founded in 1947 and continues today. As wars go, it has been the second or third most destructive of human life in all of history, after World War I and World War II."

John Stockwell,
former CIA official and author

"I don't see why we need to stand by and watch a country go communist due to the irresponsibility of its people. The issues are much too important for the Chilean voters to be left to decide for themselves."

Henry Kissinger,
Secretary of State under Richard Nixon,
about Chile prior to the CIA overthrow
of the democratically elected government
of socialist President Salvadore Allende in 1973

"The great object of American foreign policy ought to be the restoration of a more normal political world, a world in which those states possessing the elements of great power once again play the role their power entitles them to play."

Robert W. Tucker,
political scientist,
1980

" The greatest crime since World War II has been U.S. foreign policy."

Ramsey Clark,
former U.S. Attorney General

"A world in which others controlled the course of their own development ... would be a world in which the American system would be seriously endangered."

Benjamin Cohen

"We have come to recognize that there are potentially desirable limits to economic growth. There are

also potentially desirable limits to the indefinite extension of political democracy...A government which lacks authority ...will have little ability, short of cataclysmic crisis, to impose on its people the sacrifices which may be necessary.."

**1975 Trilateral Commission
Report on the Governability of Democracies**

"Hitherto acceptable norms of human conduct do not apply. If the United States is to survive, long-standing American concepts of 'fair play' must be reconsidered. We must develop effective espionage and counterespionage services and must learn to subvert, sabotage and destroy our enemies by more clever, more sophisticated, and more effective methods than those used against us. It may become necessary that the American people be made acquainted with, understand and support this fundamentally repugnant philosophy."

**World War II Gen. James Doolittle
explaining in a secret 1954 report to President Eisenhower
why CIA covert operations were needed
and what they entailed.
From Katherine S. Olmstead's book -
Challenging the Secret Government, 1996**

"Coming to grips with ... U.S./CIA activities in broad numbers and figuring out how many people have been killed in the jungles of Laos or the hills of Nicaragua is very difficult. But, adding them up as best we can, we come up with a figure of six million people killed and this is a minimum figure. Included are: one million killed in the Korean War, two million killed in the Vietnam War, 800,000 killed in Indonesia, one million in Cambodia, 20,000 killed in Angola ... and 22,000 killed in Nicaragua. These people would not have died if U.S. tax dollars had not been spent by the CIA to inflame tensions, finance covert political and military activities and destabilize societies."

**John Stockwell,
former CIA official and author**

"Military intervention to maintain the global status quo will become a constant feature of international relations, whether this is justified in terms of fighting drugs, fighting terrorism, containing "rogue states," opposing "Islamic fundamentalism," or containing China."

**Walden Bello,
sociologist and author,
International Socialist Review,
Aug/Sep 2001, p8**

"We should cease to talk about vague and unreal objectives such as human rights, the raising of the living

standards, and democratization. The day is not far off when we are going to have to deal in straight power concepts. The less we are then hampered by idealistic slogans, the better."

**George Kennan,
head of U.S. State Department Policy Planning Staff,
1948**

"But what counter-insurgency really comes down to is the protection of the capitalists back in America, their property and their privileges. U.S. national security, as preached by U.S. leaders, is the security of the capitalist class in the US, not the security of the rest of the people."

Philip Agee, CIA Diary, p562

"If we have to use force, it is because we are America. We are the indispensable nation. We stand tall. We see further into the future."

**Secretary of State Madelaine Albright
describing her vision of America's role in the world**

"America must prevent other states "from challenging our leadership or seeking to overturn the established political and economic order....We must maintain the mechanisms for deterring potential competitors from even aspiring to a larger regional or global role."

Pentagon's Defense Planning Guide for 1994-1999

" Scare the hell out of the American people."

**Senator Arthur Vandenburg,
telling President Truman what the he needed to do
in order to to tax the American people
to pay for the weapons and covert activities of the U.S.**

National Security State

"It is the function of the CIA to keep the world unstable, and to propagandize and teach the American people to hate, so we will let the Establishment spend any amount of money on arms."

**John Stockwell,
former CIA official and author**

"[Nearly 70% of the military budget] is to provide men and weapons to fight in foreign countries in

support of our allies and friends and for offensive operations in Third World countries .. Another big chunk of the defense budget is the 20% allocated for our offensive nuclear force of bombers, missiles, and submarines whose job it is to carry nuclear weapons to the Soviet Union... Actual defense of the United States costs about 10% of the military budget and is the least expensive function performed by the Pentagon..."

Rear Admiral Gene LaRoque, U.S. Navy retired

"The two-war strategy is just a marketing device to justify a high [military] budget."

Retired Air Force Chief of Staff, Merrill McPeak

"Our government has kept us in a perpetual state of fear, kept us in a continuous stampede of patriotic fervor with the cry of grave national emergency. Always there has been some terrible evil at home or some monstrous foreign power that was going to gobble us up if we did not blindly rally behind it ..."

General Douglas MacArthur, 1957

"Just between you and me, shouldn't the World Bank be encouraging more migration of the dirty industries to the LDCs (lesser developed countries)? I think the economic logic behind dumping a load of toxic waste in the lowest wage country is impeccable and we should face up to that.... I've always thought that underpopulated countries in Africa are vastly under polluted; their air quality is vastly inefficiently low compared to Los Angeles or Mexico City."

**Lawrence Summers
World Bank economist
and Deputy Secretary of Treasury,
in a 1991 internal memorandum**

"... the United States has given frequent and enthusiastic support to the overthrow of democracy in favor of "investor friendly" regimes. The World Bank, IMF and private banks have consistently lavished huge sums on terror regimes, following their displacement of democratic governments, and a number of quantitative studies have shown a systematic positive relationship between U.S. and IMF / World Bank aid to countries and their violations of human rights."

**Edward S. Herman,
economist and media analyst**

"The whole fabric of society will go to wrack if we really lay hands of reform on our rotten institutions. From top to bottom the whole system is a fraud, all of us know it, laborers and capitalists alike, and all of us are consenting parties to it."

**Henry Adams,
American historian, 1838-1918**

"Those who own the country ought to govern it."

**John Jay,
American statesman
and first Chief Justice of US Supreme Court,
1745-1829**

"If there are men in this country big enough to own the government of the United States, they are going to own it."

**Woodrow Wilson,
presidential candidate, 1912
The Nation magazine,
July 3, 2000, p5**

Corporate Government

"If the world operates as one big market, every employee will compete with every person anywhere in the world who is capable of doing the same job. There are lots of them and many of them are hungry."

**Andrew Grove, president of Intel Corp.,
in his book "High Output Management"**

"A considerable proportion of the developed world's prosperity rests on paying the lowest possible prices for the poor countries' primary products and on exporting high-cost capital and finished goods to those countries. Continuation of this kind of prosperity requires continuation of the relative gap between developed and underdeveloped countries - it means keeping poor people poor. Increasingly, the impoverished masses are understanding that the prosperity of the developed countries and of the privileged minorities in their own countries is founded on their poverty."

**Philip Agee,
CIA Diary, p595**

"The dream of the corporate empire builders is being realized. The global system is harmonizing standards across country after country - down toward the lowest common denominator. Although a few socially responsible businesses are standing against the tide with some limited success, theirs is not an easy struggle. We must not kid ourselves. Social responsibility is inefficient in a global free market, and the market will not long abide those who do not avail of the opportunities to shed the inefficient. And we must be clear as to the meaning of efficiency. To the global economy, people are not only increasingly

unnecessary, but they and their demands for a living wage are a major source of economic inefficiency. Global corporations are acting to purge themselves of this unwanted burden. We are creating a system that has fewer places for people."

**David Korten,
economist and internationalist**

"We are entering a new phase in human history - one in which fewer and fewer workers will be needed to produce the goods and services for the global population."

**Jeremy Rifkin,
economist**

"As an economy measures performance in terms of the creation of money, people become a major source of inefficiency. "

**David Korten,
economist and internationalist**

"Corporations have been enthroned An era of corruption in high places will follow and the money power will endeavor to prolong its reign by working on the prejudices of the people... until wealth is aggregated in a few hands ... and the Republic is destroyed."

**Abraham Lincoln,
American president, 1861- 1865**

"American capitalism, based as it is on exploitation of the poor, with its fundamental motivation in personal greed, simply cannot survive without force - without a secret police force. Now, more than ever, each of us is forced to make a conscious choice whether to support the system of minority comfort and privilege with all its security apparatus and repression, or whether to struggle for real equality of opportunity and fair distribution of benefits for all of society, in the domestic as well as the international order. It's harder now not to realize that there are two sides, harder not to understand each, and harder not to recognize that like it or not we contribute day in and day out either to the one side or to the other."

**Philip Agee,
CIA Diary, p597**

"A criminal is a person with predatory instincts who has not sufficient capital to form a corporation."

Howard Scott

On the Media:

"Our job is to give people not what they want, but what we decide they ought to have."

**Richard Salent,
Former President CBS News.**

"One cannot wage war under present conditions without the support of public opinion, which is tremendously molded by the press and other forms of propaganda."

General Douglas MacArthur

"Public sentiment is everything. With public sentiment nothing can fail. Without it nothing can succeed. He who molds opinion is greater than he who enacts laws."

Abraham Lincoln

"You furnish the pictures and I'll furnish the war."

**publisher William Randolph Hearst's
attributed instructions to artist Frederic Remington
in Havana, Cuba.**

"One of the intentions of corporate-controlled media is to instill in people a sense of disempowerment, of immobilization and paralysis. Its outcome is to turn you into good consumers. It is to keep people isolated, to feel that there is no possibility for social change."

**David Barsamian,
journalist and publisher**

"Propaganda is to a democracy what violence is to a dictatorship."

William Blum, Rogue State

" I have the greatest admiration for your propaganda. Propaganda in the West is carried out by experts who have had the best training in the world in the field of advertising and have mastered the techniques with exceptional proficiency ... Yours are subtle and persuasive; ours are crude and obvious ... I think that the fundamental difference between our worlds, with respect to propaganda, is quite simple. You tend to believe yours ... and we tend to disbelieve ours. "

a Soviet correspondent

based five years in the U.S.

"The propaganda system allows the U.S. leadership to commit crimes without limit and with no suggestion of misbehavior or criminality; in fact, major war criminals like Henry Kissinger appear regularly on TV to comment on the crimes of the derivative butchers. "

**Edward Herman,
Z magazine Dec 1999 p38**

Final Views:

"The dream of capitalism is to co-opt people with higher living standards without redistributing any wealth. Without co-optation, widespread repression is the only guarantor of gross inequality."

**Holly Sklar,
from her book Trilateralism**

"Since it was created in 1995, the WTO has ruled that every environmental, health, or safety policy it has reviewed is an illegal trade barrier."

**Public Citizen report,
titled 'Whose Trade Organization?
Corporate Globalization and the Erosion of Democracy.'
(from The Progressive magazine,
January 2000, p 8)**

" We are witnessing an unprecedented transfer of power from people and their governments to global institutions whose allegiance is to abstract free-market principle, and whose favored citizens are soulless corporate entities that have the power to shape and break nations."

**Joel Bleifuss,
In These Times magazine,
September 2001, p1**

"F[***] your Parliament and your Constitution. We pay a lot of good American dollars to the Greeks, Mr. Ambassador. If your Prime Minister gives me talk about Democracy, Parliament and Constitutions, he, his Parliament, and his Constitution may not last very long."

**President Lyndon Johnson
to a Greek Ambassador, 1970s**

"Get some new lawyers"

**U.S. Secretary of State Madeline Albright
said to British Foreign Secretary Robin Cook
when he told her he was informed that
the NATO bombing of Yugoslavia
was illegal under international law.**

"This program is the fixed, determined and approved policy of the government of the United States."

**Senator Joseph S. Clark
speaking on the floor of the Senate, March 1, 1962,
about PL 87-297,
which calls for the disbanding of all armed forces,
and the prohibition of their re-establishment
in any form whatsoever**

"Our task of creating a socialist America can only succeed when those who would resist us have been totally disarmed."

**Sara Brady,
Chairwoman of Handgun Control,
to Sen. Howard Metzenbaum,
The National Educator,
January 1994**

"We can't be so fixated on our desire to preserve the rights of ordinary Americans."

**Bill Clinton,
U.S.A. Today,
11 March 1993**

"Whatever the price of the Chinese Revolution, it has obviously succeeded not only in producing more efficient and dedicated administration, but also in fostering high morale and community of purpose. The social experiment in China under Chairman Mao's leadership is one of the most important and successful in human history."

**David Rockefeller,
statement in 1973 about Mao Tse-tung
in The New York Times,
August 10, 1973**

"War to the hilt between communism and capitalism is inevitable. Today, of course, we are not strong enough to attack. Our time will come in thirty or fifty years. To win, we shall need the element of surprise. The Western world will need to be put to sleep. So we shall begin by launching the most spectacular peace movement on record. There shall be electrifying overtures and unheard of concessions. The capitalist countries, stupid and decadent, will rejoice to cooperate to their own destruction. They will leap at another chance to be friends. As soon as their guard is down, we shall smash them with our clenched fist."

**Dmitrii Z. Manuilskii,
Lenin School of Political Warfare,
Moscow, 1931**

"I want to extend condolences to the families of those who died in the service of the United Nations."

**Al Gore,
as he traveled to Marrakech, Morocco,
for the signing of the new world trade agreement.
Gore appeared hours after U.S. planes
enforcing an allied 'no fly' zone over northern Iraq
accidentally shot down two helicopters,
killing 15 Americans and 11 foreign officials.
The Los Angeles Times,
June 12, 1994**

"The urge to save humanity is almost always a false front for the urge to rule."

H. L. Mencken

"The only hope for the world is to make sure there is not another United States: We can't let other countries have the same number of cars, the amount of industrialization, we have in the U.S. We have to stop these third world countries right where they are. And it is important to the rest of the world to make sure that they don't suffer economically by virtue of our stopping them."

**Michael Oppenheimer,
Environmental Defense Fund**

"Human beings, as species, have no more value than slugs."

**John Davis,
editor of Earth First Journal**

"We've got to ride the global-warming issue. Even if the theory of global warming is wrong, we will be

doing the right thing - in terms of economic policy and environmental policy."

**Timothy Wirth, former U.S. Senator (D-Colo.),
presently with the United Nations**

"The whole aim of practical politics is to keep the populace alarmed - and hence clamorous to be led to safety - and menacing it with an endless series of hobgoblins, all of them imaginary."

H. L. Mencken

"If I were reincarnated, I would wish to be returned to earth as a killer virus to lower the human population levels."

**Prince Phillip
of Great Britain,
World Wildlife Fund**

"Isn't the only hope for the planet that the industrialized civilizations collapse? Isn't it our responsibility to bring about?"

**Maurice Strong,
Head of the 1992 Earth Summit
in Rio de Janeiro**

"We reject the idea of private property."

**Peter Berle,
president of the National Audubon Society**

"The historical experience of socialist countries has sadly demonstrated that collectivism does not do away with alienation but rather increases it, adding to it a lack of basic necessities and economic inefficiency."

Pope John Paul II

"America will never be destroyed from the outside. If we falter and lose our freedoms, it will be because we destroyed ourselves."

Abraham Lincoln

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [NWO Introduction](#)

The following document appears to be the one that has raised the greatest wrath, of late, among those who are opposed to the NWO.

Following presentation of the document, there is the best and most well reasoned response, that has come to this editor's attention. The reader should note, however, that while the writer of the response recognizes many of the goals and intentions of the proponents of the Charter, he offers no alternatives to achieve those goals, nor any critique of the goals themselves.

Charter 99

A Charter for Global Democracy **Our call for international accountability, justice,** **sustainable development and democracy**

In September 2000 the United Nations will hold a special Millennium Assembly and Summit on the future of the world.

Dear Representatives to the Millennium Assembly,

This Charter is addressed to you and all the governments and peoples of the world you represent. It is a demand for global democracy.

Throughout the century now coming to an end there have been well meaning and sometimes eloquent calls for world government; calls which pointed to the unfairness, inequality and injustice of the present distributions of wealth, power and policy making - which mean that today one in five of us lives in absolute poverty; calls which emphasised the dangers to peace and even to human survival. If only we could work as one world, then we could solve the world's problems together.

If only! Sometimes with a sigh, sometimes with contempt, these calls have been dismissed as impractical.

But during the 1990s, demands for international government have taken on a new energy and precision:

The Commission on Global Governance made an unprecedented international effort to draw up a framework for global politics.

The Earth Summit in Rio, Agenda 21, The Earth Charter, the Real World coalition, Earth Action's

Call for a Safer World, Global Coalition World Democracy 2010 and many other declarations are uniting people's efforts for global democracy and sustainable development.

The Hague Agenda for Peace represents a world-wide coalition committed to replace the causes of war with a culture of peace.

The campaign against landmines successfully changed international law, although much remains to be done.

International conferences at New York, Vienna, Cairo, Copenhagen, Beijing and Istanbul have made world issues of gender equality, family and social rights.

Jubilee 2000 has co-ordinated a world-wide campaign to cancel the unpayable debts of the world's poorest countries.

The International Commission on Rights and Responsibilities made a distinguished and expert attempt to codify Human Duties and Responsibilities.

After fifty years of campaigning, a statute to create an International Criminal Court was adopted at Rome in 1998 to reinforce international criminal law.

The Human Development Report 1999 recommended an agenda for action including a more coherent and more democratic architecture for global governance in the 21st century.

In addition, a growing scholarly literature on all aspects of globalisation has begun to explore how governments can regulate and democratise international affairs.

There are now detailed, practical measures which set out an ambitious agenda for democracy in international decision-making, now increasingly known as 'global governance'.

We believe that there is a profound and important reason for this historic shift.

It is that in many ways we now have world government.

It is not to be found at the United Nations. Rather, the UN has been sidelined, while the real business of world government is done elsewhere. Global policies are discussed and decided behind closed doors by exclusive groups, such as the G8, OECD, the Bank of International Settlements, the World Bank, the International Monetary Fund, the World Trade Organisation and others. These agencies are reinforced by informal networks of high officials and powerful alliances such as NATO and the European Union. Together they have created what can be seen as dominant and exclusive institutions of world government. All too often they are influenced by

transnational corporations which pursue their own world strategies.

These agencies of actual world government must be made accountable. If there are to be global policies, let them be answerable to the peoples of the world.

We call on you, therefore, to start the new century by initiating the process of democratic global governance following three fundamental principles:

openness and accountability

environmental sustainability

justice.

The first aim is to make the already existing processes of world administration and governance accountable. We want to know what decisions are being taken and why. We want the decision takers to know they are answerable to the public in every country which feels the breath of international bodies.

Then we want all decisions to be compatible with public criteria of environmental sustainability.

Finally, if most ambitiously, we want them to be compatible with the principles of human rights and justice, including social and economic justice.

What we want from the Millennium Assembly and Member States is decisive action to put these principles into practice. We do not think they will be easy to achieve. But we believe the difficulties can and must be overcome. We want you to negotiate new global structures which give the world's people an effective role in solving this planet's problems. In our era everyone is linked through our shared environment, trade and communications. We live together as neighbours, and as neighbours we must respect the rights of all persons to address common problems. A joint effort of learning and negotiation, of trial and error, will be needed.

Many vital issues can best be tackled effectively at a global level, such as the environment, biodiversity and climate change; international security and disarmament; international trade, finance and labour rights; epidemics; communications; and international crime.

The first question is where should we start? We believe that the answer has to be at the United Nations. The inadequacy of the UN is well known. All around we see the principles of the UN subverted, sidelined and suppressed. Since the UN Charter was signed, more than 30 million people have been killed in war, most of them unarmed civilians; millions more people have been slaughtered in genocide and ethnic conflict; over 100 million people have fled their homes due to conflict or persecution, with over 20 million remaining as refugees today; permanent members of the Security Council have armed belligerents and engaged in war; governments have invested more in preparing for war than in

strengthening peace; human rights have been violated with little redress.

Nevertheless the United Nations as an institution can hardly be blamed for the appalling behaviour of its member states. Without the UN, wars would have been even more frequent; they would have gone on longer; there would have been a greater number of victims, and many more refugees living without hope. The UN is the only arena in which all countries sit side by side. For all its weakness, it retains an unmatched legitimacy in world affairs.

The UN's founding Charter mandates you to achieve international co-operation in solving international problems of an economic, social, cultural or humanitarian character and to be a centre for harmonising the actions of nations (Article 1).

We therefore call on you to create effective mechanisms to hold every agency of actual world government to account. These include international economic alliances, military alliances, and agencies for environmental, financial, social, sporting, or other activity: All should have to answer regularly for what they have done and intend to do, for their impact on the world community and for their adherence to the UN Charter and international law. We want action to start the process now.

The creation of democratic global governance may be complicated. But [it will be achieved, because] the need for it is simple and urgent. Global problems will only get worse if international decision-making is left in the hands of the present undemocratic, exclusive institutions. Therefore we will press for action and to call on public support around the world.

World-wide campaigns have led to the end of apartheid in South Africa, to the Statute for an International Criminal Court, to the ban on landmines and some debt-reduction for the world's poorest countries. The time has come to make democratic reform of international affairs our priority, both as an end in itself and as a means of solving many serious social and economic problems.

Many reforms are needed. The following 12 points are a summary of the many demands and proposals being made across the world for better international governance.

12 areas for urgent action

Strengthen democratic accountability and participation in international decision-making:

1. Give the UN General Assembly powers to scrutinise the work of UN agencies and other agencies of global governance; create an annual Forum of Civil Society; open international institutions to increased participation by civil society and elected representatives from member countries; bring the WTO into the UN system and strengthen co-operation between all international groupings under the UN system.

2. Create within the UN system an accountable, equitable and effective mechanism to monitor, supervise and regulate transnational corporations and financial institutions; and require transnational companies to

adhere to an international code of conduct covering agreed principles concerning human rights, the environment and core labour standards.

3. Give UN institutions an additional and independent source of revenue such as taxation of foreign exchange transactions, aircraft and shipping fuels, arms sales and licensing use of the global commons.

Maintain international peace and security:

4. Reform the UN Security Council to open all decision-making to public scrutiny; phase out the single country veto and permanent membership; establish equitable representation from each region of the world; set up a high level early warning system; and provide effective authority to mediate and intervene in disputes at an early stage, within national boundaries where necessary.

5. Establish a permanent, directly recruited UN Rapid Reaction Force to hold the peace in a crisis, police gross violations of human rights and support multilateral defence against aggression and genocide;

6. Make the UN register of arms mandatory; ratify and implement the Landmine Ban Treaty; outlaw all weapons of mass destruction; initiate programmes to control the arms trade, convert the arms industry to peaceful production and cut military spending world wide; strengthen accountability to the UN of all international military action; and reduce the size of national armies as part of a multilateral global security system.

Uphold fundamental human rights:

7. Strengthen world citizenship based on compliance with and respect for the Universal Declaration of Human Rights and all international instruments on Human Rights, including the six core treaties on economic, social and cultural rights; civil and political rights; racial discrimination; discrimination against women, children's rights, torture, and the conventions on genocide, refugees and labour standards.

Strengthen justice under international law:

8. Ratify the Statute of the International Criminal Court; accept compulsory jurisdiction of the International Court of Justice, the International Criminal Court and the UN Human Rights Committee; increase the Courts' powers of enforcement; open the ICJ to individual petition and protect the judicial independence of the ICC.

Promote social progress and better standards of life:

9. Establish a strong UN institution for Economic and Environmental security to promote international prosperity, protect the global commons and secure sustainable development.

10. Establish an International Environmental Court to enforce international treaties on the environment and protect the global commons.

11. Declare climate change to be an essential global security interest and establish a high-level

international urgent action team to assist the UN Conference of the Parties on Climate Change to set a scientifically based global ceiling on greenhouse gas emissions, to allocate national shares of permissible emissions based on convergence to equal per capita rights, and to work with governments, companies, international agencies and NGOs to cut emissions of greenhouse gases to a sustainable level.

12. Make poverty reduction a global priority: secure universal access to safe drinking water, health care, housing, education, family planning, gender equality, sustainable development and economic opportunities, and strengthen the capacity of development agencies to eliminate malnutrition, preventable diseases and absolute poverty through conservation and equitable sharing of global resources. Cancel the unpayable debts of the poorest nations and institute measures to prevent severe debt burdens from ever building up again.

[In addition to the above, after a nuclear war, it will be necessary to add:

- a. The establishment of International Boundaries*
- b. The certification of legitimate governments within each country*
- c. This latter may eventually require the international supervision of elections*

-Bruce]

Using the Charter

The Charter aims to build public support and political will to create a democratic and inclusive system of international decision-making by

setting out key principles and priorities for transforming global governance ;

urging national parliaments, town councils, state and regional bodies, trade unions, women's groups, political parties, churches, companies, other organisations and individuals to debate these issues and develop the ideas set out in the Charter;

encouraging people to discuss, study, publicise and lobby round the key principles;

getting individuals, organisations and representative bodies to sign the Charter

presenting the Charter to the Millennium Assembly of the UN in September 2000 and to member governments

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [NWO Introduction](#)

This excellent, well written opposition to the NWO, By Henry Lamb, WorldNetDaily.com, (taken from the web, Friday, October 01, 1999,) while accurate, offers no reasonable solution (in fact offers NO SOLUTION) to the primary problem that creates the necessity of the NWO. That problem is of course the one of elimination of war in a world that has nuclear weapons and other weapons of mass destruction. The main philosophical emphasis of this critique regards the primacy of individual freedom. While individual freedom is indeed important, as regards the freedom of religion and the search for truth, there is a balance that must be realized between those essential freedoms on the one hand and espousal of a complete social anarchy which offers no protection to the environment, no justice or opportunity for the socially disadvantaged, and has a complete lack of universal concern for the needs and brotherhood of mankind as a global whole.

In Opposition to Charter 99

An Essay

by Henry Lamb

1999 WorldNetDaily.com

In less than a year, the United Nations will convene a special Millennium Assembly as a global summit on the future of the world. This event will crown a decade of preparation to launch the new millennium on a new system of global governance. The blueprint was published by the Commission on Global Governance in 1995. Now, a Charter to achieve global governance has been developed for presentation at the Millennium Assembly next September. It will be published publicly on UN day, October 24th.

It is called The Charter for Global Democracy. It has already been signed by influential leaders in 56 nations, and has the support of civil society non-government organizations around the world. The document is, in reality, a Charter for the abolition of individual freedom.

The first of 12 principles calls for the consolidation of all international agencies under the direct authority of the United Nations. The second principle calls for regulation by the UN of all transnational corporations and financial institutions, requiring an "international code of conduct" concerning the environment and labor standards.

Principle number 3 demands an independent source of revenue for the UN, such as the "Tobin tax" and taxes on aircraft and shipping fuels, and licensing the use of the global commons. The "global commons" is defined to be "outer space, the atmosphere, non-territorial seas, and the related environment that supports human life."

Number 4 would eliminate the veto power and permanent member status on the Security Council. Number 5 would authorize a standing UN army. Number 6 would require UN registration of all arms and

the reduction of all national armies "as part of a multilateral global security system" under the authority of the United Nations.

Principle number 7 would require individual and national compliance with all UN "Human Rights" treaties and declarations. Number 8 would activate the International Criminal Court, make the International Court of Justice compulsory for all nations, and give individuals the right to petition the courts to remedy social injustice.

Principle 9 calls for a new institution to establish economic and environmental security by insuring "sustainable development." Number 10 calls for the establishment of an International Environmental Court.

Number 11 calls for a declaration that climate change is an essential global security interest that requires the creation of a "high-level action team" to allocate carbon emission based on equal per-capita rights. Principle number 12 calls for the cancellation of all debt owed by the poorest nations, global poverty reductions, and for "equitable sharing of global resources," as allocated by the United Nations.

As preposterous as these ideas may sound to freedom-loving Americans, most of the world considers them to be an improvement over their current circumstance. The fuel that fires the global governance movement, however, is not the desires of oppressed people, it is the money supplied by the well-to-do elite who feel the need to "do something" to help the less fortunate people of the world. The strategy for advancing the movement is supplied by those who expect to control the machinery of global governance.

It is no coincidence that financial contributions in support of the Charter for Global Democracy are to be made to the London office of United Nations Association.

Dozens of documents, all promoting some form of world government, have been circulating for most of this decade. All contain these same principles. The Millennium Assembly will receive these documents and meld them into the legal instruments required to modify the existing UN Charter. It will take a year or two for the legal documents to be prepared and adopted, and another year or two for ratification. The world is truly standing at the threshold of world government.

Woodrow Wilson brought the world to the same threshold nearly 80 years ago; the United States decided not to enter, and the League of Nations collapsed. Once again, it is up to the United States to determine the future of the world. If the United States embraces this Charter for Global Democracy, the world will be subjected to global dominance by the United Nations. If the United States opts out, the world may be spared centuries of inevitable oppression.

There is no issue of greater importance in next year's election than where each candidate stands on global governance and national sovereignty. So far, this issue has not emerged in any national campaign.

The United States must prevent this catastrophe-in-the-making. Global governance, as envisioned by the

Commission on Global Governance and the Charter for Global Democracy cannot succeed without the support of the United States. The United States must walk away. For all practical purposes, the next President, and the next Senate will make that decision.

By walking away from the UN's vision of global governance, we are not turning our backs to the rest of the world. Our next President and Congress should say no to global governance, and offer a better idea.

There is no better idea, nor higher aspiration, than individual freedom. America pioneered that technology 200 years ago, and it is still the most valuable asset we possess.

Freedom or democracy?

Freedom and democracy are not synonymous. In most of the world, the term democracy means the right of citizens to participate in the process of government. It is a right granted by the government, and controlled by the government, and if exercised improperly, it is denied by the government. Freedom, on the other hand, is the God-given right to govern one's self.

Freedom is the power to enter into voluntary agreements with other people who have precisely the same freedom, to achieve objectives of mutual benefit, as determined only by the parties to the agreement. Freedom is the power to make the rules that govern those agreements. Freedom is the power to create and control a system of general governance designed to serve its creators. Freedom is the power to cheat, lie, and steal -- and learn the consequences of those actions. Freedom is the power to experiment, to invent, to help others -- and learn the consequences of those actions. Freedom is the ultimate objective of human kind.

A system of global democracy, administered by the United Nations, would turn the world away from its primary quest -- individual freedom. Poverty cannot be eliminated by taking wealth from some and giving it to others. The inevitable consequence of such action is the expansion of poverty, by taking not only wealth, but the incentive to produce wealth as well.

The environment -- the global commons -- cannot be protected for long by regulated preservation. It must be protected by those who use it to meet their daily needs. Government ownership or control of the environment is the most certain way to ensure its degradation through stagnation. People, like virtually every other species on earth, should be free to use that portion of the environment they can control in whatever way they choose. If they abuse that environment, the environment will not sustain them. If they cultivate and care for that environment, it will sustain them.

This is a fundamental law of nature that cannot be repealed by any institution of government. In the long term, government attempts to manage the environment become, in retrospect, examples of gross mismanagement. Individuals, managing that portion of the planet they are able to control, provide the surest way to achieve a healthy, vibrant environment for all.

Freedom is the power to gain control over a portion of the environment -- land ownership. Freedom is the power to defend that land, by whatever means necessary, from those who have not learned the consequences of cheating, lying, or stealing. Freedom is the power to use the resources the land provides to create products and services others are willing to buy. Freedom is the power to buy products and services others have produced.

These are the ideas for which the world hungers. These are the better ideas America should offer the world. Because these ideas have produced prosperity beyond the wildest dreams of the rest of the world, we should happily share our freedom technology with the world.

Democracy can be imposed upon people by government; freedom cannot be imposed. Freedom must be learned through experience. Sometimes the experience is bloody, as it was in America, and always, it is painful, as is the current learning experience in Russia. It is the price we must pay for the benefits freedom bestows.

America should stop pouring its prosperity down the United Nations' drain. Instead, it should help directly, any nation that wants its people to be free. If given the choice, the people of every nation would choose individual freedom over a system of UN handouts. The governments of those nations, however, are not likely to embrace the possibility of relinquishing power. Governments of every stripe around the world, are the obstacles preventing individual freedom.

The people of the United States should first ensure their continued freedom by limiting the power of the government through the people elected to represent us. We should insist that America never relinquish one more ounce of its national sovereignty, and begin to reclaim our national sovereignty by disengaging from the labyrinth of UN treaties we have embraced in recent years. We should insist that our national defense is second to none, and never subject it to the command of any authority but our own. We should never relinquish our right for individuals to own and use land, nor should we allow our government to use our tax dollars to buy the land which is our posterity's birthright. We should direct our government to reestablish as its highest priority, the protection of individual freedom for every American.

These ideas are repugnant to the promoters of global democracy under the authority of the United Nations. These ideas are labeled as "jingoism." These ideas are described as "extreme nationalism bordering on hatred of non-nationals." The opposite is true. These ideas are offered to the rest of the world because America demonstrates that these ideas can bring the same kind of benefits to all nations that embrace them.

This is the message the United States should deliver to the United Nations. The next President and the next Senate will deliver whatever message we, the voters, send. If we, the United States, embrace the Charter for Global Democracy and the world government it establishes, America will be reduced to the lowest common denominator forced equity demands. The power of individual freedom will be caged in history books for generations. It could easily take centuries of gradual decline and rising oppression before a new generation of founders cast off the scourge of the UN-King and rediscover the truths upon

which America's founders built our great nation. We, the people, literally hold the future of the world in our hands. The people we send to Washington as the result of our next election will either embrace world government, or reject it. It is up to us.

Henry Lamb is the executive vice president of the Environmental Conservation Organization and chairman of Sovereignty International.

A *[SECULAR]* CHRONOLOGICAL HISTORY of the NEW WORLD ORDER

[This is a re-formation (with colored boxes) of an article that I have found on the web. While the form is different the words are the same as I found them to have been edited by John Loeffler. Neither John Loeffler nor D.L. Cuddy are known to me other than through this article. My own comments are entered in these brackets.
- Bruce Beach]

[While the original author discounts that it is a hidden conspiracy arising from the Protocols of the Elders of Zion, nevertheless it is his theory that there is an Open Conspiracy, whatever that oxymoron means.

In his view it is an evil plot by the humanists and liberals, although he still quotes from Nixon and Bush. Either the original writer, or an interim editor, has an obvious bias against New Age Religion and such. All of this recognized - it still remains an interesting historical summary, and I highly recommend that you read it.

The quotes here are mostly from westerners and capitalist organizations, but there are other organizations in other parts of the world and under other economic systems that have similar agendas.

I agree with the original author that the theory that there is some one organization completely in control, such as the Illuminati (a completely misunderstood group) or the CFR, Trilateral Commission, Bilderbergers, or anyone of a dozen other named favorites, is completely fallacious.

There IS a PLAN, and some organizations do have considerably more influence than others in implementing that PLAN, but that is another matter entirely , and one that is not at all covered here. - Bruce Beach]

A CHRONOLOGICAL HISTORY OF THE NEW WORLD ORDER by D.L. Cuddy, Ph.D. Arranged and Edited by John Loeffler

In the mainline media, those who adhere to the position that there is some kind of "conspiracy" pushing us towards a world government are virulently ridiculed. The standard attack maintains that the so-called "New World Order" is the product of turn-of-the-century, right-wing, bigoted, anti-semitic racists acting in the tradition of the long-debunked Protocols of the Learned Elders of Zion, now promulgated by some Militias and other right-wing hate groups.

The historical record does not support that position to any large degree but it has become the mantra of the socialist left and their cronies, the media.

The term "New World Order" has been used thousands of times in this century by

proponents in high places of federalized world government. Some of those involved in this collaboration to achieve world order have been Jewish. The preponderance are not, so it most definitely is not a Jewish agenda.

For years, leaders in education, industry, the media, banking, etc., have promoted those with the same Weltanschauung (world view) as theirs. Of course, someone might say that just because individuals promote their friends doesn't constitute a conspiracy. That's true in the usual sense. However, it does represent an "open conspiracy," as described by noted Fabian Socialist H.G. Wells in **The Open Conspiracy: Blue Prints for a World Revolution** (1920).

In 1913, prior to the passage of the Federal Reserve Act President Wilson's **The New Freedom** was published, in which he revealed:

"Since I entered politics, I have chiefly had men's views confided to me privately. Some of the biggest men in the U. S., in the field of commerce and manufacturing, are afraid of somebody, are afraid of something. They know that there is a power somewhere so organized, so subtle, so watchful, so interlocked, so complete, so pervasive, that they had better not speak above their breath when they speak in condemnation of it."

On November 21, 1933, President Franklin Roosevelt wrote a letter to Col. Edward Mandell House, President Woodrow Wilson's close advisor:

"The real truth of the matter is, as you and I know, that a financial element in the larger centers has owned the Government every since the days of Andrew Jackson..."

That there is such a thing as a cabal of power brokers who control government behind the scenes has been detailed several times in this century by credible sources. Professor Carroll Quigley was Bill Clinton's mentor at Georgetown University. President Clinton has publicly paid homage to the influence Professor Quigley had on his life. In Quigley's magnum opus *Tragedy and Hope* (1966), he states:

"There does exist and has existed for a generation, an international...network which operates, to some extent, in the way the radical right believes the Communists act. In fact, this network, which we may identify as the Round Table Groups, has no aversion to cooperating with the Communists, or any other groups and frequently does so. I know of the operations of this network because I have studied it for twenty years and was permitted for two years, in the early 1960s, to examine its papers and secret records. I have no aversion to it or to most of its aims and have, for much of my life, been close to it and to many of its instruments. I have objected, both in the past and recently, to a few of its policies...but in general my chief difference of opinion is that it wishes to remain unknown, and I believe its role in history is significant enough to be known."

Even talk show host Rush Limbaugh, an outspoken critic of anyone claiming a push for global government, said on his February 7, 1995 program:

"You see, if you amount to anything in Washington these days, it is because you have been plucked or handpicked from an Ivy League school - - Harvard, Yale, Kennedy School of Government -- you've shown an aptitude to be a good Ivy League type, and so you're plucked so-to-speak, and you are assigned success. You are assigned a certain role in government somewhere, and then your success is monitored and tracked, and you go where the pluckers and the handpickers can put you."

On May 4, 1993, Council on Foreign Relations (CFR) president Leslie Gelb said on The Charlie Rose Show that:

"...you [Charlie Rose] had me on [before] to talk about the New World Order! I talk about it all the time. It's one world now. The Council [CFR] can find, nurture, and begin to put people in the kinds of jobs this country needs. And that's going to be one of the major enterprises of the Council under me."

Previous CFR chairman, John J. McCloy (1953-70), actually said they have been doing this since the 1940s (and before).

The thrust towards global government can be well-documented but at the end of the twentieth century it does not look like a traditional conspiracy in the usual sense of a secret cabal of evil men meeting clandestinely behind closed doors. Rather, it is a "networking" of like-minded individuals in high places to achieve a common goal, as described in Marilyn Ferguson's 1980 insider classic, **The Aquarian Conspiracy**.

Perhaps the best way to relate this would be a brief history of the New World Order, not in our words but in the words of those who have been striving to make it real.

1912 -- Colonel Edward M. House, a close advisor of President Woodrow Wilson, publishes **Phillip Dru: Administrator** in which he promotes

"socialism as dreamed of by Karl Marx."

1913 -- The Federal Reserve (neither federal nor a reserve) is created. It was planned at a secret meeting in 1910 on Jekyll Island, Georgia by a group of bankers and politicians, including Col. House. This transferred the power to create money from the American government to a private group of bankers. It is probably the largest generator of debt in the world.

May 30, 1919 -- Prominent British and American personalities establish the Royal Institute of International Affairs in England and the Institute of International Affairs in the U.S. at a meeting arranged by Col. House attended by various Fabian socialists, including noted economist John Maynard Keynes. Two years later, Col. House reorganizes the Institute of International Affairs into the Council on Foreign Relations (CFR).

December 15, 1922 -- The CFR endorses World Government in its magazine **Foreign Affairs**. Author Philip Kerr, states:

"Obviously there is going to be no peace or prosperity for mankind as long as [the earth] remains divided into 50 or 60 independent states until some kind of international system is created...The real problem today is that of the world government."

1928 -- **The Open Conspiracy: Blue Prints for a World Revolution** by H.G. Wells is published. A former Fabian Socialist, Wells writes:

"The political world of the into a Open Conspiracy must weaken, efface, incorporate and supersede existing governments...The Open Conspiracy is the natural inheritor of socialist and communist enthusiasms; it may be in control of Moscow before it is in control of New York...The character of the Open Conspiracy will now be plainly displayed...It will be a world religion."

1931 -- Students at the Lenin School of Political Warfare in Moscow are taught:

"One day we shall start to spread the most theatrical peace movement the world has ever seen. The capitalist countries, stupid and decadent...will fall into the trap offered by the possibility of making new friends. Our day will come in 30 years or so...The bourgeoisie must be lulled into a false sense of security.

1932 -- New books are published urging World Order:

Toward Soviet America by William Z. Foster. Head of the Communist Party USA, Foster indicates that a National Department of Education would be one of the means used to develop a new socialist society in the U.S.

The New World Order by F.S. Marvin, describing the League of Nations as the first attempt at a New World Order. Marvin says,

"nationality must rank below the claims of mankind as a whole."

Dare the School Build a New Social Order? is published. Educator author George Counts asserts that:

"...the teachers should deliberately reach for power and then make the most of their conquest"

in order to "influence the social attitudes, ideals and behavior of the coming generation...The growth of science and technology has carried us into a new age where ignorance must be replaced by knowledge, competition by cooperation, trust in Providence by careful planning and private capitalism by some form of social economy."

1933 -- The first **Humanist Manifesto** is published. Co-author John Dewey, the noted philosopher and educator, calls for a synthesizing of all religions and

"a socialized and cooperative economic order."

Co-signer C.F. Potter said in 1930:

"Education is thus a most powerful ally of humanism, and every American public school is a school of humanism. What can the theistic Sunday schools, meeting for an hour once a week, teaching only a fraction of the children, do to stem the tide of a five-day program of humanistic teaching?"

1933 -- **The Shape of Things to Come** by H.G. Wells is published. Wells predicts a second world war around 1940, originating from a German-Polish dispute. After 1945 there would be an increasing lack of public safety in "criminally infected" areas. The plan for the "Modern World-State" would succeed on its third attempt (about 1980), and come out of something that occurred in Basra, Iraq.

The book also states,

"Although world government had been plainly coming for some years, although it had been endlessly feared and murmured against, it found no opposition prepared anywhere."

1934 -- **The Externalization of the Hierarchy** by Alice A. Bailey is published. Bailey is an occultist, whose works are channeled from a spirit guide, the Tibetan Master (demon spirit) Djwahl Kuhl. Bailey uses the phrase

"points of light"

in connection with a

"New Group of World Servers"

and claims that 1934 marks the beginning of

"the organizing of the men and women...group work of a new order...(with progress defined by service...the world of the Brotherhood...the Forces of Light...(and) out of the spoliation of all existing culture and civilization, the new world order must be built."

The book is published by the Lucis Trust, incorporated originally in New York as the Lucifer Publishing Company. Lucis Trust is a United Nations NGO and has been a major player at the recent U.N. summits. Later Assistant Secretary General of the U.N. Robert Mueller would credit the creation of his World Core Curriculum for education to the underlying teachings of Djwahl Kuhl via Alice Bailey's writings on the subject.

1932 -- **Plan for Peace** by American Birth Control League founder Margaret Sanger (1921) is published. She calls for coercive sterilization, mandatory segregation, and rehabilitative concentration camps for all

"dysgenic stocks"

including Blacks, Hispanics, American Indians and Catholics.

October 28, 1939 -- In an address by John Foster Dulles, later U.S. Secretary of State, he proposes that America lead the transition to a new order of less independent, semi-sovereign states bound together by a league or federal union.

1939 -- **New World Order** by H. G. Wells proposes a collectivist

" one-world state"

or

"new world order"

comprised of

"socialist democracies."

He advocates

"universal conscription for service"

and declares that

"nationalist individualism...is the world's disease."

He continues:

"The manifest necessity for some collective world control to eliminate warfare and the less generally admitted necessity for a collective control of the economic and biological life of mankind, are aspects of one and the same process."

He proposes that this be accomplished through

"universal law" and propaganda (or education)."

1940 -- **The New World Order** is published by the Carnegie Endowment for International Peace and contains a select list of references on regional and world federation, together with some special plans for world order after the war.

December 12, 1940 -- In **The Congressional Record** an article entitled **A New World Orde** by John G. Alexander calls for a world federation.

1942 -- The leftist Institute of Pacific Relations publishes **Post War Worlds** by P.E. Corbett:

"World government is the ultimate aim...It must be recognized that the law of nations takes precedence over national law...The process will have to be assisted by the deletion of the nationalistic material employed in educational textbooks and its replacement by material explaining the benefits of wiser association."

June 28, 1945 -- President Truman endorses world government in a speech:

"It will be just as easy for nations to get along in a republic of the world as it is for us to get along in a republic of the United States."

October 24, 1945 -- **The United Nations Charter** becomes effective.

Also on October 24, Senator Glen Taylor (D-Idaho) introduces **Senate Resolution 183** calling upon the U.S. Senate to go on record as favoring creation of a world republic including an international police force.

1946 -- Alger Hiss is elected President of the Carnegie Endowment for International Peace. Hiss holds this office until 1949. Early in 1950, he is convicted of perjury and sentenced to prison after a sensational trial and Congressional hearing in which Whittaker Chambers, a former senior editor of Time, testifies that Hiss was a member of his Communist Party cell.

1946 -- **The Teacher and World Government** by former editor of the **NEA Journal** (National Education Association) Joy Elmer Morgan is published. He says:

"In the struggle to establish an adequate world government, the teacher...can do much to prepare the hearts and minds of children for global understanding and cooperation...At the very heart of all the agencies which will assure the coming of world government must stand the school, the teacher, and the organized profession."

1947 -- The American Education Fellowship, formerly the Progressive Education Association, organized by John Dewey, calls for the:

"...establishment of a genuine world order, an order in which national sovereignty is subordinate to world authority..."

October, 1947 -- NEA Associate Secretary William Carr writes in the **NEA Journal** that teachers should:

"...teach about the various proposals that have been made for the strengthening of the United Nations and the establishment of a world citizenship and world government."

1948 -- **Walden II** by behavioral psychologist B.F. Skinner proposes

"a perfect society or new and more perfect order"

in which children are reared by the State, rather than by their parents and are trained from birth to demonstrate only desirable behavior and characteristics. Skinner's ideas would be widely implemented by educators in the 1960s, 70s, and 80s as **Values Clarification and Outcome Based Education**.

July, 1948 -- Britain's Sir Harold Butler, in the CFR's **Foreign Affairs**, sees "a New World Order" taking shape:

"How far can the life of nations, which for centuries have thought of themselves as distinct and unique, be merged with the life of other nations? How far are they prepared to sacrifice a part of their sovereignty without which there can be no effective economic or political union?...Out of the prevailing confusion a new world is taking shape... which may point the way toward the new order... That will be the beginning of a real United Nations, no longer crippled by a split personality, but held together by a common faith."

1948 -- UNESCO president and Fabian Socialist, Sir Julian Huxley, calls for a radical eugenic policy in **UNESCO: Its Purpose and Its Philosophy**. He states:

"Thus, even though it is quite true that any radical eugenic policy of controlled human breeding will be for many years politically and psychologically impossible, it will be important for UNESCO to see that the eugenic problem is examined with the greatest care and that the public mind is informed of the issues at stake that much that is now unthinkable may at least become thinkable."

1948 -- The preliminary draft of a **World Constitution** is published by U.S. educators advocating regional federation on the way toward world federation or government with England incorporated into a European federation. The Constitution provides for a

"World Council"

along with a

"Chamber of Guardians"

to enforce world law. Also included is a

"Preamble"

calling upon nations to surrender their arms to the world government, and includes the right of this

"Federal Republic of the World"

to seize private property for federal use.

February 9, 1950 -- The Senate Foreign Relations Subcommittee introduces **Senate Concurrent Resolution 66** which begins:

"Whereas, in order to achieve universal peace and justice, the present Charter of the United Nations should be changed to provide a true world government constitution."

The resolution was first introduced in the Senate on September 13, 1949 by Senator Glen Taylor (D-Idaho). Senator Alexander Wiley (R-Wisconsin) called it "a consummation devoutly to be wished for" and said, "I understand your proposition is either change the United Nations, or change or create, by a separate convention, a world order." Senator Taylor later stated:

"We would have to sacrifice considerable sovereignty to the world organization to enable them to levy taxes in their own right to support themselves."

April 12, 1952 -- John Foster Dulles, later to become Secretary of State, says in a speech to the American Bar Association in Louisville, Kentucky, that

"treaty laws can override the **Constitution.**"

He says treaties can take power away from Congress and give them to the President. They can take powers from the States and give them to the Federal Government or to some international body and they can cut across the rights given to the people by their constitutional **Bill of Rights**.

A Senate amendment, proposed by GOP Senator John Bricker, would have provided that no treaty could supersede the **Constitution**, but it fails to pass by one vote.

1954 -- Prince Bernhard of the Netherlands establishes the Bilderbergers, international politicians and bankers who meet secretly on an annual basis.

1958 -- **World Peace through World Law** is published, where authors Grenville Clark and Louis Sohn advocate using the U.N. as a governing body for the world, world disarmament, a world police force and legislature.

1959 -- The Council on Foreign Relations calls for a **New International Order**. **Study Number 7**, issued on November 25, advocated:

"...new international order (which) must be responsive to world aspirations for peace, for social and economic change...an international order...including states labeling themselves as 'socialist' (communist)."

1959 -- The World Constitution and Parliament Association is founded which later develops a **Diagram of World Government** under the **Constitution for the Federation of Earth**.

1959 -- **The Mid-Century Challenge to U.S. Foreign Policy** is published, sponsored by the Rockefeller Brothers' Fund. It explains that the U.S.:

"...cannot escape, and indeed should welcome...the task which history has imposed on us. This is the task of helping to shape a new world order in all its dimensions -- spiritual, economic, political, social."

September 9, 1960 -- President Eisenhower signs **Senate Joint Resolution 170**, promoting the concept of a federal Atlantic Union. Pollster and Atlantic Union Committee treasurer, Elmo Roper, later delivers an address titled, **The Goal Is Government of All the World**, in which he states:

"For it becomes clear that the first step toward World Government cannot be completed until we have advanced on the four fronts: the economic, the military, the political and the social."

1961 -- The U.S. State Department issues a plan to disarm all nations and arm the United Nations. **State Department Document Number 7277** is entitled **Freedom From War: The U.S. Program for General and Complete Disarmament in a Peaceful World**. It details a three-stage plan to disarm all nations and arm the U.N. with the final stage in which

"no state would have the military power to challenge the progressively strengthened U.N. Peace Force."

1962 -- New Calls for World Federalism. In a study titled, **A World Effectively Controlled by the United Nations**, CFR member Lincoln Bloomfield states:

"...if the communist dynamic was greatly abated, the West might lose whatever incentive it has for world government."

The Future of Federalism by author Nelson Rockefeller is published. The one-time Governor of New York, claims that current events compellingly demand a "new world order," as the old order is crumbling, and there is

"a new and free order struggling to be born."

Rockefeller says there is:

"a fever of nationalism...(but) the nation-state is becoming less and less competent to perform its international political tasks....These are some of the reasons pressing us to lead vigorously toward the true building of a new world order...(with) voluntary service...and our dedicated faith in the brotherhood of all mankind....Sooner perhaps than we may realize...there will evolve the bases for a federal structure of the free world."

1963 -- J. William Fulbright, Chairman of the Senate Foreign Relations Committee speaks at a symposium sponsored by the Fund for the Republic, a left-wing project of the Ford Foundation:

"The case for government by elites is irrefutable...government by the people is possible but highly improbable."

1964 -- **Taxonomy of Educational Objectives, Handbook II** is published. Author Benjamin Bloom states:

"...a large part of what we call 'good teaching' is the teacher's ability to attain affective objectives through challenging the students' fixed beliefs."

His **Outcome-Based Education (OBE)** method of teaching would first be tried as Mastery Learning in Chicago schools. After five years, Chicago students' test scores had plummeted causing outrage among parents. OBE would leave a trail of wreckage wherever it would be tried and under whatever name it would be used. At the same time, it would become crucial to globalists for overhauling the education system to promote attitude changes among school students.

1964 -- **Visions of Order** by Richard Weaver is published. He describes:

"progressive educators as a 'revolutionary cabal' engaged in 'a systematic attempt to undermine society's traditions and beliefs.'"

1967 -- Richard Nixon calls for New World Order. In Asia after Vietnam, in the October issue of **Foreign Affairs**, Nixon writes of nations' dispositions to evolve regional approaches to development needs and to the evolution of a

"new world order."

1968 -- Joy Elmer Morgan, former editor of the **NEA Journal** publishes **The American Citizens Handbook** in which he says:

"the coming of the United Nations and the urgent necessity that it evolve into a more comprehensive form of world government places upon the citizens of the United States an increased obligation to make the most of their citizenship which now widens into active world citizenship."

July 26, 1968 -- Nelson Rockefeller pledges support of the New World Order. In an **Associated Press** report, Rockefeller pledges that,

"as President, he would work toward international creation of a new world order."

1970 -- Education and the mass media promote world order. In **Thinking About A New World Order** for the Decade 1990, author Ian Baldwin, Jr. asserts that:

"...the World Law Fund has begun a worldwide research and educational program that will introduce a new, emerging discipline -- world order -- into educational curricula throughout the world...and to concentrate some of its energies on bringing basic world order concepts into the mass media again on a worldwide level."

1972 -- President Nixon visits China. In his toast to Chinese Premier Chou En-lai, former CFR member and now President, Richard Nixon, expresses

"the hope that each of us has to build a new world order."

May 18, 1972 -- In speaking of the coming of world government, Roy M. Ash, director of the Office of Management and Budget, declares that:

"within two decades the institutional framework for a world economic community will be in place...(and) aspects of individual sovereignty will be given over to a supernational authority."

1973 -- The Trilateral Commission is established. Banker David Rockefeller organizes this new private body and chooses Zbigniew Brzezinski, later National Security Advisor to President Carter, as the Commission's first director and invites Jimmy Carter to become a founding member.

1973 -- **Humanist Manifesto II** is published:

"The next century can be and should be the humanistic century...we stand at the dawn of a new age...a secular society on a planetary scale....As non-theists we begin with humans not God, nature not deity...we deplore the division of humankind on nationalistic grounds....Thus we look to the development of a system of world law and a world order based upon transnational federal government....The true revolution is occurring."

April, 1974 -- Former U. S. Deputy Assistant Secretary of State, Trilateralist and CFR member Richard Gardner's article **The Hard Road to World Order** is published in the CFR's Foreign Affairs where he states that:

"the 'house of world order' will have to be built from the bottom up rather than from the top down...but an end run around national sovereignty, eroding it piece by piece, will accomplish much more than the old-fashioned frontal assault."

1974 -- The World Conference of Religion for Peace, held in Louvain, Belgium is held. Douglas Roche presents a report entitled **We Can Achieve a New World Order**.

1974 -- The U.N. calls for wealth redistribution: In a report entitled **New International Economic Order**, the U.N. General Assembly outlines a plan to redistribute the wealth from the rich to the poor nations.

1975 -- A study titled, **A New World Order**, is published by the Center of International Studies, Woodrow Wilson School of Public and International Studies, Princeton University.

1975 -- In Congress, 32 Senators and 92 Representatives sign **A Declaration of Interdependence**, written by historian Henry Steele Commager. The **Declaration** states that:

"we must join with others to bring forth a new world order...Narrow notions of national sovereignty must not be permitted to curtail that obligation."

Congresswoman Marjorie Holt refuses to sign the **Declaration** saying:

"It calls for the surrender of our national sovereignty to international organizations. It declares that our economy should be regulated by international authorities. It proposes that we enter a 'new world order' that would redistribute the wealth created by the American people."

1975 -- Retired Navy Admiral Chester Ward, former Judge Advocate General of the U.S. Navy and former CFR member, writes in a critique that the goal of the CFR is the

"submergence of U. S. sovereignty and national independence into an all powerful one-world government..."

1975 -- **Kissinger on the Couch** is published. Authors Phyllis Schlafly and former CFR member Chester Ward state:

"Once the ruling members of the CFR have decided that the U.S. government should espouse a particular policy, the very substantial research facilities of the CFR are put to work to develop arguments, intellectual and emotional, to support the new policy and to confound, discredit, intellectually and politically, any opposition..."

1976 -- **RIO: Reshaping the International Order** is published by the globalist Club of Rome, calling for a new international order, including an economic redistribution of wealth.

1977 -- **The Third Try at World Order** is published. Author Harlan Cleveland of the Aspen Institute for Humanistic Studies calls for:

"changing Americans' attitudes and institutions" for "complete disarmament (except for international soldiers)" and "for individual entitlement to food, health and education."

1977 -- **Imperial Brain Trust** by Laurence Shoup and William Minter is published. The book takes a critical look at the Council on Foreign Relations with chapters such as: **Shaping a New World Order: The Council's Blueprint for Global Hegemony, 1939-1944** and **Toward the 1980's: The Council's Plans for a New World Order**.

1977 -- **The Trilateral Connection** appears in the July edition of **Atlantic Monthly**. Written by Jeremiah Novak, it says:

"For the third time in this century, a group of American schools, businessmen, and government officials is planning to fashion a New World Order..."

1977 -- Leading educator Mortimer Adler publishes **Philosopher at Large** in which he says:

"...if local civil government is necessary for local civil peace, then world civil government is necessary for world peace."

1979 -- Barry Goldwater, Republican Senator from Arizona, publishes his autobiography **With No Apologies**. He writes:

"In my view The Trilateral Commission represents a skillful, coordinated effort to seize control and consolidate the four centers of power -- political, monetary, intellectual, and ecclesiastical. All this is to be done in the interest of creating a more peaceful, more productive world community. What the Trilateralists truly intend is the creation of a worldwide economic power superior to the political governments of the nation-states involved. They believe the abundant materialism they propose to create will overwhelm existing differences. As managers and creators of the system they will rule the future."

1984 -- **The Power to Lead** is published. Author James McGregor Burns admits:

"The framers of the U.S. constitution have simply been too shrewd for us. They have outwitted us. They designed separate institutions that cannot be unified by mechanical linkages, frail bridges, tinkering. If we are to 'turn the Founders upside down' -- we must directly confront the constitutional structure they erected."

1985 -- Norman Cousins, the honorary chairman of Planetary Citizens for the World We Chose, is quoted in **Human Events**:

"World government is coming, in fact, it is inevitable. No arguments for or against it can change that fact."

Cousins was also president of the World Federalist Association, an affiliate of the World Association for World Federation (WAWF), headquartered in Amsterdam. WAWF is a leading force for world federal government and is accredited by the U.N. as a Non-Governmental Organization.

1987 -- **The Secret Constitution and the Need for Constitutional Change** is sponsored in part by the Rockefeller Foundation. Some thoughts of author Arthur S. Miller are:

"...a pervasive system of thought control exists in the United States...the citizenry is indoctrinated by employment of the mass media and the system of public education...people are told what to think about...the old order is crumbling...Nationalism should be seen as a dangerous social disease...A new vision is required to plan and manage the future, a global vision that will transcend national boundaries and eliminate the poison of nationalistic solutions...a new Constitution is necessary."

1988 -- Former Under-secretary of State and CFR member George Ball in a January 24 interview in the **New York Times** says:

"The Cold War should no longer be the kind of obsessive concern that it is. Neither side is going to attack the other deliberately...If we could internationalize by using the U.N. in conjunction with the Soviet Union, because we now no longer have to fear, in most cases, a Soviet veto, then we could begin to transform the shape of the world and might get the U.N. back to doing something useful...Sooner or later we are going to have to face restructuring our institutions so that they are not confined merely to the nation-states. Start first on a regional and ultimately you could move to a world basis."

December 7, 1988 -- In an address to the U.N., Mikhail Gorbachev calls for mutual consensus:

"World progress is only possible through a search for universal human consensus as we move forward to a new world order."

May 12, 1989 --President Bush invites the Soviets to join World Order. Speaking to the graduating class at Texas A&M University, Mr. Bush states that the United States is ready to welcome the Soviet Union

"back into the world order."

1989 -- Carl Bernstein's (Woodward and Bernstein of Watergate fame) book **Loyalties: A Son's Memoir** is published. His father and mother had been members of the Communist party. Bernstein's father tells his son about the book:

"You're going to prove (Sen. Joseph) McCarthy was right, because all he was saying is that the system was loaded with Communists. And he was right...I'm worried about the kind of book you're going to write and about cleaning up McCarthy. The problem is that everybody said he was a liar; you're saying he was right...I agree that the Party was a force in the country."

1990 -- The **World Federalist Association** faults the American press. Writing in their Summer/Fall newsletter, Deputy Director Eric Cox describes world events over the past year or two and declares:

"It's sad but true that the slow-witted American press has not grasped the significance of most of these developments. But most federalists know what is happening...And they are not frightened by the old bug-a-boo of sovereignty."

September 11, 1990 -- President Bush calls the Gulf War an opportunity for the New World Order. In an address to Congress entitled **Toward a New World Order**, Mr. Bush says:

"The crisis in the Persian Gulf offers a rare opportunity to move toward an historic period of cooperation. Out of these troubled times...a new world order can emerge in which the nations of the world, east and west, north and south, can prosper and live in harmony....Today the new world is struggling to be born."

September 25, 1990 -- In an address to the U.N., Soviet Foreign Minister Eduard Shevardnadze describes Iraq's invasion of Kuwait as

"an act of terrorism (that) has been perpetrated against the emerging New World Order."

On December 31, Gorbachev declares that the New World Order would be ushered in by the Gulf Crisis.

October 1, 1990 -- In a U.N. address, President Bush speaks of the:

"...collective strength of the world community expressed by the U.N...an historic movement towards a new world order...a new partnership of nations...a time when humankind came into its own...to bring about a revolution of the spirit and the mind and begin a journey into a...new age."

1991 -- Author Linda MacRae-Campbell publishes **How to Start a Revolution at Your School in In Context**. She promotes the use of

"change agents" as "self-acknowledged revolutionaries" and "conspirators."

1991 -- President Bush praises the New World Order in a **State of Union Message**:

"What is at stake is more than one small country, it is a big idea -- a new world order...to achieve the universal aspirations of mankind...based on shared principles and the rule of law....The illumination of a thousand points of light....The winds of change are with us now."

February 6, 1991 -- President Bush tells the Economic Club of New York:

"My vision of a new world order foresees a United Nations with a revitalized peacekeeping function."

June, 1991 -- The Council on Foreign Relations co-sponsors an assembly **Rethinking America's Security: Beyond Cold War to New World Order** which is attended by 65 prestigious members of government, labor, academia, the media, military, and the professions from nine countries. Later, several of the conference participants joined some 100 other world leaders for another closed door meeting of the Bilderberg Society in Baden Baden, Germany. The Bilderbergers also exert considerable clout in determining the foreign policies of their respective governments.

July, 1991 -- The Southeastern World Affairs Institute discusses the New World Order. In a program, topics include, **Legal Structures for a New World Order** and **The United Nations: From its Conception to a New World Order**. Participants include a former director of the U.N.'s General Legal Division, and a former Secretary General of International Planned Parenthood.

Late July, 1991 -- On a **Cable News Network** program, CFR member and former CIA director Stansfield Turner (Rhodes scholar), when asked about Iraq, responded:

"We have a much bigger objective. We've got to look at the long run here. This is an example -- the situation between the United Nations and Iraq -- where the United Nations is deliberately intruding into the sovereignty of a sovereign nation...Now this is a marvelous precedent (to be used in) all countries of the world..."

October 29, 1991 -- David Funderburk, former U. S. Ambassador to Romania, tells a North Carolina audience:

"George Bush has been surrounding himself with people who believe in one-world government. They believe that the Soviet system and the American system are converging."

The vehicle to bring this about, said Funderburk, is the United Nations,

"the majority of whose 166 member states are socialist, atheist, and anti-American."

Funderburk served as ambassador in Bucharest from 1981 to 1985, when he resigned in frustration over U.S. support of the oppressive regime of the late Rumanian dictator, Nicolae Ceausescu.

October 30, 1991: -- President Gorbachev at the Middle East Peace Talks in Madrid states:

"We are beginning to see practical support. And this is a very significant sign of the movement towards a new era, a new age...We see both in our country and elsewhere...ghosts of the old thinking...When we rid ourselves of their presence, we will be better able to move toward a new world order...relying on the relevant mechanisms of the United Nations."

Elsewhere, in Alexandria, Virginia, Elena Lenskaya, Counsellor to the Minister of Education of Russia, delivers the keynote address for a program titled, **Education for a New World Order**.

1992 -- **The Twilight of Sovereignty** by CFR member (and former Citicorp Chairman) Walter Wriston is published, in which he claims:

"A truly global economy will require ...compromises of national sovereignty...There is no escaping the system."

1992 -- The United Nations Conference on Environment and Development(UNCED) Earth Summit takes place in Rio de Janeiro this year, headed by Conference Secretary-General Maurice Strong. The main products of this summit are the **Biodiversity Treaty** and **Agenda 21**, which the U.S. hesitates to sign because of opposition at home due to the threat to sovereignty and economics. The summit says the first world's wealth must be transferred to the third world.

July 20, 1992 -- **TIME** magazine publishes **The Birth of the Global Nation** by Strobe Talbott, Rhodes Scholar, roommate of Bill Clinton at Oxford University, CFR Director, and Trilateralist, in which he writes:

"All countries are basically social arrangements...No matter how permanent or even sacred they may seem at any one time, in fact they are all artificial and temporary...Perhaps national sovereignty wasn't such a great idea after all...But it has taken the events in our own wondrous and terrible century to clinch the case for world government."

As an editor of **Time**, Talbott defended Clinton during his presidential campaign. He was appointed by President Clinton as the number two person at the State Department behind Secretary of State Warren Christopher, former Trilateralist and former CFR Vice-Chairman and Director. Talbott was confirmed by about two-thirds of the U.S. Senate despite his statement about the unimportance of national sovereignty.

September 29, 1992 -- At a town hall meeting in Los Angeles, Trilateralist and former CFR president Winston Lord delivers a speech titled **Changing Our Ways: America and the New World**, in which he remarks:

"To a certain extent, we are going to have to yield some of our sovereignty, which will be controversial at home...(Under) the North American Free Trade Agreement (NAFTA)...some Americans are going to be hurt as low-wage jobs are taken away."

Lord became an Assistant Secretary of State in the Clinton administration.

Winter, 1992-93 -- The CFR's Foreign Affairs publishes **Empowering the United Nations** by U.N. Secretary General Boutros-Boutros Ghali, who asserts:

"It is undeniable that the centuries-old doctrine of absolute and exclusive sovereignty no longer stands...Underlying the rights of the individual and the rights of peoples is a dimension of universal sovereignty that resides in all humanity...It is a sense that increasingly finds expression in the gradual expansion of international law...In this setting the significance of the United Nations should be evident and accepted."

1993 -- Strobe Talbott receives the Norman Cousins Global Governance Award for his 1992 **TIME** article, **The Birth of the Global Nation** and in appreciation for what he has done "for the cause of global governance."

President Clinton writes a letter of congratulation which states:

"Norman Cousins worked for world peace and world government...Strobe Talbott's lifetime achievements as a voice for global harmony have earned him this recognition...He will be a worthy recipient of the Norman Cousins Global Governance Award. Best wishes...for future success."

Not only does President Clinton use the specific term,

"world government,"

but he also expressly wishes the WFA "future success" in pursuing world federal government. Talbott proudly accepts the award, but says the WFA should have given it to the other nominee, Mikhail Gorbachev.

July 18, 1993 -- CFR member and Trilateralist Henry Kissinger writes in the **Los Angeles Times** concerning NAFTA:

"What Congress will have before it is not a conventional trade agreement but the architecture of a new international system...a first step toward a new world order."

August 23, 1993 -- Christopher Hitchens, Socialist friend of Bill Clinton when he was at Oxford University, says in a C-Span interview:

"...it is, of course the case that there is a ruling class in this country, and that it has allies internationally."

October 30, 1993 -- **Washington Post** ombudsman Richard Harwood does an op-ed piece about the role of the CFR's media members:

"Their membership is an acknowledgment of their ascension into the American ruling class (where) they do not merely analyze and interpret foreign policy for the United States; they help make it."

January/February, 1994 -- The CFR's Foreign Affairs prints an opening article by CFR Senior Fellow Michael Clough in which he writes that the "WiseMen" (e.g. Paul Nitze, Dean Acheson, George Kennan, and John J. McCloy) have:

"assiduously guarded it (American foreign policy) for the past 50 years...They ascended to power during World War II...This was as it should be. National security and the national interest, they argued must transcend the special interests and passions of the people who make up America...How was this small band of Atlantic-minded internationalists able to triumph?...Eastern internationalists were able to shape and staff the burgeoning foreign policy institutions...As long as the Cold War endured and nuclear Armageddon seemed only a missile away, the public was willing to tolerate such an undemocratic foreign policy making system."

1995 -- The State of the World Forum took place in the fall of this year, sponsored by the Gorbachev Foundation located at the Presidio in San Francisco. Foundation President Jim Garrison chairs the meeting of who's-whos from around the world including Margaret Thatcher, Maurice Strong, George Bush, Mikhail Gorbachev and others. Conversation centers around the oneness of mankind and the coming global government. However, the term "global governance" is now used in place of "new world order" since the latter has become a political liability, being a lightning rod for opponents of global government.

1996 -- The United Nations 420-page report **Our Global Neighborhood** is published. It outlines a plan for "global governance," calling for an international Conference on Global Governance in 1998 for the purpose of submitting to the world the necessary treaties and agreements for ratification by the year 2000.

1996 -- State of the World Forum II will take place again this fall in San Francisco. This time, many of the sessions are closed to the press.

There are hundreds more articles and speeches by those actively working to make global government a reality. We could not fit them all in here.

[As you can see, this history is a bit dated. Ending in 1996, whereas MUCH has happened since then. Indeed, IMHO, the most significant event of all is the scheduled Millenium Conference at the UN in September 2,000.

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [NWO Introduction](#)

[The following document is a hoax (in that some really believe it) but more generously we should call it a parody. Either way it is a good representation of many emotional responses that this writer receives in regard to the NWO.

While this emotional portrayal of the NWO, is entirely fictional in nature, much of what it describes is accurate as regards the present state of society. However, there is in fact no conspiracy that is at fault for mankind's plight, but rather mankind's plight results from its general immorality, selfishness, and lack of spirituality.

This document offers no reasonable solution, and in fact does not even really mention or acknowledge the primary problem that creates the necessity of the NWO. Once again that problem is of course the one of elimination of war in a world that has nuclear weapons and other weapons of mass destruction. This essay goes too far in imputing, to the formers of the NWO, a desire for creating immorality. The NWO is not immoral, but rather simply amoral. This is indeed its great shortcoming, and why it can indeed be characterized as the government of the anti-Christ, but it is important to understand this distinction, in order to understand how to effect a remedy.

- Bruce Beach]

LETTER FROM "THE GLOBALIST NEW WORLD ORDER"

An Anonymous Fictional Essay
taken from the web

Dearest Citizen of the World,

I believe the time has come to reveal to you some of the perplexities you have faced in recent decades. It is well for you to understand some of these things so that you might know how to behave in the New Order now taking shape in the earth. We want you to be able to become fully involved and integrated into our new society.

After all, this is for your best interest if you will do this. First of all, it is well that you understand some of our purposes so that you may more fully cooperate. I cannot tell you the hard times you will face if you resist us. We have ways of dealing with resisters. I am only telling you this now, since it is much too late to turn things around. The days of putting a stop to us have long since past. We have full control of the earth and its finance, along with the major media propaganda, and there is simply no way any nation or power can defeat us.

We have eyes in every level of government in every nation of the world. We know what is being planned, for our ears and eyes are ever present. State secrets are fully known to us. China recently accused the media in the U.S. of lying about Kosovo. Oh, you silly people, of course we lie. In this way we can keep the people unbalanced and always facing controversy which is very helpful to us. Have you not seen the talk show spectacle? Some of you believe we are the liberals and the good people are the conservatives. In reality, both serve our purposes. Each camp merely serves with the stamp of our approval but they are not allowed to present the real issues. By creating controversy on all levels, no one knows what to do. So, in all of this confusion, we go ahead and accomplish what we want with no hindrance.

Consider the President of the United States. Even though he regularly breaks every known check on his power, no one can stop him. He goes ahead and does whatever we want him to do anyway. The Congress has no power to stop him. He does what we want since he knows if he does not, because of his rather dark character, we can have him removed in a moment's time. Is not that a rather brilliant strategy on our part? You cannot take us to court because you can't see us and the courts are our servants as well. We run everything, yet, you do not know who to attack. I must say this invisible hand is wonderfully devised and without any known historical precedent on this scale. We rule the world and the world cannot even find out who is ruling them.

This is truly a wonderful thing. In our media we present before you exactly what it is we want you to do. Then, as if in a flash, our little servants obey. We can send American or European troops to wherever we like, whenever we like, and for whatever purpose we like, and you dutifully go about our business. How much more evidence do you need? We can make you desire to leave your homes and family and go to war merely at our command. We only need to present some nonsense to you from the president's desk or on the evening news and we can get you all fired up to do whatever we like. You can do nothing but what we put before you.

YOUR VAIN RESISTANCE When any of you seek to resist us, we have ways of making you look ridiculous as we have done with your militia movement. We have delighted to use this movement to show the world how impotent any resistance is. They look so silly marching around with their guns as if they were some match for our military. Look at what we did near Waco. Did the Davidian's little store of weapons help them? We have generously taxed you and used that money to make such sophisticated weapons you can in no way compete. Your own money has served to forge the chains we bind you with, since we are in control of all money.

Some of you think you may escape by buying some land in the country and growing a garden. Let me remind you that you still pay us ground rent. Oh, you may call it property taxes, but it still goes to us. You see, you need money no matter what you do. If you fail to pay your ground rent to us, we will take your land and sell it to someone who will pay us. Do you think we cannot do this? And with your ground rent we pay for the indoctrination of your children in the public schools we have set up. We want them to grow up well trained into the system of our thinking. Your children will learn what we want them to learn, when we want them to learn it, and you pay for it through your ground rent.

Those funds are also used for other projects we have in mind and our contractors are paid handsomely for their work. You may doubt that we own your children, or have such control, but you will find that we do. We can declare that you abuse your children when you spank them and have them confiscated. If they do not show up for school indoctrination, we can accuse you of neglect, thereby, giving them to us. Your children are not yours. They are ours. You must inoculate them, you must bring them to our hospitals if we decree or we will take them from you. You know this and we know this.

Through our electronic commerce we are able to see where you are, what you are buying and how much you have to buy things with. Where do you suppose we come up with our monthly financial statistics? Through the Internet and other sources we can even know how you think and what you say. It is not especially important to us what you believe as long as you do what we say. Your beliefs are nonsense anyway. But if you think you have a following, and we perceive that you might be somewhat dangerous to our agenda, we have ways to deal with you. We have a Pandora's box of mischief with which to snare you. We can have you in court so long you will never get out. We can easily drain away all your assets over one pretext or another. We have an inexhaustible fund with which to draw from to pay our lawyers. These lawyers are paid by you in the form of taxes. You do not have this vast supply of wealth. We know how to divide and conquer. Have we not brought down rulers of countries through our devices? Do you think your tiny self will be any match for us?

YOUR VAIN ORGANIZATIONS And, let us consider your religions and the "moral majority." The "moral majority" is neither moral nor is it in the majority. We have delighted to use this wet noodle of a movement to make ridiculous the Christian faith. The silly men who run that organization always end up with egg on their faces. We have always put them in defense of themselves as we have so successfully done with the NRA. We can make it seem by our media propaganda that the National Rifle Association is actually the New Radical Attackers.

Have we not turned the American conservative movement on its ear? If it serves our purposes we can use the conservatives to turn the liberals on their ear. It makes no difference to us but it serves to make you believe there are two sides struggling for their particular position. This helps to make things seem fair and free since everyone has a voice. Actually, there is only one side now with all kinds of masks on, but you are unable to penetrate our purposes. You see, we can do whatever we like and you can do nothing about it. Does it not seem reasonable that you simply obey and serve us? Otherwise, you get eaten up in the resistance you suppose will liberate you.

You cannot be liberated. Imagine how you can. We supply your fuel for your cars. We can turn it off whenever we like claiming that there is some sort of fuel shortage. What if your car breaks down? You cannot get parts for it without us. We supply all the money you use. At any whim of our desire we can stop the money supply or cause a complete crash all together. We can then order the president to declare all money worthless and that we will have to have new money. All of your stashes of cash will go up in smoke in a moment's time.

Don't you need food? If necessary, we can cause a trucker's strike which would stop deliveries of food to your local store. We can starve you whenever we like. You only have food because we have provided it to you from our table. During the great depression we controlled the food. We heaped mountains of food behind fences and let it rot. The hungry were then made to work in our labor camps even though there was enough and more to feed them. Do you really think you can beat us? You say you will hoard gold coins so you will still have money in the time of the crash. We can simply pass a law which outlaws the possession of gold as we have done in the past. If we find gold in your possession, we would simply confiscate it and put you in prison for breaking the law. While in prison you would be required to work in one of our prison industries. We have so formed a picture of the labor camps in our prisons these days that no one seems to object to them. We tell people that murderers should pay for their own keep.

No one seems to consider that we have the power to put tomato growers there also. We can pass laws that prohibit gardens and then make up some scientific reason why you may only buy food from our sources. If someone sees you growing tomatoes, they will report you to us and then we will have you in our fields working for us. Oh, silly nationalists, there is no escape for you, for since long before you were born, we were planning your capture. Your teachers and ministers have been forming your thoughts for us for generations now. You have no idea how to pull out of our influence short of suicide. Go ahead and commit suicide, it will only help us to deal with the excessive population. You cannot hurt us, find us, or even imagine what we are up to. I am throwing you these few crumbs only so that you may, if you have a little good sense, obey and follow our orders.

YOUR CONTROLLED MIND We run Hollywood. The movies such as Terminator and Armageddon, along with a great host of others, were simply created to get you thinking according to our directions. You have been made to delight in violence so that when we send you off to kill some bad man we have put before you, you move without a whimper. We have placed violent arcade games in your malls to prepare your young minds in the art of battle. We have made you to view our armies and police as the good forces and you submit to things that were unthinkable just a few decades ago. Our artful programs are all designed to help you to submit and even help the New World Order.

Star Trek, and other such creations, have taught you to simply obey orders from the new international rulers. Oh, silly people, you thought you were being entertained, while you were actually being educated. Dare I use the words, "brainwashed" or "mind control?" By the way, have you seen the new Star Wars? What a masterpiece of mental manipulation. Humans confer with nondescript beasts of all shapes and sizes and they confer in English. I wonder where those space beasts learned English. Oh, the simpleness of the mind of the citizen. He never considers he is being taken into fairyland. We have placed advertisements for Star Wars almost everywhere you go. You will find them in Wal-Mart, K-Mart, Taco

Bell and a host of our institutions of commerce. There is something we want you to learn from this movie. Or, perhaps it could be said, there is something we do not want you to learn. Either way, we will have what we want in the whole affair.

Of course, to keep you off guard we have instructed our elected officials to appear to be correcting the evil of our violence. President Clinton is now speaking against violence in Hollywood movies. This will not solve the problem, but will only make the people believe the problem is being worked on. Sex and violence are the very best powers to use to help us gain our advantage. How the people loathe to give up their sex and violence, so we place all they want before them. In this way, we keep them so occupied they do not have the integrity or brain power to deal with the really important matters which are left entirely in our hands. President Clinton has been very helpful to us. We knew of what character he was before we placed him as president. Exposing him was very helpful in adjusting the moral habits of the youth downward. This is to our advantage.

Even more agreeable to us were the vain efforts of those who thought they could remove him against our will. He is useful to us and he will not be removed by anyone until we are ready to have him removed. Excuse me if I seem to be mocking your system of beliefs, but they are rather outdated. Have you no eyes to see your vain liberties and your righteous pontifications are nothing before us? You can only do what we say you can do. We remove presidents when we are ready and the leader we set up will be there until it serves us to have another. At that time we place our purposed leader before you and you vote for what we want. In that way we give you the vain voting exercise in the belief you had something to do with placing your president in office.

OUR UNFATHOMABLE MYSTERIES Our recent war in Serbia has many purposes to it but we do not speak of these things openly. We let the talk show hosts blather all sorts of nonsense but none of it touches the core. First of all, there is a wealth of natural resources in Kosovo that we must have complete control of. Kosovo has large supplies of uranium in its soil and uranium is very helpful to our regime. Also, it suits us to keep all such minerals out of the hands of potential enemies. Milosovic has not been helpful in giving those resources into our hands so we simply make things difficult for him until he does. Even now victory over Yugoslavia is imminent.

We are reducing that proud nation to the level of humility we require from all people. After the war, if Mr. Milosovic does not sufficiently humble himself, we will take him to the world court charged with war crimes. We made up that term; rather ingenious, don't you think? How could there be such a thing as a war crime? The very nature of war is that the rules are off. It is so entertaining to watch the nations try to fight war according to the laws we have placed before them. The only war crime there really is only involves the crime of being against us. Anyone against us is violating our law. As you have seen when someone is for us we do not care what they do. Was not Nelson Mandella [sic] a bomb toting terrorist who killed many of his enemies? We made a hero of him.

We observe no laws when it comes to war. We do what we want, when we want and where we want. We can starve nations to death, we can ruin civilians and any other horror for which we would take our

enemies to court. Look at our example. We bomb Serbia out of its wits, bomb Kosovans out of their homes, poison their rivers and streams, turn off their electricity making a grand crisis in that country, and then we masterfully make it appear it is all Mr. Milosovic's fault and he needs to go to court for it. It is the same way we made our inferno at Waco look like Mr. Koresh's fault. Then there was our chief villain, Saddam with all of his weapons of mass destruction. Bad men are a dime a dozen and we can conjure one up whenever it suits us. This is really quite funny when you think of it. I am not one who is usually given to humor, but I do catch myself laughing sometimes at the absolute absurdity of the notions we place before you and you readily accept.

Do you wonder that the leaders of the world tremble at our presence? They know they have no power except the power we give them. We have no fear of Russia or China for we are already in full control of their system of things. China knows that we can freeze any number of its corporations in America and all of its capitol at the stroke of a pen. We use the nations for what we want to use them for. Everyone knows that they must yield to us or die. Fortunately, we have had a few resisters such as Saddam and Milosevic that have been helpful in showing the world leaders what we will do to them if they do not submit. There is only glory in following our purposes and doing what we say. If one does not, there will be such a sad and tragic result. I would really have you spared of such an end. But, then, again, if you are not spared, it is of no consequence to us. We will use you to alleviate some of the overpopulation problem.

YOUR SILLY REBELLION AGAINST OUR DOMINION Some of you have thought you could stop us by placing a bomb in one of our abortion clinics or in a government building. Silly souls! How can that hurt us? All that does is give us an example to use so that we might place more controls and heavy burdens on the population. We love it when you rebel and blow something up. You are our reason for making more laws against all those things which might contribute to your freedom from us. If someone did not blow something up on occasion, we would have no justification in placing more hedges about you. Can't you see how impossible it is for you to resist us? The more you wiggle, the more we squeeze.

Our kingdom is the kingdom of money. Excuse me, but I must confess that we are the rulers of the kingdom of non-money. You must see the humor in that statement. We have given you a piece of paper or some numbers on a computer screen that we have termed money. It is backed up by nothing and proven by nothing but what we say it is. We create it from nothing, we print it, we loan it, we give it its value, we take its value away. All things that have to do with money are in our hands. Think of it, what is it that you can do against us without money? If you try to resist, we can cancel your credit or freeze your accounts. Your cash is easily confiscated. We have made so many rules in the realm of living that you cannot live without money.

Camp on government land and you must move in two weeks. You cannot grow much of a garden in two weeks. Many of our wilderness trails are entered by permit only. We have passed laws that do not allow you to live in trailers over a certain period without moving to another location. Have you not thought it ridiculous that we will allow a man to live in a box full time but we will not allow a man to live in an RV full time unless he is in a taxpaying campground? We want you to be in the system. When you are buying a house, we not only receive the tax revenue to use for our purposes, but we gain large increases

from the interest on the loan. You may pay for your house two or three times over from the interest alone. The interest is also taxed which is again placed for use in those sectors of influence we choose.

We do not want you to escape free and that is why we have made it as we have. You are our property. We will not permit you to buy or sell unless you submit to our mark of authority. If you go to court against us, we will wear you out there and in the end you will lose. If you use violence, we will end up having you in one of our labor camps, more specifically called prison industries. You need our money, our entertainments, our fuel, and our utilities to function and if you don't have them, you feel deprived. By this, you are made to yield to our will. You don't even know how to think anymore since we have thoroughly emasculated your religions and your faith in God. Now, you only have yourself and we have gotten that self pretty well chasing its tail these days.

I hope this little note is sufficient to inform you what the new millennium is all about. The 21st century is our century. You may enter it if you do as you are told. We have no intention of playing around with your so-called human rights or your so-called Constitution. These things were only used for our purposes for a time. Your Constitution is a joke to us and we can do with it what we please. It never occurred to you that 50 years ago your Constitution was used to refuse abortions. When we decided to have abortions legalized we used the same Constitution to justify it. Your human rights are what we say they are and your Constitution is what we say it is. We have only used this phrase of human rights to keep things sufficiently in turmoil. The more things are unsettled, the better we like them until we have everything in complete servitude. This little letter may offend you, since I speak so plainly, but that truly is no concern of ours. Too bad isn't it? For all of you zombified sheep that is.....

Individual Agricultural Recovery After Nuclear Holocaust

"The Farmer Comes First in the Reconstruction of Society"
(Techniques for Agriculture Recovery)

bruce@webpal.org

[Bruce M. Beach](#)

Table of Contents:

Prolog: [and about the Author](#)

For over forty years the author has proclaimed the necessity of nuclear survival preparedness. These pages, however, are concerned with the next step - recovery after nuclear holocaust. It is the author's recognition that "*the farmer must come first*" that has led him to develop these pages.

Introduction: [What the Farmer Needs](#)

The societal importance of the farmer
and how society needs to be reconstructed
to reflect that importance.

LETS: [How to operate without money](#)

This will be one of the major problems facing the farmer - and here is the solution. Barter is good - but this is much better. This webpage is actually in another section - but it is so important that it is again listed and linked from here.

Radiation: [Fallout and Radiation *IN FOOD* after a Nuclear War.](#)

There is so much information on this subject that this links to a separate Table of Contents where you will find information on everything including:

Overviews and explanations for the Layman
Fallout on the Farm.

Measuring Radiation in Food
Removing radiation from food and milk
Highly technical documents for health professionals

For much more detailed information about the effect of nuclear weapons, the measurement of radiation, radiation measuring instruments, and so forth, for *other* than in food see: [the Resources Section in the Root Web page](#)

[Agriculture: Farming After a Nuclear War](#)

There is so much here also that a separate Table of Contents is provided. Because many people may be returning to farming after several generations - basic farming skills are covered here but there are also some techniques that modern mechanized farmers may have ignored (such as seed saving and the use of humanure) and that may be of use to the experienced farmer.

There is also a lot about simplified farming in the separate Table of Contents linked from the Pioneering section below:

[Energy: Alternate resources.](#)

There are covered here a variety of alternate energy resources:

Stills for making an alternate to diesel fuel.
Generating electricity with home made generators made from:
Truck brakedrums using:
 Windpower
 Waterpower
 Bicycle power
 Small engines, etc.
Old electric motors
Homemade solar power heating systems

[Technology: Simplified Machines and how to make things work.](#)

Explanations of how many machines work and alternate approaches where they can't be fixed.

[Pioneer: The way they did it in the old days.](#)

Many skills that have been practically lost but that may be needed for a time during recovery.

What ???: **What else might someone recommend for this series?**

What things will farmers need to know that I have not covered here?

Prolog: **About the Author**

The purpose of this web page, as with many others that I written, is to assist mankind in the restoration of society after a nuclear holocaust, which I strongly anticipate to be its destiny.

The sub-title of this essay "*The Farmer Comes First in the Reconstruction of Society*" is self explanatory. Not only is it an obvious truth, it is also a subject dear to the author's roots. While it is true that he is the first generation in his family to be born off the farm, his wife was born on the farm and mostly for the exception of educational years and military service, he has lived in farming communities and among relatives that have remained in that industry.

While the author is particularly suited to deal with the problems of societal reconstruction, having been formally trained as an institutional economist, these subjects that he has written upon for many decades seriously suffer from the defect that there is almost total lack of dialog or critique because they are a subject in which there is practically absolutely no interest on the part of others. If you wish, you may:

Introduction: **What the Farmer Needs**

For the farmer to accomplish his task,
he must have three things.

security

incentive

resources

While confiscation, plundering, theft, exorbitant taxation, forced labor, and other similar forms of social transfer can accomplish short term goals of acquisition, in the long run they are very inefficient. As well as are over-centralization of authority and bureaucratic overburdens.

Free competitive markets, individual initiative, entrepreneurship, private ownership of the means of production, and the other accruements of a free society boundlessly demonstrated their worth in the productivity of the North American farmer when combined with plentiful fertile land, semi-stable markets and revolutionary advances in technology and the biosciences. These permitted, in the last two centuries, an inversion of 90% of the population living on the farm and 10% off to 10% living on the farm and 90% off with there still being great surpluses of production for export.

With all that - the often instability of many of the food product pricing markets, the machinations of the banking and finance industry, along with the vagaries of weather and pestilence combined with the oft-time seeming burden of government regulations to make farm life one of turmoil as society struggled to find a just method of reallocation of resources from an overproductive industry to other fields which were also struggling with problems of oversupply.

The concern for justice, both for the farm community suppliers and the non-farm community consumers, must ever remain the foremost consideration of those who try to regulate the agricultural field at any time. Pure laizze faire is not the answer, as evidenced by what happened to the farm community in the Great Depression, and there is no question but that the instability of completely free markets can be equally detrimental to producer and consumer alike.

Scale of production, scale of processing plants, the means of transportation and distribution, costs for machinery, fuel, fertilizer, seed and other resources are all matters that have often been outside the control of the individual farmer or even the farm community as a whole. Any concept that individual farm families can retreat to an isolated unit on their own is totally unrealistic. The great productivity that was achieved in North America was achieved through efficiencies arising out of social organization, specialization and economies of scale.

While there was bounty, there were also many undesirable effects. Styles of life that were not pleasant to those entrapped in them - such as migrant labor, or often what amounted in fact to even slave labor for many producers in the world market. There was the expense of high production at the cost of an often onerous burden to the environment in the destruction of resources that would sometimes take centuries to replace, if they were replaceable at all, and there was reasonable suspicion that some of the methods of production resulted in product that was not as healthy for the end user as it should have been.

To the survivor's of a nuclear holocaust, many of the above points will seem to be but quibbles, and they will simply wish for the "good old days" before the nuclear war. However, we must remember that it was the power of the over centralized bureaucracies and the gigantic soulless corporations that created the problem in the first place. It was their unjust international transfer of resources and products of labor and the lack of universal concern for justice in economic exchange between all nations of the world in both agriculture and other economic spheres that created the social unrest, and eventual holocaust. It is not that institutional greed is more evil than individual greed, it is just that it is less amendable to rectification. Over the last two centuries the resulting terrible cost to the farm community has not been just an economic one but also, for untold tens of thousand families, personal loss of loved ones who were drawn up in the maelstrom of international conflicts, far beyond their personal interest, never to be seen again.

There is no question but that in time, productivity can be restored. However, the real question is - can justice be established - because that is something that has never been achieved. Justice, in this world, has always been, and always will be relative. Because there is always a better way and a worse way, we should try to find the better way. If we decide that we don't like peace, then we can always go back to war. And there is no question, that if we work at it, we can be ready for another nuclear war in twenty years.

Top down design has been the problem. Direction by gigantic entities of power, influence and control. The rule of power politics and special interest groups. The solution is bottom up selection WITHOUT POLITICS. The top will then reflect the aspirations of the bottom. All of this, I explain in the

[LETS](#) system.

Also, under LETS, no matter how misguided or mistaken the policies in the higher echelons may be, there still remains a degree of autonomous local control that permits the amelioration of what could otherwise be intolerable suffering.

After Nuclear Holocaust](#)

Table of Contents:

[Overview: Layman's overview on Radiation in Food.](#)

A non-technical overview of how radiation gets into food. The effect that it has and what can be done about it.

[Food: Shorter letter on radiation in Food](#)

This was in response to a study that I commissioned. The full report is the next item.

[Radiation in Food: Explanation by a microbiologist](#)

This is the full report by the microbiologist, Aina Shapley. It covers the measurement of radioactivity in food and WATER. [There is also a copy of this available in .pdf](#)
(for which you need a pdf reader)

[Risk: Radiation Risk and Ethics](#)

There was much scare talk about the effects of peace time radiation. This professional paper gives a much different view. It helps to get things into perspective.

[Measurement: Manual of food quality control - radionuclides in food](#)

This .pdf document is the prime authoritative document on the subject. I obtained the information through its author Edmond J. Baratta, International Expert on Radioactivity with the US Food and Drug Administration at the research facility in Winchester, Massachusetts. The document is published both by the FDA and FAO (Food and Agricultural Organization of the UN). 133 pages in length and both very technical and readable in its detailed description of the methodologies and processes involved. However, since it does carry a copyright, and the government charges hundreds of dollars for a copy, this file is presently sealed until after the nuclear war.

[Milk: Removal of Strontium 89 and 90 from milk](#)

How to remove radiation from milk in a processing plant. This is the 61 page masters thesis of David Gene Easterly. I have the author's personal permission to republish it here.

[Potatoes: How to remove radiation from potatoes](#)

(link not yet working)

Now, if I can find this information again.

[Radiation in Food](#)
[Table of Contents](#)

Prolog: **Nature of the Problem**

Radiation does not harm food. Radiation in food is very harmful. One needs to make the distinction. Without entering into the debate, about whether microwave ovens harmed food, destroyed vitamins, etc., the irradiation of food in general, and by most researchers, has not been considered as being harmful. In fact it has been found to be very beneficial, for the same reasons that we cook and preserve any food.

However, radiation *in* food is *very* harmful because it is then absorbed by the consumer. Radioactive particles give off energy. This energy weakens, destroys, or otherwise harms cells. One might picture it as little microwave ovens, inside the body, cooking it from the inside. What is cooked are the cells in the body. Just like with any burn, there may be degrees. Sometimes a cell is destroyed completely and if enough are destroyed then we become sick, weaken, or die. Other times, radiation may only damage or deform the cells. The deformed cells may multiply, causing cancer which is one of the main longterm concerns about radiation.

Radioactive particles are isotopes of minerals that the body naturally seeks and absorbs. We call them isotopes because in the nuclear chain reaction process they have obtained one or more extra electrons. In this state they are unstable and will eventually give off the electron as energy and thus return to their stable state. It is that energy which is harmful.

Radioactive isotopes give off their energy in a random fashion but at a predictable rate. That is like saying that everyone in a population will die within 100 years. This we can predict with high probability and build mortality tables to that effect although we don't know when any one individual will die. The

same is true with isotopic atoms. We know that a population of them will give off all their energy in a predictable time, although we do not know when any one atom will give off its energy.

Just as different species of animals have different average lifetimes, for example shorter for fruit flies and dogs than for people, and longer for some species of parrots and turtles than people, so also do the isotopes of different minerals have different average lifetimes. For some isotopes, indeed most, the average lifetime is very short by human lifetime standards. The isotopes last only milliseconds, or less. Gone in far less than the blink of an eye. Their energy makes up what we call the initial radiation of an atomic blast. Most other radioactive particles decay, that is to say lose their energy in a matter of minutes, hours, or days. They linger around to cause the problems that we see in fallout and are the reason that one needs a fallout shelter for a few weeks after a nuclear war. But even with the latter, most of the radiation is gone in a couple of weeks.

The length of time that it takes a quantity of a radioactive isotope to lose half of its energy is what we call its half life. This can vary from milliseconds to a great many years. As mentioned, for most isotopes it is all over in milliseconds, but the ones that we are most concerned about take decades. Let us suppose that the half life of an isotope was 50 years (there are a couple that approximate that) and that we had a sufficient quantity of it that it was giving off 100 rads. Then in 50 years the radioactive source would be giving off 50 rads. In a hundred years it would be giving off 25 rads. In a hundred and fifty years it would be giving off about 12 rads. In two hundred years it would be giving off 6 rads.

For all practical purposes that source would be depleted, that is to say giving off less than 1 rad in three hundred years. As to when it would reach zero that is sort of the old Greek problem of when the bear would get out of the cave. Starting at the back of the cave it has to go half of the distance first to get out. Then at the half-way point it has to go half of the remaining distance to get out. And then at the quarter-way point, half that distance again. And so on. Logically, (this is the problem with logic and math) we can say the bear will never get out of the cave. It is what we call an asymptotic problem.

So there may always be some residual radiation from a nuclear war. Indeed, some people have speculated that there is already residual radiation on the planet from pre-historic nuclear wars. We also get background radiation from the cosmos. So radiation is always with us. Indeed, some radiation may not be harmful. It may even be necessary. Just as arsenic is considered a deadly poison, nevertheless, without any arsenic in your body - you would equally well die. Enough water and you will drown. Not enough and you will die of dehydration. Balance in all things. Probably regarding radiation also. Experiments have shown that people who live at higher altitudes and who therefore receive more natural radiation from the sun and cosmos, have lower incidence of cancer.

But here, we are talking about too much radiation. And most seriously, radiation that has gotten right into our systems through food. As before, a little bit may not hurt, but we are talking about lots. How it happens is this. The food chains filters in the radiation because it is trying to concentrate the minerals and can't tell the difference between a radioactive isotope of a particular mineral, and its non-radioactive isotope variety.

As an example, let us look at iodine. Too much iodine in the body is poisonous. Too little is also very detrimental. The thyroid absorbs iodine for the body. Because we naturally get iodine from the food we eat and because it is generally added to salt, there is little likelihood that today (although in previous centuries it was a problem) that one gets too little. A nuclear explosion creates isotopes of iodine (I-131 and I-132). These have a half life of about 8 days. This means that it will hang around for about a month after a nuclear explosion. That is the reason that we take Potassium Iodide pills, for a month after a nuclear explosion, so that the thyroid will be loaded with iodine and won't accept anymore iodine during that period.

But here is what happened, during the atomic experiments, when people didn't know about this and didn't take the potassium iodide. The radioactive particles were carried up into atmosphere and settled down on the milk shed of southern Utah. There were so few particles that the radiation meters couldn't measure them. However, they washed down into the soil and the bacteria in the soil, seeking minerals, absorbed them in preference to other inert matter. The lichen in the soil, also seeking minerals, then absorbed the bacteria. These were further absorbed by the legumes and higher grasses. Then a cow came along and ate the grass. Each organism concentrated the minerals because that is what it was really seeking.

Indeed, within the body, certain organs filter out certain minerals also. The bone marrow seeks calcium and such, as do the mammary glands which produce milk. As an aside, concentration of radioactive particles in the bone marrow causes leukemia, actually one of the more prevalent forms of cancer caused by radiation. And leukemia destroys the body's immune system which makes it fatal because of all sorts of causes. However, to continue with our journey of a radioactive particle. This particular one, particularly ended up in the milk. When the milk was drunk by a nursing mother, her system too concentrated the mineral iodine, especially in her milk and she thus passed along the radioactive isotopes to her child with their mother's milk. Finally the child's biological system concentrated the iodine in its thyroid and radioactive isotope had by now become so concentrated that if we held a radiation detector up by the child's neck near the thyroid - it buzzed like a rattlesnake.

The radiation had become very detrimental to the children, and there was a high incidence of mental retardation in the St. George area of southern Utah as a result of the atomic experiments in Nevada. Indeed, scientific studies showed that approximately eleven thousand cases of cancer occurred in the general population of the United States, as the result of nuclear testing. Before we get too excited about that, one must remember that about 20 times that number of cases were caused by desired uses of medical and dental x-ray and other sought after uses of radiation.

Yes, radiation causes cancer. So does water cause drownings. And automobiles cause much greater numbers of fatalities than both put together. Before automobiles horse accidents also caused many human deaths. In all these matters, one has to weigh the relative social benefits before they dispense with radiation, water, automobiles or horses. Every activity, whether manufacturing or mining, whether production or sport, has its attendant risk. Pollution from burning coal has caused much more in the way of cancer than industrial radiation ever has, so let us keep things in perspective.

The issues, in this essay, and in the accompanying scientific papers, are how much radiation we will be dealing with for how long a period of time - along with the techniques of dealing with it.

Click here to return to the
[Layman's Overview](#)
[Table of Contents](#)

Short: **The Short Term Problem**

In the short run after a nuclear war the problem is fallout. Fallout that prevents work outside. Fallout that gets onto food. Fallout that contaminates the soil and prevents the immediate planting of new crops. Fallout that kills the animals. Fallout that contaminates the water and streams. Fallout that blows about in the very air itself.

But fortunately all this is a short term problem of just a few weeks and the radiation in the fallout will decay. Following that, one will then have to deal with the problem of long term residual radiation. However, that is a subject for another section. The problem being discussed here is short term radiation and in the next section the short term solutions for dealing with it.

Click here to return to the
[Layman's Overview](#)
[Table of Contents](#)

Survival: **The Short Term Solutions**

The good news is that food that was grown before the nuclear event, does not become radioactive. As long as the radioactive particles that fall on it are removed then it is perfectly okay. Wash off a banana - then peel and eat it. Wash off an egg - crack it open and it is ready to cook. These principles apply to any fruits and vegetables. Scrub the dirt off the potatoes and they will be perfectly fine. Open any can or closed container and the food will be unaffected. A case of tomatoes could have been sitting outside in the fallout and all one would need is to wash off the can and open it.

Some food may take a little more care. Grain stored in a grainery where dust can have gotten in may need to be washed. Animals may have died or gotten sick from the radiation and needed to be slain, but so long as care is taken in handling the exposed part of the animal the meat will still be okay. We are only talking about immediately after the event. Animals that have had an opportunity to forage in fallout

contaminated areas will assimilate the radiation into their bodies and also into products such as eggs and milk.

So, this is the good news. Immediately after a nuclear war, any food that is still around and that would otherwise be edible, will still be edible. If it has spoiled from lack of refrigeration, or some other cause - then that is another matter. However, in rural areas that have storage facilities there should not be any lack of food of some type. In fact there may well be more food than survivors, but eventually they are going to need a new crop - and that is an entirely different matter, covered in a separate section.

Click here to return to the
[Layman's Overview](#)
[Table of Contents](#)

Long: **The Long Term Problem**

The long term problem of radiation after a nuclear war arises from the fact that some isotopes, as explained in a previous section, have half-lives of decades. Those isotopes which have half-lives of centuries are not really a problem because they give off so little energy during a human lifetime that they are irrelevant.

Neither are the isotopes that we are talking about an external bodily threat because they are usually found in very small quantities. However, because they are concentrated by living organisms, and because in food they become internal to the organism, they can be a serious health concern in food. The two most serious problems, long term, are isotopes of cesium and strontium, both of which in themselves are desirable minerals for many living organisms. The organism is unable to distinguish between a beneficial and a harmful isotope and will therefore equally absorb those which are harmful.

Exactly what quantities are of serious concern and how they may be detected and measured are explained in technical papers in this series. The next section will explain, in generalities, how the problem can be dealt with. At present there is no coterie of professionals trained, equipped or experienced to deal with the technical issues. These technicians will have to be developed from individuals with related technical training - after a nuclear holocaust - and it is for that reason that the necessary technical papers are provided here.

Click here to return to the
[Layman's Overview](#)
[Table of Contents](#)

Solutions: The Long Term Solutions

The long term problem of radiation in food is indeed a horrendous one, but not an insurmountable one. We are used to processing food and to preserving it. This is just an additional step like testing for bacteria or other spoilage. Unfortunately, it is not one that is as easily done at home as other food preparation methods have been in the past. Still one can take care to make sure that radiation does not get into their home produced crops - in the first place.

Some of the necessary procedures may at first seem arduous but that is just a matter of custom. Because of radiation, there may be areas of land which one will wish to avoid in growing crops. But really, that is no different than today where some areas are avoided because they are too rocky and others because they are too swampy.

Some plants prefer other minerals rather than cesium and strontium. Those plants and soil with the alternate minerals, or fertilizer containing them, can be used. These again are matters of expertise that need to be developed in each local soil and plant area, so while information assisting those determinations is presented in the accompanying technical papers it is a matter beyond the generalities of this essay.

I have often stated that there are long term strategies for dealing with radiation in food. Many times I have been asked to list examples in one place and so to satisfy that request - I do so now:

1. Selection of land that is not radioactive.
2. Deep plowing land to turn it over and bring non-radioactive soil up to the surface. (This works well only where there is deep topsoil).
3. Selecting plants to match the soil characteristics, i.e.. that they have no desire for the radioactive minerals that are in the soil.
4. Fertilizing the soil with a mineral that will be taken up in preference to the radioactive mineral. (Oftentimes this is calcium as found in marl).
5. Composting and creating soil that does not have radioactivity in it and then using that soil in a green house, or otherwise protecting it from contamination.
6. Using hydroponics gardening or other similar methods that tightly control the mineral uptake of the plants.
7. Using distilled water on the plants. (Unfortunately this deprives them of the minerals that they

need and minerals then need to be added to the water).

8. Removing the radioactivity from the food. See the article on milk processing for example. There are other techniques for other foods.

9. Storing the food until radioactivity decreases. This works well for the radioactive iodine isotope in powdered milk and cheese.

10. Avoiding foods that have high radioactive content. For example, soy milk might be substituted for dairy or mother's milk for children.

11. Eating lower down on the food chain. As explained in an earlier section, radiation is concentrated by living organisms. Each higher level concentrating it more. It is possible to make flour directly out of bacteria. Using non contaminated oil sources from wells or tarsands would then produce pure uncontaminated flour.

12. Avoiding meats and animal products because they are high up the food chain.

13. Classifying foods by radioactive content and using high content foods for feed for animals that will neither produce product nor be eaten - such as dogs. Coincidentally, because of their relatively short life expectancies, in many cases this will not be detrimental to them.

14. Reserving foods with high radioactive content for individuals with short life expectations. Because at some levels it takes twenty years or longer for the radiation to take effect this will not be detrimental to people who are already elderly. Let them have the meat, fresh milk and eggs.

15. This is by no means an exhaustive list and still other strategies will be developed with experience. Food radioactive content can be indicated in packaging, the content can be certified and varieties of foods can be imported from areas that are radioactive free for that particular food. Eat well and prosper.

MENU: [HOME](#) » [Reconstruction](#) » [Recovery](#) » [Renewal](#) » [Survival](#)

October 13, 1985

Dear Bruce Beach:

I am starting to understand why the information you want is not in literature. The most obvious, the one you are well aware of, is that experts plan to eat stored food. There is enough of it around in North America. I have seen the problem of food discussed in regard to England - their worry is that there just wouldn't be enough food of any kind to feed the surviving population. Therefore, measuring radioactivity in food is not the major problem.

If the attack came at harvest time, in most areas the food wouldn't be harvested because of the external radioactivity. If it came in spring, the plants would be killed or stunted over large areas. There probably would be some areas where there could be some harvest. Here you would have to compare the radioactivity of the washed or the processed product to what you had in stored food. Storage of the fresh food for a few more months might bring the radioactivity down to a safe level. A number of experts have implied that if you survived the first year, you would survive. I don't know a thing about "nuclear winter".

It comes down to measuring radioactivity (fallout contamination) in stored food. It is possible you might get large quantities that have no contamination at all or less than double of normal background. Then you can use a label "no significant radioactive contamination". A Geiger-Mueller counter would be very good for this. If you plan to look after thousands of people, you would need a lot of them.

The problem starts when the food is substantially contaminated. What kind of classification would be meaningful to the general public? There also would be a social problem. You and I might be willing to eat the more contaminated food so that our children and grandchildren could eat less contaminated food. But what about people in thirties and forties who wouldn't have children in the group you were working with or didn't have children at all. Would they take risks for the future benefit of society? At present, I don't find this a very prevalent trait in our society. If things were really scarce, one would also have to protect the individuals whose skills would be essential for the survival of the greatest number of people.

Back to science. You would like to have figures on bars of food telling how much you could eat without getting radiation sickness. For example, a label on a wheat bag saying you can eat 1 lb/day for a year (indefinitely) and not get radiation sickness. To arrive at this figure one would have to take into account the decay rate and the rate at which it is accumulating in the body. Assume that the consumer has no accumulated radioactivity. Despite the oversimplifications to the extent that you might consider it inadequate, I have not come across anything as complicated in the scientific literature. Needless to say I can't do these calculations.

I will be asking this question of a number of health physicists and see if they theoretically could make

some approximations and provide us with a method of doing it, and second, if they would be willing to do it.

Another approach. A Geiger counter would be calibrated against a certain radionuclide (whatever standard you had available), let us say cesium. Now we could have a label on a wheat bag saying "on this date it has the equivalent of X mc of cesium/lb" (meaning, if all the activity measured by the Geiger counter was due to cesium, that is how much it would be; I have invented a new unit). I would have to find somebody who would be willing to estimate how many rads of body burden it would result in if you ate one lb of it. This would have to be modified by (1) what time interval after the measurement was done you started to eat it, (2) the quantity you are eating, (3) how many days you will be eating it, and (4) even the length of time after the explosion has some effect. Next week you get a bag of corn with Y mc/lb of cesium equivalents. The following week it might be back to wheat with a higher level of contamination than before. In effect, each person would have to keep a daily track of their body burden. All of this ignores the external radiation you had received or will be receiving, what internal radiation you had received from inhalation and ingestion (water and other foods) or will be receiving, age of person, weight of person, persons nutritional state and health. Are you starting to understand why this information is not available?

In some ways it might be the best to say by what factor a certain food is above the normal background radiation of the world. There would have to be some chart where one could read off what it would be a certain number of days after testing. This could be related to rough categories for eating indefinitely: completely safe for everybody at 1 lb/day, slight danger to children and pregnant women, danger to children and pregnant women and slight danger to others, danger for everybody. One problem would be that as time went on it would be harder and harder to get a normal background reading. There is no way of getting around that people would be eating different quantities of varying concentration at different times.

My personal reaction is to keep it relative and eat whatever has less ticks with a Geiger counter. If you didn't like the number of ticks, you wouldn't have any choice anyway. Starving to death isn't an easy way to die either. If one looked only for what was relatively better, accurate standardization of a Geiger counter wouldn't be as important. You would need a lot of Geiger counters and a lot of people who understood enough about radioactivity to use a Geiger counter in a meaningful way. I see education of people as one of the biggest problems. How many people do you know in your town at present who know properties of radiation? To how many people would it be meaningful if you quantified the radioactivity?

You were willing to consider going the whole way and getting a spectrometer. That way you would know exactly how much of what you got. Dr. Prudham's question was what good would it do to you if you did have that information? I couldn't answer that question. If you are still considering such a possibility, I would like you to answer the question, in case someone asks it of me again.

Dr. Eaton's comment was that there are so many parameters that it is impossible to work with something

like that. He expressed his sympathy to me when I said that you wanted definite figures.

Since there are more than 10 variables, there are more than 100 possibilities. Judging from the literature, there certainly should be a few people who could take one or two variables and come up with some figures. The only problem is that they would not fit the other 99 cases.

I certainly won't be able to provide you with the information you want, but I am getting close to being able to tell you who are the people who would have the best understanding of the subject. Some of them are acknowledged at the end of the book "Nuclear War Survival Skills".

Hopefully, we come across somebody who is willing to play around for a few days and see if he can come up with a way of quantifying the relative danger of contaminated food.

I have written some 14 letters and I will have more written by the time you get this letter.

You have expressed quite an interest in I-131 in milk and the possibility of decontamination. It is not something that I would recommend. If you will have to stay in your bunker for 6 weeks, the cows would probably be dead. If there are cows and there are people to milk them, the dairy plants are also standing. Convert the milk to canned milk, powdered milk, sterile milk (the kind you can buy in stores now) or cheese and wait until the I-131 decays. Meanwhile, pass a "law" that all canned milk and powdered milk on hand has to be reserved for children under 1 year of age. If the supply is greater than what babies would need for next 3 months (if the cows are alive and there is a prospect of returning to normal), older children could have milk too. If there was plenty of fresh milk, adults might drink it, provided they took KI tablets. (I personally don't see why anybody would want to do it.) A decontamination plant would have to be completely operational before the disaster, otherwise there wouldn't be enough time to get it going before the danger would be over. Besides, there might not be any milk anyway.

The reason why there is so much literature on I-131 is because it is one of the greatest dangers from nuclear power plants. I will find out if the Bruce Nuclear Plant is of the type that could give off large quantities of I-131.

This gives you an idea of what I am doing. You might want to see me. I will be available next week, I will be visiting my relatives in Michigan this Thursday.

Sincerely,
Aina J. Shapley

Preface: Since Mrs. Shapley completed this study in 1985, there has now been extensive experience of the contamination of the food chain as a result of Chernoybl. In light of this, and other research, Mrs. Shapley, who has remained an active T.E.A.M. Leader in the Ark Two Community, is preparing an addendum to this study. The plan is to post the addendum when it is ready.

Study prepared for Bruce Beach on the

CONTAMINATION OF FOOD PROBLEM AFTER NUCLEAR WAR

December 4, 1985

Note.

The vast majority of papers referred to have been copied.

A lot of subjects have not been discussed, e.g. units, different instruments, properties of radiation, and dose calculations. They are described in health physics text books. You have *An introduction to radiation protection* by Alan Martin and Samuel A. Harbison and *Radiation Protection* by Jacob Shapiro.

Abbreviations:

OTA = Office of Technology Assessment

DEF = Dose Effectiveness Factors

MT = Megatons

MR = Milliroentgens

R = Roentgens

RAD = Radiation Average Dose

REM = Radiation Equivalent Man

R, REM and RAD are essentially equivalent

Overview

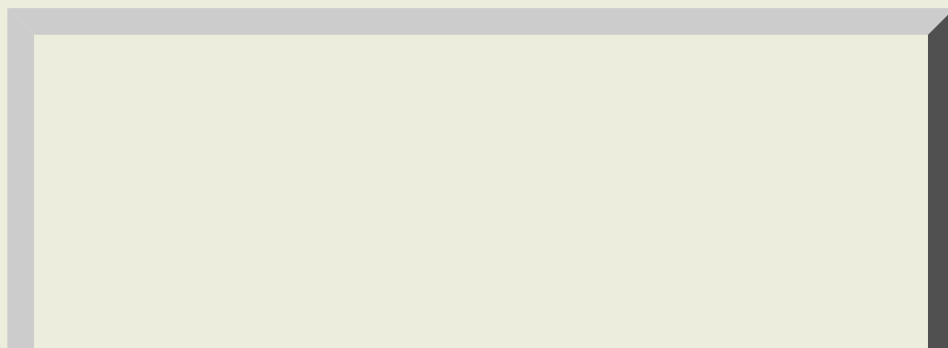

Shapley Page 1

The most thorough and the most authoritative book on *The effects of nuclear weapons* is a book by that title compiled and edited by S. Glasstone and F. J. Dolan, 3rd ed., U.S. Department of Defense and U.S. Department of Energy, 1977. This book is referred to in almost all the articles and books dealing with a nuclear war. It is the source book on the description of the different atomic bombs, their uses and the consequent explosive blast, direct nuclear radiation, direct thermal radiation, EMP, and fallout.

The most thorough study of the probable consequences of nuclear weapons on the United States, as well as on the Soviet Union, was done by the Office of Technology Assessment (OTA), *The effects of nuclear war*, 1979, (for complete ref see [\(Shapley p. 8\)](#) They considered five major cases ranging from 1 atomic weapon to an all out mixed military and population attack of 6500 MT (half of it air bursts and the other half surface bursts).

We are interested in the latent health effects. I have copied 7 of the most interesting pages and given them page numbers in the upper right hand corner. The risk factors for the latent health effects, as well as the sources and the compromises they made to arrive at them are given on [\(Shapley p. 2\)](#) The risk factors they used for latent cancer deaths from internal organ exposures are given on [\(Shapley p. 3\)](#)

Before we go any further, we have to examine some of the categories they use for the way they present their data. Local fallout is what is deposited within 24 hours after the burst. The fraction of nuclear debris in the local fallout varies from 0.8 from surface bursts to 0 from airbursts. Worldwide fallout can be of two kinds, tropospheric and stratospheric. Tropospheric fallout is short (weeks). Stratospheric fallout is in years, e.g. removal half-time for Cs-137 is 5 years. Stratospheric fallout can be from 0 to .99 of the fallout, depending on the altitude and size of the weapon.

which are a reprint from
OTA (Office of Technology Assessment),
The effects of nuclear war

Shapley Page 4

For the worst scenario (6500 MT) they predict 100 million early fatalities (could be as high as 160 million). On ([Shapley p. 5](#)) they give a comparison of latent health effects from external and internal exposures from local fallout. By far the most of the effects are from external exposure rather than from internal exposure. For cancer deaths only 7% are from internal exposure and for thyroid cancers it is less than 1%. On ([Shapley p. 6](#)) they give worldwide fallout health effects for the U.S. The most interesting thing about this is that they see carbon-14 as the biggest problem in this category. Next table ([also on Shapley p. 6](#)) is total latent health effects and the numbers do look high. The thing to keep in mind is that these figures are for the subsequent 40 years. 6.6 million cancer deaths in 40 years is about 40% of the current U.S. annual rate. It is interesting to note that there are almost as many latent health effects outside of the U.S. (e.g. 4,545,000 cancer deaths). These would be distributed all over the world. If there was a similar attack on the Soviet Union, there would be 167,000 cancer deaths plus all the other latent health effects in the U.S.

([Shapley p. 7](#)) and ([Shapley p. 8](#)) give the summary of their conclusions.

([Shapley p. 9](#)) gives their references.

CONCLUSIONS

The long-term major adverse health effects resulting from hypothesized nuclear scenarios covering a nuclear employment range from a single weapon to a massive attack utilizing thousands of nuclear weapons were calculated. The general findings were as follows:

1. Several million latent cancer deaths could result from a massive nuclear attack directed at urban-industrial, military, and counterforce targets. **note* However, without improved civil defense capabilities, the number of projected latent cancer deaths is small when compared with the total number of early fatalities. Similar magnitudes of thyroid cancers, thyroid nodules, and genetic anomalies are also projected.

**note 5 million worldwide cancer deaths over a period of 40 years represent an increase of about 2 to 3 percent of the current cancer death rate. - They must be using Northern Hemisphere or something. For U.S. this would be closer to 30%.*

2. For limited attacks where the target points are in relatively low population density areas, the resulting number of latent cancer deaths could be large when compared with the total number of early fatalities.

3. For nuclear employments that are dominated by airbursts, the projected number of long-term adverse health effects that would occur in the attacked country is only a small percentage of the projected worldwide total.

4. For airbursts, the resulting number of long-term adverse health effects are larger for low yield weapons (40 KT) than for high yield weapons (1 MT) when compared on a per unit

fission yield basis. The reason is that the nuclear debris of low yield airbursts is confined within the troposphere, whereas most of the nuclear debris from high yield airbursts enters the stratosphere.

5. Increasing the local fallout decontamination effectiveness to residual levels below 0.1 will not materially decrease the total number of long-term latent health effects because the local fallout post-shelter population dose constitutes only a small

Shapley Page 8.

fraction of the total population dose when the fallout levels are reduced by a factor of 0.1 by decontamination.

6. The use of low yield weapons in the surface burst mode rather than high yield weapons as air bursts would increase the long-term latent adverse health effects in the country attacked and decrease the number of the effects in the rest of the world.

7. For massive nuclear attacks (Scenario 5a and 5b), although the number of early fatalities are sensitive to the shelter protection provided the population, the projected total number of latent health effects are relatively insensitive to the shelter protection provided.

THE MOST IMPORTANT FISSION PRODUCTS IN FOOD

Shapley Page 10

There are a number of good books on the subject. The most valuable probably is *Radioactivity and Human Diet*, ed. R. Scott Russell, Pergamon Press, 1966. Others: *Radionuclides in Foods*, National Academy of Sciences, 1973. *Radioactive Fallout, Soils, Plants, Foods, Man*, ed. Eric B. Fowler, 1965.

Iodine, strontium, and cesium are the most important radionuclides that enter the food chain and are absorbed by man from the intestinal tract. Barium-140, ruthenium-103, iron-55 can also be absorbed to a small extent. Tritium and carbon-14 are also very important but they are so mobile in the environment, no one can do anything about them. There are many other radionuclides that are important in the first few months after a nuclear explosion if one eats food directly contaminated by the fallout. Although the latter radionuclides are not absorbed by the body, they can do great damage to the intestinal tract while they are

passing through the body.

Iodine. There are some 11 isotopes of iodine that are produced in fission. All except I-129 which has a half-life of 1.6×10^7 years have shorter half lives than I-131.

Isotope	Half-life	Activity relative to 24 hrs after thermal fission of U-235
I-131	8.05 days	1
I-132	2.3 hrs	3
I-133	20.8 hrs	9
I-135	6.7 hrs	5

Although I-132, I-133, and I-135 are more abundant initially, they result in lower doses than I-131 because of their shorter half-lives. I-132 persists in appreciable amounts longer than its half-life would indicate, because it is produced mainly from tellurium-132 which has a half-life of 78 hours. The doses from and I-132 and I-133 can exceed I-131 near the explosion site for the first week. (R. J. Garner and R. Scott Russell, "Isotopes of iodine", in *Radio activity and Human Diet*, 1966.)

Shapley Page 11.

Iodine is readily absorbed through any moist skin or mucosal surface, and essentially all that is ingested is absorbed. The amount of radioiodine taken up by the thyroid is closely dependent on the dietary level of stable iodine. About 20% of the intake ends up in the thyroid. Most of the iodine in man is excreted via the urine, and its biological half-life is 2-4 months. The effective half-life is a little less than its physical half-life, 7.6 days. Iodine is actively concentrated in the thyroid, that means that the concentration in the thyroid is much higher than in plasma.

Since thyroid is relatively small, 20 g, it doesn't take much to damage the gland. The first type of damage is nodules, then cancers and if the dose has been extremely high, destruction of the tissue itself. The result of the last case is hypothyroidism. Radiation induced cancers are almost invariably less malignant than the usual type that aren't induced by radiation. It is, therefore, believed that radiation increases the number of cancers but does not increase mortality as a whole. (Diane G. Crocker, "Nuclear reactor accidents - the use of KI as a blocking agent against radioiodine uptake in the thyroid," *Health Physics*, 46:1265-1279, 1984.)

There is a lot of literature on I-131 as well as on potassium iodide (KI) as a means of preventing the uptake of radioiodine by the thyroid. The reason is that potentially there could be high releases of I-131 from nuclear power plant accidents. Windscale accident in England resulted in the withholding of milk from the market for a while. Initial exposure in such cases is from inhalation, but the subsequent dose from eating contaminated food is 400-700 times higher. The main source of I-131 in human diet is milk,

partly because milk is consumed relatively fresh.

Both KI and potassium iodate (KIO₃) can be used to saturate the iodine uptake system of the thyroid. The advantage of KIO₃ is that it has a much longer shelf life,

Shapley Page 12.

up to 10 years, versus about 2 years for KI. Inside the body I¹³¹ gets quickly converted to I⁻ and acts the same way as if originally it had been KI. About 130 mg of KI completely blocks radioiodine uptake for about 24 hours, 65 mg of KI is probably sufficient for children. It is most effective if given shortly before to 1-2 hours after exposure. The effectiveness of KI decreases rapidly with time after exposure, limited benefit is possible up to 12 hours after a single exposure. KI can be bought at drugstores without prescription in the U.S.

Unfortunately, there are side effects to taking large quantities of KI. It is only when the exposure level is 10 rem that the risk from radiation damage exceeds the risk from KI. In geriatric or coronary patients the hazard from KI might be greater than the radiation hazard under any circumstances. Asthmatics, chronic heart or renal failure patients, patients with hypocomplementemic vasculitis and autoimmune related diseases have reacted very severely to KI treatments. The fetus and the newborn are also susceptible to harmful effects. Unfortunately, this group is also more susceptible to the adverse effects of radioiodine. (Diane G. Crocker, *ibid.*)

The half-life of I-131 is too short for absorption from the soil or from the plant base to be major routes of entry into the food chain. The interval between grain harvesting and consumption is long enough that one doesn't have to worry about iodine. When iodine is deposited on leaves of plants, most of it is not absorbed. A lot of it can be washed off by rain or removed by mechanical processes. All of the above explains why a cow eating grass directly is the main entry route of iodine into the food chain. Levels of contamination in milk have frequently decreased more rapidly than the physical half-life of I-131. This is due to "field-loss" factor. In one case, the activity decreased by a factor of 2 in 2 weeks compared to the loss due to physical decay.

Shapley Page 13.

Fraction of ingested I-131 taken up by the thyroid can vary quite a bit but it is approximately 20% in cow as well as man. I-131 starts appearing in milk in 30 minutes and reaches maximum within 12 hours after a single exposure. The kind of conditions that would be true after a nuclear war, it would be 2-4 days after the start of fallout that it would reach the maximum concentration in milk. Both the cow's udder and the human breast concentrate iodine into milk in relation to the blood iodine level.

I-131 can also be incorporated into egg yolks in chickens on free range. After Windscale accident the activity of I-131 per egg averaged approximately 1/20 of that per litre of milk. (R. J. Garner and R. Scott Russell, *ibid.*)

If iodine were deposited in winter, the iodine hazard would be greatly reduced. The highest levels of contamination occur when the cows are grazing or are fed recently cut herbage. Contamination decreases markedly when stored food is substituted. From this it can be seen that the greatest danger would be right at the haying season. Previous year's stocks would have been exhausted and the next year's stocks wouldn't be in the barn yet.

Summary of the proposed protective measures:

1. Removal of lactating cows from pasturage-feeding system and substitution of stored feed rations. I-131 is reduced to insignificant levels in 3-4 days. The reverse is true if cows are placed on contaminated pasture. If cows were in and kept in when the fallout started, no problem would arise.
 2. Withholding contaminated product to allow radioactive decay.
 3. Supplying milk to areas of high contamination from areas where contamination is low.
 4. Diverting contaminated milk into manufactured products and substituting processed milk, e.g., powdered or canned milk.
 5. Storage of frozen fresh milk.
- Shapley Page 14.
6. Storage of fresh concentrated milk.
 7. Storage of frozen concentrated milk.
 8. Physical removal of iodine-131 from milk with ion- exchange resin.

(Frank A. Todd, "Protecting foods and water against radio- active contamination," pp. 235-256, *Protection of the Public in the Event of Radiation Accidents*, World Health Organization, 1965.)

All of the above, except #1, are completely dependent on the availability of electricity and transportation. Number one is partly dependent on transportation. If there was no electricity, the cows would not be milked. We don't have the personnel who know how to milk cows. So you could learn it in a day, but there is no way you could develop the strength in a short time to milk more than one cow. I called up the local dairy farmer to ask what they would do if there was no electricity. They have 40 cows and they would not be milked unless they obtained a generator. They have had to do that once in the past. Their milk goes down to Guelph, that is more than 100 km away. There are 2 small cheese plants that are a little closer, but she couldn't think of any milk processing plant that would be closer.

Strontium. There are two types of strontium (Sr). Sr-89 is important the first month and Sr-90 is important for a long time. Both emit only B rays.

Strontium is metabolized the same way as calcium (Ca). Strontium absorption, however, is discriminated against by body, compared to calcium absorption. Ratios of Sr/Ca in blood is 1/3 to 1/4 of what it is in diet. Mother's milk has half the Sr concentration in blood and the fetus

Shapley Page 15.

also has only half the concentration. The effective half-life in body is 50 days for Sr-89 and 17.5 years for Sr-90. (Cs also has a long half-life but its effective half-life in body is less than 100 days.) Its long effective-half life is what makes Sr-90 such a dangerous radionuclide.

Ratio of Sr to Ca in new bone is in equilibrium with body fluids. In other words, the amount of strontium that gets deposited in bone is dependent on the ratio of Sr/Ca in blood. Therefore, radiostrontium concentration is a lot of times expressed in terms of Ca concentration. The common units are pc of Sr/g of Ca or for milk pc Sr/l.

The main source of strontium in a western diet is dairy products. But that doesn't give the whole picture. As explained above, strontium absorption depends on the level of calcium and dairy products are also the major source of calcium in western diets. It might look like elimination of dairy products would improve the situation but the reverse would be true. More vegetables would be consumed and there the ratio of Sr/Ca is much higher. Third world countries got twice the amount of strontium in their diets compared to that of the western countries.

**The following table of contribution of various foods to Sr-90
in population of N.Y. City
illustrates the differences in calcium levels
and their subsequent effect.**

Food	pc/yr	% total intake	% total intake
		----- ca	----- Sr-90
Dairy products	2080	58	38
Vegetables	1212	9	22
Fruits, fresh and canned	1192	3	22
Cereals and bakery products	588	20	11
Meat, poultry eggs	178	8	3
Fish	5	2	-
Water	200	-	4

Radionuclides in Foods, p. 34, National Academy of Sciences, 1973.

Shapley Page 16.

In vegetables the strontium content can be reduced 19-55% by common home preparation. In canned fruit the reduction can even be higher compared to fresh fruit. The following are given as methods for reducing strontium intake.

1. Protection of packaged and stored foods.
2. Removal of surface contamination by washing and scrubbing of fruits and vegetables.
3. Removal of surface contamination by peeling.
4. Removal of internal contamination of food through processing.
5. Reduction of strontium-90 secretion into milk by supplementing rations of dairy cows with calcium.
6. Removal of radioactivity by use of such processes as ion-exchange, electro dialysis, or calcium phosphate treatment.

Frank A. Todd, *ibid*. One important method Todd doesn't mention is milling of wheat. Whole wheat has twice the Sr/Ca than white flour.

There is a good discussion of remedial measures by C. L. Comar and J. C. Thompson, Jr. with emphasis on "certain aspects of feasible large-scale measures" in *Survival of Food Crops and Livestock in the Event of Nuclear War*, 1970, "Status of remedial measures against environmental radiocontamination".

The plant root makes little distinction between Ca and Sr if they are in the same chemical form. Soluble Ca in the soil acts as a diluent for the Sr - the amount of calcium in soil is important. Generally good agricultural soils result in lower Sr content in food. Strontium deposited on the plants may be trapped and absorbed through those parts of the plant which are above the ground. The amount that is so trapped depends on the form of the plants, it is usually considerable in grasses. Again, a cow comes along and picks it all up, the absorbed and the unabsorbed Sr. Luckily, there is discrimination against strontium relative to calcium by a factor of about 10 which occurs in the transfer of the two elements from the diet of cattle to milk.

Shapley Page 17.

Cesium. Cesium (Cs)-137 is the third most dangerous radio- nuclide that enters very quickly the human food chain after a nuclear fallout. It is an alkali metal like potassium (K) and its behaviour in nature as well as the human body is similar to that of potassium. The relationship between the two, although, is not as close as between Sr and Ca. The decay scheme of Cs-137 is shown below.

Cesium is around in the environment for a long time, its half-life is 30 years. Quite commonly Cs is referred to as a Y source. Technically this is not correct. Cs decays by a B emission to Ba-137 which has a half-life of only 2.57 min. when it decays by a Y emission to a stable form of Ba. Its "daughter", however, has such a short half-life that Cs is ordinarily identified by Y spectometry of the Y emission of its daughter. Cs is more common in fallout than Sr by 1.3 to 1.7.

Cesium is freely absorbed from the human intestinal tract and appears to have an average stay of 4 months.. Compared to other radionuclides, it is distributed fairly uniformly over the body. The human body content of Cs-137 is closely related to the level of it in the diet. It is absorbed preferentially to potassium. The ratio of Cs-137/ gK is 3 times higher in body than in food. In animal studies one has to take 9 times the normal level of K to cut Cs-137 level by half. L. Fredriksson, R. J. Garner and R. Scott Russell , "Caesium-137", in *Radioactivity and Human Diet*, 1966.

Sources of Cs in human food:

Cows milk 30% or 25-40%

Grain products 25% or 17-30%

Meat 20% or 12-26%

Fruit 10% or 15%

Vegetables 10% or 15%

Fish important where it forms a large part of diet,

Shapley Page 18.

The two sets of figures just given are from two different sources. They indicate that cesium is distributed relatively evenly among the different food groups.

Because cesium has volatile precursors, a lot of it ends up in stratosphere. Very roughly its mean time in stratosphere is 2 years. As it falls down, it is deposited on any growing vegetation. Most of the Cs that enters the food chain is absorbed by the plants directly and not from soil after it has been washed down. The heaviest fallout occurs in spring because most of the mixing between stratosphere and troposphere occurs during late winter. Areas with higher rainfall can receive twice as much fallout.

Cesium is readily absorbed by clay particles in soil. It is held tightly enough that only a few per cent of Cs-137 in soil is taken up through the roots of plants. Sandy soils and especially soils with a high content of organic matter bind Cs less effectively. Plants grown on these soils have higher Cs-137 content. Most of the Cs contained in the edible parts of vegetables is due to deposition of particulate material on leaves.

Under certain conditions, Cs can undergo considerable concentration in terrestrial and aquatic food chains. Freshwater fish have been shown to contain it in concentrations several thousand times higher than the concentration in their surroundings. Fish feed on lower aquatic organisms which have already concentrated it above the levels present in water. Shellfish do the same thing. Cesium is effectively trapped and retained by the lichen and moss of the tundra, which are major sources of food for caribou and reindeer. Caribou flesh contained up to 100 times the quantities found in meat in mid latitudes.

Once fallout has stopped Cs becomes trapped in the top 2 cm of soil. External radiation from it would continue for many years. Its greatest danger is considered to be genetically.

Shapley Page 19.

Carbon-14. Most of the carbon (C)-14 is released into the stratosphere, from where it equilibrated with the troposphere with a half-time of about 2 years. Tissue C-14 comes into equilibrium with C-14 in the atmosphere with a delay time of about 1.4 years. The retention half-time of dietary carbon in mammals is estimated to be about 40 days. Like tritium, carbon 14 is highly mobile in the environment and no one can do anything about it.

Tritium. Tritium is radioactive hydrogen. Less than 1% of tritium becomes part of the water molecule but it is in this form that it passes through the eco-systems. It behaves identically to ordinary water. It is

highly mobile in the environment and very quickly equilibrates in the different systems.

Iron-55. Two pathways are known for the concentration of iron (Fe)-55. Lichen-caribou pathway is important for Eskimos and Lapps. The second source is marine fish. The marine food chain concentrates Fe-55 even more than the first pathway. The reason for this is the low concentration of stable iron in sea water.

Half-life of Fe-55 in lichens is 1.4 years.

Erythrocyte is considered to be the critical organ.

Ruthenium-106. Ruthenium is known to have accumulated in at least one known food chain. A seaweed in Irish sea that is used by some people in making bread. Critical organ for this case is the lower large intestine. Some people got as much as half the yearly dose limit of rems/yr for lower intestine during the Windscale accident.

METHODS OF MEASUREMENT

Shapley Page 20

There is a lot of literature on the measurement of Sr-89 and -90, I-131 and Cs-137 in the environment and in food. Scientists have been doing it all over the world as the result of the atomic bomb tests in the fifties and the first part of the sixties. The most comprehensive references are: Esther Ferri, Paul J. Magno and Lloyd R. Setter, *Radionuclide analysis of large numbers of food and water samples*, U.S. Dept. Health, Education, and Welfare, 1965. National Center for Radiological Health, *Radioassay Procedures for Environmental Samples*, U.S. Dept. of Health, Education, and Welfare, 1967. *Manual of Standard Procedures*, NYO-4700, Health and Safety Laboratory, U.S. Atomic Energy Commission, New York Operations Office. The above do give details for the procedures but are designed for quantities much smaller than what one would be measuring after a nuclear war. They require highly skilled personnel and very sophisticated equipment.

E. R. Mercer ("Analytical Methods" in *Radioactivity in Human Diet*, ed. R. Scott Russell, 1966.) has a short but clear review of the above methods. He says that in emergencies, when much higher levels of contamination than normal will be acceptable, much simpler analytical methods are adequate. Unfortunately he doesn't describe them. This happens quite a few times, they aren't described because they are obvious to people who work with radioactivity but not so obvious for a person who doesn't have

any experience using different radiation detection instruments or measuring mixtures of different radionuclides. He does make a few relevant comments in passing. If Cs-137 exceeds 300 pc/l in milk, it can be measured directly in a sodium iodide (NaI) crystal scintillation counter. Gamma spectrometric measurement of I-131 can also be done directly on whole milk if the level is high enough. Cesium and iodine can also interfere with each other.

Strontium assays are very complicated, numerous radiochemical separations have to be done. Usually Sr-90 is

Shapley Page 21.

calculated from the amount of its daughter yttrium-90 (Sr-90 decays to Y-90) and Sr-89 is determined by the difference.

Daniel A. Collnick does give a simple method for analyzing, milk (*Experimental radiological health physics*, 1978). Since the ratio, of Cs-137 to each of the Sr isotopes is a fixed constant at the time when fission takes place, the strontium concentrations can be calculated from the cesium concentration.

$$\frac{\text{Cs-137}}{\text{Sr-90}} = 5 \qquad \frac{\text{Cs-137}}{\text{Sr-89}} = 0.03$$

First of all, these formulas are for milk, in the fallout Cs-137 to Sr-90 ratio is about 1.6. Second, Sr-89 has a relatively short half-life compared to Cs-137, so the ratio changes with time, it has to be doubled every 51 days after the fissions have occurred. Cs-137 and Sr-90 have similar enough half-lives that the change with time can be ignored.

The milk is passed through an anion exchange resin. I-131, being the only anion in the group of 4 we are interested in, is retained on the resin and everything else passes through. Resin is transferred to a bottle that is counted in a solid scintillation counter. The result is calculated from a known I-131 sample that has been treated the same way. The strontium isotopes are pure beta emitters, therefore, the effluent can be poured into a beaker that fits into a NaI counter and counted for gamma emissions from cesium. The result is compared to a known amount of Cs-137 under the same conditions. The cesium value is used in the formulas given above to calculate the amounts of the two different strontiums.

Collnick also gives the following very useful table of what would be the dose commitment from milk, given a level of activity in milk when it is at the highest (2-4 days after the event). There must be, however, some mistake in rads for Sr-89. If it is 3 rads in the first year, there is no way with its short half-life it can give 2 more rads in subsequent years.

Shapley Page 22.

Dose Commitment from Milk

Radionuclide	RADS	Max. conc. in milk uc/l,p
Sr-89	3 in 1st yr, 5 total	1.1
Sr-90	3 in 1st yr, 5 total	0.05
I-131	10	0.07
Cs-137	3 in 1st yr, 5 total	0.72

The above is the sort of approach, that I think would be taken, if there were a nuclear holocaust. There are different models for predicting dose commitment from the level of fallout. R. Scott Russel, B. O. Bartlett, and R. S. Bruce, "The significance of long-lived nuclides after a nuclear war," in *Survival of Food Crops and Livestock in the Event of Nuclear War*, 1970. A. Aarkrog, "Prediction models for Strontium-90 and Caesium-137 Levels in the Human Food Chain", *Health Physics*, 20:297-311, 1971. W. F. Lengeman has many papers on prediction models. The measurement would be done from an airplane or for more detail from a car. A. C. Chamberlain, R. J. Garner and D. Williams, "Environmental monitoring after accidental deposition of radioactivity," *React. Sci. Technology*, 14:155-167, 1961.

There are some references that sound good but are not easily available. *Guidance on Offsite Emergency Radiation Measurement Systems, Phase 2: The Milk Pathway*, B. J. Salmonson, L. G. Hoffman, R. J. Honkus, and J. H. Keller, Westinghouse Idaho Nuclear Company, Inc., WINCO-1009, April 1984. Also by the same people, company and title but a different subtitle: *Phase 3: Water and Non-Dairy Food Pathway*, WINCO-1012, October 1984. I wanted to send for these two papers but I couldn't find Westinghouse Idaho Nuclear Co. listed in any of the industrial indexes. The closest I could get is that Westinghouse does have a subsidiary called Bettis Atomic Power Lab, Idaho Falls, Idaho (1-208-526-0111). It could be the same company.

Shapley Page 23.

Daniel A. Gollnick also has a book out *Basic Radiation Protection Technology*, Pacific Radiation Press, 1983. It isn't available in Toronto. It might have the type of information we are interested in because it has been referred to in places where the concern has been nuclear war.

LACK OF STANDARDS AND MPD

Shapley Page 24

Currently there aren't any guide lines for intake of radioactive material under the conditions of a nuclear war. The main reason for this is that radioactivity in food is not regarded as a priority in an event of a nuclear war.

"Eating food produced in the years after a large attack would cause an increase in the cancer rate... this increase would be a small fraction of the number of additional cancer deaths that would result from external radiation." Cresson H. Kearney, *Nuclear War Survival Skills*, p. 65, 1980.

Most vegetables would be fit to eat once they had been thoroughly washed. When it is safe to work outside, can plant new crops - they will be safe to eat. Ivan Tyrell, *The survival Option, A guide to living through nuclear war*, 1982.

"Standing crops in the early stages of growth are damaged by radiation but otherwise are safe to eat if washed clean of dust." p. 105. "Lack of food and water will cause starvation and death of many millions, especially the young and old." p. 115. Diane Diacon, *Residential Housing and Nuclear Attack*, 1984. The latter two books are English and I don't know anything about the credentials of their authors. The quotes that follow are by R. Scott Russell, unquestionably one of the world authorities on strontium and cesium in fallout and their biological pathways.

"In short, the total deaths caused by long-lived nuclides seem broadly comparable to the annual traffic death rate." (Incidentally, the figures for lung cancer from smoking are higher than traffic fatalities.) "Thus, by the standards the community now accepts, remedial action against the risks from long-lived nuclides would not seem justified; The number of casualties would be so small relative to the total loss and the difficulty of avoiding them would be so great that remedial action could not

Shapley Page 25.

reasonably be contemplated." "...efforts to mitigate doses from radiation should be devoted solely to the early period when short-lived nuclides predominate."

R. Scott Russell, B. Bartlett, and R. S. Bruce, "The significance of longlived nuclides after a nuclear war," in *Survival of Food Crops and Livestock in the Event of Nuclear War*, 1970.

The maximum permissible doses (MPD) used now are based on the philosophy that any radiation is bad and the less the better. Dose limiting recommendations by the National Council on Radiation Protection (NCRP) are given in Table 6.1. The levels are very low, for general population, 0.17 rem/year. This is less than the natural background radiation in some places.

There certainly is awareness that maximum permissible doses are not what would be in effect after a nuclear holocaust.

J. C. Thompson, Jr., R. A. Wentworth, and C L. Comar ("Control of fallout contamination in the postattack diet," in *Survival of Food see: (...above1, ...above2, ...above3)* expressed the need for guidelines that respond to tolerance or survival levels of radioactivity rather than the minimum-exposure concept that is in effect now. They would like to have a "system of radiation-exposure priorities" that would become operational after a nuclear attack. They are aware of the irony that the larger the attack, the lower the priority of fallout considerations in food.

"It would be poor operational procedure to initiate efforts to reduce dietary contamination from 10 R to 1 R when general external radiation levels were 100 R and a state of pestilence threatened."

The problem of lack of radiation protection standards designed for nuclear war conditions has been discussed by Lauriston S. Taylor in "Standards for radiation exposure management in accident or nuclear attack," a talk he has given at some recent symposium. (I don't have a complete reference, the paper was sent to me.) The same as J. C. Thompson *et al*, he recognizes that there can really be no fixed standards that can be applied to basically uncontrollable

Shapley Page 26.

328 *Radiation Protection* by Jacob Shapiro

Table 6.1. Dose-limiting recommendations of N C R P (1971).

Occupational exposure limits

Whole body, gonads, lens of eye, red bone marrow

5 rem in any one year

Skin

15 rem in any one year

Hands

75 rem in any one year (25/qtr)

Forearms

30 rem in any one year (10/qtr)

Other organs, tissues and organ systems

15 rem in any one year (5/qtr)

Fertile women (with respect to fetus)

0.5 rem in gestation period (5/qtr)

Dose limits for the public, or occasionally exposed individuals	
Individual or occasional	0.5 rem in any one year
Students	0.1 rem in any one year
Population dose limits	
Genetic	0.17 rem av per year
Somatic	0.17 rem av per year
Emergency dose limits-lifesaving	
Individual (older than 45 yr if possible)	100 rem
Hands and forearms	200 rem, additional (300 rem total)
Emergency dose limits-less urgent	
Individual	25 rem
Hands and forearms	100 rem total
Family of radioactive patients	
Individual (under 45 yr)	0.5 rem in any one year
Individual (over 45 yr)	5 rem in any one year

Source : NCRP, 1971, Table 6.

Shapley Page 27.

radiation situations. The best that we have are what is called "penalty tables". The following is based on

brief, whole body gamma-ray doses:

Dose	Need Medical Care	Able to Work	Die
15-50 R	no	yes	0
50-200 R	no	yes	<5%
200-400 R	yes	no	<50%
450-600 R	yes	no	>50%
>600 R	yes	no	100%

The above is the kind of data that is available but that is not what the situation would be after a nuclear war. There would be a long period of high radiation level followed by even longer period of moderate radiation levels. The following table is a little more useful:

Category	Need Medical Care	Accumulated Exposure in: 1 Week	Accumulated Exposure in: 1 Month	Accumulated Exposure in: 4 Months
A	None	150 R	250 R	300
B	Some (5% die)	250 R	350 R	500
C	Most (50% die)	450 R	600R	--

Lauriston S. Taylor, *ibid.*

There is very little information on *chronic* exposures that scientists could use to develop emergency standards. Needless to say, there is even less information on continuous internal intake of low or large amounts of radioactivity (the only exception is the radium dial painters). Japan did not have any early fallout in 1945. From the Japanese data and past medical uses of radioactivity it is known how many people would get leukemia and other cancers if a certain number of people would be exposed to a certain level of radiation. From this is derived a linear dose-effect relationship without a threshold. Both NCRP and ICRP (International Commission for Radiological Protection) work on assumption that there is no threshold dose of ionizing radiation below which there is no damage. The dose

Shapley Page 28.

effects are assumed to be additive. Taylor does not think it would be true for long range, low or moderate level chronic exposures. Too many theoretically dead persons are still walking around, as he puts it. There are many people who have been working for years within the maximum permissible dose limits for radiation workers. None of them have had any effects of practical importance. He feels the limits could

be 10 times for more higher before there would be any detectable consequences. Taylor blames the lack of war time radiation guidelines on the media and the public. He feels that the news media have so over-exploited radiation matters that the public is truly frightened of *any* radiation exposure.

"This makes the presentation and public acceptance of any kind of emergency planning extremely difficult."

(There is an analogous phenomenon going on right now. 130 people have died so far from AIDS in Canada. At the same time 4000/yr. die in car accidents, plus many more permanently crippled. Half of the latter are caused by alcohol. Yet the public accepts one but is panic stricken of the other.)

Maximum permissible body burdens, plus all the other dose limits have been developed by the International Commission on Radiological Protection (ICRP) and the National Council on Radiation Protection (NCRP). The body burden of a particular radioactive nuclide is the amount of the nuclide in uc which is present in an individuals body. The maximum permissible body burden is the body burden of a particular radioactive nuclide which results in a MPD (Maximum permissible doses that have been developed for external exposure) to the whole body or to one or more organs in the body. It is computed on the basis that it is the only one in the body. The maximum permissible body burden for a radionuclide of a bone seeking element (e.g. strontium, calcium, radium and plutonium) is the number of uc required to deliver to the bone a dose in rems equal to that provided by 0.1 uc of radium-226. Body burdens

Shapley Page 29.

for radionuclides other than bone seekers require the identification of "critical organ" (the organ which is the most sensitive or has the highest concentration). For a nuclide with the whole body as the "critical organ", the maximum permissible body burden for occupational exposure is the activity present continuously in the body which delivers a dose equivalent of 5 rem/year to the whole body. Nuclides which concentrate in abdominal organs are given limiting body burdens which provide 15 rem/year. (Kedar N. Prasad, *CRC Handbook of Radiobiology*, p. 241, 1984.)

Maximum permissible body burdens and maximum permissible concentrations of radionuclides in water for occupational exposures are given in ICRP publications (for references see *Radiation Protection by Jacob Shapiro*, 1981. The following values for the radionuclides that enter the food chain as a result of a nuclear fallout are from *Radiological Health Handbook*, U. S. Dept. Health, Education and Welfare, p. 207, 1970.

Radionuclide	Critical organ	Body Burden uc	MPC water continuous intake uc/cc

Sr-89	Bone	4	10^{-4}
Sr-90	Bone	2	10^{-6}
Cs-137	Total body	30	2×10^{-4}
I-131	Thyroid	0.7	2×10^{-5}

Given equal concentrations, Sr-90 is 100 times more dangerous than Sr-89. The differences can even be higher, radium-226 is 10,000 times more dangerous than tritium.

ICRP Publ. 2 *Report of Committee II Permissible Dose for Internal Radiation*, Pergamon Press, p. 23-27, 1959 talks about permissible concentration of unidentified radionuclides, mixtures of known radionuclides and some of the problems one would run into if one tried to apply the occupational MPC for water to fallout in water and food.

Shapley Page 30.

Assuming Taylor was right that the external doses could be raised 10 times without much danger, the same thing would also apply here. Iodine and strontium -89 could still be increased by much more because of their short half-lives. The figures given were for continuous intake for 40 years. Although one can take in 100 times more Sr-89 than Sr-90, it initially occurs in 180 times the greater concentration than Sr-90. That is why initially it is the more important. Its half life is 51 days and after that Sr-90 becomes the most important contaminant. Unfortunately, strontium is the hardest to measure.

EMERGENCY SCHEMES

Shapley Page 30

The only permissible emergency levels of radioactivity in food and water for civilians were put out by the United States Agricultural Research Service in 1960, *USDA Radiological Training Manual for Inservice Training*. This procedure was still recommended by the U.S. Dept. of Health, Education and Welfare in 1965, *Civil Defense information for food and drug officials*. I haven't come across anything, that would have replaced this procedure.

There is a food and water standard (CDV-787) that is placed in a standard tin. A Geiger-Mueller counter is placed on top of the tin and a reading is taken, should be in 10 to 15 mr/hr area. The tin is filled with food or water when an unknown is tested. Anything below the standard reading is fit for a 10 day consumption. Anything below 2/3 of the standard reading is fit for 30 day consumption period. The values that they represent are 9×10^{-2} uc/g and 3×10^{-2} uc/g for 10 and 30 day consumption periods respectively.

There is a more extensive emergency scheme by J. D. Teresi and C. L. Newcombe, "Calculations of maximum permissible concentrations of radioactive fallout in water and air based upon military exposure criteria," *Health Physics* 4:275-288, 1961. Although this is for water, I think it would also be applicable to directly contaminated food. Permissible levels for food and water are always the same in literature. It would not be applicable to food grown on contaminated soil. Their figures are based on the 14 major contributors in the fallout mixture. This is subdivided in 3 groups: major contributors for the first 7 days, major contributors for 8 - 104 days and major contributors for 105 - 365 days after the explosion.

Shapley Page 31.

On this basis they calculate the allowable $\mu\text{g}/\text{cm}^3$ to give 15 rem in 90 days, eaten in 7 different time spans, from 1 to 90 days and starting at 11 different times after time 0, from 3.5 hrs to 365 days. See their [Table 6](#). They do the same thing for 150 rems in 30 days. See their [Table 7](#). The tables can be used to get values for any other dose e. g., if you want 75 rem dose in 30 days, divide the value by half. They don't say what standard would be used to determine $\mu\text{g}/\text{cm}^3$. I am concerned that the data on which they based their calculations would be outdated. They submitted their paper for publication Nov 1959. The atomic weapons have changed since that time - the fission products would not be in the same proportions now. For example, cesium is not mentioned. There would also be a better idea of the biological effect of some of these radionuclides in 1985.

There are two other methods for emergency monitoring of drinking water. G.W.C. Tait and W. F. Merritt, "Emergency monitoring of drinking; water", *Health Physics* 1:164-168, 1958. See their [Table 5](#).

Dept. of National Health and Welfare (Ottawa), *Control of radioactive fallout in water systems*, 1965, on (p.81) have presented Teresi and Newcombe's 90 day scheme in form of a graph. Whatever the time after explosion, up to a year, one can read off the values for water contamination that would deliver 15 rems in 90 days. They also give a number of handy approximations to know. Curies of beta particle radioactivity = 2 x curies of gamma ray radioactivity for the first 3 months (ibid. p.7). One day following a nuclear detonation: curies of gamma radioactivity per sq. ft. = roentgens/ hr divided by 100.

From: p. 23/243 of OTA, [The effects of nuclear war](#)

Absolute risk is defined as the product of assumed relative risks times the total population at risk. *Relative risk* is defined as the ratio of the risk in those exposed to the risk to those not exposed. The difference between the two risk models leading to major differences in the projected number of cancer deaths lies in the calculated excess of cancers arising from the 0 - 9 years age group at the time of irradiation. Because data on relative risks are sparse and inconclusive, and more data exist supporting the absolute model, the absolute model was used to calculate the latent health effects. Also, because the effectiveness of low exposure rates and/or low radiation exposure doses for producing late health effects remains unresolved, projected cancer deaths were calculated with dose effectiveness factors (DEF) of 1.0 and 0.2 for low exposure rates and doses.* (see below) Also, because there is insufficient data to warrant limiting the risk plateau period to 30 years, a 40 year risk period was used. 9)([see Shapley page 9](#)) Estimates of radiation genetic risks are also uncertain. Reference 8([see Shapley page 9](#)) estimates that the doubling dose for genetic risks to be between 20 and 200 rems although the possibility of it being lower than 20 rems or higher than 200 rems is not dismissed. Since a doubling dose of 100 rems was suggested by Reference 6 ([see Shapley page 9](#)) and it is within the estimated range of Reference 8, ([see Shapley page 9](#)) it was used to project the genetic risks. It follows that if the doubling dose is 20 rems then the projected number of genetic disorders (spontaneous abortions and "other genetic effects") should be multiplied by 5, and if the doubling dose is 200 rems then the projected number of genetic disorders should be halved.

**The (resulting) projected latent health effects
from radiation exposures using a DEF=1
for cancer deaths (are as follows):**

* Multiply by 0.2 for DEF = 0.2

EFFECTS	Number per 10⁶ person rems
Cancer deaths*#####	194.3
Thyroid cancers	134.1

Thyroid nodules	197.4
Spontaneous abortions	42
Other genetic effects	132.4

* A DEF=0.2 implies that the radiation received is only one-fifth as effective per unit of dose for producing latent effects when compared to a high dose received over a short period of time.

Shapley Page 3

From: p. 24/244 of OTA, The effects of nuclear war

**Projected latent cancer deaths
from internal organ exposures (are as follows):**

Organ	Cancer deaths per 10⁶ organ rems
Marrow	45.4
Lung	35.5
Digestive	27.1
Bone	11
Other	75.3

Also, for thyroid exposures from ingested I-131, the effectiveness of the exposure is estimated to be one-tenth that of an external (gamma) exposure. 6)([see Shapley page 9](#))

Emergency schemes	p. 30

Note.

The vast majority of papers referred to have been copied.

A lot of subjects have not been discussed, e.g. units, different instruments, properties of radiation, and dose calculations. They are described in health physics text books. You have An introduction to radiation protection by Alan Martin and Samuel A. Harbison and Radiation Protection by Jacob Shapiro.

OVERVIEW

The most thorough and the most authoritative book on The effects of nuclear weapons is a book by that title compiled and edited by S. Glasstone and F. J. Dolan, 3rd ed., U. S. Department of Defense and U.S. Department of Energy, 1977. This book is referred to in almost all the articles and books dealing with a nuclear war. It is the source book on the description of the different atomic bombs, their uses and the consequent explosive blast, direct nuclear radiation, direct thermal radiation, EMP, and fallout.

The most thorough study of the probable consequences of nuclear weapons on the United States, as well as on the Soviet Union, was done by the Office of Technology Assessment (OTA), The effects of nuclear war, 1979, (for complete ref see p. 3). They considered five major cases ranging from 1 atomic weapon to an all out mixed military and population attack of 6500 MT (half of it air bursts and the other half surface bursts).

We are interested in the latent health effects. I have copied 7 of the most interesting pages and given them page numbers in the upper right hand corner. The risk factors for the latent health effects, as well as the sources and the compromises they made to arrive at them are given on p. 2. The risk factors they used for latent cancer deaths from internal organ exposures are given on p. 3.

Before we go any further, we have to examine some of the categories they use for the way they present their data. Local fallout is what is deposited within 24 hours after the burst. The fraction of nuclear debris in the local fallout varies from 0.8 from surface bursts to 0 from air-bursts. Worldwide fallout can be of two kinds, tropospheric and stratospheric. Tropospheric fallout is short (weeks). Stratospheric fallout is in years, e.g. removal half-time for Cs-137 is 5 years. Stratospheric fallout can be from 0 to .99 of the fallout, depending on the altitude and

Absolute risk is defined as the product of assumed relative risks times the total population at risk. Relative risk is defined as the ratio of the risk in those exposed to the risk to those not exposed. The difference between the two risk models leading to major differences in the projected number of cancer deaths lies in the calculated excess of cancers arising from the 0 - 9 years age group at the time of irradiation. Because data on relative risks are sparse and inconclusive, and more data exist supporting the absolute model, the absolute model was used to calculate the latent health effects. Also, because the effectiveness of low exposure rates and/or low radiation exposure doses for producing late health effects remains unresolved, projected cancer deaths were calculated with dose effectiveness factors (DEF) of 1.0 and 0.2 for low exposure rates and doses.* Also, because there is insufficient data to warrant limiting the risk plateau period to 30 years, a 40 year risk period was used.⁹⁾ Estimates of radiation genetic risks are also uncertain. Reference 8 estimates that the doubling dose for genetic risks to be between 20 and 200 rems although the possibility of it being lower than 20 rems or higher than 200 rems is not dismissed. Since a doubling dose of 100 rems was suggested by Reference 6 and it is within the estimated range of Reference 8, it was used to project the genetic risks. It follows that if the doubling dose is 20 rems then the projected number of genetic disorders (spontaneous abortions and "other genetic effects") should be multiplied by 5, and if the doubling dose is 200 rems then the projected number of genetic disorders should be halved. The resulting projected latent health effects from radiation exposures using a DEF=1 for cancer deaths are as follows:

<u>Effects</u>	<u>Number per 10⁶ person rems</u>
Cancer deaths *	194.3
Thyroid cancers	134.1
Thyroid nodules	197.4
Spontaneous abortions	42
Other genetic effects	132.4

* Multiply by 0.2 for DEF = 0.2.

* A DEF=0.2 implies that the radiation received is only one-fifth as effective per unit of dose for producing latent effects when compared to a high dose received over a short period of time.

The projected latent cancer deaths from internal organ exposures are as follows:

<u>Organ</u>	<u>Cancer deaths per 10⁶ organ rems</u>
Marrow	45.4
Lung	35.5
Digestive	27.1
Bone	11
Others	75.3

Also, for thyroid exposures from ingested I-131, the effectiveness of the exposure is estimated to be one-tenth that of an external (gamma) exposure.⁶⁾

size of the weapon.

For the worst scenario (6500 MT) they predict 100 million early fatalities (could be as high as 160 million). On p. 5 they give a comparison of latent health effects from external and internal exposures from local fallout. By far the most of the effects are from external exposure rather than from internal exposure. For cancer deaths only 7% are from internal exposure and for thyroid cancers it is less than 1%.

On p. 6 they give worldwide fallout health effects for the U.S. The most interesting thing about this is that they see carbon-14 as the biggest problem in this category. Next table is total latent health effects and the numbers do look high. The thing to keep in mind is that these figures are for the subsequent 40 years. 6.6 million cancer deaths in 40 years is about 40% of the current U.S. annual rate. It is interesting to note that there are almost as many latent health effects outside of the U.S. (e.g. 4,545,000 cancer deaths). These would be distributed all over the world. If there was a similar attack on the Soviet Union, there would be 167,000 cancer deaths plus all the other latent health effects in the U.S.

Pages 7 and 8 give the summary of their conclusions.

Page 9 gives their references.

CONCLUSIONS

The long-term major adverse health effects resulting from hypothesized nuclear scenarios covering a nuclear employment range from a single weapon to a massive attack utilizing thousands of nuclear weapons were calculated. The general findings were as follows:

1. Several million latent cancer deaths could result from a massive nuclear attack directed at urban-industrial, military, and counterforce targets.* However, without improved civil defense capabilities, the number of projected latent cancer deaths is small when compared with the total number of early fatalities. Similar magnitudes of thyroid cancers, thyroid nodules, and genetic anomalies are also projected.
2. For limited attacks where the target points are in relatively low population density areas, the resulting number of latent cancer deaths could be large when compared with the total number of early fatalities.
3. For nuclear employments that are dominated by airbursts, the projected number of long-term adverse health effects that would occur in the attacked country is only a small percentage of the projected worldwide total.
4. For airbursts, the resulting number of long-term adverse health effects are larger for low yield weapons (40 KT) than for high yield weapons (1 MT) when compared on a per unit fission yield basis. The reason is that the nuclear debris of low yield airbursts is confined within the troposphere, whereas most of the nuclear debris from high yield airbursts enters the stratosphere.
5. Increasing the local fallout decontamination effectiveness to residual levels below 0.1 will not materially decrease the total number of long-term latent health effects because the local fallout post-shelter population dose constitutes only a small

* 5 million worldwide cancer deaths over a period of 40 years represent an increase of about 2 to 3 percent of the current cancer death rate. - They must be using Northern Hemisphere or something. For U.S. this would be closer to 30%

fraction of the total population dose when the fallout levels are reduced by a factor of 0.1 by decontamination.

6. The use of low yield weapons in the surface burst mode rather than high yield weapons as air bursts would increase the long-term latent adverse health effects in the country attacked and decrease the number of the effects in the rest of the world.
7. For massive nuclear attacks (Scenario 5a and 5b), although the number of early fatalities are sensitive to the shelter protection provided the population, the projected total number of latent health effects are relatively insensitive to the shelter protection provided.

THE MOST IMPORTANT FISSION PRODUCTS IN FOOD

There are a number of good books on the subject. The most valuable probably is Radioactivity and Human Diet, ed. R. Scott Russell, Pergamon Press, 1966. Others: Radionuclides in Foods, National Academy of Sciences, 1973. Radioactive Fallout, Soils, Plants, Foods, Man, ed. Eric B. Fowler, 1965.

Iodine, strontium, and cesium are the most important radionuclides that enter the food chain and are absorbed by man from the intestinal tract. Barium-140, ruthenium-103, iron-55 can also be absorbed to a small extent. Tritium and carbon-14 are also very important but they are so mobile in the environment, no one can do anything about them. There are many other radionuclides that are important in the first few months after a nuclear explosion if one eats food directly contaminated by the fallout. Although the latter radionuclides are not absorbed by the body, they can do great damage to the intestinal tract while they are passing through the body.

Iodine. There are some 11 isotopes of iodine that are produced in fission. All except I-129 which has a half-life of 1.6×10^7 years have shorter half lives than I-131.

Isotope	Half-life	Activity relative to I-131 24 hrs after thermal fission of U-235
I-131	8.05 days	1
I-132	2.3 hrs	3
I-133	20.8 hrs	9
I-135	6.7 hrs	5

Although I-132, I-133, and I-135 are more abundant initially, they result in lower doses than I-131 because of their shorter half-lives. I-132 persists in appreciable amounts longer than its half-life would indicate, because it is produced mainly from tellurium-132 which has a half-life of 78 hours. The doses from I-132 and I-133 can exceed I-131 near the explosion site for the first week. (R. J. Garner and R. Scott Russell, "Isotopes of iodine", in Radio-

activity and Human Diet, 1966.)

Iodine is readily absorbed through any moist skin or mucosal surface, and essentially all that is ingested is absorbed. The amount of radioiodine taken up by the thyroid is closely dependent on the dietary level of stable iodine, About 20% of the intake ends up in the thyroid. Most of the iodine in man is excreted via the urine, and its biological half-life is 2-4 months. The effective half-life is a little less than its physical half-life, 7.6 days. Iodine is actively concentrated in the thyroid, that means that the concentration in the thyroid is much higher than in plasma.

Since thyroid is relatively small, 20 g, it doesn't take much to damage the gland. The first type of damage is nodules, then cancers and if the dose has been extremely high, destruction of the tissue itself. The result of the last case is hypothyroidism. Radiation induced cancers are almost invariably less malignant than the usual type that aren't induced by radiation. It is, therefore, believed that radiation increases the number of cancers but does not increase mortality as a whole. (Diane G. Crocker, "Nuclear reactor accidents - the use of KI as a blocking agent against radioiodine uptake in the thyroid," Health Physics, 46:1265-1279, 1984.)

There is a lot of literature on I-131 as well as on potassium iodide (KI) as a means of preventing the uptake of radioiodine by the thyroid. The reason is that potentially there could be high releases of I-131 from nuclear power plant accidents. Windscale accident in England resulted in the withholding of milk from the market for a while. Initial exposure in such cases is from inhalation, but the subsequent dose from eating contaminated food is 400-700 times higher. The main source of I-131 in human diet is milk, partly because milk is consumed relatively fresh.

Both KI and potassium iodate (KIO_3) can be used to saturate the iodine uptake system of the thyroid. The advantage of KIO_3 is that it has a much longer shelf life,

up to 10 years, versus about 2 years for KI. Inside the body IO_3^- gets quickly converted to I^- and acts the same way as if originally it had been KI. About 130 mg of KI completely blocks radioiodine uptake for about 24 hours, 65 mg of KI is probably sufficient for children. It is most effective if given shortly before to 1-2 hours after exposure. The effectiveness of KI decreases rapidly with time after exposure, limited benefit is possible up to 12 hours after a single exposure. KI can be bought at drugstores without prescription in the U.S.

Unfortunately, there are side effects to taking large quantities of KI. It is only when the exposure level is 10 rem that the risk from radiation damage exceeds the risk from KI. In geriatric or coronary patients the hazard from KI might be greater than the radiation hazard under any circumstances. Asthmatics, chronic heart or renal failure patients, patients with hypocomplementemic vasculitis and autoimmune related diseases have reacted very severely to KI treatments. The fetus and the newborn are also susceptible to harmful effects. Unfortunately, this group is also more susceptible to the adverse effects of radioiodine. (Diane G. Crocker, ibid.)

The half-life of I-131 is too short for absorption from the soil or from the plant base to be major routes of entry into the food chain. The interval between grain harvesting and consumption is long enough that one doesn't have to worry about iodine. When iodine is deposited on leaves of plants, most of it is not absorbed. A lot of it can be washed off by rain or removed by mechanical processes. All of the above explains why a cow eating grass directly is the main entry route of iodine into the food chain. Levels of contamination in milk have frequently decreased more rapidly than the physical half-life of I-131. This is due to "field-loss" factor. In one case, the activity decreased by a factor of 2 in 2 weeks compared to the loss due to physical decay.

Fraction of ingested I-131 taken by the thyroid can vary quite a bit but it is approximately 20% in cow as well as man. I-131 starts appearing in milk in 30 minutes and reaches maximum within 12 hours after a single exposure. The kind of conditions that would be true after a nuclear war, it would be 2-4 days after the start of fallout that it would reach the maximum concentration in milk. Both the cow's udder and the human breast concentrate iodine into milk in relation to the blood iodine level.

I-131 can also be incorporated into egg yolks in chickens on free range. After Windscale accident the activity of I-131 per egg averaged approximately 1/20 of that per litre of milk. (R. J. Garner and R. Scott Russell, ibid.)

If iodine were deposited in winter, the iodine hazard would be greatly reduced. The highest levels of contamination occur when the cows are grazing or are fed recently cut herbage. Contamination decreases markedly when stored food is substituted. From this it can be seen that the greatest danger would be right at the haying season. Previous year's stocks would have been exhausted and the next year's stocks wouldn't be in the barn yet.

Summary of the proposed protective measures:

1. Removal of lactating cows from pasturage-feeding system and substitution of stored feed rations. I-131 is reduced to insignificant levels in 3-4 days. The reverse is true if cows are placed on contaminated pasture. If cows were in and kept in when the fallout started, no problem would arise.
2. Withholding contaminated product to allow radioactive decay.
3. Supplying milk to areas of high contamination from areas where contamination is low.
4. Diverting contaminated milk into manufactured products and substituting processed milk, e.g., powdered or canned milk.
5. Storage of frozen fresh milk.

6. Storage of fresh concentrated milk.
7. Storage of frozen concentrated milk.
8. Physical removal of iodine-131 from milk with ion-exchange resin.

(Frank A. Todd, "Protecting foods and water against radioactive contamination," pp. 235-256, Protection of the Public in the Event of Radiation Accidents, World Health Organization, 1965.

All of the above, except #1, are completely dependent on the availability of electricity and transportation. Number one is partly dependent on transportation. If there was no electricity, the cows would not be milked. We don't have the personnel who know how to milk cows. So you could learn it in a day, but there is no way you could develop the strength in a short time to milk more than one cow. I called up the local dairy farmer to ask what they would do if there was no electricity. They have 40 cows and they would not be milked unless they obtained a generator. They have had to do that once in the past. Their milk goes down to Guelph, that is more than 100 km away. There are 2 small cheese plants that are a little closer, but she couldn't think of any milk processing plant that would be closer.

Strontium. There are two types of strontium (Sr). Sr-89 is important the first month and Sr-90 is important for a long time. Both emit only B rays.

Strontium is metabolized the same way as calcium (Ca). Strontium absorption, however, is discriminated against by body, compared to calcium absorption. Ratio of Sr/Ca in blood is 1/3 to 1/4 of what it is in diet. Mother's milk has half the Sr concentration in blood and the fetus

also has only half the concentration. The effective half-life in body is 50 days for Sr-89 and 17.5 years for Sr-90. (Cs also has a long half-life but its effective half-life in body is less than 100 days.) Its long effective-half life is what makes Sr-90 such a dangerous radionuclide.

Ratio of Sr to Ca in new bone is in equilibrium with body fluids. In other words, the amount of strontium that gets deposited in bone is dependent on the ratio of Sr/Ca in blood. Therefore, radiostrontium concentration is a lot of times expressed in terms of Ca concentration. The common units are pc of Sr/g of Ca or for milk pc Sr/l.

The main source of strontium in a western diet is dairy products. But that doesn't give the whole picture. As explained above, strontium absorption depends on the level of calcium and dairy products are also the major source of calcium in western diets. It might look like elimination of dairy products would improve the situation but the reverse would be true. More vegetables would be consumed and there the ratio of Sr/Ca is much higher. Third world countries got twice the amount of strontium in their diets compared to that of the western countries. The following table of contribution of various foods to Sr-90 in population of N.Y. City illustrates the differences in calcium levels and their subsequent effect.

Food	pc/yr	% total intake	
		Ca	Sr-90
Dairy products	2080	58	38
Vegetables	1212	9	22
Fruits, fresh and canned	1192	3	22
Cereals and bakery products	588	20	11
Meat, poultry, eggs	178	8	3
Fish	5	2	-
Water	200	-	4

Radionuclides in Foods, p. 34, National Academy of Sciences, 1973.

In vegetables the strontium content can be reduced 19-55% by common home preparation. In canned fruit the reduction can even be higher compared to fresh fruit. The following are given as methods for reducing strontium intake.

1. Protection of packaged and stored foods.
2. Removal of surface contamination by washing and scrubbing of fruits and vegetables.
3. Removal of surface contamination by peeling.
4. Removal of internal contamination of food through processing.
5. Reduction of strontium-90 secretion into milk by supplementing rations of dairy cows with calcium.
6. Removal of radioactivity by use of such processes as ion-exchange, electro dialysis, or calcium phosphate treatment.

Frank A. Todd, ibid. One important method Todd doesn't mention is milling of wheat. Whole wheat has twice the Sr/Ca than white flour.

There is a good discussion of remedial measures by C. L. Comar and J. C. Thompson, Jr. with emphasis on "certain aspects of feasible large-scale measures" in Survival of Food Crops and Livestock in the Event of Nuclear War, 1970, "Status of remedial measures against environmental radiocontamination".

The plant root makes little distinction between Ca and Sr if they are in the same chemical form. Soluble Ca in the soil acts as a diluent for the Sr - the amount of calcium in soil is important. Generally good agricultural soils result in lower Sr content in food. Strontium deposited on the plants may be trapped and absorbed through those parts of the plant which are above the ground. The amount that is so trapped depends on the form of the plants, it is usually considerable in grasses. Again, a cow comes along and picks it all up, the absorbed and the unabsorbed Sr. Luckily, there is discrimination against strontium relative to calcium by a factor of about 10 which occurs in the transfer of the two elements from the diet of cattle to milk.

Cesium. Cesium (Cs)-137 is the third most dangerous radionuclide that enters very quickly the human food chain after a nuclear fallout. It is an alkali metal like potassium (K) and its behaviour in nature as well as the human body is similar to that of potassium. The relationship between the two, although, is not as close as between Sr and Ca. The decay scheme of Cs-137 is shown below.

Cesium is around in the environment for a long time, its half-life is 30 years. Quite commonly Cs is referred to as a γ source. Technically this is not correct. Cs decays by a B emission to Ba-137 which has a half-life of only 2.57 min. when it decays by a γ emission to a stable form of Ba. Its "daughter", however, has such a short half-life that Cs is ordinarily identified by γ spectrometry of the γ emission of its daughter. Cs is more common in fallout than Sr by 1.3 to 1.7.

Cesium is freely absorbed from the human intestinal tract and appears to have an average stay of 4 months. Compared to other radionuclides, it is distributed fairly uniformly over the body. The human body content of Cs-137 is closely related to the level of it in the diet. It is absorbed preferentially to potassium. The ratio of Cs-137/gK is 3 times higher in body than in food. In animal studies one has to take 9 times the normal level of K to cut Cs-137 level by half. L. Fredriksson, R. J. Garner and R. Scott Russell, "Caesium-137", in Radioactivity and Human Diet, 1966.

Sources of Cs in human food:

Cows milk 30% or 25-40%

Grain products 25% or 17-30%

Meat 20% or 12-26%

Fruit 10% or 15%

Vegetables 10% or 15%

Fish important where it forms a large part of diet.

The two sets of figures just given are from two different sources. They indicate that cesium is distributed relatively evenly among the different food groups.

Because cesium has volatile precursors, a lot of it ends up in stratosphere. Very roughly its mean time in stratosphere is 2 years. As it falls down, it is deposited on any growing vegetation. Most of the Cs that enters the food chain is absorbed by the plants directly and not from soil after it has been washed down. The heaviest fallout occurs in spring because most of the mixing between stratosphere and troposphere occurs during late winter. Areas with higher rainfall can receive twice as much fallout.

Cesium is readily absorbed by clay particles in soil. It is held tightly enough that only a few per cent of Cs-137 in soil is taken up through the roots of plants. Sandy soils and especially soils with a high content of organic matter bind Cs less effectively. Plants grown on these soils have higher Cs-137 content. Most of the Cs contained in the edible parts of vegetables is due to deposition of particulate material on leaves.

Under certain conditions, Cs can undergo considerable concentration in terrestrial and aquatic food chains. Freshwater fish have been shown to contain it in concentrations several thousand times higher than the concentration in their surroundings. Fish feed on lower aquatic organisms which have already concentrated it above the levels present in water. Shellfish do the same thing. Cesium is effectively trapped and retained by the lichen and moss of the tundra, which are major sources of food for caribou and reindeer. Caribou flesh contained up to 100 times the quantities found in meat in mid latitudes.

Once fallout has stopped Cs becomes trapped in the top 2 cm of soil. External radiation from it would continue for many years. Its greatest danger is considered to be genetically.

Carbon-14. Most of the carbon(C)-14 is released into the stratosphere, from where it equilibrated with the troposphere with a half-time of about 2 years. Tissue C-14 comes into equilibrium with C-14 in the atmosphere with a delay time of about 1.4 years. The retention half-time of dietary carbon in mammals is estimated to be about 40 days. Like tritium, carbon 14 is highly mobile in the environment and no one can do anything about it.

Tritium. Tritium is radioactive hydrogen. Less than 1% of tritium becomes part of the water molecule but it is in this form that it passes through the eco-systems. It behaves identically to ordinary water. It is highly mobile in the environment and very quickly equilibrates in the different systems.

Iron-55. Two pathways are known for the concentration of iron (Fe)-55. Lichen-caribou pathway is important for Eskimos and Lapps. The second source is marine fish. The marine food chain concentrates Fe-55 even more than than the first pathway. The reason for this is the low concentration of stable iron in sea water.

Half-life of Fe-55 in lichens is 1.4 years.

Erythrocyte is considered to be the critical organ.

Ruthenium-106. Ruthenium is known to have accumulated in at least one known food chain. A seaweed in Irish sea that is used by some people in making bread. Critical organ for this case is the lower large intestine. Some people got as much as half the yearly dose limit of rems/yr for lower intestine during the Windscale accident.

METHODS OF MEASUREMENT

There is a lot of literature on the measurement of Sr-89 and -90, I-131 and Cs-137 in the environment and in food. Scientists have been doing it all over the world as the result of the atomic bomb tests in the fifties and the first part of the sixties. The most comprehensive references are: Esther Ferri, Paul J. Magno and Lloyd R. Setter, Radionuclide analysis of large numbers of food and water samples, U.S. Dept. Health, Education, and Welfare, 1965. National Center for Radiological Health, Radioassay Procedures for Environmental Samples, U.S. Dept. of Health, Education, and Welfare, 1967. Manual of Standard Procedures, NYO-4700, Health and Safety Laboratory, U.S. Atomic Energy Commission, New York Operations Office. The above do give details for the procedures but are designed for quantities much smaller than what one would be measuring after a nuclear war. They require highly skilled personnel and very sophisticated equipment.

E. R. Mercer ("Analytical Methods" in Radioactivity in Human Diet, ed. R. Scott Russell, 1966.) has a short but clear review of the above methods. He says that in emergencies, when much higher levels of contamination than normal will be acceptable, much simpler analytical methods are adequate. Unfortunately he doesn't describe them. This happens quite a few times, they aren't described because they are obvious to people who work with radioactivity but not so obvious for a person who doesn't have any experience using different radiation detection instruments or measuring mixtures of different radionuclides. He does make a few relevant comments in passing. If Cs-137 exceeds 300 pc/l in milk, it can be measured directly in a sodium iodide (NaI) crystal scintillation counter. Gamma spectrometric measurement of I-131 can also be done directly on whole milk if the level is high enough. Cesium and iodine can also interfere with each other.

Strontium assays are very complicated, numerous radiochemical separations have to be done. Usually Sr-90 is

calculated from the amount of its daughter yttrium-90 (Sr-90 decays to Y-90) and Sr-89 is determined by the difference.

Daniel A. Gollnick does give a simple method for analyzing milk (Experimental radiological health physics, 1978). Since the ratio of Cs-137 to each of the Sr isotopes is a fixed constant at the time when fission takes place, the strontium concentrations can be calculated from the cesium concentration.

$$\frac{\text{Cs-137}}{\text{Sr-90}} = 5 \qquad \frac{\text{Cs-137}}{\text{Sr-89}} = 0.03$$

First of all, these formulas are for milk, in the fallout Cs-137 to Sr-90 ratio is about 1.6. Second, Sr-89 has a relatively short half-life compared to Cs-137, so the ratio changes with time, it has to be doubled every 51 days after the fissions have occurred. Cs-137 and Sr-90 have similar enough half-lives that the change with time can be ignored.

The milk is passed through an anion exchange resin. I-131, being the only anion in the group of 4 we are interested in, is retained on the resin and everything else passes through. Resin is transferred to a bottle that is counted in a solid scintillation counter. The result is calculated from a known I-131 sample that has been treated the same way. The strontium isotopes are pure beta emitters, therefore, the effluent can be poured into a beaker that fits into a NaI counter and counted for gamma emissions from cesium. The result is compared to a known amount of Cs-137 under the same conditions. The cesium value is used in the formulas given above to calculate the amounts of the two different strontiums.

Gollnick also gives a very useful table of what would be the dose commitment from milk, given a level of activity in milk when it is at the highest (2-4 days after the event). See next page. There must be, however, some mistake in rads for Sr-89. If it is 3 rads in the first year, there is no way with its short half-life it can give 2 more rads

in subsequent years.

Radionuclide	RADS	Max. conc. in milk uc/l
Sr-89	3 in 1st yr, 5 total	1.1
Sr-90	3 in 1st yr, 5 total	0.05
I-131	10	0.07
Cs-137	3 in 1st yr, 5 total	0.72

The above is the sort of approach, that I think would be taken, if there were a nuclear holocaust. There are different models for predicting dose committment from the level of fallout. R. Scott Russel, B. O. Bartlett, and R. S. Bruce, "The significance of long-lived nuclides after a nuclear war," in Survival of Food Crops and Livestock in the Event of Nuclear War, 1970. A. Aarkrog, "Prediction models for Strontium-90 and Caesium-137 Levels in the Human Food Chain", Health Physics, 20:297-311, 1971. W. F. Lengeman has many papers on prediction models. The measurement would be done from an airplane or for more detail from a car. A. C. Chamberlain, R. J. Garner and D. Williams, "Environmental monitoring after accidental deposition of radioactivity," React. Sci. Technology, 14:155-167, 1961.

There are some references that sound good but are not easily available. Guidance on Offsite Emergency Radiation Measurement Systems, Phase 2: The Milk Pathway, B. J. Salmonson, L. G. Hoffman, R. J. Honkus, and J. H. Keller, Westinghouse Idaho Nuclear Company, Inc., WINCO-1009, April 1984. Also by the same people, company and title but a different subtitle: Phase 3: Water and Non-Dairy Food Pathway, WINCO-1012, October 1984. I wanted to send for these two papers but I couldn't find Westinghouse Idaho Nuclear Co. listed in any of the industrial indexes. The closest I could get is that Westinghouse does have a subsidiary called Bettis Atomic Power Lab, Idaho Falls, Idaho (1-208-526-0111). It could be the same company.

Daniel A. Gollnick also has a book out Basic Radiation

Protection Technology, Pacific Radiation Press, 1983.

It isn't available in Toronto. It might have the type of information we are interested in because it has been referred to in places where the concern has been nuclear war.

LACK OF STANDARDS AND MPD

Currently there aren't any guide lines for intake of radioactive material under the conditions of a nuclear war. The main reason for this is that radioactivity in food is not regarded as a priority in an event of a nuclear war.

"Eating food produced in the years after a large attack would cause an increase in the cancer rate... this increase would be a small fraction of the number of additional cancer deaths that would result from external radiation." Cresson H. Kearney, Nuclear War Survival Skills, p. 65, 1980.

Most vegetables would be fit to eat once they had been thoroughly washed. When it is safe to work outside, can plant new crops - they will be safe to eat. Ivan Tyrell, The survival Option, A guide to living through nuclear war, 1982.

"Standing crops in the early stages of growth are damaged by radiation but otherwise are safe to eat if washed clean of dust." p. 105. "Lack of food and water will cause starvation and death of many millions, especially the young and old." p. 115. Diane Diacon, Residential Housing and Nuclear Attack, 1984. The latter two books are English and I don't know anything about the credentials of their authors. The quotes that follow are by R. Scott Russell, unquestionably one of the world authorities on strontium and cesium in fallout and their biological pathways.

"In short, the total deaths caused by long-lived nuclides seem broadly comparable to the annual traffic death rate." (Incidentally, the figures for lung cancer from smoking are higher than traffic fatalities.) "Thus, by the standards the community now accepts, remedial action against the risks from long-lived nuclides would not seem justified; The number of casualties would be so small relative to the total loss and the difficulty of avoiding them would be so great that remedial action could not

reasonably be contemplated." "...efforts to mitigate doses from radiation should be devoted solely to the early period when short-lived nuclides predominate." R. Scott Russell, B. Bartlett, and R. S. Bruce, "The significance of long-lived nuclides after a nuclear war," in Survival of Food Crops and Livestock in the Event of Nuclear War, 1970.

The maximum permissible doses (MPD) used now are based on the philosophy that any radiation is bad and the less the better. Dose limiting recommendations by the National Council on Radiation Protection (NCRP) are given in Table 6.1. The levels are very low, for general population, 0.17 rem/year. This is less than the natural background radiation in some places.

There certainly is awareness that maximum permissible doses are not what would be in effect after a nuclear holocaust. J. C. Thompson, Jr., R. A. Wentworth, and C L. Comar ("Control of fallout contamination in the post-attack diet," in Survival of Food... see above) expressed the need for guidelines that respond to tolerance or survival levels of radioactivity rather than the minimum-exposure concept that is in effect now. They would like to have a "system of radiation-exposure priorities" that would become operational after a nuclear attack. They are aware of the irony that the larger the attack, the lower the priority of fallout considerations in food. "It would be poor operational procedure to initiate efforts to reduce dietary contamination from 10 R to 1 R when general external radiation levels were 100 R and a state of pestilence threatened."

The problem of lack of radiation protection standards designed for nuclear war conditions has been discussed by Lauriston S. Taylor in "Standards for radiation exposure management in accident or nuclear attack," a talk he has given at some recent symposium. (I don't have a complete reference, the paper was sent to me.) The same as J. C. Thompson et al, he recognizes that there can really be no fixed standards that can be applied to basically uncontrollable

328 Radiation Protection by Jacob Shapiro**Table 6.1.** Dose-limiting recommendations of NCRP (1971).

Occupational exposure limits	
Whole body, gonads, lens of eye, red bone marrow	5 rem in any one year
Skin	15 rem in any one year
Hands	75 rem in any one year (25/qtr)
Forearms	30 rem in any one year (10/qtr)
Other organs, tissues and organ systems	15 rem in any one year (5/qtr)
Fertile women (with respect to fetus)	0.5 rem in gestation period
Dose limits for the public, or occasionally exposed individuals	
Individual or occasional	0.5 rem in any one year
Students	0.1 rem in any one year
Population dose limits	
Genetic	0.17 rem av. per year
Somatic	0.17 rem av. per year
Emergency dose limits—lifesaving	
Individual (older than 45 yr if possible)	100 rem
Hands and forearms	200 rem, additional (300 rem total)
Emergency dose limits—less urgent	
Individual	25 rem
Hands and forearms	100 rem, total
Family of radioactive patients	
Individual (under 45 yr)	0.5 rem in any one year
Individual (over 45 yr)	5 rem in any one year

Source: NCRP, 1971, Table 6.

radiation situations. The best that we have are what is called "penalty tables". The following is based on brief, whole body gamma-ray doses:

Dose	Need Medical Care	Able to Work	Die
15-50 R	no	yes	0
50-200 R	no	yes	<5%
200-400 R	yes	no	<50%
450-600 R	yes	no	>50%
600- R	yes	no	100%

The above is the kind of data that is available but that is not what the situation would be after a nuclear war. There would be a long period of high radiation level followed by even longer period of moderate radiation levels. The following table is a little more useful:

Category	Need Medical Care	Accumulated Exposure in:		
		1 week	1 month	4 months
A	None	150 R	200 R	300 R
B	Some (5% die)	250 R	350 R	500 R
C	Most (50% die)	450 R	600 R	--

Lauriston S. Taylor, *ibid.*

There is very little information on chronic exposures that scientists could use to develop emergency standards. Needless to say, there is even less information on continuous internal intake of low or large amounts of radioactivity (the only exception is the radium dial painters). Japan did not have any early fallout in 1945. From the Japanese data and past medical uses of radioactivity it is known how many people would get leukemia and other cancers if a certain number of people would be exposed to a certain level of radiation. From this is derived a linear dose-effect relationship without a threshold. Both NCRP and ICRP (International Commission for Radiological Protection) work on assumption that there is no threshold dose of ionizing radiation below which there is no damage. The dose

effects are assumed to be additive. Taylor does not think it would be true for long range, low or moderate level chronic exposures. Too many theoretically dead persons are still walking around, as he puts it. There are many people who have been working for years within the maximum permissible dose limits for radiation workers. None of them have had any effects of practical importance. He feels the limits could be 10 times or more higher before there would be any detectable consequences. Taylor blames the lack of war time radiation guidelines on the media and the public. He feels that the news media have so over-exploited radiation matters that the public is truly frightened of any radiation exposure. "This makes the presentation and public acceptance of any kind of emergency planning extremely difficult." (There is an analogous phenomenon going on right now. 130 people have died so far from AIDS in Canada. At the same time 4000/yr. die in car accidents, plus many more permanently crippled. Half of the latter are caused by alcohol. Yet the public accepts one but is panic stricken of the other.)

Maximum permissible body burdens, plus all the other dose limits have been developed by the International Commission on Radiological Protection (ICRP) and the National Council on Radiation Protection (NCRP). The body burden of a particular radioactive nuclide is the amount of the nuclide in uc which is present in an individuals body. The maximum permissible body burden is the body burden of a particular radioactive nuclide which results in a MPD (Maximum permissible doses that have been developed for external exposure) to the whole body or to one or more organs in the body. It is computed on the basis that it is the only one in the body. The maximum permissible body burden for a radionuclide of a bone seeking element (e.g. strontium, calcium, radium and plutonium) is the number of uc required to deliver to the bone a dose in rems equal to that provided by 0.1 uc of radium-226. Body burdens

for radionuclides other than bone seekers require the identification of "critical organ" (the organ which is the most sensitive or has the highest concentration). For a nuclide with the whole body as the "critical organ", the maximum permissible body burden for occupational exposure is the activity present continuously in the body which delivers a dose equivalent of 5 rem/year to the whole body. Nuclides which concentrate in abdominal organs are given limiting body burdens which provide 15 rem/year. (Kedar N. Prasad, CRC Handbook of Radiobiology, p. 241, 1984.)

Maximum permissible body burdens and maximum permissible concentrations of radionuclides in water for occupational exposures are given in ICRP publications (for references see Radiation Protection by Jacob Shapiro, 1981. The following values for the radionuclides that enter the food chain as a result of a nuclear fallout are from Radiological Health Handbook, U. S. Dept. Health, Education and Welfare, p. 207, 1970.

Radionuclide	Critical organ	Body burden uc	MPC water continuous intake uc/cc
Sr-89	Bone	4	10^{-4}
Sr-90	Bone	2	10^{-6}
Cs-137	Total body	30	2×10^{-4}
I-131	Thyroid	0.7	2×10^{-5}

Given equal concentrations, Sr-90 is 100 times more dangerous than Sr-89. The differences can even be higher, radium-226 is 10,000 times more dangerous than tritium.

ICRP Publ. 2 Report of Committee II Permissible Dose for Internal Radiation, Pergamon Press, p. 23-27, 1959 talks about permissible concentration of unidentified radionuclides, mixtures of known radionuclides and some of the problems one would run into if one tried to apply the occupational MPC for water to fallout in water and food.

Assuming Taylor was right that the external doses could be raised 10 times without much danger, the same thing would also apply here. Iodine and strontium -89 could still be increased by much more because of their short half-lives. The figures given were for continuous intake for 40 years. Although one can take in 100 times more Sr-89 than Sr-90, it initially occurs in 180 times the greater concentration than Sr-90. That is why initially it is the more important. Its half life is 51 days and after that Sr-90 becomes the most important contaminant. Unfortunately, strontium is the hardest to measure.

EMERGENCY SCHEMES

The only permissible emergency levels of radioactivity in food and water for civilisns were put out by the United States Agricultural Research Service in 1960, USDA Radiological Training Manual for Inservice Training. This procedure was still recommended by the U. S. Dept. of Health, Education and Welfare in 1965, Civil Defense information for food and drug officials. I haven't come across anything that would have replaced this procedure.

There is a food and water standard (CDV-787) that is placed in a standard tin. A Geiger-Mueller counter is placed on top of the tin and a reading is taken, should be in 10 to 15 mr/hr area. The tin is filled with food or water when an unknown is tested. Anything below the standard reading is fit for a 10 day consumption. Anything below $2/3$ of the standard reading is fit for 30 day consumption period. The values that they represent are 9×10^{-2} uc/g and 3×10^{-2} uc/g for 10 and 30 day consumption periods respectively.

There is a more extensive emergency scheme by J. D. Teresi and C. L. Newcombe, "Calculations of maximum permissible concentrations of radioactive fallout in water and air based upon military exposure criteria," Health Physics 4:275-288, 1961. Although this is for water, I think it would also be applicable to directly contaminated food. Permissible levels for food and water are always the same in literature. It would not be applicable to food grown on contaminated soil. Their figures are based on the 14 major contributors in the fallout mixture. This is subdivided in 3 groups: major contributors for the first 7 days, major contributors for 8-104 days and major contributors for 105-365 days after the explosion.

On this basis they calculate the allowable ug/cm^3

to give 15 rem in 90 days, eaten in 7 different time spans, from 1 to 90 days and starting at 11 different times after time⁰, from 3.5 hrs to 365 days. See their Table 6 on next page. They do the same thing for 150 rems in 30 days. See their Table 7. The tables can be used to get values for any other dose e.g., if you want 75 rem dose in 30 days, divide the value by half. They don't say what standard would be used to determine $\mu\text{g}/\text{cm}^3$. I am concerned that the data on which they based their calculations would be outdated. They submitted their paper for publication Nov 1959. The atomic weapons have changed since that time - the fission products would not be in the same proportions now. For example, cesium is not mentioned. There would also be a better idea of the biological effect of some of these radionuclides in 1985.

There are two other methods for emergency monitoring of drinking water. G.W.C. Tait and W. F. Merritt, "Emergency monitoring of drinking water", Health Physics 1:164-168, 1958. See their Table 5.

Dept. of National Health and Welfare (Ottawa), Control of radioactive fallout in water systems, 1965, have presented Teresi and Newcombe's 90 day scheme in form of a graph. Whatever the time after explosion, up to a year, one can read off the values for water contamination that would deliver 15 rems in 90 days. They also give a number of handy approximations to know. Curies of beta particle radioactivity = 2 x curies of gamma ray radioactivity for the first 3 months (p.7). One day following a nuclear detonation: curies of gamma radioactivity per sq. ft. = roentgens/hr divided by 100 (p.81).

Terini and Newcombe, 1961

Radiation Risk and Ethics

by [Zbigniew Jaworowski*](#)

(This article, while perhaps no longer available there, originally appeared in: [Physics Today](#), 52(9), September 1999, pp. 24-29, [American Institute of Physics](#).)

The established worldwide practice of protecting people from radiation costs hundreds of billions of dollars a year to implement and may well determine the world's future energy system. But is it right?

The psychosomatic disorders observed in the 15 million people in Belarus, Ukraine, and Russia¹ who were affected by the April 1986 Chernobyl accident are probably the accident's most important effect on public health.² These disorders could not be attributed to the ionizing radiation, but were assumed to be linked to the popular belief that any amount of man-made radiation—even minuscule, close to zero doses—can cause harm, an assumption that gained wide currency when it was accepted in the 1950s, arbitrarily, as the basis for regulations on radiation and nuclear safety.

It was under the same assumption that an *ad hoc* Soviet government commission decided to evacuate and relocate more than 270 000 people from many areas of the former Soviet Union where the 1986–95 average radiation doses from the Chernobyl fallout ranged between 6 and 60 millisieverts.

[Note by Bruce: 1 sievert (Sv) = 100 rem. Therefore a millisievert would be about 10 millirem. Remembering that a millirem is one thousandth of a rem and a rem is equivalent to a rad, gray, or roentgen all of what we call 1 R, you can see how low these peace time events were. 1 rem = 0.01 sievert (Sv)]

By comparison, the world's average individual lifetime dose due to natural background radiation is about 150 mSv. In the Chernobyl-contaminated regions of the former Soviet Union, the lifetime dose is 210 mSv—and in many regions of the world it is about 1000 mSv.³ The forced evacuation of so many people from their—presumably—poisoned homes calls for ethical scrutiny. Examining the physical and moral basis of that evacuation action and other radiation policies is the subject of this article.

As they have developed over the last three decades, the principles and concepts of radiation protection seem to have gone astray and to have led to exceedingly prohibitive standards and impractical recommendations. Revision of these principles and concepts is now being proposed by an increasing number of scientists and several organizations. They include Roger Clarke, who chairs the International Commission on Radiological Protection, the Health Physics Society, and the French Academy of Sciences. In addition, in April this year, the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) decided to study a possible revision of the basic dosimetric and biological concepts and quantities generally being applied in radiation protection. In the years to come, such reevaluations may trigger what I believe will be welcome changes in the basic worldwide approach to radiological protection.

Natural and man-made radiation

We are all immersed in naturally occurring ionizing radiation. Radiation reaches us from outer space and it comes from radionuclides

present in rocks, buildings, air, and even our own bodies. Each flake of snow, each grain of soil, every drop of rain—and even every person on this planet—emits radiation. And every day, at least a billion particles of natural radiation enter our bodies.

The individual dose rate of natural radiation the average inhabitant of Earth receives is about 2.2 mSv per year. In some regions—for example, parts of India, Iran, and Brazil—the natural dose rate is up to a hundred times higher. And no adverse genetic, carcinogenic, or other malign effects of those higher doses have ever been observed among the people, animals, and plants that have lived in those parts since time immemorial.^{4,5}

In the case of man-made radiation, the global average dose has increased by about 20% since the beginning of the 20th century—mainly as a result of the broader application of x-ray diagnostics in medicine. Other major sources of man-made radiation, such as nuclear power, nuclear weapons tests and the Chernobyl accident, have contributed only a tiny proportion—less than 0.1%—to that increase.

In the regions of the former Soviet Union that were highly contaminated by the fallout from the Chernobyl accident, the increased radiation dose rate for local inhabitants is far less than the dose rate in areas of high natural radiation. In those places, the entire man-made contribution to radiation dose amounts to a mere 0.2% of the natural component.

Three and a half billion years ago, when life on Earth began, the natural level of ionizing radiation at the planet's surface was about three to five times higher than it is now.⁶ Quite possibly, that radiation was needed to initiate life on Earth. And it may be essential to sustain extant life-forms, as suggested by experiments with protozoa and bacteria.⁷

At the early stages of evolution, increasingly complex organisms developed powerful defense mechanisms against such adverse radiation effects as mutation and malignant change. Those effects originate in the cell nucleus, where the DNA is their primary target. That evolution has apparently proceeded for so long is proof, in part, of the effectiveness of living things' defenses against radiation.

Other adverse effects—which lead to acute radiation sickness and premature death in humans—also originate in the cell, but outside its nucleus. For them to take place requires radiation doses thousands of times higher than those from natural sources. A nuclear explosion or cyclotron beam could deliver such a dose; so could a defective medical or industrial radiation source. (The malfunctioning Chernobyl reactor, whose radiation claimed 28 lives, is one example.)

The concern about large doses is obviously justified. However, the fear of small doses, such as those absorbed from the Chernobyl fallout by the inhabitants of central and western Europe, is about as justified as the fear that an atmospheric temperature of 20°C may be hazardous because, at 200°C, one can easily get third-degree burns—or the fear that sipping a glass of claret is harmful because gulping down a gallon of grain alcohol is fatal.

According to recent studies, by far the most DNA damage in humans is spontaneous and is caused by thermodynamic decay processes and by reactive free radicals formed by the oxygen metabolism. Each mammalian cell suffers about 70 million spontaneous DNA-damaging events per year.⁸ Only if armed with a powerful defense system could a living organism survive such a high rate of DNA damage.

An effective defense system consists of mechanisms that repair DNA, and other homeostatic mechanisms that maintain the integrity of organisms, both during the life of the individual and for thousands of

generations. Among those homeostatic mechanisms are enzymatic reactions, apoptosis (that is, suicidal elimination of changed cells), cell cycle regulation, and intercellular interactions.

Ionizing radiation damages DNA also, but at a much lower rate. At the present average individual dose rate of 2.2 mSv per year, natural radiation could be responsible for no more than about 5 DNA-damaging events in one cell per year.

Perhaps we humans lack a specific organ for sensing ionizing radiation simply because we do not need one. Our bodies' defense mechanism provides ample protection over the whole range of natural radiation levels—that is, from below 1 mSv to above 280 mSv per year.^{3,4} That range is much greater than the range of temperatures—about 50K—that humans are normally exposed to. Increasing the water temperature in your bath tub by only 80 K, from a pleasant level of 293 K to boiling point at 373 K (that is, by a factor of only 1.3), or decreasing it below freezing point (that is, by a factor of 1.07), would eventually kill you.

Because such lethal high or low temperatures are often found in the biosphere, the evolutionary development of an organ that can sense heat and cold has been essential for survival. Organs of smell and taste have been even more vital as defenses against dangerously toxic or infected food. But a lethal dose of ionizing radiation delivered in one hour—which for an individual human is 3000 to 5000 mSv—is a factor of 10 million higher than the average natural radiation dose that one would receive over the same time period (0.00027 mSv). Compared with other noxious agents, ionizing radiation is rather feeble. Nature seems to have provided living organisms with an enormous safety margin for natural levels of ionizing radiation—and also, adventitiously, for man-made radiation from controlled, peacetime sources.

In short, conditions in which levels of ionizing radiation could be noxious do not normally occur in the bio-sphere, so no radiation-sensing organ has been needed in humans and none has evolved.

Why radiophobia?

If radiation and radioactivity, though ubiquitous, are so innocuous at normal levels, why do they cause such universal apprehension? What is the cause of radiophobia—the irrational fear that any level of ionizing radiation is dangerous? Why have radiation protection authorities introduced a dose limit for the public of 1 mSv per year, which is less than half the average dose rate from natural radiation and less than 1% of the natural dose rates in many areas of the world? Why do the nations of the world spend hundreds of billions of dollars a year to maintain this standard?⁹

Here I propose some likely reasons:

- The psychological reaction to the devastation and loss of life caused by the atomic bombs dropped on Hiroshima and Nagasaki at the end of World War II.
- Psychological warfare during the cold war that played on the public's fear of nuclear weapons.
- Lobbying by fossil fuel industries.
- The interests of radiation researchers striving for recognition and budget.
- The interests of politicians for whom radiophobia has been a handy weapon in their power games (in the 1970s in the US, and in the 1980s and 1990s in eastern and western Europe and in the former Soviet Union).

- The interests of news media that profit by inducing public fear.
- The assumption of a linear, no-threshold relationship between radiation and biological effects.

Since nuclear weapons are regarded as a deterrent, naturally the countries that possess them wish to make radiation and its effects seem as dreadful as possible. Not surprisingly, national security agencies seldom qualify or correct even the most obviously false statements, such as “Radiation from a nuclear war can annihilate all mankind, or even all life,” or “200 grams of plutonium could kill every human being on Earth.”¹⁰

The facts say otherwise. Between 1945 and 1980, the 541 atmospheric nuclear tests that were performed together yielded an explosive energy equivalent to 440 megatons of TNT (1.8×10^{24} joules). After all those explosions, despite the injection into the global atmosphere of about 3 tons of plutonium (that is, almost 15 000 supposedly deadly 200-gram doses), somehow we are still alive! The average individual dose of radiation from all these nuclear explosions, accumulated between 1945 and 1998, is about 1 mSv, which is less than 1% of the natural dose for that period.

In the heyday of atmospheric testing, 1961 and 1962, there were 176 atmospheric explosions, with a total yield of 84 megatons. The maximum deposition on Earth’s surface of radionuclides from those explosions took place in 1964. The average individual dose accumulated from the fallout between 1961 and 1964 was about 0.35 mSv.

At its cold war peak of 50 000 weapons, the global nuclear arsenal had a combined potential explosive power of about 13 000 megatons,

which was only 30 times larger than the megatonnage already released in the atmosphere by all previous nuclear tests. If that whole global nuclear arsenal had been deployed in the same places as the previous nuclear tests, the average individual would have received a lifetime radiation dose of about 30 mSv from the ensuing worldwide fallout. If we use the years 1961 and 1962 as a yardstick instead, the dose would have risen to about 55 mSv. And even exploding all the nuclear weapons in just a few days rather than over a two-year period would not change that estimate by very much. Clearly, 55 mSv is a far cry from the short-term dose of 3000 mSv that would kill a human.

Of course, the approach taken above, based as it is on averages, fails to account for the immense loss of life and human suffering caused by the mechanical blast, fires, and local fallout that follow nuclear explosions in highly populated areas. However, no matter what the losses to those areas might be, it is certain that human and other life on Earth would survive even an all-out global nuclear war.

A-bomb survivors and linear no-threshold

The survivors of the atomic bombing of Hiroshima and Nagasaki who received instantaneous radiation doses of less than 200 mSv have not suffered significant induction of cancers.^{[11](#)} And so far, after 50 years of study, the progeny of survivors who were exposed to much higher, near-lethal doses have not developed adverse genetic effects.^{[12](#)}

Until recently, such findings from the study of A-bomb survivors had been consistently ignored. In place of the actual findings—and driving the public's radiophobia—has been the theory of linear no-threshold (LNT), which presumes that the detrimental effects of radiation are proportional to the dose, and that there is no dose at which the effects of radiation are not detrimental.

It was LNT theory that the International Commission on Radiological

Protection chose, in 1959, as the basis for its rules of radiation protection. At that time, applying LNT theory was regarded as an administrative decision, based on practical (not to mention political¹³) considerations. Adopting a linear relationship between dose and effect, along with no threshold, enabled doses in individual exposures to be added and enabled population-averaged quantities to be evaluated, and made the administration of radiation protection generally easier. Furthermore, the policy undertone—that even the smallest, near-zero amounts of radiation could cause harm—was politically useful at the time: It played an important part in effecting first a moratorium and then a ban on atmospheric nuclear tests. LNT theory was and still is the pillar of the international theory and practice of radiation protection.

Over the years, however, what started as just a working assumption for the leadership of ICRP came to be regarded—in public opinion and by the mass media, regulatory bodies, and many scientists, and even by some members of the ICRP—as a scientifically documented fact.

The absurdity of the LNT was brought to light after the Chernobyl accident in 1986, when minute doses of Chernobyl radiation were used by Marvin Goldman, Robert Catlin, and Lynn Anspaugh to calculate that 53 400 people would die of Chernobyl-induced cancer over the next 50 years.¹⁴ The frightening death toll was derived simply by multiplying the trifling Chernobyl doses in the US (0.0046 mSv per person) by the vast number of people living in the Northern Hemisphere and by a cancer risk factor based on epidemiological studies of 75 000 atomic bomb survivors in Japan. But the A-bomb survivor data are irrelevant to such estimates, because of the difference in the individual doses and dose rates. A-bomb survivors were flashed within about one second by radiation doses at least 50 000 times higher than those which US inhabitants will ever receive, over a period of 50 years, from the Chernobyl fallout.

We have reliable epidemiological data for a dose rate of, say, 6000

mSv per second in Japanese A-bomb survivors. But there are no such data for human exposure at a dose rate of 0.0046 mSv over 50 years (nor will there ever be any). The dose rate in Japan was larger by 2×10^{15} than the Chernobyl dose rate in the US. Extrapolating over such a vast span is neither scientifically justified nor epistemologically acceptable. Indeed, Lauriston Taylor, the former president of the US National Council on Radiological Protection and Measurements, deemed such extrapolations to be a “deeply immoral use of our scientific heritage.”

Radiation dose and eternity

An offspring of the LNT assumption is the concept of dose commitment, which was introduced in the early 1960s. At that time, the concept reflected the concern that harmful hereditary effects could be induced by fallout from nuclear tests. After almost four decades, the concept of dose commitment is still widely used, although both the concept and the concern ought to have faded into oblivion by now.

UNSCEAR, which first used “dose commitment” in 1962, defined it as “the integral over infinite time of the average dose rate in a given tissue for the world population, as a result of a given practice—for example, a given series of nuclear explosions.” Such integration requires making some daring assumptions and having a superhuman omniscience about population dynamics and environmental changes for all the eons of time to come. Later, in a humbler frame of mind, UNSCEAR introduced the so-called truncated dose commitment, limited arbitrarily to 50, 500, 10 000 or many millions of years. However, the original “infinite” definition is still retained in recent UNSCEAR documents.

To accept the definitions of dose commitment and of collective dose, we must also accept the following premises:

- An LNT relationship between absorbed dose and risk to an individual.
- The additivity of risk (by means of the additivity of dose) during the lifetime of an individual.
- The additivity of risk (dose) across individuals of the same generation.
- The additivity of risk (dose) across the lifetimes of individuals over any number of generations.
- The expectation that late harm due to a dose accumulated over many years or generations (dose commitment) be the same as the harm done by an instantaneous dose of the same magnitude.
- The expectation that late harm due to a given value of collective dose or dose commitment calculated for a large number of people exposed to trifling doses be the same as that calculated for a small number of people exposed to large doses. (This expectation is contrary to the common practice of diluting or dispersing noxious agents below dangerous levels.)

In 1969, UNSCEAR advised making the level of natural radiation a convenient reference for comparing dose commitments from man-made sources. However, during the three decades since the introduction of the dose commitment concept, UNSCEAR has not followed its own advice. The collective dose commitment for the world population from natural sources, truncated to 50 years (650 000 000 man Sv), was published for the first time in UNSCEAR's 1993 report. But why stop at 50 years—when, for man-made radiation, UNSCEAR estimates the dose commitments over infinite time? It is easy to calculate the individual dose commitment from past exposures

to natural radiation for periods comparable to those used for calculating man-made sources of radiation. In making the calculation, one may assume that during the past several million years the natural radiation dose rate has been the same as is now—that is, 2.2 mSv per year.

In the table on this page are presented the values of truncated natural dose commitment for various periods since the putative appearance of some of our ancestors. One may compose a similar table for the collective truncated dose commitments for the global populations integrated over the past generations, information that is also given in the table. One may also calculate the future natural dose commitments of our descendants for tens or thousands of generations.

[Bruce: There was a table here and a couple of other places in the original article but I have not included the tables and figures.]

Each of us is burdened with these values of dose commitment. Do these values represent anything real, or are they just an academic abstraction? What are the medical effects of these enormously high doses?

In an international study, the collective dose for the world population from nuclear dumping operations in the Kara Sea (part of the Arctic Ocean), truncated to the year 3000 AD, has been estimated to be about 10 manSv. Let us explore the implications of that value, which may be equivalent to:

2×10^{-12} Sv per each of 5×10^9 people now living and their descendants from 33 generations in 1000 years (no concern).

Obviously, the use of collective dose obliterates information on the patterns of dose deposition in space and time, which are of major importance for estimating their biological effects, in terms of risk to

humans. Individual doses cannot be additive over generations, simply because humans are mortal, and the dose dies when an individual does. Similarly, individual doses cannot be added for individuals of the same generation because we do not contaminate one another with a dose that we have absorbed. The presence of biological repair processes and the multistage process of cancer induction render the linear addition of small contributions of individual dose to estimate the associated risk of cancer occurrence highly unlikely. Collective dose and dose commitment cannot have any biological meaning. The large values of collective doses and collective dose commitments that have often been published were derived from minuscule individual doses.

For example, UNSCEAR's calculations include the following:

- 100 000 man Sv from nuclear explosions during the past 54 years,
- 205 000 man Sv for the global population in the next 10 000 years from power reactors and reprocessing plants,
- 600 000 man Sv from Chernobyl fallout in the Northern Hemisphere for eternity,
- and 650 000 000 man Sv for the world's population from natural radiation in the past 50 years.

These large values, terrifying as they are to the general public, do not imply that individuals or populations are harmfully burdened by nuclear explosions, nuclear power plants, Chernobyl fallout, or nature. In fact, they provide society with no relevant biological or medical information. Rather, they create a false image of the imminent danger of radiation, with all its actual negative social and psychosomatic consequences. If harm to the individual is trivial, then the total harm to members of his or her society over all past or future time must also be trivial—regardless of how many people are or will have been exposed to natural or man-made radiation. The intellectually invalid concepts of collective dose and dose commitment deserve to be hacked off with

William of Occam's razor .

Enter hormesis

The LNT theory is contradicted by the phenomenon of hormesis—that is, the stimulating and protective effect of small doses of radiation, which is also termed adaptive response. The first report on hormetic effects in algae appeared more than 100 years ago.¹⁶ More recently published hormetic effects include A-bomb survivors' apparent lower-than-normal incidence of leukemia and their greater longevity.¹⁷ Although more than 2000 scientific papers had been published on radiation hormesis, the phenomenon was forgotten after World War II and was ignored by the radiation-protection establishment. It was only in 1994 that UNSCEAR recognized and endorsed the very existence of radiation hormesis. It caused a revolutionary upheaval of radiology's ethical and technical foundations.

Many radiologists have come to realize that their overreaction to theoretical (actually imaginary) health-harming effects of radiation is unethical in that it leads to the consumption of funds that are desperately needed to deal with real health problems. Applying the no-threshold principle for the alleged protection of the public has led to the imposition of restrictive regulations on the nuclear utilities, restrictions that have virtually strangled the development of environmentally benign nuclear energy in the US and in other countries. My own country, Poland, spent billions of dollars on the construction of its first nuclear power reactor—only to abandon the project after what I regard as the politically motivated manipulation of public opinion by means of the LNT theory.

Each human life hypothetically saved in a Western industrial society by implementation of the present radiation protection regulations is estimated to cost about \$2.5 billion. Such costs are absurd and immoral—especially when compared to the relatively low costs of

saving lives by immunization against measles, diphtheria, and pertussis, which in developing countries entails costs of \$50 to \$99 per human life saved.¹⁸ Billions of dollars for the imaginary protection of humans from radiation are actually spent year after year, while much smaller resources for the real saving of lives in poor countries are scandalously lacking.

A practical alternative

There is an emerging awareness that radiation protection should be based on the principle of a practical threshold—one below which induction of detectable radiogenic cancers or genetic effects is not expected. Below such a threshold, radiation doses should not require regulation. Nor is any regulation required for extreme levels, such as those experienced at Hiroshima and Nagasaki, where dose rates were extremely high.

The practical threshold to be proposed could be based on epidemiological data from exposures in medicine, the nuclear industry, and regions with high natural radiation. The current population dose limit of 1 mSv per year could then be changed to 10 mSv per year or more. Individual doses could be evaluated at any level below the practical threshold, but radiation-protection authorities would be required to intervene only if individual doses above the threshold were involved. Adopting a practical threshold would be an important step taken toward dealing with radiation rationally and toward regaining the public's acceptance of radioactivity and radiation as blessings for mankind.

**Zbigniew Jaworowski is a professor at the Central Laboratory for Radiological Protection in Warsaw, Poland, and has served on the United Nations Scientific Committee on the Effects of Atomic Radiation. His e-mail address is: jaworo@clor.waw.pl.*

To the Graduate Council:

I am submitting herewith a thesis written by David Gene Easterly entitled "Removal of Strontium-89 and Calcium-45 from Milk by Use of Ion Exchange Resins." I recommend that it be accepted for nine quarter hours of credit in partial fulfillment of the requirements for the degree of Master of Science, with a major in Dairying.

Major Professor

We have read this thesis
and recommend its acceptance:

Accepted for the Council:

Dean of the Graduate School

REMOVAL OF STRONTIUM-89 AND CALCIUM-45 FROM MILK BY
USE OF ION EXCHANGE RESINS

A THESIS

Submitted to
The Graduate Council
of
The University of Tennessee
in
Partial Fulfillment of the Requirements
for the degree of
Master of Science

by

David Gene Easterly

June 1959

ACKNOWLEDGEMENTS

The author wishes to express his sincere appreciation to Dr. B. J. Demott for his assistance in planning and conducting this study, and to Dr. R. G. Cragle for his guidance and assistance in helping to conduct this study. Great appreciation is due the UT-AEC Agricultural Research Laboratory, Oak Ridge, Tennessee, for facilities used in this study and especially to Dr. N. S. Hall, the Director, for encouragement and suggestions. Appreciation is also due R. C. McIlhenny for his advice and suggestions. The author is also exceedingly grateful to one and all of the laboratory staff for the help and advice so freely given.

INTRODUCTION

The increased usage of nuclear power and the testing of atomic weapons have brought the problem of damaging effects of radiation to public attention. In recent months much publicity has been given the passage of strontium from the atmosphere into food and its accumulation in bone.

Due to its long half-life and its biological similarity to calcium, strontium is generally regarded to be one of the principal fission products which are of concern to the health of humans. The strontium level in milk has been steadily rising since 1954, the year adequate routine measures were first made. Since milk is the principal source of calcium of most Western Countries (people in the United States receive 85 per cent of their dietary calcium from milk products (17) it has received attention as a source of strontium.

If the strontium content of milk could be reduced the overall strontium in the diet would be reduced.

The object of this investigation was to determine the feasibility of the use of ion exchange resins to remove strontium from milk.

REVIEW OF THE LITERATURE

Ion Exchange

Although the treatment of water by solid adsorbents such as sand is probably as ancient as civilization itself, the phenomenon of ion exchange was first recognized as such in soil experiments. In 1850, two Agricultural Chemists, Thompson (28) and Way (29) reported on exchange properties of certain soils. Their experiments showed that upon treating certain types of soils with either ammonium sulfate or ammonium carbonate most of the ammonia was adsorbed and lime was released. After further study they decided that such action was due to the complex silicates present in the soils, and concluded that ion exchange was taking place.

The first industrial use of ion exchange was attempted by Harms (13) in 1896. His effort to purify sugar juice by use of base exchange silicates was only partly successful. Gans (9), in 1906 also attempted to utilize ion exchange for industrial purposes. This experimenter employed both natural and synthetic aluminum silicates for the purpose of softening waters and for treating sugar solutions. A significant step in ion exchange history was the observation by Adams and Holmes (1) in 1935, that certain synthetic resins were capable of exchanging ions.

The explanation for the phenomenon of ion exchange may be grouped into three theories; the crystal-lattice exchange theory, the double-layer theory, and the Donnan membrane theory.

The crystal-lattice theory explains ion exchange by assuming that in an ionic solid the constituents of the crystal lattice are present as ions instead of molecules. Complete dissociation of the ionic solid is assumed. Each ion in the crystal is surrounded by a fixed number of ions of opposite charge, and since the coulomb attractive force between these ions is dependent upon the charge on the ions and the distance between them, the ions on the surface are bound less closely than those beneath the crystal surface. When placed in a medium such as water, these surface ions may be easily replaced by ions in solution.

The ease with which the surface ions may be replaced by another ion depends on (a) the nature of the forces binding the ion to the crystal, (b) the concentration of the exchanging ion, (c) the charge of the exchanging ion, (d) size of the two ions, (e) the accessibility of lattice ions, and (f) solubility effects (16).

The double-layer theory, as an explanation of the electrokinetic properties of colloids, has been considered by many to explain ion exchange. The exchange material is believed to be a fixed inner layer of charges surrounded by a diffuse and mobile outer layer of charges which extend into the external liquid media. There is no sharp boundary between the ions in the diffuse outer layer and those in the equilibrium external medium. It may be considered that the concentration of the ions constituting the diffuse layer as varying continuously and depending upon the concentration and pH of the external solution. Therefore, any change in the concentration of the ions in the external solution

upsets the equilibrium and a new equilibrium is obtained. Some of the ions held in the diffuse outer layer will be replaced by some of the new ions.

The Donnan membrane theory pertains to the unequal distribution of ions on two sides of a membrane, when one side contains ions too large to diffuse through the membrane. An unequal distribution will occur because of the undiffusible ions and the necessity of maintaining electroneutrality.

In applying the latter theory to ion exchange, the exchange material is assumed to be the ion too large to diffuse, and although in ion exchange no membrane is used, the interface between the solid and liquid phases is assumed to represent a membrane (16).

Otting (25) discusses the problems involved in the changing of equipment used for water treatment to a design which would be satisfactory from the sanitary viewpoint for ion exchange work in milk. The gravel in the bottom of the water softening device was replaced by a wire screen and a perforated plate to reduce the milkstone. Before a commercially feasible process resulted many changes in design of equipment and revival methods were necessary.

Milk can be modified by treatment with various types of organic ion exchange materials to produce certain desired characteristics. Haller and Morin (12) found that the type and extent of modification can be controlled at will by using the proper exchangers or combination of exchangers and by the proper regeneration of these exchangers. In one treatment these workers produced a soft curd milk of normal pH.

In another, approximately 20 per cent of the citrates, phosphates, and chlorides in addition to calcium and other cations were removed. Still another treatment removed citrates and chlorides and small amounts of calcium and other cations, but no phosphates.

In order to make cow's milk more suitable for the feeding of infants, modifications of the milk is necessary, particularly in the matter of curd tension. In 1930 Lyman (21) revealed that calcium could be removed from cow's milk by placing it in contact with greensand, a highly siliceous sand containing a little magnesia and alumina, and that the resulting milk exhibited soft-curd properties. This application of base-exchange silicates to the commercial treatment of dairy products was probably the first successful use of this principle in connection with a food product.

Murthy and Whitney (23) investigated the effect of mixed cation and anion resins upon the salt content of milk. The batch process was used to treat fresh raw skim milk with cationic and anionic resin mixtures at four different levels each. The pH and the calcium, sodium, and potassium content decreased with increases in cation resin concentration. Citrate, chloride, and sulfate content decreased with increases in anion resin concentration. The nitrogen content was not affected except when coagulation occurred.

Sasaki, et al. (26) studied the effects of treatment with ion exchange resin on heat coagulation of milk. Calcium was adsorbed on a cation exchanger of sulfonic acid structure but no clear relationship was observed between the removal of calcium and the temperature of heat coagulation of milk.

Gehrke and Almy (10) investigated the adsorption affinity to synthetic ion exchange resins of the cations and anions normal to milk. The relative order of adsorption of the cations from the synthetic whey solution was found to be Ca^{++} Mg^{++} K^{+} Na^{+} .

Baker and Gehrke (4) developed an ion exchange resin contact time method to study the equilibria of calcium in milk and to measure directly the ion-exchangeable calcium. They also reported (5) that heating skim milk to 40°, 60°, and 80° C. for 30 minutes had no noticeable effect on the exchangeability of calcium. However, the exchangeable calcium was significantly decreased as the temperature of heating increased from 100° to 120° C. for holding times of 30 minutes. Similar results were reported by Gehrke and Smith (11) who also observed that as the pH is increased the per cent of instantaneously exchangeable calcium decreases.

Two methods of recovering lactose from cheddar cheese whey were studied by McGlasson and Boyd (22). One method involved passing the original whey through ion exchange resins, removing the whey protein by heat treatment and further purifying the removed lactose solution with ion exchange resins. The second method differed from this only in that the original whey was not treated with ion exchange resins prior to the recovery of the protein fraction. Lactose with a higher degree of purity was recovered by the second method.

Josephson and Reeves (14) found that when mineral ion exchange treated milk was added to evaporated milk it was capable of stabilizing the evaporated product against coagulation during steriliza-

tion at 240° F. for 15 minutes. Mineral ion exchange milk was found to be effective in stabilizing milks exhibiting a wide range of instability to heat.

Nervik, et al. (24), by both a column and a bulk technique, removed nearly 90 per cent of the tracer isotopes of calcium and strontium from milk to which they had added isotopes, using Dowex-50W resin in the sodium form.

Radioactive Strontium

The strontium isotopes (mass numbers 84 through 94 and 97) may be formed as fission products and from the bombardment of other isotopes by nuclear particles. In the fission of Uranium-235 the strontium isotopes have a relatively large yield (about 5.8 per cent strontium-90). No radiation problem is presented by the stable isotopes of strontium 84, 86, 87 and 88. An isomeric form of strontium-87 and the isotopes 91, 92, 93, 94 and 97 have relatively short half-lives (range from ten hours to less than two minutes) and consequently, would decay rapidly compared to an isomeric form of strontium-85 and the isotopes 89 and 90, which have half-lives of 65 days, 55 days, and 25 years, respectively.

Strontium is one of the alkaline earths metals, belonging to Group II of the Periodic Table along with calcium, barium, and radium. Strontium-90 is generally regarded as the principal health hazard among the fission products since it is taken up by the human skeleton where it remains deposited for many years. The metabolism of stron-

tium has been found similar to that of calcium (2, 17, 15). Schulert and Peets (27) found that intravenously administered strontium-85 and calcium-45 in man were somewhat equally divided between bone and soft tissue for the first few days after administration but that after four months, about 99.5 per cent of the isotopes which were retained in the body were found in bone. The retention among the bones was greatest in vertebrae and least in long bone shaft and skull. Initially, the bone exhibited no marked preference for one isotope over the other, however, as strontium-85 was preferentially excreted by the kidney, the relative ratio of calcium-45 to strontium-85 remaining in bone gradually increased. The net retention of the isotopes appeared to level off at about 60 per cent for calcium-45 and 25 per cent for strontium-85. Although strontium retention in the body is less than calcium, the distribution throughout the body seems very similar.

Factors influencing the health hazards of strontium have been estimated by health physicists according to (1) quantities available, (2) initial body retention, (3) fraction going from blood to critical body tissue, (4) radiosensitivity of the tissue, (5) size of the critical organ, (6) biological half-life, (7) radioactive half-life, (8) energy of radiation produced by the radioisotope, and (9) specific ionization and attenuation of energy in tissue.

With the present knowledge, it is hardly possible to do more than broadly indicate the biological damage caused by strontium-90. However, the likely biological damage from ingestion of strontium-90 may be described under four headings: leukemia, bone tumor, life-shortening and genetic damage (6, 18).

According to Lewis (19) leukemia in man can be induced by ionizing radiations and can also occur spontaneously. He estimated that a 5 to 10 per cent increase in the current spontaneous incidence of leukemia would occur if the population were to reach and maintain a body level of strontium-90 amounting to one-tenth of the "maximum permissible concentration". The maximum permissible levels are recommended by the National Committee on Radiation Protection and Measurement and represent concentrations which are currently considered safe over a lifetime and which may occasionally be exceeded for short periods of time.

It has been demonstrated in laboratory animals that acute doses of radiostrontium cause bone tumors. As yet, nothing definite is known regarding the quantitative relationship between the magnitude of the dose and the incidence probability of bone tumors.

Radiostrontium Movement from Atmosphere to Milk

Radioactive fallout is the settling to earth of particles which are radioactive as a result of a nuclear explosion. Radiostrontium comes down mainly in raindrops. Part of the radiostrontium descending will lodge in plants, and part will enter the soil and then enter plants through their roots. The fraction which falls on leaves of growing plants is partially absorbed directly into the plant (7, 20).

Soil, like ion exchange resins, readily absorbs and retains most metal ions, including strontium. Approximately 80 per cent of the strontium-90 deposition is held in the top 2 inches of soil (7, 20).

About 50 per cent of the total is contained in the top one inch layer and the remaining portion in the soil to a depth of about 6 inches. The period for which radiostrontium stays in top-soil without becoming buried relatively deep, due to plowing, dispersion, or transformation into insoluble compounds, is not easily estimated, but probably extends over several years. Many factors, however, such as the nature of the soil, the extent of leaching by rain, the action of worms, and the cracking of the soil in dry weather, will affect the depth of penetration (7).

Very little is known about the actual mechanism of absorption and uptake of metal ions by plants but as strontium is chemically similar to calcium, it is reasonable to assume that calcium and strontium are absorbed in the same manner. The growing plant discriminates against strontium in favor of calcium at the ratio of about 2 to 1 (20). The absorption of strontium-90 by plants in a season is of the order of one per cent of the amount present in soil, the highest values in plants being in leaf tissue (7).

Animals markedly discriminate against strontium relative to calcium in their absorption of these elements from feed. The strontium activity in milk expressed as per gram of calcium present, is much below its value in the animal's ration. The experiments of Comar, et al. (7) and those of Cragle and Demott (8), have shown that the ratio of the strontium concentration in the animal's ration to that in the milk to be about 7-10 to 1. The cow acts as a barrier resisting the flow of strontium along the food-chain from soil to man. This

means that the strontium concentration (per gram of calcium) in milk is only about one-seventh to one-tenth of what it is in the feed the cow eats.

Since strontium and calcium metabolism are very closely associated, concentrations of strontium are generally expressed in terms of calcium. The most common and convenient unit for this purpose is the sunshine unit or sometimes called the Strontium Unit (S.U.), which is equal to the number of micromicrocuries of strontium-90 per gram of calcium. In itself it is not an absolute amount of strontium-90 but applies only to calcium contamination with strontium-90; and it provides a direct measure of this specific contamination. The maximum permissible body burden of strontium-90 for the general public is 0.1 microcurie, corresponding to 100 S. U. (as of April 22, 1959, unofficially 200 S. U.). On the basis of extensive experience of radiologists and technicians in work with X-rays and radium therapy, limited animal experimentations, experience with man and comparison with background concentrations of naturally occurring radioisotopes in our bodies, in the air we breathe and in the water and food we consume, the U. S. National Committee on Radiation Protection has recommended maximum permissible amounts and concentrations of radiation exposure.

The yearly average for the period ending July 1958 for strontium-90 in milk ranged from 4.2 to 10.2 micromicrocuries per liter, as compared to the permissible limit of 80 (unofficially 100 as of

April 22, 1959) micromicrocuries per liter (3). However, the strontium-90 level in milk has been steadily rising since the first adequate measurements were taken in 1954, roughly, in proportion to the rise in the level of strontium-90 deposition in soil. There has been approximately a fourfold increase in the average world strontium-90 content of milk from 1954 to the level of 5-6 S. U. in 1958 (17).

EXPERIMENTAL PROCEDURE

Removal of Strontium-89 and Calcium-45 from Milk of Dosed Cow

Eight daily milk samples from four Jersey cows dosed orally with one dose of calcium-45 and strontium-89 was separated mechanically by use of a DeLaval Junior Model 3300 separator and the skim milk passed through an ion exchange column at room temperature. The columns were 18 mm in diameter and 24 inches long and contained 50 grams of either Dowex 50-W, 50-100 mesh cross linkage of 4 per cent; Duolite C-20; or Dowex 50-W, 50-100 mesh with a cross linkage of 12 per cent. These resins are strongly acidic, cross-linked polystyrene cation exchangers. Preliminary results indicated that the conventional downflow system could not be used due to packing of the resin, making it impossible to put the desired quantity of effluent through the column. Therefore, the upflow system was used (see Fig. 1) in which solutions were passed in at the bottom and out at the top of the container. Due to the turbulent action caused by the milk entering the bottom this system can not be called a true column action since the "layering" effect associated with column action is not present. Flow rate was adjusted to approximately 7 milliliters per minute to avoid channeling and control contact time.

Both the calcium and sodium form of each of these resins were tested for its effectiveness in the removal of strontium-89 and calcium-45 from skim milk. After initial conditioning of the resin, one liter of milk was passed through each column before the resin was

Figure 1. Modified Ion Exchange Column.

again regenerated. After each operation the cations bound by the resin were eluted by treatment with approximately 1500 milliliters of approximately 3 N hydrochloric acid. The columns were then washed with sufficient quantities of calcium chloride or sodium chloride to convert the exchangers into the desired form, followed with 100 to 200 milliliters of distilled water to wash the excess calcium or sodium chloride from the resin. The 2nd, 6th and 10th 100 milliliter portions coming through the column were sampled for analysis. Two twenty-five milliliter samples of milk were taken from each of the 100 milliliter portions. The samples were transferred to porcelain crucibles and dried in an oven at 90-100° C. for a minimum of 16 hours. They were then transferred to a muffle furnace and ashed at 600° C. for approximately 16 hours. Approximately 2 ml of hydrochloric acid was added to the ashed samples to bring the calcium and strontium into solution. The samples were then transferred quantitatively to a 40 milliliter centrifuge tube. One drop of methyl red was added as an indicator. The calcium and strontium were precipitated by adding 3 milliliters of saturated ammonium oxalate, then, by neutralizing the sample with ammonium hydroxide until the solution was faintly alkaline, and by adjusting the solution to a final pH of approximately 5.0 using acetic acid. After the solution was allowed to stand overnight for complete precipitation of the calcium and strontium oxalate, it was centrifuged and the precipitate washed twice with distilled water and transferred quantitatively into a tared cup-and-tube assembly. This assembly consisted of a tapered-end polyethylene cylinder with a

stainless-steel Tracerlab cup forming the bottom. The 4-inch plastic tube was pressed securely into the cup until the assembly was water-tight.

Following centrifugation at 1800 revolutions per minute (920 times gravity) for 10 minutes in a 20 inch diameter International centrifuge, the supernatant was drawn off and the cup removed and dried to a constant weight in an oven at approximately 60° C. The samples were then measured for radioactivity by conventional methods using a thin mica window Geiger-Müller tube connected to a scaler unit.

The activity measurements of calcium-45 are greatly dependent upon the mass of the sample measured primarily because of self-absorption of its relatively low beta energy (0.26 Mev.). The total calcium and the correction for self-absorption were calculated from the mass weight of the oxalate in the dry cup.

All samples were counted with an aluminum absorber of 54.5 or 66.6 mg/cm² and again with no absorber. Both of these absorbers will stop essentially all the calcium-45 beta rays from the sample and will reduce the strontium-89 counts by factors of 1.39 and 1.50 respectively. Therefore, when no absorber was used the activity was due to both isotopes but when the same sample was measured again with an absorber the activity represented a portion of the strontium-89 only. The calcium-45 contribution was calculated by difference. The observed count with the aluminum absorber present, times the appropriate factor represents the corrected strontium-89 count. The total observed count

with no absorber present, minus the corrected strontium-89 count, times the mass correction factor for calcium oxalate self-absorption represents the corrected calcium count.

The same procedure as described above was used for duplicate samples of standards, having no resin contact.

Removal of Strontium-89 and Calcium-45 from Dosed Milk

In this experiment "dosed milk" was used instead of milk from "dosed cows". Here the calcium-45 and strontium-89 were put directly into the milk instead of being administered to the cow. Calcium-45 and strontium-89 were put into fresh raw whole milk at approximately 4 P. M., mixed thoroughly and left undisturbed for 16 hours at 40° F. The following morning the milk was thoroughly mixed again, heated in a water bath to 30° C., and mechanically separated. After bringing the skim milk to room temperature the procedure described previously was followed.

Resin-milk and Isotope-milk Equilibrium Studies

In order to determine how long an ion exchange resin must be in contact with milk containing calcium-45 and strontium-89 to reach equilibrium, a liter of raw skim milk was dosed with calcium-45 and strontium-89, mixed thoroughly and left undisturbed for approximately 16 hours at 40° F. After heating the milk to room temperature, four-100 milliliter samples were put into 250 milliliter beakers and 5 grams of Dowex 50-W, X-12, 50-100 mesh, in the calcium form were added to each beaker. After one minute of mixing, sample one was filtered and two

25 milliliter milk samples ashed, precipitated with ammonium oxalate and counted. The same procedure was followed for samples two, three and four after 10, 60, and 120 minutes of agitation respectively. All samples were mixed by hand for the first minute and by use of a mechanical agitator thereafter. Two 25 milliliter samples of milk having no resin contact were used as standards. The percentage removal of calcium-45 and strontium-89 was calculated for each contact time.

In order to determine how long a sample of milk must be in contact with calcium-45 and strontium-89 for the sample to reach equilibrium, four - 100 milliliter samples of raw skim milk at room temperature were dosed with calcium-45 and strontium-89. After mixing for 1, 10, 30 and 60 minutes the samples were treated by exposure to 5 grams of Dowex 50-W, X-12, 50-100 mesh, in the calcium form for 60 minutes after which the samples were filtered by use of a suction funnel. Two 25 milliliter samples from each exposure time were ashed, precipitated with ammonium oxalate and counted. The percentage removal of calcium-45 and strontium-89 was calculated for each exposure time.

Removal of Calcium-45 and Strontium-89 from Milk by Use of a Series of Four Columns

One liter of milk was passed through a series of four columns, each containing 12.5 grams of Dowex 50-W, X-12, 50-100 mesh in the calcium form. The 2nd, 6th and 10th 100 milliliter portions passing through the last column were sampled for analysis in the same manner as described previously. This experiment was repeated four times. Following the last run the four columns were disconnected and the

resin was washed with 1 liter of 3 N hydrochloric acid. Samples of the eluate from each of the four columns were assayed for radioactivity.

Removal of Strontium-89 and Calcium-45 from Dosed Milk by the Batch Method

Raw skim milk was dosed with calcium-45 and strontium-89, agitated thoroughly by hand and left undisturbed for approximately 16 hours at 40° F. After heating the milk to room temperature six - 200 milliliter samples were put into 400 milliliter beakers and 1, 5, 10, 20, 40, and 100 grams of Dowex 50-W, X-12, 50-100 mesh, in the calcium form, were added. After mechanical agitation for four hours the samples were filtered by use of a suction funnel. Two - 25 milliliter milk samples from each beaker were dried, ashed, precipitated with ammonium oxalate, dried and counted. Two 25 milliliter samples of milk having no resin contact were used as standards. The percentage removal of calcium-45 and strontium-89 was calculated for each quantity of resin.

RESULTS AND DISCUSSION

Values for the percentage of removal of strontium and calcium, from milk of dosed cows, by use of ion exchange resins are summarized in Table I. Significant differences were noted between resins, between ionic form of the resin as well as between portions passed through the column. Results indicate that Dowex 50-W, with a cross linkage of 12 per cent, in the calcium form is the most effective resin tested for removal of strontium-89 and calcium-45 from milk. From these data it is suggested that exchange of like (Ca-Ca) or similar (Ca-Sr) ions is more easily accomplished than the exchange of unlike (Na-Ca or Na-Sr) ions from milk. All three resins in the calcium form showed a slightly higher percentage of removal of strontium than calcium for all samples tested, although the degree varied with resins and the portion of milk passed through the column. A higher removal of strontium and calcium was attained in the first portion of milk passed through the columns as compared to other portions. The percentage removal decreased as the amount of milk passed through the column increased.

The same general conclusions may be drawn from the data presented on removing strontium and calcium from dosed milk (Table II). However, between resins, between ionic form of the resin and between the portion of milk passed through the column, no significant differences for removal of calcium were shown. There was no significant difference between resins for removal of strontium from dosed milk, whereas in the case of milk from dosed cows, between resins, between

ionic forms of the resin and between portions of milk passed through the column were all significantly different. Using Dowex 50W-X12 in the calcium form, the percentage removal of strontium decreased at a faster rate, as measured by the amount of milk passed through the column, when metabolized milk was used, as compared to milk which was dosed 16 hours before the exchange treatment. The average of eight trials showed 76, 59 and 45 per cent removal of the strontium from metabolized milk on samples from the 2nd, 6th and 10th 100 milliliter portions of milk respectively and 79, 63 and 55 for the equivalent samples when dosed milk was used. The removal of strontium from dosed milk is significantly different ($P < .01$) from the removal of strontium from milk of dosed cows while no significantly different removal of Ca^{45} was noted under the same circumstances. This may be due to the incorporation of strontium into the protein molecule in metabolic milk, whereas in dosed milk this would not likely be the case.

Data from eight trials on removal of calcium and strontium from milk of dosed cows and data from a similar experiment using dosed milk were subjected to analyses of variances. The F values for the main effects, and first and second order interactions in these experiments are presented in Table III. Significant differences were noted between resins for the removal of both calcium-45 and strontium-89 milk of dosed cows but not for the removal of either from dosed milk. Significant differences were noted between days following dosing of the cow for the removal of calcium-45 from milk and also

between trials conducted on different days on dosed milk. Strontium-89 removal was not significantly different for either. Significant differences on the removal of calcium-45 and strontium-89 between portions passed through the column (samples) were noted on both dosed milk and milk from dosed cows.

Raw skim milk, without the addition of isotopes, was passed through an exchange column identical to the ones used for milk containing the isotopes. Data on the titratable acidity, curd tension, pH, and rennet coagulation time are shown in Table IV. Before the milk was passed through the exchange column the average pH was approximately 6.71, titratable acidity 0.162 per cent, coagulation time 490.6 seconds, curd tension 61 grams, and the taste was that of normal raw skim milk. The first 100 milliliters of milk passed through the column had a slightly lower pH, a higher titratable acidity, higher curd tension and a lower rennet coagulation time compared to the standard. Under conditions which removed the highest percentage of strontium and calcium from milk, these effects were more pronounced. Therefore, as more milk was passed through the column the closer these properties approached normal milk with the exception of curd tension which continued to increase. The shorter rennet coagulation time is partially indicative of a higher calcium content in treated milk. As calcium concentration increases it tends to form calcium hydrogen phosphate, releasing hydrogen ions from calcium dihydrogen phosphate consequently lowering the pH. Milk so treated (without added radioactivity) was

tasted and found to have a slightly bitter flavor in those samples which exhibited the largest pH drop.

Data on the removal of strontium and calcium from milk as influenced by the resin-milk contact time are presented in Table V. All contact times were made on a milk-resin ratio basis of 20 to 1 using the batch techniques. Times of 1, 10, 30 and 60 minutes were used. The average of three trials showed 62 per cent strontium-89 and 52 per cent calcium-45 were removed after a contact time of one minute, while 76 per cent strontium-89 and 67 per cent calcium-45 were removed after 120 minutes, the greatest difference being from one to ten minutes ($P < 0.05$). This is illustrated more clearly in Fig. 2 which indicates that the solution had approached equilibrium after 10 minutes but not at the end of one minute.

The data for the removal of strontium and calcium as influenced by the isotope-milk contact time are presented in Table VI. Each sample was intermittently hand agitated for either 1, 10, 30 or 60 minutes, then treated by exposure to Dowex 50W-X12 in the calcium form for 60 minutes under constant agitation. The milk to resin ratio was 20 to 1. Results show approximately 30 per cent removal of strontium-89 and approximately 75 per cent removal of calcium-45 with very little difference between milk agitated for one minute and that agitated for 60 minutes before exchange treatment. The isotopes are fully incorporated into the milk within one minute or the rate of incorporation at this stage is so slow that 60 minutes is not suffi-

cient time to show a definite trend, the latter probably being the case since less of the isotopes were removed after contact with the milk 16 hours than 60 minutes.

The data on removal of strontium and calcium from milk by use of a series of four ion exchange columns are shown in Table VII. This experiment was conducted to compare the action of four columns in a series, each containing 12.5 grams of resin, to one column containing 50 grams of resin (Table 2). No differences were noted in the percentage removal of strontium and calcium between the two methods.

Following the last trial each of the four columns of resin was washed with 1 liter of 3 N hydrochloric acid. Forty milliliter samples of the eluate from each of the four columns were assayed and the radioactivity of both calcium and strontium was found to decrease in the resin from the first column to the last (Table VIII).

The data in Table IX and Fig. 3 indicate a direct relationship between the percentage of strontium and calcium removed from milk and the amount of resin used. Because Dowex 50W-X12 in the calcium form had appeared to be more effective in the removal of strontium and calcium from milk than either Dowex 50W-X4 or Duolite C-20 (Tables I and II), it was used in this batch experiment. The percentage removal of strontium-89 ranged from a high of 94, where one part resin was used per two parts of milk, to a low of 21, where one part resin per 200 parts of milk was used. Similarly the percentage calcium-45 removal ranged from a high of 93 to a low of 16

Figure 3. Effect of Milk-Resin Ratio on Percent Removal of Sr⁸⁹ and Ca⁴⁵ from Milk.

per cent. The total resin exchange capacity (Meq./gm.) was approximately twice the amount required for complete removal of the calcium from the milk at a milk-resin ratio of 20 to 1. At the 20 to 1 ratio the average percentage removal of strontium was approximately 70 and calcium 57.

Relationships between resin weight and exchange of calcium-45 and strontium-89 from milk are useful for predictions for different ratios. Since calcium in milk is in a very high concentration (6.23 meq./100 ml.) in relation to strontium (.00093 meq./100 ml.) a linear equation was derived for calcium-45 exchange on the assumption of isotope dilution.¹ This equation is:

$$w = a \frac{1 - f_m^e}{\dots}$$

where: w = weight of moist resin

$$a = \text{slope} \frac{\text{quantity of resin}}{\frac{\% \text{ removed}}{\% \text{ not removed}}}$$

$$f_m^e = \text{Ca}^{45} \text{ percentage found in milk.}$$

This is plotted in Fig. 4 with w on the y axis and $\frac{\text{per cent of isotope removed from milk}}{\text{per cent of isotope not removed from milk}}$ on the x axis.

This equation was tested for strontium also and a non-linear relationship was observed which may have been due to ion selectivity of the resin.

¹Preliminary calculations on these relationships were made by R. C. McIlhenny, Radiochemist, UT-AEC Agricultural Research Laboratory.

Figure 4. Relationship of Milk-Resin Ratio and the Percentage Exchange of Ca45 and Sr89.

On the basis of calcium oxalate weights, milk treated with the resin contained more calcium than the non-treated milk (Table VIII). This may be due to the excess calcium chloride not being washed from the recharged resin when the batch system was used. Some additional calcium may also come from the exchange of calcium on the resin for strontium and other ions in milk. In general the percentage of calcium removal from milk was less than strontium based on the total calcium and strontium in the untreated milk.

An estimation of the efficiency of the column system versus the batch system was made. The following four equations were derived by the method of least squares from the data presented in Tables 1 and 2.

Ca^{45} dosed milk:

$$y = -33.26 + 1.48736X + \frac{117.8174}{1.063x}$$

Milk from Ca^{45} dosed cows

$$y = -154.0086 + 6.75665X + \frac{238.6207}{1.061x}$$

Sr^{90} dosed milk

$$y = -187.0063 + 5.58810X + \frac{269.86}{1.037x}$$

Milk from Sr^{90} dosed cows

$$y = -98.6204 + 4.20296X + \frac{183.4547}{1.059x}$$

Where y = % removal and X = 100 ml. portions passed through the column.

The integrated forms of these equations for determining the area under the curve were respectively:

$$A = -33.26X + .74368X^2 - \frac{1928.5873}{1.063x} + 1928.5873$$

$$A = -154.0086X + 3.5783X^2 - \frac{4030.0743}{1.061x} + 4030.0743$$

$$A = -187.0063X + 2.7940X^2 - \frac{7430.0660}{1.037x} + 7430.0660$$

$$A = -98.6204X + 2.10X^2 - \frac{3199.895}{1.059x} + 3199.895$$

Since the columns contained 107 milliliters of milk and 50 grams of resin when completely filled, a convenient point of comparison was the per cent of removal for some volume less than 107 ml. and a comparable volume in the batch system. Therefore the area under the curve was determined for 100 milliliters of milk. The comparisons of the systems are presented in Table X. It is estimated that the column was only 86 per cent as efficient as the batch system for removal of Sr^{88} . The corresponding value for Ca^{45} was 88 per cent. The lower efficiency for the column can be attributed to the milk-ion and resin-ion complex not being allowed to come to equilibrium. Milk was found to contain an average of 6.23 meq. of calcium per 100 milliliters and is estimated to contain 0.00096 meq. of strontium per 100 milliliters. The calculations presented in Table X are based on these values.

CABLE X

PER CENT OF RESIN CAPACITY EXCHANGE BY CALCIUM AND STRONTIUM USING THE BATCH AND COLUMN SYSTEM

System used	Ratio Milk Resin of portion through column	Resin Capacity (meq.)	Isotope Removed	Percentage removed	Meq. Exchanged	Per Cent Resin Capacity Exchanged
Batch	2 - 1	135	Ca ⁴⁵	93	5.79	4.27
Batch	5 - 1	54.3	Ca ⁴⁵	84	5.24	9.6
Batch	10 - 1	27.1	Ca ⁴⁵	76	4.74	17.4

Batch	40 - 1	13.5	Ca ⁴⁵	34	4.24	31.3
Batch	200 - 1	2.7	Ca ⁴⁵	16	1.99	73.6
Batch	2 - 1	135	Sr ⁸⁸	94	--	--
Column	1st 100 ml.	135	Ca ⁴⁵	82	5.10	3.77
Column	1st 100 ml.	135	Sr ⁸⁸	81	--	--
*Column	1st 100 ml.	135	Sr ⁸⁸	81	--	--
*Column	1st 100 ml.	135	Ca ⁴⁵	74	4.62	34.1

*Milk from Dosed cows. All other samples were dosed milk.

**Stable strontium in milk is negligible compared to calcium.

SUMMARY

Much publicity has been given the passage of strontium from the atmosphere into food and its accumulation in bone in recent months. The strontium level in milk has been accumulating at a rate which is causing some alarm due to the damaging effect it may have on the health of humans.

Modified ion exchange resin columns and the batch system have been used to remove strontium-89 as well as calcium-45 from both dosed milk and milk from dosed cows. Dowex 50W-X12, Dowex 50W-X4 and Duolite C-20 were used, the first found to be most effective, by removing 76 per cent of the strontium and 74 per cent of the calcium from milk of dosed cows and 77 and 76 per cent respectively from dosed milk. These data represent only the second 100 milliliter portion of one liter passed through the column.

Using this modified column technique the per cent resin capacity exchanged was only 86 per cent as effective for removal of strontium-89 and 88 per cent for the removal of calcium-45.

Dowex 50W-X12 resin was left in contact with milk for periods of 1, 10, 60 and 120 minutes to study the exchange rate. Differences existed between the 1 and 10 minute periods only.

Using the batch system and dosed milk, the percentage of removal of strontium-89 and calcium-45 decreased as the ratio of milk to resin increased. The percentage of removal ranged from a high of 94 and 93

for strontium and calcium respectively at a milk-resin ratio of 2 to 1 to a low of 21 per cent strontium and 16 per cent calcium at a milk-resin ratio of 200 to 1.

An approximately linear relationship was found between the ratio of calcium-45 removed over that not removed and the quantity of resin used.

Farming after a Nuclear War

At one time, almost every home was a little farm. Everyone had a garden and a few chickens. It is a life-style now unknown to present city dwellers but still present to some degree with our village neighbors. It is a life-style to which many will probably return and the purpose of these pages is to help that transition. This is our own little greenhouse.

Table of Contents:

[Library: Gathering Resources for After a Nuclear War.](#)

This web page deals with the technical aspects of farming such as seed saving, fertilizers, crop management and so forth. Other web pages in the hierarchy above this one deal with measuring radiation

in food, alternate energy sources, and other subjects necessary to successful farming.

Farm1: Protection of Food and Agriculture From Nuclear Attack

(In .pdf format.)

This 42 page booklet was the US Department of Agriculture comprehensive attempt to prepare the farmer for nuclear attack. It contains much important information.

Farm2: Fallout on the Farm

(In .pdf format.)

This 14 page booklet is by the Canadian Government and has useful information about crop alternatives after a nuclear war, the handling of animals exposed to fallout, and many other items of information.

More: The Have More Plan

(In .pdf format.)

The "Have-More" Plan (A Little Land - A Lot of Living) by Ed and Carolyn Robinson is a 1940 classic devoted to the creation of a small farm. It is a bit dated in its view of DDT but generally may be exceptionally useful to those who are inexperienced and are trying to start.

Seeds: Basic Seed Saving

(In .pdf format.)

6 pages in .pdf format from Seeds of Diversity.

Humanure: Humanure Handbook

This 200 page book - winner of *many* awards is placed here through the kind permission the author Joseph Jenkins. It can be obtained in print at Jenkins Publishing, PO Box 607, Grove City, PA 16127. To order, phone: 1-800-639-4099. <http://www.jenkinspublishing.com/> .

Humanure: The Handbook available in .pdf format.

Mulch: Explains organic composting.

(In .pdf format.)

This 30 year old 101 page book gives information about mulching.

Fences: Fence Planner for the Common Sense Fence

(In .pdf format.)

This 12 page booklet gives information about wire fences, barbed, stranded, and electric. There are other kinds.

[Seed Presses](#) [Pressing Oil from Seeds](#)

This 24 page .pdf file lists 56 oil bearing seeds and discusses a variety of methods for extraction and processing. These oils can be used either for food or fuel.

The books below this level are copyrighted and will be available (if there is enough Internet to disseminate them) after the nuclear war - when surely no one will object. The information here will indicate the types of information that you might be interested in gathering into your own library ahead of time.

[Ark: Build Your Ark](#)

(In .pdf format.)

"Build Your Ark" (How to Prepare for Self-Reliance in Uncertain Times) by Geri Welzel Guidetti. Published by: The Ark Institute, P.O. Box 364, Monkton, MD 21111, email arkinst@concentric.net : This 248 page Book One on Food Self-Sufficiency covers basic concepts on gardening and goes into detail on soil improvement and insect control. Details are provided on a wide variety of garden vegetables.

[Farmstead: The Farmstead Book](#)

(In .pdf format.)

"The Farmstead Book 1" edited by Paul Harmond and is Published in the US by: Cloudburst Press of America, Inc. 2116 Wetern Avenue, Seattle, Washington 98121 and in Canada by: Cloudburst Pres Ltd., Mayne Island British Columbia V0N 2J0 - This 262 page Book covers soil and woods management on a more macro level than the book above and also covers the farm machine shop.

[Taste: Like They Used To Taste](#)

(In .pdf format.)

"Grow Friuts & Vegetables The Way They Used To Taste" by John F. Adams published by Wynwood Press - New York, New York. This 104 page book deals somewhat with vegetables and seed saving but is more largely devoted to fruit trees.

[Seeds: Saving Seeds](#)

(In .pdf format.)

"Saving Seeds" (The Gardener's Guide to Growing and Storing Vegetable and Flower Seeds) by Marc Rogers and published by Storey Communications, Inc. Pownal, Vermont 05261. 97 pages.

[Click here to return to the

After Nuclear Holocaust](#)

Overview

Gathering information Resources for Farming After a Nuclear War

This web page deals with the technical aspects of farming such as seed saving, fertilizers, crop management and so forth.

Other web pages, in the previous table of contents in the hierarchy above this one, deal with measuring radiation in food, alternate energy sources, and other subjects necessary to successful farming.

Still other web pages, in the previous table of contents in the hierarchy above this one, deal with old Pioneering skills. There may be some overlap between those and these immediate pages but it is well to look at both of them for what may be start up farming without access to all the present modern technology.

We cannot just go back to the old ways. We have lost many of the skills. No one had them all then and you would be hard put today to find a wheelwright, a miller, a tanner, a barrel maker. All those trades, like farming have advanced into modern technology and the present experts seldom have used the old ways. Many of the old implements are no longer around and we certainly don't have the horses. Modern horses are neither bred nor conditioned to pull the plow. Still, in the skills of the past we may find solutions to the problems of the moment.

Our personal library is very extensive. At one time I counted 13 encyclopedias. These are mostly specialized - like a 14 volume set on gardening and another 16 volume set on do-it-yourself repairs. There are others on health and medicine and a variety of other subjects.

We have also acquired CDs with hundreds of books and one summer put a crew to work microfilming thousands of documents which we have on microfiche. These, plus many many books, are in just our own home but our Ark Two Community librarian is the real gatherer of information - he has many thousands of books, mostly on technology for recovery.

In the future, when people want it, we hope to be able to disseminate all this information widely. There are many blind spots in our library. We have little information on modern technology and almost no information on leading edge technology. Members of our Ark Two community are of far more than average knowledge about nuclear and computers but there are many, many fields such as in modern metallurgy, petroleum refining, hundreds of specialties in chemistry, medicine, and untold numbers of

other areas that the expertise to re-establish them will have to survive with the experts - if they are going to be recovered in the immediate decades following.

One major focus of our library has been maps, in order to determine where that expertise may reside. We have thousands of maps. Local road maps. Topographical maps. More and more maps on an expanding scale. We have every map ever published by the National Geographic. We have CDs with map search programs. North American and World Atlases. The list goes on. One map set which we were very desirous of obtaining cost thousands of dollars (far beyond our budget) from the US government. It comes with a subscription program for real-time updating and the printed book is reprinted annually. A marvelous tool for demographers tracking changing patterns - but one copy would serve our purposes. Amazingly, we found one on the Internet - at a fraction of the cost.

Other associates of ours are providing us with gigabytes of survival information on CDs. Our problem has not been so much one of obtaining information but determining which areas on which to concentrate our limited resources for storing and cataloging. Tons of information is of no use, if you have no way of finding what you want in it. In early years we were given literally tons of books by libraries and publishers. Expensive volumes that cost over hundreds of dollars each - but we finally had to abandon that effort simply because of lack of storage space and manpower to handle it. We passed on trailer loads of books.

So the problem of the moment has not been getting information but one of determining which information is going to be most useful to survivors. These have been our choices. What we offer in these pages, measuring radiation contamination in food, producing food without the modern technology and its skills, finding alternate sources of energy, recovering and repairing remaining machinery, creating the nucleus of an economic system and restoring the basis of functioning society - information on how to do these things are what we feel will be most needed at the outset. It is our sincerest hope that we will be able to get it to the people who need it and that they will find it useful.

- Dwarf Fruit Trees and Berries
- Fish Pond in Your Backyard
- Starting Right with Poultry, Rabbits, Milk Goats or Cow, Bees, etc., etc.

Dear Reader,

Garden Way Publishing Co. is the successor to the Noroton Country Bookstore and we are pleased to make the original "Have-More" Plan by Ed and Carolyn Robinson available again.

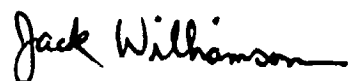

This classic book was written in the 1940's by leading experts of the day, to aid the individual in his search for self-sufficiency and independence on a country acre. We have reissued this work unchanged because it is still one of the best references available for the home gardener and homesteader. After all, poultry, goats, lettuce and home canning haven't changed much in a generation. It's no wonder the "Have-More" Plan has been in constant demand since it was first published. It will show you how to do things in ways that work superbly.

There are, however, just a few items mentioned such as the use of pesticides containing DDT, which we trust you will excuse and overlook. Three decades ago our understanding of such hazards was non-existent. We can help you, through our other publications, to learn more about non-toxic materials and techniques.

Many of the bulletins and books that were developed from the "Have-More" Plan are available once again directly from us. Please write to Garden Way Publishing, Charlotte, Vermont 05445 for our free book catalog which lists the "Have-More" Plan bulletins and books, as well as the most current books by all publishers that we feel to be the best on gardening and country living.

Please do feel free to contact me for any help I can be in your quest for "A Little Land—A Lot of Living".

Sincerely,

A handwritten signature in cursive script that reads "Jack Williamson".

Why We Moved to the Country and What We Set Out to Accomplish

CAROLYN, our son Jackie, and I haven't any land to sell—we aren't promoting anybody's products. We just want to tell you

some things we learned about how to have more fun, more health and more security than 99% of the people in this world ever had before.

Back in 1942, we Robinsons lived in a big apartment house in New York. Far from having all the conveniences and easy living you are supposed to have in a big city, we discovered we had very little.

In the first place, we always felt restricted. Living in the city wasn't easy, it was difficult. And every time we turned around—it cost us money.

For example, just to let the baby walk or play outdoors cost us money and trouble. First, we had to dress the baby nice (because we were going to the park), then get together blankets, diapers, his toys, etc., carry all this and the baby out to the elevator, wait until the elevator came for us, then outside we would have to walk two blocks and wait for a bus, then ride about 15 blocks and get off the bus, carry everything into the park, and find a spot where we could sit down.

One terribly hot Sunday afternoon we had gone all through this procedure and finally found a spot that wasn't crowded, spread a blanket to sit on, unpacked the baby's toys, diapers, etc. and settled down for a few minutes' peace. Just then a policeman came up to us: "Look—you can't stay here," he said.

"Why not?" I asked.

"How long d'ya think the grass would last if everybody was allowed to set and walk all over it?"

I suddenly remembered as a boy how wonderful it had been to lie in the grass in back of our house in the little New England town in which I was brought up.

We got up to leave. I said to Carolyn, my wife, "Look, let's get out of here!"

"It'll be awful hot back at the apartment," she said, "and Jackie hasn't had any sun for a long time."

"What I mean is let's get out of this dirty, noisy city—let's go live in the country . . ."

That is how we began to think seriously about living in the country. I say think about it—because we thought about it for a long time before we did it. First, we couldn't see how we could afford living in the country. Then we

began to wonder if we couldn't have a garden and maybe some chickens and by raising some of our food have more money so we could afford it.

The trouble was that a couple of our city friends who had farms always said the vegetables they raised cost about three times what they sold for in the store.

In fact, one man we knew about who had a fine modern dairy used to set before his guests two bottles. One was milk, the other champagne. "Take your choice," he'd say. "They cost me the same."

After we thought about this we realized these men were trying to run a commercial farm by remote control. Usually they went to their farms week ends only because it was so far away—and a hired man ran the farm for them. We wanted to keep a city job, for cash income; we wanted to stay near enough to the city to keep its advantages. We wanted to add the security and fullness of living that seemed more likely to come if we owned our home and some land, not much land necessarily, but good land and at least enough of it to raise most of our food.

There was nothing new about this idea. We were aware that Henry Ford and many others had been advocating just this for years. We knew that hundreds of thousands of American families were already doing what we proposed to do.

We faced the fact that we knew absolutely nothing about raising any part of what our family needed to live. In fact, our utter and absolute dependency on my job was appalling. If I should

lose my job—even temporarily—we would have no money to pay our rent—the landlord would put us out.....no money to buy groceries or pay the butcher and we wouldn't eat.

If there were another depression—and I were to lose my job like millions in the last depression—then there wouldn't be a thing to do but stand in line and beg the government for "surplus commodities" . . . rent money . . . relief clothing until things got better again—which might be years!

Living in the city we couldn't save much. Everything we did, almost, cost money. Our biggest item was food. Suppose, we thought, we could raise a big part of our food . . . We knew nothing about farming. But we began to look at things we ate . . . started to study how we could grow them ourselves. For a long time before we actually did move into the country we studied how to raise things. Perhaps in all we read a couple of hundred books and pamphlets on this. We found that most material was out of date and most of the newer books were designed for commercial farming specialists. For example, we found a dozen huge books on commercial dairy cattle, but no simple, up-to-date little book telling us how to produce milk efficiently for our family—and whether it was really economical to do so.

Then again there were lots of people telling you how to choose a farm of say 50-100 or 200 acres, but a dearth of information on telling us how little land we actually needed to raise food for one family.

Yet we gradually accumulated a good

Life in the City

many excellent books and pamphlets—all of which you'll find listed in these pages. When we had a fair idea of what we wanted to do we moved to our small place in Connecticut, about an hour from my job in New York, to try out our ideas.

This plan is the story of our place, of my family and me. It's the true story of how we have built our homestead. I hope you will be able to get some new ideas from it.

We call our plan—the "Have-More" Plan because that is the way it worked for us. Our plan shows how you can have a lovely home of your own on a piece of land that will furnish your family with food, recreation and health. Yes, and extra income too.

**If you'll follow our Plan
Here's how you'll be situated:**

You too can have a good home and an acre or more of land within a few miles of where you work. Your place will pay for itself as you go along—you will eventually own it free and clear. Think what that means—*no more rent to pay!*

You'll have far smaller weekly grocery, meat, and milk bills. With the small scale, modern, labor-saving methods we'll show you, you can raise up to 75% of all your family's food—perhaps do it all in spare time—and find real pleasure in doing it.

You and your family can become truly self-reliant. You will be able to keep your own home in shape, even improve your house and land. You can be healthier and happier. You can be sure that the food you eat is rich in vitamins and minerals. You need never worry very much about losing your job. You can retire years sooner, if you want to, and if you'll put away enough to be assured of just a small regular income.

Best of all, you can do as much or as little of our "Have-More" Plan as you like. You can fit it to your own pocket-book and spare time. If you are in

earnest it makes no difference whether you start with just a few dollars or five thousand.

If You Have a Full-time Job:

You can easily work out the "Have-More" Plan in *spare time*. If you work long hours and don't have a chance to do the whole plan at present, you can do part of it in as little as 15 or 30 minutes a day. Even so you can have all the health, happiness, and security of this kind of living. You can have a fine garden, beautiful flowers, get your fruit trees and berries, asparagus and rhubarb started, and perhaps have a few chickens.

This way of living is especially good for children. You can get your place all paid for and have that wonderful sense of security and independence knowing that you and your family have your place to fall back on—knowing that you could get by with very little cash income if you ever had to.

If You Have a Part-Time Job:

If you work short hours, such as 40 hours a week or less, you can get all the more benefit out of the Plan. Perhaps in your work you have several days a week free or maybe several weeks or months a year free. Perhaps there's an extra member in your household who'd like to help. If you have a place like ours, you can make your spare time worth money by developing a paying hobby right on your own place.

If You Are Planning To Retire:

Or if you have already retired, you can see that this Plan is a most practical way to stretch your retirement income and help keep yourself in better health. If you are going to receive Social Security benefits, or just a small pension, annuity, or small income of any sort, you can look forward to many years of happiness and security.

This Plan in no sense attempts to

turn you into a commercial farmer. There is all the difference in the world between farming for profit and raising only your own family's food. A farmer is a business man whose factory is his land. Probably—if he is really successful—he has become a specialist in producing one crop—milk—or poultry—or fruit. He has spent years learning to become expert enough not only to produce quantity but also to sell wholesale at a high enough price to pay overhead, his labor, machinery costs, etc. You, on the other hand, produce only what your family needs. You save yourself retail prices. You have no labor costs—practically no overhead—no distribution or selling costs. You sell only your surplus—and can easily find a ready retail market among neighbors or friends where you work.

You will be tempted—especially during a food shortage to produce, for example, more chicken than your family can eat—and sell the surplus at a profit. This you can do—but only if you have enough spare time so that you will not have to sacrifice growing some other foods for your family's own use.

The very fact that our "Have-More" Plan calls for raising a variety of vegetables, fruit, poultry, meat and dairy products means a diversification of work, a lot of different things to do, so that none of them becomes tiresome. Planning to have a garden, a cow or milk goats, laying hens and broilers, rabbits, bees—and maybe other livestock—sounds as though you had as much to take care of as many farmers who are notoriously overworked. But you have only sufficient garden, fruit, and livestock to supply your family's food.

A farmer, to have been deferred in the draft, and that meant that he was farming on a full-time basis, had to produce a certain amount, according to government rulings. For example if he himself were responsible for 5 milk cows, 60 hogs, 150 hens, and a 6 acre garden, he would be considered sufficiently productive to be deferred. On the same basis, if you were supplying 75% of your family's food—that is, you had 1/3 of an acre for a garden, 2 milk goats, a dozen hens, 100 broilers, 2 pigs, enough fruit trees and berries, you would have about 1/16 of what a farmer needed to win deferment.

I point this out so you will see that it is entirely possible for you to raise your family's food in your spare time if you go at it efficiently. A garden, hens, broilers, cow or milk goats, bees, etc. sound like an awful lot. Actually, only the variety is impressive—not the quantity.

Another thing, even though you have only enough poultry to supply your family, you use the most up-to-date, easiest way to take care of it. Then again, you will find this plan broken up by projects so that you add one project at a time and get that working perfectly before undertaking another.

Every so often somebody asks

Life at Your "Have-More" Homestead

"How much of the Plan should I undertake?"

You yourself will have to decide this. The most difficult job is to get your house, barn, fencing and land ready for efficient operation. But once your place is set to go the actual chore time doesn't take long. A small flock of hens takes about 7 minutes care a day . . . a garden, the biggest and most difficult home food raising project, may take 150 hours a year or so.

Many people moving from the city to the country hesitate to add livestock to their places—because they don't want to be tied down. Livestock, however, can supply 40% of your family's food. Our livestock doesn't tie us down—our neighbors will do chores for us and, of course, we do chores at our neighbors' when they want to go away.

What has amazed us, was how relatively easy and practical it has become in the America of today for the average family with modest income to work out this plan of country living and city job.

No doubt many city families who have considered getting a place "out in the country" where they could live and raise some of their own food, have not done so because they thought it would take too much time and trouble to get back and forth; it would be all hard work and no play; it wouldn't be practical—it would cost more to grow food than to buy it—their chickens would die, the garden wouldn't grow, the bugs and birds would get all the fruit and berries; it would cost too much to get started anyway.

Well, the real reason we have written this Plan is to tell other people that these objections just aren't so. The average family can, today, make the country-living-city-job idea work and they can make it pay.

Some of the reasons why they can make it work today, where they might not have been able to even ten or twenty years ago, are these:

1. *There has been a tremendous amount of highway building in the past*

twenty-five years. Automobiles and busses, plus train service where needed, make it entirely practical for most people to live a considerable distance from their jobs. These same highways and cars have taken the loneliness out of country living, too.

2. *Modern appliances and methods have eliminated much of the really hard work in keeping house and raising food for the family. The pressure cooker and the home freezer, for example, have made preserving far easier than it used to be. The short work week (30-48 hrs.) leaves plenty of spare time for work at home plus plenty of spare time for play. To add work at home on top of a 6 day, 70 hour week was one thing. To do the same work at home on top of a 5 day, 40 hour week is an entirely different thing. What was work actually becomes fun.*

3. *It is easy to learn to raise plants and livestock successfully today. Methods are simpler, more scientific. Seeds and plants are better, surer to grow, more productive. Fertilizers are better. Livestock breeds are better—they produce more per hen, per goat or per pig. Feeds you buy are better, more scientifically prepared. Disease and pest control is far more sure and specific. For example, what the famous sulfa drugs are doing for sick people, they are also doing for sick chickens.*

4. *Low-cost, long-term federal and private financing now bring the possibility of home and land ownership within the means of people who couldn't have even dreamed of it not so many years ago. Mass production of appliances, furnishings, tools, even houses has brought the cost of getting started down to a low figure. Both of these points will be even more true in the post war years. Home freezing equipment, for instance, which before the war was priced in hundreds of dollars will be priced in tens of dollars.*

Even at 3½ our son Jackle likes to "help." Actually as yet, he isn't much help, but we try to encourage him. We want him to learn to do things — older children can be a real help on a homestead. And, more important, country living furnishes excellent opportunities for children to develop intelligent and responsible personalities.

Everything we tell you about in our Plan has been tried out by us personally, or by people we trust. We believe we can make it all work just as well as we've said it would. Of course, nobody can guarantee what results other people in other places will get. But I've made a sincere effort to give you honest and frank answers in the plainest language I know how to use.

And I hardly need to remind you that various parts of the country have differing climate and soil conditions. We are telling what we've been doing here in Connecticut (a fine state, by the way) and you will realize what allowances you must make for your own local conditions.

You don't have to spend as much on buildings as we did. We happen to think this a good investment, but are the first to admit that you can get along fine with less expensive buildings.

Building a small barn for your livestock, buying a couple of acres of land instead of simply a lot big enough to set a house on, or shelling out fifteen dollars for a pressure canner is different from the same amount of money spent on a trip to Florida or an expensive dinner and theatre party. Money invested in productive capital will bring you a great deal for a good long time to come.

We believe that many farm families, too, are going to raise more of their own food. They will forego some of their extreme specialization to develop a more rounded self-sufficiency.

If homesteading, as we mean it here, really does become a trend in the post war years, it can itself create vast business and employment opportunities. It can furnish a pattern, an idea, an objective for the city, highway and industrial planning we hear so much about these days. It can contribute greatly to continuing security for all.

A friend once said to me, "Ed, why do you bother with other people? Why don't you settle down and just enjoy your own job and your "Have-More" Homestead? Why try to spread it all over the country?" I may sound silly trying to tell you why. But I feel, somehow, that in the years to come the U. S. is going to need all the help it can get toward happiness and peace and security. We aren't always going to have a boom going on. I've got a boy and I want to see him grow up in a good country, and if ten or twenty million American families can get set as well as we Robinsons are I don't think anything can hurt this nation.

Do you see what I mean? That's why I've worked so hard putting this Plan together. That's why I was so careful to be truthful and sensible in everything we put in it.

Anyway, Carolyn and I think this is a darn good idea and we hope you think it is a good idea—so good you'll want to get some of your friends to buy a copy of this book too.

A Letter to Wives from Mrs. Robinson

Dear Friends:

If your husband reads this plan and then tries to talk you into doing something like it, you might say, "Poor Mrs. Robinson—I'll bet she has to do most of it and I wouldn't be in her shoes for anything." So I thought you might like to know where I stand on all this.

The cue to our success with the "Have-More" Plan is found in one common little word throughout these pages. Our editorial "we" means exactly that—it isn't used just for the sound effect. We have honestly worked together as a team on everything from our first seven hens to writing this Plan. Believe me, the marriage of a man and woman really means something when you start homesteading. Somehow, working close to the earth and with nature seems to make the combination of man and wife more important and, I believe, makes marriage a happier success than is possible in sterile city life.

Do I sound old fashioned? Let me explain that neither Mr. R. nor I came from farms originally. We married and lived in New York City for five years and I suppose we could have been described as city sophisticates. So what we have discovered as an exhilarating way of life comes from actually trying city life and country living and then choosing (intelligently, we think) the better.

Out here on our wee farm my husband really needs me and I, in turn, could not get along without him. When he calls out, "Quick, honey, bring me my bee veil! These bees are in a bad mood," he really does depend on me to help him out.

Mr. R. naturally does the heavy work in the garden and with the animals, while I take care of canning, freezing and household jobs. But!!! We both encroach on the other's job. Mr. R. canned at least 50 quarts of tomatoes and froze a couple of dozen packages of vegetables—all after he got home at night which isn't before 7 o'clock. He's nuts, you think? Maybe, but he says it's a pleasure after sitting at a desk all day. I, in turn, do necessary chores during the day and I usually milk the goats.

Ed always envies me getting in on all the exciting events here—it's I who watched the bees swarm (sad affair, but very interesting), I who greet the fuzzy day old chicks that are so adorable, I who had the great thrill of watching the goslings gradually emerge from their shells, and so on indefinitely. There's always something happening here. That's what made me decide the old idea is really true—if you want to be happy and stay young, keep growing things around you. When you

grow vegetables, flowers, chickens, pigs, geese, goats and a child all at the same time, how can you be bored?

But about the work—that's what's worrying you, I know. Yes, I do work hard, I suppose—at least, other women seem to be impressed. But I don't work any harder than I did when I was employed in an office and at the same time kept house as so many women do. One secret I have found is not trying to keep a spotless house—I have decided it's a waste of time. I guess our other secret is that what seems dull work to many people frequently is fun to us.

Now I don't claim we enjoy doing everything—for instance, picking chickens, washing too many greens at one time for canning, or cleaning out manure. But even these disagreeable jobs are not too bad when done together, and what satisfaction I get when they're done! Being a woman you can imagine my blessed feeling at knowing I have, to name just one item, 25 broilers in my freezer—ready to be cooked for my family or friends whenever I want them. We women probably place security for our families above everything else—so you wouldn't mind being in *my shoes*, would you, if you could say—"I could feed my family well without buying another thing for six months!"

I guess you may think by now that I am a very unsociable person but I like to play as well as anyone else. I get very fed up with it all occasionally. When that happens, I try to park our child and the chores with a neighbor and off I go to the city—the Robinsons don't begrudge Mom her day off, especially when it makes her so glad to get back.

There are certain basic facts about the work though—summer is obviously the busiest season while winter gives you loads of time for parties, dinners or whatnot. Except in the middle of summer we have weekend guests who like to play at farming and in the winter we have supper parties. Incidentally, I find it doesn't cost much to entertain guests since we started our "Have-More" Homestead, because we

always have surplus food on hand. Nature has worked out a swell scheme—by the very fact of winter she forces you to rest. Then when spring comes, you're refreshed and eager to start all over again.

And I think you'll make some new friends you'll like—without exception, the people we have met in connection with our animals have been tops. I don't know whether owning animals makes people nice or whether only swell people care for animals, but whichever it is, both Ed and I have thoroughly enjoyed the new friends we have made.

After you work on some of the "Have-More" projects, you may well find you are so interested you would like to expand one of them on your very own and develop it to "pin-money" size. I, for example, really adore the geese and next year I think I'll raise a fair-sized flock.

There's one more vital point in what the "Have-More" Plan means to me. That's Jack Robinson, our little son. I can't begin to tell you what our new way of life is doing for him. He loves all the animals and already at the age of four wants to help take care of them. And we let him to the best of his tiny ability. He is already an independent little thing, afraid of nothing. And need I say what has been written so many times before—by seeing and helping care for our animals he will naturally grow up knowing many facts of life (and I don't mean just sex, though that is included). Furthermore, he will have a basic understanding of what living is all about and what it means to earn his own bread. I believe it is frequently the country boys who have made good in America—anyhow, I sincerely believe we are giving Jackie the best opportunity in the world to learn everything from hammering a nail to developing an intelligent and responsible personality.

And what's more—he will have all the childhood fun for which country life is famous. From his standpoint alone all this is worthwhile.

As you can see, I can't even keep "we" out of my own letter to you. Your husband can't "Have-More" alone—he needs all your interest and help—but isn't that the way you want it? If you start the "Have-More" Plan I truly believe you'll find many intangible rewards for yourself and your entire family—for you'll all be working together, probably more so than ever before in your lives.

My very best wishes to you with your plan—I hope you'll get as much fun and deep satisfaction out of it as I.

Sincerely,
Carolyn Robinson

What Sort of Place Do You Have — or Want?

Country home for city worker

Part-time commercial farm

A business at home

A full-time commercial farm

A place to retire

WHEN we first wrote our "Have-More" Plan we thought of it simply as a way a family could raise a good deal of its food on an acre of land.

"A little land—a lot of living" was our idea. Imagine our surprise when we began getting letters such as these:

"Dear Ed and Carolyn,
 "Your Plan is just what we've been looking for out here on our 2,200 acre cattle ranch. Why should we drive 40 miles for our groceries? We are putting in a big freezer and raising our meat, fruits, vegetables, etc. . ."

"Dear Carolyn and Ed:
 We think your Plan is wonderful. Of course, we aren't interested in raising our own food, but we have bought two-and-a-half acres so that our two children, Emily, 4 and Johnnie, 2½, can have a nice yard to play in. Keep up the good work. We are recommending your Plan to lots of our friends."

From many letters we saw that, in reality, our Plan is basic to five different patterns of country living:

1) **Country Home for City Workers:** In this set-up a family's main income comes from a "full-time" job. The land that this family can use productively is limited to what can be cared for in "spare time". However, with only an acre and an hour's spare time a day it is surprising how much of its food a family can produce, how many improve-

The "Have-More Plan" is basic for all

ments it can make, how much repairing and maintenance it can do. In fact, with proper instruction a willing family can make an acre home in the country productive enough to pay for itself. More important than any economic considerations, however, are the wholesome aspects—a country home gives a family a chance to work together creatively outdoors in the fresh air and sunshine. As the length of the work week shortens and city workers have more time to themselves, home ownership on an acre or so is going to become even more popular.

2) **A Part-Time Commercial Farm:** The distinction between a "Country Home for City Workers" and a "Part-time Commercial Farm" is a difference of degree. But because a Part-time Farm generally requires a good deal more than one to three acres of land, the distinction is important. Inasmuch as the Part-time Farmer will raise some crops for cash, the whole subject of what to raise becomes complicated by the necessity of considering a market. Generally, "part-time" is associated with hobby farming or "subsistence" farming—but thousands of part-time farmers, particularly truck gardeners, nurserymen, and even turkey raisers, farm during the growing season and work in industry during the winter and do well. The most profitable crops for the part-time or small farmer are those produced for home use.

3) **A Business in the Country:** Great opportunity lies in the "rural service field." Recently, the *N. Y. Times* said:

"The tremendous scope of the rural-service field is visualized by few. In the years ahead it is certain to include more frozen-food community locker plants, rural electrification, custom work with power machinery for farmers who prefer to hire instead of own, repair shops for farm machinery, expanded telephone service, scientific soil conservation, modern forestry and refrigeration. There will be opportunities for roadside stand sale of products bought from farmers who live some distance from main roads.

"It seems evident that we are ready for a great expansion toward higher standards of country living. It does not mean more farmers. It does mean many more part-time country homes on the roads radiating from cities and large towns."

Next time you're riding through the country, notice the many signs along the road put up by people operating little businesses of their own. It's just as though a classified telephone directory had come to life. Most of these people, whether business or professional men, own a home with considerable land around it. Very often they have a garden, fruit, berries, chickens, other livestock.

4) **A Full Time Commercial Farm:** Farmers realize farming can be more than a business—it can be a way of life. A farmer who raises only tobacco is no more secure than the man who runs the corner cigar store. But the tobacco farmer, having gone through food rationing, is now apt to be keeping a cow, a couple of pigs, poultry and a large garden. The Department of Agriculture has found that the indigent farmer was the "one-crop" specialist operating on the theory of raising everything to sell and buying all his groceries, meat, milk, and vegetables, just as though he were a city dweller. Today, most farmers know that it is not cheaper to buy their family's food. In the corn belt, points out Rt. Rev. Ligutti, a year's supply of vegetables would cost approximately \$260 for a family of five. In order for the corn belt farmer to earn \$260 cash, he must spend 520 hours working 50 acres of land and produce 2,000 bushels of corn when corn sells at 50 cents a bushel. A vegetable garden only 50 x 100 feet, with \$1.25 spent for seeds plus 50 hours of field work and 25 hours of canning will produce \$312 worth of vegetables. Which is better off—the man who raises corn to buy vegetables—or the man who raises his own vegetables?

5) **A Place to Retire:** Social Security, retirement income insurance, civil service, Army, Navy and the many pension plans of industry mean millions today can look forward to a regular income in later years. The man who will put his spare time in developing a productive country home can retire years sooner. With no rent to pay, with land and the ability to make it produce the family's food, a man can live in grand style on a small pension or other steady income.

The "Have-More" Plan is basic to each of these five ways of country living. Expressed in terms of a "platform," the "Have-More" Plan calls for:

- 1) A source of cash income.
- 2) Home ownership on at least an acre of land.
- 3) A family willingness to use a good part of its spare-time productively and creatively.

Before you dash off to the country and buy a place, consider carefully what sort of country home you want.

Setting Up a Homestead

AN old farmer struck it rich in oil and his family persuaded him to buy a \$4,000 automobile. Never having had anything better than a second-hand Model T, the old boy insisted on only one thing for the new car—the most colossal and expensive set of bumpers he could find!

I wish we'd had some good bumpers when we decided to move to the country. We bumped our noses on land, on the layout of our house, on the location of our barn, fruit trees, and pasture—on nearly everything a family could blunder at. I hope you'll profit by our mistakes!

Setting up a productive country home is probably the biggest and most important job any of us attempt during our lifetime. Despite all of the people who have needed some basic data on setting up a homestead, no one had completely worked the methods out and put them on paper. Every new family has been left to stumble its own way toward the answers.

Not long after our first edition of the "Have-More" Plan went out we began to get letters asking for help in laying out a place. Of course, we couldn't give specific advice without seeing each piece of property; and then, people have different ideas of what they want to do with their place.

Even though no one layout will fit everybody's ideas and site, there are certain basic points that ought not to be violated.

For example, where should you locate your house in relation to the highway? (If you do this right you can probably get the town snow plow to do your snow shovelling for coffee and doughnuts.) Where should your barn be placed with reference to the house? Toward what compass points should house and barn face?

What are the best locations for garden, orchard, pasture, hayfield? In placing fruit trees how much space should be allowed for them to mature without crowding? How can fencing and gates be placed for easy pasture rotation and so livestock can always get water without your having to carry it?

In planning the house itself, how can

you start small and yet make additions through the years so that the finally completed homestead is attractive and efficient for country living?

If you plan your place correctly from the beginning, you will save countless steps in the years to come. You can actually cut your chore time in half. One minute saved twice a day on chores equals 12 hours a year!

Have a Plan

Before you lay out your place you ought to be able to answer all the above points and more too. Even if you're buying a country house that's already built you should have a definite plan for refitting the house and land to your use. Over and over I've seen city people buy a farm, remodel the house but let the land go to rack and ruin. Even if you can't use all the land you've bought, you should learn enough about land management so you can rent your unused land to a neighbor and see that he keeps it in a good state. Idle land deteriorates just as fast as an idle house.

When we moved to the country about the only layout we could find to help us was the diagram below. Even though it shows so little detail as to be of questionable help to the novice, it has two major faults. The combination barn and poultry house should be located where the berry patch is—this will be painfully evident to anyone who has had to carry 100 pound sacks of grain and 150 pound bales of hay from the end of the proposed driveway 90 feet or so to the barn. The second questionable point is that far too many trees are shown in the orchard—a family couldn't possibly eat all the apples, peaches, pears, and cherries which would total about 75 bushels when these trees were mature. Of course,

you might sell the surplus, but it is difficult to make a small part-time orchard pay.

Some Mistakes We Made

At the top of the next page is a sketch of our homestead. The things wrong with it are errors that any novice is apt to make and if we tell you about them you ought to avoid making them. First, although very pretty, there is too much lawn. Our house sits 90 feet back from the road and the front and back lawn take a good hour to mow each week. Second, our small barn is too close to our neighbor's property; there is no room for a poultry run in back of the barn—in front is our backyard play area. Third, our quarter-acre hayfield isn't large enough. Fourth, there are too many trees in our pasture—good pasture grass needs sunlight. Fifth, originally our house sat right in the middle of a woods. We believed this the best way to have trees around the house, believing it would be easy enough to clear land for garden, pasture, and crops while "only God could make a tree". However, we found it is cheaper to build your homestead on clear land and plant a couple of big trees.

Our total acreage is only about 2½. Three to five acres would give us enough pasture for our livestock and enough hay we could then depend on our place to supply us with over 75% of all our food requirements and a high percentage of the roughage and grains needed to feed our livestock.

An "Ideal" Layout

At the bottom of page 8 is a cut of an "ideal" layout for a productive country home. The drawing is available in full-

Shown below is a suggested layout for a 4 acre homestead. To the original 2 acre house plot, 2 additional acres are attached to rear. These 4 acres of good land would not only provide the family vegetables, fruit and berries but more than enough pasture and hay for two or three milk goats or pasture for a cow and a good part of a cow's hay requirements. There is also room for a pig or two plus other livestock.

On the front cover is a suggested layout for a 2 acre homestead, and on page 28 is shown a suggested layout for a half-acre.

We emphasize that these are only suggested layouts. Each family will have its own ideas on just how to manage their own particular place.

size (about as large as the top of a bridge table). Two experts helped with this "ideal" homestead plan: Milton Wend, author of *How to Live in the Country Without Farming* and John H. Whitney, R.A., an architect who specializes in designing country homes.

About 40 pages of description accompany this excellent plan; all the details can't be given here, but I'd like to point out that this basic plan of the "homestead area" (the country house, garden, barn, orchard, lawn, pastures, etc.) is a good point of departure if you're interested in any of the five productive homes described on page 6.

For example, suppose you want only an acre place in the country where you can have a lovely home, a garden, some dwarf fruit trees, and maybe some chickens. An acre is more than enough room; an acre, remember, is 209 feet by 209 feet. The portion of the ideal layout shown in the lower left-hand corner of this page is just over an acre. You'll notice that this "basic acre" includes a large house, an orchard of standard trees, barn and barnyard, a good-sized garden, flower gardens, lawns, driveways, and even some pasture and hayfield. The pasture and hayfield are not shown complete—the wavy line at the top of the cut indicates that these are only partially shown.

A Larger Place?

If you wanted a larger place, a part-time farm where you could, if necessary, grow 75% of the family's food, then you'd want more pasture space and hayfield. But the basic acre is still an excellent layout.

Then again, if you wanted to carry on a business at home, the office and "shop" to the left of the living room could be built. Naturally, this could be as small or as large as needed for your business.

If you want a commercial farm, then this same homestead acre is a good layout. You'd still want a kitchen garden for home use even if you were growing tobacco, or flowers, or fruit; if you

Here's a sketch of our homestead.

were running a commercial dairy or a poultry business then you'd drop your goats or cow out of the small barn, but might well have the rest of the items. Naturally, on a commercial farm you'd add to the basic acre as much land as you needed.

As a place to retire you might want an acre, or enough for a part-time farm.

Basic Acre Most Important

You can see that this *basic acre* is the key to a productive country home. Even though the house may not suit you, or the exact location of the items may be impossible to achieve, due to the fact that you are remodeling an existing place, or even because you want your place laid out differently, I think you'll find that this "ideal layout" makes a good point of departure. It does indicate basic principles that ought to be kept in mind.

For example:

- 1.) Every bit of land should be used advantageously.
- 2.) Garden rows should be of good length for easy cultivation; and run North and South for equal sunlight.
- 3.) Pasture should be fenced into plots for rotation. Pasture gates should be wide

enough for entry for haying and plowing equipment.

- 4.) Vegetable garden should be handy to kitchen.
- 5.) Lawn and shrubbery arranged attractively, yet easily cared for.
- 6.) Child's play area screened from street and located so it can be watched from the house.
- 7.) Compost heap should be placed between barn and garden.
- 8.) Trees should be spaced so as not to be crowded at maturity.
- 9.) Shower, bath, dressing room should be accessible from outside.
- 10.) Barn should be to lee of house; close enough to make supervision of livestock easy.
- 11.) Adequate closet and storage space in house.
- 12.) Space for good home workshop.
- 13.) Housing for garden tools, wheelbarrow, lawnmower, small tractor.
- 14.) A cold storage room for vegetables and canned goods.
- 15.) Fencing so arranged that livestock may be turned loose from the barn.
- 17.) Space for home freezer, laundry, fireplace wood.
- 18.) Orchard should not shade garden.

If you're thinking of having a place of your own — or you want to lay your present place out more efficiently — send for "Layout for a Productive Homestead" from which this small reproduction was made.

This will give you an idea of some of the things that you ought to think about when planning a homestead.

Houses Especially Designed For Country Living

TODAY practically all houses are designed for suburban living—not country living. A suburban house is simply an expanded apartment. No provision is made for the more productive kind of life you can live in the country.

For instance, if you have a garden or chickens or fruit trees, and most certainly if you are going to have livestock, you'll find that the small kitchen of the suburban house is totally inadequate. If you're going to have a laundry or you want to start your seedlings indoors or you plan on a quick freezer, you'll find no provision for these in the usual suburban house.

The fundamental differences between the ordinary suburban house and a house that's really satisfactory for productive country living or a small farming operation is illustrated in the three floor plans at the right.

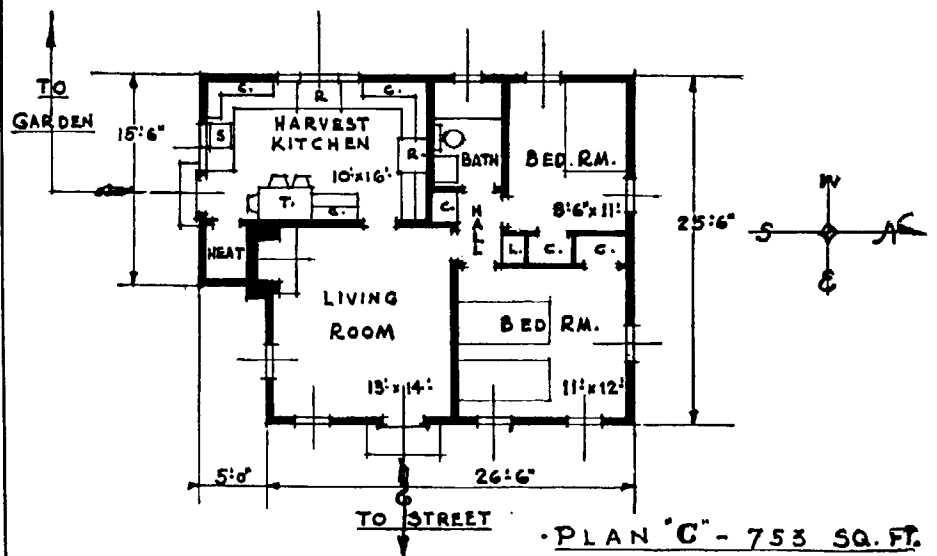

The smaller the house the more difficult it is to provide space for homestead activities. Thus we asked John Whitney, R.A., an architect who specializes in country houses, to take a good small suburban house and show how approximately the same floor area might be laid out in a productive country home.

Note these plans are about minimum—one story, four rooms, with heater space instead of a basement. Ordinarily if 10% of a house is "waste space" (hall area), the plan is considered satisfactory. Hall area in these plans is only 2%!

PLAN A: (705 sq. ft.) Here is an efficient suburban house well planned for that type of living. Note that the kitchen is the small apartment house type. Living room is large.

PLAN B: (705 sq. ft.) This is the same basic plan as "A" achieved by turning "A" up-side-down and reversing it. (Dotted lines show eliminations.) The living-room becomes a "Harvest Kitchen" with heater space, chimney, and bedroom closet off one end thereby eliminating two small closets in larger bedroom and gaining 8 square feet of valuable wall area for dining in the enlarged kitchen. Heat and chimney area of Plan "A" becomes smaller sitting-room. By reversing living-room and kitchen in most suburban house plans you have a better country layout.

PLAN C: (753 sq. ft.) This is an ideal small homestead. By adding 48 square feet, 76 square feet are gained for the "Harvest Kitchen." Here is room for all food preserving activities plus laundry. The living room is 182 square feet compared with 181.5 square feet in Plan "A". Bedrooms are same size in both "A" and "C". By changing the corner closets in Plan "A" there is an additional gain of 8 square feet plus wall space.

Plan a "Harvest Kitchen" With Your Wife

NOT long after Ed and I moved into our country house I began to realize *my* department was going to be overcrowded.

One look at our big quick freezer, the cream separator, the honey extractor, the pressure canner—and another look at our small kitchen and we were somehow reminded of trying to get a grand piano into a phone booth!

You see, when you begin to grow a good part of your food you need a "factory" to process it and preserve it. And you just *live* differently. The ordinary kitchen-dining room combination of the conventional house simply doesn't fit.

What you need is a streamlined, modern little food-conserving set-up, combined with the charm and warmth of Grandmother's kitchen.

We went to John Whitney, an architect who specializes in country houses, with our idea. Together we planned out every detail of food preservation, preparation and serving, added such things as the greenhouse window (for winter herbs, flowers, and spring plant starting), a desk and record-keeping corner and a rocking chair corner for relaxation, darning and sewing and general coziness.

And now we have our "Harvest Kitchen." It has turned out lovelier and more practical than our fondest dreams. Believe me, if you want to make cooking, canning and freezing a joy for your wife build her a "Harvest Kitchen!"

You can add it to any house; you can put it into *new-house* plans; sometimes you can convert your present dining room and kitchen into this needed "Harvest Room" or "Harvest Kitchen" as we call it.

In our "Harvest Kitchen" (see pictures at right) we have such features as a greenhouse window, special milk-handling and cooling equipment, quick-freezer cabinet, hardwood chopping block for meat and poultry dressing, vegetable-cleaning sink, glass-enclosed preserved and canned food compartments, garbage-handling arrangement, dry food storage space, cooking, canning and work space, etc.

Isn't it astounding that such a room has never been designed, not even for a *farmhouse*?

We can't begin to give you all the important details, plans and so forth, but if you're interested in building a country house or remodeling your present one, you can write for our complete portfolio giving full information plus plans drawn up by John Whitney, the architect.

OUR HOUSE: This snapshot shows our house which is the so-called "Cape Cod" style. We found that the ordinary-size kitchen cramped our canning, freezing, and cooking so we planned the addition of an up-to-date version of the old "summer kitchen."

OUR HOMESTEAD: Another snapshot six months later showing how our suburban house has been turned into a homestead by adding a "Harvest-Room." The garage was remodeled—note the greenhouse window. Also, we improved the front entrance and added picket fence at left.

Here is one end of a special room every "Have-More" home needs very, very much. The big, roomy old farm kitchen was its "ancestor"—yet it is completely new in design and conception. We call it the "Harvest Kitchen."

This architect's sketch from PLAN FOR A HARVEST-KITCHEN is one of six showing various ways a "Harvest-Room" may be added to an existing house or planned for if you are building a new house.

Finding a Suitable Place

MAYBE you already have a place of at least $\frac{3}{4}$ of an acre of level, good land. So much the better, but read this section carefully to make sure your land is suitable for intensive cultivation.

I am going to suppose you live in the city—own no land—and know nothing about finding a suitable place in the country.

Here's how you start. Get a good map of your locality. Take a compass and using your place of work as a center point, make a circle the radius of which should be approximately the distance you can travel in one hour.

If you own a car, this radius could well be 25 miles. This 25 mile radius will enclose a territory of 1,962 square miles (an area about equal in size to the whole state of Delaware). If you expect to travel by bus, street car or subway to your job, the radius would be shorter.

Next study the encircled area. Is there any particular part of it in which you would especially like to live? Have you friends in some part? If so—talk to them about finding a place.

The most important single step in the "Have-More" Plan is selecting a suitable place. If there is any question in your mind as to whether you will enjoy owning your own home—raising your own food or living in the country—or any other doubts—rent in the community you select before you buy. Remember, you are choosing a place to make a permanent home—you are not simply leasing an apartment for another year.

The very fact that this first step is so important and difficult is a good thing because if you haven't enough gumption to go out and find yourself a place—then you probably would never

make it amount to anything even if a rich Uncle left you the place in his will.

One reason so many city dwellers continue to go on paying rent and living the restricted life people lead in an apartment seems to be because they don't know how to go about finding and developing a place of their own. Another obstacle is the mistaken belief that they can't afford a country place of their own.

Deal With A Good Real Estate Man

Many people who go to a doctor when they are sick, a dentist when they've got a toothache, balk at going to a real estate man to buy property. Somehow they figure they can find a bargain in real estate themselves if no real estate man enters the picture. Of course, a real estate man is in the business of selling real estate—and he is going to sell everybody he can. But most people who get stuck by a real estate man let him sell them something he wants to sell. They don't tell him exactly what *they* want—and make him find it for them.

We have prepared a "score-card" which you will find helpful in talking with a real estate man. This "score-card" is a guide to the qualifications a place in the country should ideally have in order for you to utilize it successfully in accordance with the "Have-More" Plan. Of course, you may not find a place that has everything you want, but with your own good judgment and careful consideration you can pick the best suited available place in your chosen locality.

Take this "score-card" with you when you talk to any real estate man.

It will save you time in telling him what you want. It will save you fruitless hours of riding from one piece of property to another only to be disappointed because it is not suitable. But most important, it may save you hundreds of dollars and years of work by protecting you from buying a place that you later find impossible to make productive.

When you are buying property it costs nothing to deal with a real estate man. He gets a commission, usually 5% of the sale price, from the seller. Every real estate man has a number of houses with land listed. This same property may also be listed by other real estate agents. So you can see how competition tends to keep the prices on property in line. Usually, it is the best practice for you to talk to a number of real estate agents. Then, you can do business with the agent you like.

A Word of Caution: If you can, rent a place with an option to buy it at a definite price at the end of a certain time—for example, a year—do this if there is any doubt in your mind about the place and the community.

Land More Important Than House

A good farmer in buying a new farm gives primary consideration to the land—the state it's in . . . whether it's easy to cultivate—neither dry nor wet, nor too sandy, nor too shallow. This you should also do.

We are approaching a wonderful new era of home-building. Shortly houses the like of which we have never seen will become available at low cost. Nobody knows just when these houses will be ready—but authorities agree they are coming. Remember this—and consider seriously buying your land now and getting the land in the condition you want it. Perhaps the house on it—even if it's "just a shack"—can be made livable for the present.

Should you plan to build your own house or buy land with a house on it? This question you can decide for yourself. If you find a suitable piece of land—I mean suitable because of size, condition, levelness, closeness to work—and it has a good substantial house on it that you like then buy it. But if you can't find on one place both a satisfactory house and satisfactory land—take the place where the land is right. You can always build a house—but some land is almost impossible to make fertile.

How Much Money Do You Need?

If you plan to rent a place before you buy—then you can find a house and

Points to check in buying a house (From F. H. A.)

1. Exterior trim.
2. Attic ventilation, attic room.
3. Flashings.
4. Chimney masonry, cap, etc.
5. Roof.
6. Rafters, studding.
7. Roof sheathing.
8. Dormers.
9. Weather-stripping.
10. Lath.
11. Garage—tool space, workshop, etc.
12. Walks and drives.
13. Exterior walls.
14. Sheathing and insulation.
15. Window frames and sash.
16. Blinds, shutters.
17. Porch—beach, transom, door columns, etc.
18. Steps—brick, wood, concrete, tile, etc.
19. Drain tile.
20. Footing.
21. Foundation walls.

22. Basement floor.
23. Recreation room, laundry, workshop, etc.
24. Heating plant.
25. Grading and landscaping.
26. Gutters, downspouts.
27. A modern kitchen.
28. Built-in bookshelves, cabinets, cupboards, etc.
29. Joists and sub-flooring.
30. Fireplaces, mantel, flue.
31. Paint, wall-paper, interior decoration.
32. Interior trim.
33. Stairways—treads, rails, balusters, etc.
34. Electric fixtures.
35. Doors, hardware.
36. Plumbing and fixtures.
37. Outlets and wiring.
38. Flooring—finished lumber, tile, linoleum, etc.
39. Wallboard, plaster, etc.
40. Closet space, shelves, etc.

land for what you are now paying. Specifically, you can rent a satisfactory place for \$15 a month or go as high as \$100, depending on section of country.

If you plan to buy you will find the price of suitable land ranges from \$100 to \$1500 an acre. The larger the piece—the less cost per acre. If you want to buy the land only, this is all right if you are now living close enough to go to it regularly and start getting it in shape.

You can buy land by putting up a cash payment of as little as 30%. Even if your land has no house you perhaps are living close enough to have a garden. The money you don't have to spend on vegetables can then help you pay for the land. Or go get a bank to pay the owner outright and take a mortgage for the balance. If a bank won't give you a mortgage on the land, *be careful*. There might be something wrong with the land, its location or price.

Perhaps you can buy land with a house on it. You can then put your rent money into paying for the property. Also, a house on the land means you can start immediately making the land pay for itself because if you live there you will be able to put more time into getting your "Have-More" Plan under way.

You may be surprised at this, but 44% of all Americans own their own homes. This the government encourages by sponsoring the Federal Housing Authority (F.H.A.).

F.H.A. makes it possible to buy or build a beautiful modern home and pay for it out of a moderate income.

For example—a small home:

Suppose land and buildings are worth . . .	\$2650.00
Of which the value of land is	150.00
Your down payment would be	150.00
Your F.H.A. loan would be	2500.00
Your monthly payment including principal and financing charges (taxes and fire insurance a couple of dollars extra)	\$ 20.90
At the end of 180 months your F.H.A. loan is completely off . . . you own your home and land.	

For a more expensive home:

Appraised value of property	\$7500.00
Total down payment	900.00
F.H.A. mortgage	6600.00
Average monthly payment over 20-year period (including principal, interest, mortgage insurance)	\$ 43.36

The purchase, or building, of your house will probably be the biggest single financial transaction you will ever undertake. Only if you have a super-abundance of funds can you afford to experiment. Few people have the technical knowledge to tell the difference between a well-built house and a poorly built structure. As the F.H.A. points out:

The very elements which make the proposed loan a 'good risk' to the lender and to F.H.A. are the same elements which assure the borrower of a sound investment, good construction, livability, and comfort in his new home.

A Little House Can Grow Into A Homestead

1. Here's a pay-as-you-go house that starts small and can grow step-by-step. In fact, maybe you can pay for additions out of savings made by raising your family's food.

2. Added to the main section is a nice garage and root cellar . . . garage should be deep enough to provide space for a workbench in rear and garden tools.

3. A dining room, or better yet, a "Harvest Kitchen," has been added. The house now becomes a real homestead.

4. Finally, another bedroom (at right) is built. The so-called Cape Cod style lends itself particularly well to growth.

"Score-Card" of What To Look For In a "Have-More" Homestead

I. LOCATION

Owner's or Broker's Name and Address:

.....

Distance to your job ... Commutation Expense

Time Condition of Roads in winter

in spring Distance to: schools (school bus) to church to town Telephone Available ... Electricity ... Mail Del. ... Express ...

II. WATER SUPPLY

Town water..Artesian well..Shallow well..Spring..

If other than town water have tested by State Health Dept. (free). Be sure you have a minimum of 2-3 gallon flow per minute *even in dry season.*

III. SEWAGE DISPOSAL

Municipal septic tank cess pool

IV. LAND

Total Land Available

Should be at least $\frac{3}{4}$ acre of good, level land. Total of 2 to 5 acres to include orchard, pasture, hay field, and land to grow some stock feed.

Size of GardenDepth of Soil

For family of five should eventually be 100 x 150. Dig holes several places. Top soil should be 7" deep; 12" is better. Important: if top soil only 6" or 7" subsoil should then not be hardpan or deep gravel.

Pasture

$\frac{1}{2}$ to 1 acre for goats; 1 to 2 acres for cow.

Hayfield

Not necessary—but will save you buying hay. 1 to 2 acres for 2 sheep; 2 acres for steer. $\frac{1}{4}$ to $\frac{1}{2}$ acre for goats; 2 acres for cow.

Land for grain crops

Part time farmer probably won't have time for grain. Additional 4-12 acres necessary to grow all livestock grain.

Woodlot

Enough for fireplace—fenceposts, etc.

Lay of land

At least $\frac{3}{4}$ acre level; also hayfield level—pasture, woodland need not be level.

Natural Fertility

Observe present garden, vegetation, etc. Watch out for poor drainage, too sandy or too much clay, too many large stones.

V. OUT BUILDINGS

Garage Tool House Workroom Barn

Poultry House and/or Barn

Barn for dairy, rabbits and poultry ideally should contain a minimum of 500 sq. ft. floor area.

VI. HOUSE (see diagram page 11).

VII. ORCHARD

Apple Peach Cherry

Plum Grape Raspberries

Strawberries Blackberries Blueberries

Currants Asparagus Rhubarb

An established orchard in good condition is worth money. For a family of 5 this should contain: 5 apple, 3 pear, 5 peach, 3 cherry, 2 plum trees, 10 grape vines. . . Small fruits: 50 raspberries, 100 strawberries, etc. (See pages 26-29).

WATER . . . SANITATION . . . ELECTRICITY . . . ROADS

A **SPRING** is simply an opening where water flows out of the ground. It may be located at the bottom of a pond or lake. If you have a good spring near your house you may be saved the expense of digging a well. And if the spring is located on a high enough level you may be able to use a gravity system instead of a pump.

WHEN we bought our house in the country the water, sewage, electricity, and driveway were supposedly all finished. They looked all right to us. But we've had to spend additional money on all four.

Our main expense was the need to rebuild our sewage system—the builder had installed a minimum amount of drainage pipe and no siphon discharge system. We've also piped water to our barn and to our concrete pig pen. It was an easy job to wire our barn with electricity.

We've had to add more fill and build an edging to our driveway. In short, we've found that knowing a little about country water supply, sewage, electricity, and road building is most worthwhile.

If you are used to city water service, you probably think it means an awful lot of expense and trouble to have your own rural water supply. The expense of digging a well is uncertain because you can't be absolutely sure how deep you will have to go. Still there are a lot of people living within 100 feet of a town water main who find it is less expensive to dig their own wells than to buy water from the city. One man I know, who is now building a house in town, has discovered that installing city water will cost him about \$300. On top of this he will have to pay a water bill of about \$25.00 a year. He figured up this bill for a period of ten

A **RAM** is really a sort of pump but it requires no electricity or gasoline and has no moving parts and is completely automatic. The water virtually pumps itself. There must be at least a 20 inch fall of water between the source and the ram. Under these conditions the ram will pump water to a much higher level, as high as 20 feet.

A **DUG WELL** is the kind that is actually dug with hand digging tools. This is the old fashioned type of well you see on many farms today. Wells are not dug by hand so often nowadays as they used to be because it is frequently easier to get a well driven or drilled. Another reason is that the dug well is more easily contaminated by seepage through the walls or from above. On the other hand, this type of well if properly constructed can be kept entirely pure and provide plentiful quantities of water for generations. If you're thinking of digging a well yourself, you'll want to learn more about this kind of well.

A **DRIVEN WELL** is made by driving into the ground a simple pipe fitted with a well point. It may be either a deep or shallow well, depending on how deep you go to get a satisfactory flow of water. If your soil is suitable for this type of well it is something worth investigating for it usually costs less than drilling a well or digging one. It is not generally considered as reliable as an Artesian well (which produces a steady flow of water), but in some sections it is quite satisfactory. You need a good sized storage tank and you should know what to do if the well points become clogged.

A **DRILLED WELL** is made by drilling a hole into the ground 4 to 8 inches in diameter with special well-drilling equipment. The upper part of this well is lined with a steel casing which protects it from contamination. If you think you will have to go down deep to get water, you should learn more about drilled wells. Also you will need to investigate deep and shallow well pumps. The cost of a shallow well pump is much less and can be used with a good Artesian well when you don't have to pump water up from over 22 feet.

LOCATING THE RURAL WATER SUPPLY

BAD—This well is located too near the barn and sewage disposal system. Sewage seeps into the well or drains directly into ground water the well uses.

GOOD—This well is located where it is not likely to be polluted by the sewage disposal system or livestock in the barn. Cesspool is over 100 feet from the well.

years (\$250) and added it to the \$300 he would pay for installing the city water, getting a total of \$550. When he compared this cost with that of drilling a good Artesian well 100 feet deep and putting in his own electric shallow well pumping system, he found that the city water over a 10 year period would cost him \$50 more . . . And in 20 years this city water would cost \$260 more. In 30 years he could install an entire new pump and tank and still beat the cost of city water for this period by \$400!

Here is a comparison of costs:

YOUR OWN WATER SYSTEM

Low Estimate

Drilling 50 ft. well (@ \$3.50 per foot)	\$175
120 gallon tank	40
Labor	25
Shallow Water Pump	45
Upkeep for 10 years	30
	<hr/>
	\$315

High Estimate

Drilling 300 ft. well	\$1,050
150 gallon tank	50
Labor	50
Deep Water Pump	150
Upkeep for 10 years	50
	<hr/>
	\$1,350

CITY WATER SYSTEM

Installation	\$300
Water bill for 10 yrs.	250
	<hr/>
	\$550

As you can see, your well may cost you anywhere between \$175 and \$1,050. About the only way to predict this cost is to find out how deep your neighbors had to dig their wells. Unless there is something unusual about your situation, you will probably have to go to the same depth. Be sure to have your well water tested for purity. The Health Department will make this test free in most states.

We've discussed a few of the many ways you can obtain water in the country. There's probably *one* combination just right for your circumstances.

Sewage Disposal

If you don't have city sewage disposal there are three practical solutions to your sewage problem: a cesspool, a septic tank, or a septic tank with a siphon discharge system.

Maybe you can use a cesspool, but on a long term basis you should consider spending a little more money and getting a septic tank.

After we bought our place, we discovered that our septic tank didn't have a siphon discharge system. This caused fouling of the ground near the tank. We had to dig up the whole system and found a siphon discharge tank was needed. The siphon discharge method distributes the sewage more forcefully so it spreads over a much wider ground area. Sometimes you can get by without the siphon discharge feature in a vacation home.

Electricity

If your house has never been sup-

Here is a simple septic system with only one tank and a tile drainage field. Inside the septic tank are anaerobic bacteria which decompose a part of the solids into liquids and gasses. Incidentally these bacteria are killed by pouring strong disinfectants and mouth washes down the drain in your house.

Here is a septic tank with a separate siphon discharge system. Another workable combination is a single septic tank like the one shown above which drains into a cesspool instead of a tile drainage field. The whole problem of proper sewage disposal is so important to health that it will pay you to go into the subject pretty thoroughly before you decide which system to use.

plied with electric power, measure the distance to the nearest power line. In our area the cost of getting this power to the house is about 25¢ a ft. You can reduce this cost by getting neighbors to come in with you. The more people on the line, the less each has to pay. Also, your contract with the power company should entitle you to a rebate when other people come in later. In wiring a house it's important not to underestimate the size of the wire needed. Some day you may want an electric stove, a freezer, electric power tools, or electricity in your barn and hen house so it's safer to use a no. 12 wire rather than a no. 14, the legal minimum.

Roads

Particularly today when land values are high you may save hundreds of dollars by buying land off the road and building your own road to it. Land not touched by a road may be a far more desirable site and usually sells at 30% or 50% less. If you build a road acceptable to your town or county, you can get it declared a public highway and have it kept up by the town.

Landscape Your Place—Increase the Value 20%

Developing a Plan

FIRST—Divide your place into four separate areas: public, private, service and production.

SECOND—In each area lay out the buildings, gardens, lawns as desired.

THIRD—Decide how each area should be planted to make boundaries for privacy, beauty and productivity.

ALTHOUGH our homestead is not for sale, in January of this year I was offered more than twice the amount we originally paid for it.

Part of this increase is due to inflation and the housing shortage. But even a few years from now when the housing shortage is over and inflation has levelled off—and maybe real estate prices will take a big drop—even then I feel confident that our homestead will be worth considerably more than we originally paid and will be far more desirable and easier to sell than it was when we bought it.

One big reason for this extra value is the simple combination of a few little things that improve its appearance and its *outdoor livability*. I don't want to call it landscaping because you may think that means we have a large estate or have spent a lot of money on fancy things whereas what we've actually done is to plant a few inexpensive trees, shrubs and flowers in the most natural places. The amazing fact is with \$25 worth of seeds and plants you can add literally hundreds of dollars to the value of a small place. More important, the place becomes lovelier and more livable. Your aim needn't be to make your yard showy—but just the kind of place people want to be in—a place that *feels* right outdoors.

If you'll look at the two top pictures of our place on page 10, you can see a couple of smaller changes that made a big difference. See how much better the small evergreens look compared with the tree at the corner. Also note the big improvement in the front entrance. Although it doesn't show too much in the snapshot, the picket fence (at left) gives the house a longer look.

Next time you are driving in the country look at the difference in various houses. Some seem bleak and undesirable. Others seem friendly and inviting. Often you see a new expensive place equipped with many modern improvements that you just wouldn't want to have for yourself. Then you'll notice a less expensive, less modern place, perhaps with a nice orchard and an informal hedge of berry bushes and several nice shade trees. This sort of place, though less modern, is the one that says "home".

Just what is it you do to a country place to make this difference? Here are a few suggestions—a *five year plan* that can greatly increase the value of a small homestead:

A 5-Year Landscape Plan

1st Year

Become familiar with basic landscaping methods so you can work out a good plan for the entire place. Make a pencil layout of your land showing the

house, road, driveway, nearest neighbors, barn, vegetable garden, etc. On this drawing show where you want to plant shade trees, fruit trees (dwarf), hedges and vines. Then mark desirable spots for flower beds, climbing roses, etc. You may need a screen of privet hedge or hemlock for privacy or to conceal the laundry yard or compost heap or close neighbors. If you want tall trees in a hurry, consider the fast-growing poplars—also privet hedge will grow high in one season. You can plant beds of perennials the first year too, but plant only as many as you can manage. Plant the trees, vines and shrubs first because they will take several years to grow and develop. If you don't like cutting the grass, you needn't have a large lawn. You can make it small by setting a hedge of brambles or berries, for instance, at the desired limits and beyond plant a beautiful field of alfalfa or clover.

2nd Year

Finish planting the flowers and any shrubs still desired. Be sure to have some good perennials (peonies, chrysanthemums, iris, hollyhocks). Study up on outdoor furnishings—maybe a terrace near the house or a trellis for climbing roses or grapes. Decide where you'd like to have a garden seat beneath a good shade tree or possibly an arbor with a love seat, swing or hammock.

3rd Year

Develop your present plantings a little more as needed. By now you may be ready to add the trellis you've been planning and some simple garden furniture. A brick walk set in sand can be very attractive and is easy to do. Consider adding a combination fish pond and garden pool using it partly as a fence with a border of blueberries. Any steep slopes or terraces will make a good place for a rock garden.

4th Year

By now you have finished all the foundation plantings. You are getting fruit from your dwarf fruit trees and berries from your "hedges" of raspberries, blackberries etc. A few finishing touches will probably be needed in the flower bed. Try to have enough flowers so they will bloom continuously from Spring to late Fall. Plant borders along the front walk from the house to the road.

5th Year

The plan should now be about complete, but you will see obvious improvements. For instance, you may want a little more variety now in your flowers and fruits. See if you can't find a few interesting and different varieties in your reference library. Consider ways to blend your animals into the general

scheme—especially ducks and geese in the pond, goats in the more wooded section, sheep on the more distant slopes. By now your experience, plus a little study, will tell you what is needed.

Be sure to take a picture of your homestead *before* you start this plan and another *after* it is completed. I'll bet there will be such a difference in the two photographs that you will hardly recognize the *old* place.

Now finally, to save you needless expense on plants and seedlings and flowers, here are a few practical tips:

- 1.) *Always have your holes dug before you get the plants for transplanting.*
- 2.) *Transplant immediately — don't give the plants time to dry out or they will die.*
- 3.) *Plan to get "bare root" plants in early Spring or late Fall. At this time it is not usually necessary for plants to be balled and burlapped (as it is in the Summer) so you will save money.*
- 4.) *Don't buy more plants than you can plant in a day.*
- 5.) *Most big nurseries have a surplus list of trees and bushes which have grown so large that they must be transplanted. These are often reduced in price "for clearance". They will be perfectly healthy plants if you are dealing with a reliable nursery.*
- 6.) *If you learn enough about trees and plants and flowers you can master the trick of getting them from the woods and having a "wild garden" on your own grounds. Many varieties cannot be obtained in any other way.*

At the right you'll find two aids to landscaping which can be a lot of help. First of all at the top are the two little diagrams showing the "wrong way" and the "right way" to arrange plantings and driveway of a small area. It shows pretty clearly what a mistake it is to just plant anywhere, how you can spoil the looks of your place by bad planning even though you may spend a lot of money for pretty flowers and beautiful trees. Of course you can avoid this by having a landscape architect, but we don't think that is necessary for a small place.

If you will do a little reading on the subject you'll find landscaping is simple and it's easy to learn the *don'ts*.

Below the "right-wrong" diagram is a landscaping score card which we've adapted from a farmstead score card put out by the Agricultural Extension Service at Ohio State University. You may not agree with all of the things listed here—some points are largely a matter of personal taste and a great deal depends on your locality. But we think you'll find this score card very useful just the same, for checking over your own place and finding ways to improve it.

Score Your Own Homestead

	Value points	1st scoring	2nd scoring
I. — CONDITION OF GROUNDS:			
1. Arrangement—well separated areas for lawn, service, storage, stable yards, etc.	8		
2. Livestock and poultry in pens away from house and opposite direction of prevailing winds.	6		
3. Drainage of ground — good natural drainage or by grading and tiling, if necessary.	4		
4. Convenient system of walks and an attractive drive-way, hard surfaced.	3		
5. Freedom from rubbish and scattered machinery.	3		
II. — LAWN:			
1. Well graded. Surface should sag rather than bulge. Should slope away from the house in all directions.	5		
2. Should have a smooth dense turf free from weeds.	5		
3. Should have no flower beds, trellis, or benches except around edges. Center should be open.	3		
III. — BUILDINGS:			
1. Dwelling			
a. Good design. Simple, seems to belong to setting.	7		
b. Well painted and in good repair.	4		
c. Appears as the most important building of the homestead as seen from the approach.	3		
2. Outbuildings and barns			
a. Properly placed — not too close to the dwelling.	5		
b. In good repair and painted.	4		
IV. — PLANTING:			
1. Good shade trees in rear of dwelling to form background, and in the front to frame building and to give shade on dwelling where needed.	6		
2. Screen planting of shrubs and trees to hide unsightly objects from dwelling and road.	6		
3. Good taste and restraint in use of vines on walls and fences; and in shrubbery at base of house and along margin of lawn.	5		
4. Some large hardwood trees in barnyard well protected from livestock. Protective frames on all young trees in this area.	3		
5. Some space devoted to the growing of annuals and perennials. Materials well cared for.	5		
V. — SOME PROVISIONS FOR FAMILY RECREATION: (Tennis court, outdoor fireplace, picnic area, etc., well placed.)			
	8		
VI. — ATTENTION TO BEAUTY OF ROADSIDE: (Adjacent to farmstead.) Absence of billboards. Native trees and shrubs preserved. No weeds.			
	7

Plans for a Small Barn

THE idea for this "Have-More" Plan came to us at a party—our own "barn warming" party.

When our small "concentrated barn" was finished, we thought it deserved a celebration. And so we invited all the neighbors and our friends to come and see it. We had planned and built our small barn to house not only our milk goats and their kids, but a couple of sheep, 25-30 laying hens, a battery brooder that would produce 30 broilers a month, a six compartment rabbit hutch, a squab loft, plus storage space for grain, straw and bailed hay. Yet the size of the barn was only 16 x 30 feet, as large as a fair-sized living-room.

Of course, Carolyn and I—and Jackie—thought our small barn a thrilling place, but when we discovered how interested our guests were in all the animals and the compact, efficient layouts we had worked out for them, we saw that perhaps many people would be interested in the idea of a family producing a large part of its food in spare time on a small amount of land. Eventually, with the prodding of two friends at the party who are in the publishing business, we got this "Have-More" Plan written.

Now after producing about 75% of our family's food for four years, we realize there are three main fundamentals which set a *productive* country home apart from the ordinary "house in the country." First, the layout of the grounds should be planned for efficient working of the land. Second, a "Harvest Room"—or a large kitchen—carefully planned for the *processing* of food, as well as the preparation, is needed to make the wife's part enjoyable. Third, an efficient small barn is a necessity—a homesteader's livestock can account for 40% to 50% of a family's food.

"Slightly Crazy!"

When we planned our barn we had almost nothing to go by. We wrote to all the barn equipment people, the lumber companies, the state and federal departments of agriculture, asking if they had small barn plans to house goats or a cow, laying chickens, rabbits, sheep, ducks, a pig, pigeons, and geese. Some of the answers indicated that the specialists thought we were slightly crazy. Some wrote of small commercial barns that we might adapt.

Well, we finally ended up with somewhere around \$15 worth of miscellaneous plans. None of them suitable for what we had in mind, however. So we set about designing our own barn. It was quite a job. We got the most efficient layout for poultry from one place, the best arrangement and style of goat stalls came from study and visits to a number of goat keepers and goat dairies. The broiler battery we bought for around \$30 and the rabbit hutch for \$20; both are of wire, sanitary, and efficient.

I was determined that our barn would be easy to operate with the best practices adapted from commercial barns and not cost us a fortune either. We moved to our country house in the fall and didn't start our barn building until the following spring. During the "long winter evenings", which actually flew by as time does at our place, we worked out scale models of goat stalls, brooder, hutch, feed storage, etc.

I was also able to locate not far away, a dilapidated horse barn and bought it "as is" for \$35. It had a lot of good siding and some usable timber in it.

Wrecking Is Fun

Wrecking the old barn was fun. A couple of teen age boys in the neighborhood got interested in my barn project and they turned out to be a big help in tearing down the old barn. In fact, if you can locate an old building to use and get it cheap enough, then I highly recommend rounding up a couple of teen age boys, buying them each a fifty cent wrecking bar, and turning them loose on the barn you want to demolish. Of course, you'd better be around to see that they don't pull the barn down on their heads.

Anyway, a Saturday afternoon and Sunday was enough time for us to get the sizable horse barn down flat. The following half-dozen winter weekends we spent in what is known as "cleaning up the lumber." This is the tedious process of going over every piece of timber and board and pulling out the old nails. Incidentally, this job is what makes it costly to hire a carpenter to take down an old building and re-use the lumber in a new structure. Usually, unless you are given an old building outright, it doesn't pay to have a carpenter pull it down, clean up the lum-

ber, and build with it. A carpenter dislikes old boards because he's apt to run his good saw into a nail and then its an hour's job to resharpen and reset it. Incidentally, an old barn is worth more than an old house—a house doesn't usually supply any more usable lumber and the wrecking job is much greater.

As we cleaned up a pile of lumber, we stowed it in our Crosley, with one of the front seats removed and the top down, and trucked it down the long hill to our place. Naturally, we piled it well so the air could circulate through it until spring.

When the ground thawed, we started building. I believe it was around the first of April when we could actually begin the trenching for the foundation. Before we started, Carolyn and I had a long heated discussion as to exactly where the barn was going to be located. She wanted it six feet closer to the house than I did. Her desire was based on aesthetic reasoning—mine on the practical point that if it were six feet closer, then I would have to dig and chop my way through a tremendous root. Finally, after we delayed the digging a weekend while we argued, we agreed to compromise because the goat we'd bought was due to kid the last week in May and we had to get the barn done so she could freshen in it—a goat is supposed to "take to" a place after she has had her kids there. We compromised by splitting the difference—only I still dug through the root.

In laying out the barn, which was to be 16 x 30 feet, I measured 16 feet one way, then 30 feet along the South side, 16 along the West end, and 30 feet along

How to make a building square: measure 6 feet on the end sill and 8 feet on the side—if a cross piece then measures 10 feet (from outer edges) the building is square. This is often called "the rule of 6, 8, and 10."

the back. I connected the stakes with string and started to dig. That, it turned out later, was where I made my first mistake. I forgot, or rather didn't know, one important thing. I should have measured diagonally across corners to see if the measurements were the same. By not doing so, I wound up with a parallelogram instead of a rectangle. Not a noticeable one, but I was off about eight inches.

The foot-wide ditch I dug through stone and roots—there was very little soil as I well remember—to a depth of about two feet which is below frost level in our part of the country.

The next step was building the wooden forms into which concrete for the footing and the foundation wall was poured.

Cement—Ready-Mixed!

We ducked the laborious job of mixing gravel and cement and water to make the concrete; we simply ordered the cement ready-mixed just as a professional builder does. Ready-mixed cement delivered to the job costs little more than the materials and this is the best way to buy it when you are using a yard or more—this is the minimum amount usually delivered.

Before the cement stiffened in the forms we sunk about a dozen half-inch, foot-long iron bolts upright to use later to anchor the 4 x 4 sill to the foundation. If you have the bolts on hand it is a simple matter for the man who brings your cement to place these for you.

In two days the cement had hardened so we could take off the forms, but inasmuch as we couldn't do any more cement pouring until the next Saturday, we spent evenings tossing in stones to bring the ground inside the foundation up to within 6 inches of where the top of the floor was to be. Three of the six inches were filled with cinders.

On Saturday we were ready for the floor. The cinders were raked level and the sloping form for the dairy gutter was braced in place. The concrete floor was poured in three sections. The fellow who brought the concrete showed us how to lay two 12 foot 2 x 4's just inside the concrete foundation but three inches down from the top. Concrete was poured and the top of these 2 x 4's used as a guide for another 15 foot 2 x 4 which we sawed back and forth leveling the cement. This is not nearly as complicated as it sounds. We used wooden trowels to smooth off the top surface because we didn't want it as slick as you can make cement with a steel trowel.

The next step, according to the good book on carpentry we were reading, was to "lay the sills." This highly technical sounding procedure simply meant to take a piece of timber, in this case we used 4 x 4's from the old barn, and lay them lengthwise along the top of the concrete foundation. Where necessary, holes were bored in this sill to let the anchor bolts come through; the

washers and nuts were not screwed on for a few more days just to be absolutely certain that the bolts had hardened into the cement. The sills were set all around the foundation except where the doors were to go.

Next, at the four corners, 4 x 4 uprights (7½ feet at front, 4½ feet at back) were set in place, leveled so they would stand absolutely perpendicular by tacking a pair of braces from about half-way up each post down to the sill at either side. Then the corner posts were spiked to the sills. The 7½ foot 2 x 4's were cut and nailed up. The 2 x 4 plate, the piece that goes across the top of the studs, was leveled and nailed. Next the two end rafters were notched and fitted. The end studs cut and fitted under the end rafters . . . then all the rest of the rafters were put in place, we started boarding the sides and roof.

None of this was complicated, but it did take a good deal of time because we had to figure each step out as we went along. In fact, I would like to say right here, that there is nothing complicated about building a chicken house, a barn, or even the traditional country house. And now that the prefabricators are offering complete heating, plumbing, cooking, freezing, and laundry facilities built in one compact unit, building your own house has become about as easy as building a log cabin.

If a person has just a little manual dexterity, say the ability to drive a car, then he will have no difficulty in doing practically all the building that has to be done on a homestead. Carpenters, masons, plumbers, electricians love to make a great mystery of things—and the building codes, the building supply people, the utilities and appliance manufacturers do their best to keep the average householder from doing any building on his own. But the truth of the matter is that most of the skills of

the average mechanic are pretty simple to master. Naturally, their speed and accuracy is based on years of practice. But just as anybody who can read music can play all the notes in a difficult piano piece, anybody can build a barn or a house if he'll get some good manuals on building and good plans for what he wants to build—the difference is that in the case of the amateur at the piano, the piece won't sound right played so slowly, whereas when the building is finished, no one will ever know whether it took a day or a year to build.

Race Against Time

To return to our barn, a couple of rainy weekends, a garden waiting to be planted, plus the inescapable fact that Cassandra, the goat we'd bought but hadn't brought home yet, was due to kid in two weeks, made us call a carpenter to help finish our barn. I am not going to take time to describe in detail just how the interior of our barn was finished—you can get a good idea of that from the sketch shown below. If you want to build a small barn, we've had a draftsman work out complete details with a number of variations.

In the years that we've used our barn, we've found little that we've wanted to change. The only addition we are planning is to extend the barn another 10 feet in length to the West; this will give us more storage space which we will need when we begin harvesting our own hay. Of course, we could change the shed-roof to a gable or gambrel roof and store the hay there, but it is just as cheap to extend the length and eliminate hoisting hay into the loft and climbing up to throw it down.

This "breakaway" drawing shows interior of our small barn. We found that this 16 x 30 foot barn efficiently houses 30 hens, 60 broilers, 20 or more rabbits, 4 goats or a cow and calf, 3 or 4 sheep, and a dozen squab. Barn cost \$200 to \$400. Bill of materials, plus complete building plans including 10 large detail drawings of front, ends, interior layout, goat stalls and milking stand, cow stalls, chicken section, squab loft, also a turkey sunporch are available.

The Importance of Raising Part of Your Food

WHY do we put so much emphasis on home food production? *In the first place, the health of millions of Americans would be far better if every family raised part of the food it eats.*

And when we say *every family*, we really mean *every family*. No man, no matter who he is, can break the rules of health and escape suffering the consequences. Even the Presidents of the United States, we honestly believe, would be healthier individuals if they tended their own gardens and milked a family cow. Let us explain.

There are two basic reasons for raising part of your own food. First, only by so doing can you be perfectly fed. Secondly, physical contact with the good earth and livestock are the best known antidotes to the mad, hustle and bustle of our present work-a-day world.

There are many lesser reasons for owning your own home and raising part of your own food. There is the basic security of this way of life, an opportunity for the productive use of your spare time, cooperation of the family and the greater enjoyment of family life, the benefits of fresh air, sunshine, outdoor exercise, an opportunity to be creative, the independence and responsibility of land ownership, all in addition to the direct economic benefits.

3 Square Meals and Starve!

A doctor friend who read our Plan said, "Ed, you don't make clear in your Plan how important living-in-the-country and raising-your-food is from the health standpoint."

"Well, we meant to—we sure believe that country living can be healthier. . ."

I replied.

"What I mean," he explained, "is the

belief of so many physicians today that too much time is being spent diagnosing illness and patching up the sick without doing much about the cause. We're finding that *basically* much disease is caused by the food we didn't eat—and because the food we *did* eat lacked vital elements."

He spoke of how a millionaire in Manhattan could suffer from hunger as much as a share cropper. This hunger he talked about he called a "hidden hunger"—a lack of minerals and vitamins in food. Of course, he went on, we all know how a lack of iron causes anemia, a lack of calcium causes rickets, goiter is caused by insufficient iodine, night blindness by insufficient Vitamin A, tooth decay by a lack of fluorine, calcium and phosphorus. The thing, he said, doctors now worried about was *how many more* diseases of civilization were caused by year-in-year-out deficiencies in the food we eat. The unfortunate aspect of all this is the fact that vitamin and mineral deficient spinach looks about the same as spinach right out of a good garden!

Are You Growing Old Too Fast?

My doctor friend stimulated our interest. He opened our eyes to the vast amount of evidence appearing day-by-day on the subject of being healthy by eating properly.

For example, Army doctors found in their young patients symptoms that looked like those of old age. In the early New Guinea campaign young soldiers suffered from dejected appetites, physical and mental fatigue, reduced resistance to infection. Analyses of tinned food showed only slight deficiencies, but when supply ships came with fresh vegetables, fruit and meat,

these minor symptoms of old age disappeared.

And what about the major degenerative diseases of old age? Of middle age, rather—high blood pressure, hardening of the arteries, wearing out the heart, the kidneys, the brain?

Dr. N. Philip Norman, in a Friends of the Land Food Conference in Ohio, pointed out the harm that has been done and is being done to the health of our people by commercial food processing and by our food habits.

He told how all this stuff about vitamin pills had grown as a parasite on the nutrition-for-war-and-defense program—from a little over a million dollars in advertising to two hundred fifty million dollars a year in just four years shows what modern advertising can do with part of the truth. How much good has been done by this? Dr. Norman believes that had we eaten whole-grain cereals in our bread and breakfast food, unprocessed, untouched by the kiln drying, unexploded and not devitalized grain, forage fresh from the vine, tree, and garden—and if we had eaten the meat of animals that had been fed on whole cereals, forage rich with nutrients, especially the internal organs of these animals, and if we had drunk plenty of milk that has been not too badly abused, we would avoid most of these degenerative diseases. There is much evidence to back up Dr. Norman.

3 Ways Food Goes Wrong

Evidence is beginning to appear showing that soil and freshness all effect the mineral and vitamin content of the food we eat. Carrots raised in a mineral-rich soil are more healthful than those raised in poor soil. Hot-house tomatoes, the kind you buy in the store, have but half the Vitamin C content of tomatoes fresh from the garden. Steam-table restaurant fare has a fraction of the value of properly home-cooked foods.

Many of the so-called "fresh" vegetables you buy in the store haven't nearly the value of these same foods out of your garden. Out at Ohio State experiments show that about 43% of the "fresh" vegetables sold in stores have lost the biggest part of their vitamin content. Oranges and grapefruit lose around 30% of their Vitamin C 30 days after picking I've heard.

Now, if you will get yourself a productive home in the country, if you will take a real interest in the fertility of your soil, if you eat plenty of your own home-raised fresh vegetables and fruits, your own fresh eggs, fresh meat, use honey instead of sugar, drink lots of raw whole milk and eat whole grain bread, all the evidence says you and your family will be far healthier and live longer, more active lives *as well!*

Protective Foods You Should Eat Daily

FOODS	BABY 1 YR.	CHILDREN			ADULTS
		Preschool	Early School	Adolescent	
MILK, whole	1 qt	1 qt	1 qt	½ qt	½-1 qt
VEGETABLES and FRUITS					
Green, leafy, or yellow	¾ Tb	½-¾ c	¾-1 c	1 c	1 c
Tomatoes*	6-7 Tb	⅝ c	¾ c	1 c	¾ c
Other vegetables	¾ Tb	½-¾ c	1-1½ c	1½-2 c	1½-2 c
Other fruits	¾ Tb	½-¾ c	¾-1 c	1-1½ c	1-1½ c
MEATS	½ Tb	1 small serving	1 serving	2 servings	1 large serving
EGGS	1	1	1	1	1

*Half as much orange as tomato. Tb = tablespoon; c = cup.

MILK, VEGETABLES (particularly FRESH green leafy ones), MEAT, EGGS and FRUIT are called the "protective" foods because they safeguard the body from a variety of diseases.

These foods are needed at all ages—not only by children and adults, but elderly people.

If you raise them on your homestead, you can eat them generously. Most of us need more calories—potatoes, wholegrain bread and cereals, butter, sorghum, and dried beans are good suppliers of calories. Eat sparingly of sugar and other refined foods!

A Good Garden With a Lot Less Work

EVEN before the victory garden boom there were so many books, articles, pamphlets on gardening that garden writers seemed to be having quite a time of it trying to be original. For example, I have in front of me a cute article in one of the "garden and home" magazines explaining how you can have cucumbers climb a fence, use carrots for borders, and make a tepee for the children by planting pole beans.

Well, maybe garden articles like that appeal to some folks, but what we wanted at our place was somebody to tell us how to raise a lot of vegetables with as little work as possible.

We weren't interested in gardening as a hobby. We wanted to make it pay and believed we could. We knew that out of every dollar's worth of vegetables my wife bought at the store 60 cents went for marketing and handling.

Our first garden was small—about 30 by 40 feet. We simply dug up the ground, mixed in a little all-purpose commercial fertilizer, bought some seeds at "the corner drug store"—and, needless to say, our garden was pretty much of a flop. Some vegetables grew fairly well, but most didn't. And the insects got more out of it than we did.

We were discouraged. Like many city people we thought a garden was "duck soup". But we've found out that
